Towards the end of the century romantic poetry became imbued with Fr. symbolism, and A. C. Swinburne (1837-1909) possessed a unique capacity for verbal music. Swinburne in poetry and Pater in criticism were the patron saints of the aesthetic school of the 'nineties, in which Oscar Wilde (1856-1900) was the most notable. George Moore (1852-1933) in his work combined the aesthetic doctrine of art for art's sake with the realism of the Fr. novels of Zola, while having something in common with the Celtic Revival. If his art and religion somewhat obscure his intention, he is essentially a story-teller. The Fr. naturalism which Moore imbibed was assiduously avoided by Stevenson (1850-94) in his adventure novels. The typical poet of the Celtic Revival is W. B. Yeats (1865-1939), who was also a playwright, but in the plays of J. M. Synge (1871-1909) Irish mysticism is tempered with a humorous observation of Irish life. Other poets of the Celtic Revival are Lionel Johnson (1867-1902), George Russell ('A.E.') (1867-1935) Padraic Colum, James Stephens, Katharine Tynan, etc. Gerard Manley Hopkins, an Eng. poet sent to Ireland by the Society of Jesus, is too individualistic in his poems, 1876-89, to belong to any school, but his rhythmic experiments have influenced a succeeding generation since his poems were first pub. posthumously in 1918. Tennyson was succeeded as Laureate by Alfred Austin (1835-1913) and after him by Robert Bridges (1844-1929), with Tennyson one of the greatest of England's practising Laureates. Symbolism was carried over into the twentieth century by John Davidson (1857-1909) and Arthur Symonds (1865-1945), while Francis Thompson (1860-1907) was, like Hopkins, a Rom. Catholic and, like him, an adept in verbal music. Thomas Hardy in *The Dynasts* (1904-8) reached epic grandeur, other notable epics of the twentieth century being *The Dawn in Britain* (1906-7), by C. M. Doughty (1813-1926), the author of *Travels in Arabia Deserta*, and *The Torch-Bearers*, an epic by Alfred Noyes, completed in 1930. Rudyard Kipling (1865-1936) became the poet of an imperialism which has become somewhat discredited for its ultra-jingo note, combined with a love of Eng. soil; he is also known as a novelist and short-story writer. As an imperialist he is allied to the poets W. E. Henley (1849-1903) and Sir Henry Newbolt (1862-1938); but socialism has found its spokesmen in G. B. Shaw and H. G. Wells (1863-1946), and also, but of a more medieval guild variety, in Chesterton (1874-1936) and Belloc. The open-air school of nature writers must also be mentioned: Richard Jefferies (1848-87), W. H. Hudson (1846-1922), and Edward Thomas

(1878-1917), poet and essayist; while a forerunner of these authors is George Borrow (1803-81).

Several poets writing about 1910 are classed in the 'Georgian group': T. Sturge Moore; W. H. Davies (1870-1910); John Masefield (laureate, 1930); W. W. Gibson; Lascelles Abercrombie (1881-1938) who, as a critic, wrote much on the nature of great poetry, which obtained recognition as work of real value; Lady Margaret Sackville; James Elroy Flecker (1884-1915); Sir John Collings Squire; Rupert Brooke (1887-1915); Humbert Wolfe (1885-1940); Edmund Blunden, whose collected verse was pub. in 1941. He, like Chancer and Hardy, is steeped in the English soil, reminiscent without bitterness, expressive of the harmony which he sees amid the rancour and hatreds of to-day. The poetry of Walter de la Mare is pervaded by a note of sadness and mystery, showing a pre-occupation with a world of dreams, a twilight space or region of intangible secrecies that lies just beyond the edge of sense. But while his earlier poems showed marked simplicity, in the later the craftsman at times seems to overwhelm the poet. The note of the younger members of the Georgian group was changed by the First World War which bred its own generation of poets: Siegfried Sassoon; Osbert, Sacheverell, and Edith Sitwell; Wilfred Owen (1893-1918); Robert Nichols; Robert Graves; Charles Sorley (1895-1915); and Isaac Rosenberg (1890-1918) whose collected works were pub. in 1937. His influence on the younger generation of poets and the praise of his work by T. E. Lawrence and Lascelles Abercrombie indicate the range of his appeal. His mastery of imagery is exemplified in such pieces as *Moses*, *The Unicorn*, and *Dead Man's Dump*.

The young poets of the pre-1930 period, the group that came from Oxford in the first years following the war, are the poets of this day—Auden, Spender, MacNiece and Day Lewis. All were social idealists drawn to active sympathy with the Sp. Civil War and left-wing political parties, but later, became less political in outlook. Auden, leader of the group, had adopted Amer. citizenship when he pub. vols. of poems and one vol. of didactic poetic drama. Stephen Spender, with a large following among the young, is perhaps the most prominent figure of the group after Auden. Day Lewis writes conventional modern poetry of good quality. MacNiece has a fine talent in a light vein. Among the generation of poets that have emerged during the period of the late war must be mentioned Dylan Thomas, a Welsh poet writing, in Eng., emotional verse instinct with a rare passion, and Vernon Watkins, also Welsh, who has some of the qualities of his fellow countryman; and among the younger poets too should be mentioned Kathleen Raine. Also may be noted a group of Anglican poets who reveal the influence of T. S. Eliot's advocacy of the sect. Religious dramas by these poets, among whom are Norman Nicholson, Anne Ridler, and Ronald Duncan have been performed at

the Mercury Theatre. Yet others among many writers of Eng. verse are John Betjeman, writer of sentimental poems about Eng. vills. and churches, and Sidney Keyes, a young poet of high talent who was killed in the late war. Many poets of the older generation continued to produce good verse during the war—Herbert Read, Edmund Blunden, Walter de la Mare, and Siegfried Sassoon—though their verse does not suggest the contemporary world. By common consent the influence of T. S. Eliot among students suggests that there must be something seriously wrong with Eng. poetry which in a generation has produced no poet of a stature equal to Eliot, an Amer. (now a naturalised Brit. subject) who 'having been the iconoclast of a body of dead poetic convention twenty years ago, now stands cathedral-like as a symbol of tradition, the past, the values of a civilisation away from which we know that we must proceed towards a very different world, a very different kind of sensibility' (Kathleen Raine). His *Murder in the Cathedral* (1935) is drama reached through poetry with a hidden dramatic quality, but without the incorporation of the moral in the matter—wherein it differs fundamentally from the verse dramas of Byron and Browning. To an older generation his name suggests a difficult, unattractive poetry—*The Waste Land* and *Samson Agonistes*, the utterance of dynamic despair at the future of the world: yet to a younger generation, Eliot is a symbol of the old European culture, of the Christian church, of political conservatism—everything severely classical and retrospective. To understand the position of Eng. poetry to-day demands an appreciation of the position of Eliot, who, apart from his poetry, is perhaps the leading critic in the contemporary literary world, the one poet whose utterance touches universals rather than a particular time or mode. Edith Sitwell however is foremost among the others and her three vols. of verse pub. since the war have confirmed her position as a poet of rare accomplishment, whose work posterity will recognise as essentially 'early twentieth century.' Auden's vol. of *Poems* attracted the attention of those anxious for the present destiny of Eng. poetry. In *The Orators* (1932) the technical achievement is even more surely fixed, while rhythms and allusions are handled with rare skill. In *The Use of Poetry and the Use of Criticism* (1933) T. S. Eliot surveys the relation of criticism to poetry in England and gives valuable hints on the appreciation of poetry, the function of poetry and of criticism and the relation of literature to civilisation and of poetry to politics and religion. The work is an important landmark in Eng. criticism worthy to be ranked with that of Ben Jonson, Sidney, Dryden, Dr. Johnson, Matthew Arnold, and Walter Pater.

Moving nature descriptions against a background of war couched in a distinctive style are the feature of *Twentieth Century Psalter* (1943) of Richard Church which embodies the poet's reactions to life in the months of attack on Britain.

B. Ifor Evan's *Tradition and Romanticism* (1940) helps to resolve the old feud between the classical and romantic schools by side-tracking the arguments and tracing the conceptions of poetry held by the poets themselves. Also in the field of the most recent belles lettres may be noted Walter de la Mare's *Pleasures and Speculations* (1910)—essays on subjects which give scope for the author's imagination and fancy which invest most things in an aura of novelty. G. Wilson Knight's *Starlit Dome* (1941) are 'studies in the poetry of vision' emphasising that in interpreting poets and poetry, symbols are the significant element, for these and imagery illustrate the poet's particular angle of vision. George Sampson's *Concise Cambridge History of English Literature* (1911) is a reliable guide, well in the English literary tradition; and in the same sphere is *English Literature in the earlier seventeenth century* (Oxford History of English Literature) by Douglas Bush (1945). Eng. belles lettres are further enriched by the *Death of the Moth* (1942) in which Virginia Woolf, almost in the manner of Sir Thomas Browne or Charles Lamb, reveals her gift of transmuting her own personal meditations into literature though she is unique in capturing those more elusive shades of thought which are mostly gone before they can be really apprehended. Robert Lynd's essays on multifarious topics, contributed for many years to the *New Statesman and Nation* under the nom. de plume of 'Y. Y.' revealed something of the happy facetiousness of Lamb.

Throughout the decade before the late war and during the war much admirably-written history was added to E. L. The *Cambridge Ancient History*, Vol. XII, *The Imperial Crisis and Recovery, A.D. 193-324* (1939), completed a monumental series pub. over the period 1923-39 and a similar great co-operative enterprise is *The Cambridge Medieval History*, vol. viii, of which, *The Close of the Middle Ages*, appeared in 1936. In these vols. the hist. of each special period is told with great skill and interest, and with clear suggestions on the true origins of many modern political institutions and theories and valuable for the maturity of judgment of the standard authorities of the period. Arnold Toynbee's *A Study of History* (1934-39) is a standard work on the evolution of civilisations revealing wide erudition in the handling of most problems of hist., whether ant. or modern. G. M. Trevelyan's *Ramfilles and the Union with Scotland* (1932), based firmly on contemporary records, is splendidly descriptive and vivid: it is part of a trilogy which is already a standard work on the reign of Queen Anne. The third vol., *England under Queen Anne* (1934) is a masterly survey and a classic, generally, in Eng. historical literature. The same historian's *English Social History* (1944), which was an eagerly-sought work as soon as pub., is a portrayal of six centuries of social hist., from Chaucer to Queen Victoria written with great felicity of style.

Recent biography in E. L. has produced

work of varying merit and literary treatment. History and fiction have met in a form of biographical writing, exploited by Lytton Strachey (1880-1932), Philip Guedalla (1889-1944) and others. It introduces elements conventionally regarded as outside the legitimate sphere of biography and tends to distort and denigrate the portrait of its subject. *Eminent Victorians* is an example of this kind of biographical writing. On the other hand Winston Churchill's *Marlborough* (1932), a large-scale work, which purports to rehabilitate the character and career of a soldier and historical figure reputedly misinterpreted by Macaulay, is remarkable for its lucid and attractive narrative style, and the vivid boldly rhetorical sketches of the wild youth and early military career of his subject. Herbert Bell's *Lord Palmerston* (1936) too, embodies the substantial results of clear and documentary research as opposed to bright biography of unequal worth. Similarly D. M. Low's *Edward Gibbon* (1737-1794), pub. in 1937, the best modern life of Gibbon, sets a standard of soberly-written biography in an age much degraded by fictional irrelevancy. Sir Osbert Sitwell's autobiography, *Left Hand, Right Hand* (1943) essentially a fantasy of a bygone decorative form of English life, is written with a rare distinction of style eminently suited to its matter.

E. L. sees no falling-off in acutely-written works in the category of religion and philosophy or kindred subject-heads. Sir Charles Sherrington's *Man on his Nature* (1910) marks the entry of a physiologist of great repute into the realm of metaphysics. The work is an exposition of certain aspects of biological science, imparted with rare literary art and deals, more particularly, with those frontiers of natural science which coincide with those of natural theology. In his eminently readable *History of Western Philosophy and its connection with Political and Social Circumstances from the Earliest Times to the Present Day* (1946), Bertrand Russell gives accounts of doctrines, and sometimes brief summaries of the chief works, of over thirty influential European philosophers. His conclusions tend to conform with a not unduly altered general point of view. He does not aim here at furnishing one more conventional textbook of the history of thought; rather is the work an exposition of his philosophy with reference to such history. The literary style is clear, alive, and acute and, with its seasoning of anecdotes and pleasantries, seems intended mainly for the general reading public. In the manner of a literary pastiche is G. B. Shaw's *The Adventures of the Black Girl in her search for God* (1932)—a parable to show the different conceptions of the deity that may be found in the world from the phases of God in the Old and New Testaments to the God of Natural Science, written in excellent prose in a clear racy style. Equally mordant irony marks his work *Everybody's Political What's What* (1944) which may be mentioned here; it is a summary of the doctrines which Mr. Shaw has declared for the last half

century, but, if a remarkable literary *tour de force* for a man of eighty-eight years of age, its denigration of British political institutions argues a prejudiced if characteristic outlook.

With the turn of the century competent craftsmen in novel-writing are numerous and often start some particular fashion. Henry James, George Moore, D. H. Lawrence are not among the more generally popular novelists but they are among the most novel for their time and artistically adventurous, as are also Aldous Huxley, E. M. Forster, Charles Morgan, Virginia Woolf, Dorothy M. Richardson and James Joyce. None of these are traditionalists or followers of the main road of Eng. fiction, but are experimentalists turning fiction to new purposes. The mainstream of the novel during the past quarter of a century or more was fed, not by the experimentalists, but by such writers as Joseph Conrad (1856-1924), Arnold Bennett (1867-1931), John Galsworthy (1867-1933), H. G. Wells (1868-1946), Hugh Walpole (1884-1941), Somerset Maugham and later J. B. Priestley. Henry James (1843-1916), a writer of somewhat narrow outlook, is a psychological novelist, with a unique style full of mannerisms yet lucid for those who will persevere with him. D. H. Lawrence's prose has in its time produced rare effects; it is a prose that bleeds with compassion and it is often powerful and impulsive, but saturated with sexual images. Few writers have his power of vividly communicating physical sensations or convey the idea of so great a mastery of the dark region that exists somewhere between thought and feeling. Like Lawrence's work that of Virginia Woolf (1882-1942) constitutes a class in itself. Subtlety of structural technique and sensitiveness of character evocation mark her novels, as also keen sensibility and lyrical power. If she has added no character to Eng. fiction, she has contributed pages of rare quality to Eng. prose; and if her highly impressionistic work, as exemplified in her short stories, lacks external drama, it is because she rates the life of the mind higher than the movement of the body. James Joyce's *Ulysses*, which records in one large book only one day in a man's mental life, has been justifiably described as the *reductio ad absurdum* of the extreme subjective method. He and Dorothy Richardson have carried the method as far as it can usefully go or farther. Of greater value in the art of intercepting the 'stream of consciousness' is the work of Virginia Woolf for the reasons given above. The root-idea of psychoanalysis—the most significant contribution to psychology that has been made in the last hundred years—has inevitably been exploited by innumerable modern novelists, though, as it has been well said, Samuel Richardson was really the true father of psychological fiction. May Sinclair may be mentioned as one novelist whose later work at least betrays the influence of Freud's doctrines. Yet other writers of the 'stream of consciousness' school are T. E. Powys, but with an obsession for single-track minds,

and Wm. Faulkner. Also among the modernistic novelists, though in a very different vein from Joyce, are Evelyn Waugh, Charles Williams (1886-1945) and H. M. Tomlinson, the first and last being at times brilliant essayists in atmospheres and symbols while all three are agreeably free from the pretentiousness of the ultra-experimentalists. Aldous Huxley, as the disillusioned voice of modern consciousness, ruthlessly satirises a machine-made society in extravagant and witty characterisation and with encyclopaedic knowledge. Charles Morgan's novels are remarkable for delicate workmanship, convincing characterisation and brilliant development of relevant spiritual values. E. M. Forster stands alone and chiefly for his novel *A Passage to India*, which will live as a social-political tract if somewhat biased, as a psychological novel if prejudiced by over-mystification, and as a superb character study of people of one race writing of another. It is difficult to do justice to the elusive charm of his style and to the new and surprising beauties that teem in its pages. Reverting to the traditionalists in Eng. fiction—Arnold Bennett's work has sometimes been described as largely the apotheosis of the commonplace; but his best achievements are unassailable and may be regarded as inspired by Zola and Balzac and other leading Fr. writers, of whom he had a profound knowledge. Galsworthy's *The Forsyte Saga* and *A Modern Comedy* constitute perhaps the most magnificently convincing social hist. of our time. In them he exhibits with extraordinary genius the forms and expressions of thought of a class that are worshipped by none so much as they worship themselves,—the acquisitive upper middle class. The Forsytes may be described as the best mirror in Eng. literature of the social existence and mentality of a family whose members are interesting largely by reason of the inevitable accident of their birth. The novels of the very versatile H. G. Wells, though not experimental in the accepted sense, fall easily into three or four well marked phases or categories—the highly-original pseudo-scientific romances of his early years as a novelist; the quasi-autobiographical novels of wistful humour like *Kipps* and *Mr. Polly*; and sociological novels, in which the true function of the novelist is really lost in discursive socio-political essays shot through with interludes of graphic fiction. The most developed work of Hugh Walpole is, generally speaking, dominated by the gorgeously-tapestried work in the tetralogy of *Rogue Herries*, *Judith Paris*, *The Fortress*, and *Vanessa*, an achievement which is perhaps the finest and most sustained product of the romantic revival of recent times giving new life to historical fiction. Precise character-delineation and supreme technical finish mark Somerset Maugham's novels and short stories, the former of which sometimes take the form of a series of incidents yielding a cynical philosophy towards life or, as in his *Theatre*, reflect a debonaire satirist's picture of a petty world seen through the objec-

tive spectacles of an adroit moralist. Conrad's adventure novels, with firsthand experience of the sea and seamen, are remarkable for their style and are among the finest literary achievements of this century. J. B. Priestley has restored to the Eng. novel the picaresque elements of Smollett's day combined with the robust and expansive humour of Dickens. Most of the novels of J. D. Beresford are chronicles which, by contrast with the period novel, attempt a picture of society valid for all time; and a similar universality of delineation and appeal characterise the stories of Compton Mackenzie, Frank Swinnerton and R. H. Mottram, the first named also writing 'chronicle' novels while Mottram's chief work, *Spanish Farm*, rises to epic heights with its treatment of the central character as the symbol of martyred Belgium through the centuries. Robert Graves is a novelist who makes an impressive attempt at historical reconstruction in the guise of fictional autobiography. Fictional biography against a background of philosophy is a favoured literary device of some Eng. writers as e.g. David Garnett. Richard Aldington's novels are reflections of contemporary problems and the work of a writer who is also a poet of distinction. James Stephens, in prose and verse alike a poet, is an imaginative writer who retells in English the auct. and lovely legends of Ireland with the technique and in the spirit of an accomplished modern novel. Another novelist whose work is the expression of a poetic temperament is Francis Brett Young. A. J. Cronin may be classed among the social reformative novelists, notably as exemplified in *The Citadel*. Richard Hughes's novels of adventure on the seas are characterised by exactness and brilliance of description and may almost be regarded as allegories. Sombre writing in the vein of Tolstoy, both as to choice of theme and treatment, is the keynote of the work of H. E. Bates, which shows a keen flair for rural atmosphere. Richard Llewellyn, in a successful first novel (*How Green is My Valley*, 1938) exploits the ordinary pleasures of peasant existence in hues romantic yet true to life. Other novelists in E. L. of the past two decades include Louis Golding, a writer of novels of considerable power and tragic beauty; Wm. Gerhardt, with a flair for copious characterisation and digressive comedy; Harold Webber Freeman; Gilbert Cannan; A. M. Monkhouse; and A. P. Herbert, who is also a modern Euphuist in the art of writing witty topical verse. E. M. Delafeld (1880-1943), Margaret Kennedy, Rose Macaulay, Naomi Mitchison, Ethel Mannin, Violet Sackville-West, Theodora Benson, Storm Jameson, Sheila Kaye-Smith, and Mary Webb (1883-1928) are women authors whose novels, eminently readable, can yield all the wit that may be required by way of counterbalance to the proselytising seriousness of much modern male talent. Mary Webb's novels, which for some time were unrecognised, were lifted from obscurity by the eulogies of J. M. Barrie and Earl Baldwin. They are of considerable

power, and in their themes suggest the outlook of Thomas Hardy. Katherine Mansfield is regarded by some as the one great short story writer of undoubted genius in the present century. Somerset Maugham and Walter de la Mare are other leading writers whose short stories reflect a quality of mind original in modern literature. An over-wrought style characterises the otherwise admirable short stories of C. E. Montague. Other short story writers are A. K. Coppard—the best of whose hard-etched tales have a strong aroma of reminiscence and unusual plots—Martin Armstrong, P. G. Wodehouse (humorous), Ethel Colburn Mayne, W. W. Jacobs—who, however, really belongs to an older generation—and in this sphere should be mentioned also the Father Brown stories of G. K. Chesterton.

English Review. The, was started by John Murray, the celebrated publisher. It first appeared as an annual register, entitled *The London Mercury*. A 2s. 6d. review of the same name was founded by Chapman & Hall in 1908. Noteworthy for its high literary qualities, and devoted itself to the pub. of such articles, essays, belles lettres, short stories, and poems, by whomsoever written, as it deems remarkable for intrinsic merit. Many an obscure or struggling writer has sprung into fame through the medium of its pages.

English River, estuary on Delagoa Bay in S.E. Africa.

English River, see CHURCHILL RIVER.

Englishry, term used during the Norman rule in England. It was used to show contempt, for if the hundred could prove that a murdered person was English, that is to say, make a 'presentment of E.' it escaped without punishment. This was abolished in the first half of the fourteenth century.

English Setter, see SETTER.

Engraving, primarily the art of drawing on a substance by means of an incised line. The term was early applied to the work produced by that process and later to the impression of the engraved work upon a sheet of paper. This article deals with E. on metals. From very early times gems have been engraved with ornaments or signets, and commemorative inscriptions have been cut into metal tablets, but technically the word E. is confined to the incision of a design upon a plate of metal or a wooden block, for the purpose of producing upon paper by the aid of ink a series of reproductions of that design. Copper plate and steel E. was introduced at the end of the fifteenth century. On metals, E. are usually in intaglio, that is, the lines are sunk in and possess a positive value in that they actually trace the design. In woodcuts and wood-engraving (q.v.) the lines are negative, their object being to leave the true design projecting in relief. Copper and steel are the favourite metals of engravers, but zinc, brass, silver, and iron have also been employed. Steel is much harder to work with than copper, but on the other hand its very toughness makes it possible to take off a greater number of good impressions. By means of electrolysis, it is now possible for the engraver to protect his copper plate by a thin coating of steel; the result of this has been almost to do away with steel plates altogether. Copper has always been preferred where the aim of the artist is to produce a highly finished and delicate reproduction of the design.

Line Engraving.—Implies the use of a tool called the graver or burin. This con-

sists of a steel rod some 4 in. long, with a square or lozenge-shaped section, a sharp edge being secured by cutting the section obliquely. The engraver controls the rod by grasping a wooden handle, and in making his strokes varies the pressure in accordance with the thickness of the line desired. When his work is finished he covers the plate with printer's ink, presses it into the incisions by the aid of a dabber, rubs away the superfluous ink with a piece of muslin and then carefully lays a sheet of moistened paper on the engraved surface. The plate, with the paper thus attached, is placed on a board which slides between two rollers in what is called the copperplate press, blankets softening the contact of paper and roller. The

AN ENGRAVING BY DURER:
'Christ on the Cross'

design is reproduced by the transference of the ink from plate to paper. *Etching* (q.v.) involves the use of a mordant to eat into the plate. An etching-ground is spread over the copper surface and the lines are opened up with an etching needle.

Dry-point is a method of E. akin to the processes already described. The implement used is a steel point stronger and more tapering than the etching needle. When this is firmly drawn across the metal surface, quite a distinct burr—like a miniature thorn—is produced, the effect of which is to leave a semi-luminous ridge of tone at the side of each line, and thus to impart to the whole print an attractive richness of tone. Skilful engravers often blend these three processes in the one plate.

Tone-processes aim at achieving a result on the plate similar to that produced by a colour wash in painting. If the artist

uses the 'crayon or chalk-manner,' he first perforates his etching-ground with special needles like the mace-head or roulette, his aim being to suggest the rough texture of crayon strokes. If he follows the 'stipple method,' he imitates broad tone surfaces by covering the etching-ground with dots and short strokes, using the curved stipple engraver, the dry-point, or the roulette for the purpose. The essential distinction of the *mezzotint* process is that the craftsman begins with a dark ground and proceeds to create his lights by a negative and scraping device. With the assistance of a kind of chisel, called the 'cradle' or 'rocker,' he roughens the plate by raising metal points or burrs. At this stage the copper would print a rich black, but the mezzotinter removes the burrs with his 'scraper' in proportion to the tone he wishes to produce. Thus, if he scrapes down to the bottom of the indentation, he will get a smooth surface, which will not be able to hold any ink and will therefore print white. For *aquatints* the plate is prepared for E. by a porous coating of sand or resinous gum. This method produces Es. not unlike mezzotints.

Not more than twenty-five good mezzotints or dry-points can be obtained from one plate, as the brilliancy of the impression depends on the delicacy of the burr. A steel facing, however, increases the number to a hundred, whilst with this protection as many as three thousand line Es. may safely be taken off. The value of a print depends on the engraver and the fineness of the impression, which decreases, naturally, with the number taken. 'Artist's proofs' are treasured, as they bear the signature of the painter or engraver, or of both. The signature is considered a guarantee of the quality of the print and may imply retouchings by the artist.

History of line-engraving and etching.—*Line-engraving*.—E. is an art of comparatively recent development and the earliest known illustration, with metal as the medium, is the 'Flagellation,' which is dated 1446, and is the work of a Ger. who lived in the neighbourhood of Cologne or Basle. In Italy the art grew side by side with painting, and arose, as some think, from that of niello, which was a process of incising a pattern on gold or silver and then filling in the groove with a black compound (nigellum). The work of Maso Finiguerra (1426-61), with its plentiful cross hatchings illustrates the 'Fine Manner,' whilst that remarkably fine achievement of the Florentine Antonio Pollaiuolo (1429-98), 'The Battle of the Nudes,' exhibits the broad and simple lines of parallel shading which characterises the exponents of the so-called 'Broad Manner.' Somewhat similar in style is 'The Virgin and Child' of Andrea Mantegna (1431-1506). Albrecht Dürer, the Ger. (1471-1528), Marcantonio Raimondi, the Bolognese (1475-1530), and Lucas van Leyden, the Netherlander (1494-1533), form a conspicuous triumvirate of engravers. Formal dignity, refinement of touch, and unremitting care are a few of

the merits of Dürer's portrait of Albrecht of Brandenburg and his 'St. Jerome in the Wilderness.' Marcantonio is famous for his reproductions of Raphael's work. According to Vasari it was the engraver's magnificent 'Death of Lucretia' which was responsible for his long association with that painter. Lucas's skill may well be studied in his 'David playing before Saul.' The first French engraver of note was Jean Duvert (1485-1561), whose 'Apocalypse' series emphasises his mysticism and at the same time his somewhat heavy, overloaded style. In England the same distinction must be reserved for Wm. Rogers (fl. 1580-1610), who executed sev. portraits of Queen Elizabeth, all of which, however, are stiff and too ornate. Professional print-sellers, ready to provide portraits for historians and maps for discoverers, first began to flourish in the latter half of the sixteenth century. The pioneers were mostly Netherlanders, like Hieronymus Cock and Philippe Galle (1551-1612), many of whom migrated to Italy and Germany and thus popularised commercial En. abroad. Robert Nanteuil (1623-78), who was engraver at the court of Louis XIV., stands easily at the head of all Fr. engravers of portraits, and a similar honour among his own countrymen is with justice claimed for Wm. Faithorne (1656-91). Faithorne was the first great master of line engraving and raised E. to its place in art in England, equal to any work being done on the Continent. To quote his own words: 'The result of air, the symmetry of parts, the exact harmony of proportions, of lights and shadows, may be performed to the height in Graving.' Wm. Sherwen was initiated in the art of mezzotint E. by Prince Rupert and a dated mezzotint portrait of Charles II. (1669) establishes him as the first Eng. man to practise the art. John Smith (b. 1652) was a master of his period. He engraved over 100 portraits by Sir Godfrey Kneller and he also engraved after Correggio and Titians. John Faber who was born in Holland (1695), the son of a mezzotint engraver, engraved hundreds of plates after contemporary artists from Kneller and Reynolds to Hogarth and Franz Hals. Among the more notable of Eng. line-engravers were: George Vertue (1684-1756), engraver of portrait plates, appointed engraver to the Society of Antiquaries, and buried in Westminster Abbey; Wm. Hogarth (q.v.); Ravenet, who came from France in 1750, and blended line-engraving and etching; John Hall (1739-97), historical engraver to the king, one of whose works is 'Oliver Cromwell dissolving the Long Parliament'. François Vivares, the first landscape engraver in England and founder of a school of engravers in line; Lupton Goff (1791-1873), mezzotint engraver, estab. the use of steel for copper; Sir Robert Strange (q.v.) who pub. (1757) the famous plates 'Cæsar repudiating Pompeia', 'Romulus and Remus' after Cortona, and 'Charles I.'s Three Children' after Van Dyck and whose masterpiece 'Charles I.', also after Van Dyck, confirmed his European repu-

tation as an engraver of genius; Wm. Woollett (1735-85), who engraved in line and etching, his best plates being landscapes after Claude Lorraine and Richard Wilson, but the most famous of his works are the 'Death of General Wolfe' and 'The Battle of La Hogue' after Benjamin West; and Wm. Sharp (b. 1749) the last of the great copper-plate engravers, who executed many fine portraits after Reynolds and Romney and historical subjects. Wm. Blake (1757-1827) was also an engraver of merit in this period. There is true inspiration in his 'Illustrations of the Book of Job,' which have been rarely surpassed in purity of line, harmony of composition and independence of convention, whether in design or execution.

AN ENGRAVING BY BLAKE

'And my Servant Job shall pray for you'

At the end of the eighteenth century line-engraving was in its decline. Etchings and heliogravures have quite superseded line-engravings, and the burin will evidently soon be a tool of very subsidiary importance. Wood-engraving, on the other hand, has seen a strong revival. John Thompson (1785) a pupil of Branstrop and the best of all the wood-engravers of the period, also engraved for the Bank of England and executed the vignette of Britannia used on bank notes. Timothy Cole became known in America as a wood engraver of the works of old It. masters; and James Whistler (q.v.) the famous painter was also one of the distinguished Amer. etchers. Present day engravers of note include: Macnab, Alison McKenzie, Percy Bliss, Stephen Gooden and Gortulde Hermes. See also ETCHING; MEZZOTINT; NIELLO WORK; PHOTOGRAPHY.

PROCESS WORK ; WOODCUTS. See M. C. Salaman, *Old Engravers of England*, 1906 (with bibliography); *Bryan's Dictionary of Painters and Engravers*, 1930.

Engrossing, term applied to the practice of buying up any commodity in such large quantities that the buyer then commands the market. It was practically the same sort of system as forestalling, which meant buying cheap to sell at a much larger price. Under the old laws these practices and all others like them were considered as crimes and contrary to justice, and were forbidden by the statutes of the land. But in 1844 all the laws with regard to these practices were finally abolished, and they are now considered quite legal—a fact which is proved by the modern system of forming 'trusts.'

Enharmonic, term in music applied to modulations made merely by changes of sharps to corresponding flats and vice versa, e.g., C \sharp to D \flat , E \sharp to F \flat , etc. On the piano or other keyboard instrument there is no change in sound, but on string or wind instruments there is a minute difference, discernible to the trained ear.

Enid, city of Oklahoma, U.S.A., with an air-port. The leading grain mkt. of the state, and the trade centre for a large agric. dist. and for gas and oil fields. It is an important railway junction, has railroad shops, oil refineries, flour mills, and meat-packing plants, and makes agric. implements and wire. Pop. 28,000.

Enkhuizen, one of the dead cities of the IJssel Meer (Zuider Zee), Holland, and a delight to every visitor. The great Dromedaris Tower (1510), a splendid relic of the old fortifications, stands guardian over a curious little harbour. It takes an hour to walk round the tn., but its once busy streets are now gardens and its former pop. of 40,000 has fallen to about 8000. There are many interesting buildings, the chief being the belfry of 1542, called the *Zuidertoren*, and the orphanage or *Weeshuis* (1619). The herring fishery was the great wealth of E., but now not one of the 400 smacks remains. Paul Potter (1625-54), the Dutch painter, was born here.

Enlistment, method by which the army is recruited in such countries as do not have a form of conscription. Most of the European countries have some form of conscription, but in the case of Great Britain and America E. traditionally takes its place, though it would seem not improbable that conscription, which was re-introduced in Britain in 1939, will eventually replace voluntary enlistment permanently. Up to the beginning of the eighteenth century E. took place through an official who had no definite recognition by the army authorities, but who received a commission for every recruit. The period of service for which a soldier enlisted was not determined, in fact he served as long as he was physically fit. At the beginning of the nineteenth century recruiting was taken over by the army authorities, and since that time many changes have been made. A man on enlisting nowadays must make declaration

before a magistrate or before the commanding officer. He then takes the oath, signs a declaration, and is then, and only then, held to have enlisted. Punishment for false declarations can be made either in a civil court or by means of a dist. court-martial. A soldier is at liberty to purchase a discharge under certain conditions, but never when the country is at war. In ordinary peace-time engagements in recent years soldiers enlisted for twelve years, seven with the colours and five with the reserve, but many alterations were made in this system soon after the end of the First World War, e.g. in the Artillery, E. was for six years with the colours and six with the reserve. Further, it was possible to re-enlist at the end of twelve years' service and do twenty-one, after which a soldier became entitled to a pension (or after eighteen years' service if discharged on medical grounds after completing that period). The Special Reserve enlisted under special terms, usually for six years, with the possibility of doing more later if they so desired.

Enna, see CASTROGIOVANNI.

Ennis: (1) Tn. in co. Clare, Ire. It is the co. tn., and is situated on the Fergus about 20 m. N.W. of Limerick. In the tn. are the remains of a Franciscan friary, and also a Rom. Catholic church and college, while close by is a racecourse. The port is Clare Castle. Pop. 6000. (2) Tn. in Ellis co., Texas, U.S.A. It lies to the S.E. of Dallas, with cotton gins and compresses and cotton seed oil mills. Pop. 7000.

Enniscorthy, tn. of co. Wexford, Ire., situated on the Slaney, about 14 m. N.W. of Wexford. It has a beautiful situation, the land around being very fertile. Below E. the riv. is navigable for barges. The castle, now partially destroyed, is an interesting old building. Pop. 5500.

Enniskillen, co. tn. of Fermanagh, Northern Ireland, 116 m. from Dublin and 88 m. from Belfast on the G.N. (Ireland) Railway. Situated on an is. between Upper and Lower Lough Erne, with suburbs on both sides. It has an agric. trade and its secondary industries are the manuf. of cutlery and tanning. E. was granted its first charter in the seventeenth century, and was a noted Protestant centre in the time of Wm. III. It gave its name to two regiments of the Brit. Army: the 28th Foot, known as the Royal Inniskilling Fusiliers (q.v.) and the Royal Inniskilling Dragoons. In 1921 the latter regiment was disbanded and its name transferred to the 5th Dragoon Guards. Pop. 4900.

Ennistimon, tn. of co. Clare, prov. of Munster, Ire. Pop. 1200.

Ennius, Quintus (c. 239-c. 169 B.C.), one of the first Rom. poets, was b. at Rudiae in Calabria. Although little is known of his hist., he seems at first to have pursued a military career. At about the age of thirty-eight he became acquainted with M. Porcius Cato and accompanied him to Rome. From that time he seems to have lived chiefly at Rome, and was successful in obtaining Rom. citizenship, a thing

which a foreigner very rarely did. He was a man of great learning, having a good knowledge of Gk. as well as Lat., so that he was able to earn his living as a tutor. He was buried in the Scipios' tomb and his monument placed among those of that family. Of his works, which it is believed existed as a whole until the thirteenth century, only fragments now remain, among them being dramas, satires, and annals. See E. Stuart's ed. of *Annals*, 1925.

Enns: (1) Tn. of Upper Austria, standing on the riv. of the same name, about 10 m. S.E. of Linz, with a museum and local Rom. antiquities. Pop. 4200. (2) Riv. of Austria which rises S. of Radstadt, and flows into the Danube. Chief trib. is the Steier.

Enoch (Heb. *Hanôkh*), name of four persons in the Bible: (1) A son of Cain (Gen. iv. 17); (2) a grandson of Abraham (Gen. xxv. 4); (3) a son of Reuben (Gen. xlv. 9); (4) the son of Jared and grandson of Enoch (1), with whom he has probably been confused. In Gen. v. 18-24 we read that after a life of 365 years this E., who 'walked with God,' was translated—he was not, for God took him. The number 365 hints at certain connections between the Heb. tradition and a Babylonian sun-god. Later Jewish legend makes E. the inventor of writing, arithmetic, and astronomy, and the apocalyptic books described below were ascribed to him. Among the Arabians he is known as *Idris* (the learned one). The 'St. Enoch' of Glasgow is a corruption of St. Thénaw, the mother of St. Kentigern.

Enoch, The Book of, apocalyptic work belonging to the two centuries immediately preceding the Christian era, which purports to give an account of the revelations made, both before and after his translation, to the Enoch 'who walked with God.' It gives a hist. of the introduction of sin into the world and the fall of the angels. It describes the deluge which followed on the intercourse of the fallen angels and the human race, the course of the world after that time until the period of the Messianic kingdom, and the final judgment. It also gives some explanation of astronomy, the seasons and the secrets of nature in general. The B. of E. was originally written in Heb., in the Palestinian region, and was then trans. into Gk. It was well known to the early Christians, by many of whom it was held in high esteem. St. Jude in his general epistle quotes from Enoch in v. 14. The work was lost sight of about the seventh century, and only quotations could be obtained until 1773, when James Bruce, the traveller, brought back from Abyssinia two Ethiopic copies of it, which proved to have been made from the Gk. version. A trans. was pub. by Archbishop Lawrence in 1821, and the Ethiopic text followed in 1838. The B. of E. is held to be of composite origin, and Prof. Charles divides and dates it thus: (1) ch. i.-xxxvi. before 170 B.C.; (2) ch. lxxviii.-xc. a few years later; (3) ch. xci-civ. between 134 and 95 B.C.; (4) ch. xxxvii.-lxx. between 94 and 64 B.C. The rest of the work consists chiefly of quotations

from a lost Book of Noah, etc. The Book of the Secrets of Enoch (*q.v.*), is a similar mystical work. See R. H. Charles, *Book of Enoch*, 1893.

Enoch, The Book of the Secrets of, has been also called 'the Slavonic Enoch,' because the MSS. of it, which have only recently been discovered, are in that language. It seems, however, to have been originally written in Gk. during the course of the first century A.D., and also to have been composed in Egypt. This book, which is entirely independent of the Book of Enoch—sometimes known as the 'Ethiopic Enoch'—gives an account of the way in which Enoch was taken up into the heavens, seven in number, and of his visions there, followed by an account of his subsequent experiences. See R. H. Charles (ed.), *The Book of the Secrets of Enoch* (trans. by W. R. Morfill).

Enos, seaport of Greece, situated on the Maritsa. It is impossible for any but small vessels to enter the harbour owing to the silting of sand. Pop. 7000.

Enschede, tn. of Holland in the prov. of Overijssel. It is one of the prin. centres of the cotton industry and has parks, a people's univ. and industrial museum. Pop. 87,470.

Ensete, Abyssinian banana. *Musa ensete*, which has the largest leaf on any known land plant, the size being as much as 17 ft. by 3 ft. The flower-stem is eaten by natives, but the fruit is not edible. The plant is cultivated in tubs as a decorative plant in sub-tropical horticulture.

Ense, Karl August Varnhagen von, see VARNHAGEN.

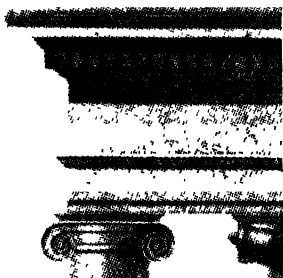

Ensign: (1) Originally the name applied to the lowest rank of commissioned officer in the Brit. army. He obtained this name from the fact that it was his duty to carry the colours or ensign, but after the custom died out, the title was changed in 1871 to that of second lieutenant. (2) The national flag used on board ship, which flies from the pole known as the E. staff. The red, white, and blue Es. which are in use now date from some time back, but their present use differs slightly from the former. The red E. is used for merchant vessels. Ships of the Royal Navy fly the white E., and so does the Royal Yacht Squadron, while the Naval Reserve, in common with certain yacht clubs, flies the blue E. The present system dates from 1864. Until that year, the Navy bore three different Es.; but after that year the divs. of Flag officers into those of the red, white and blue squadrons was discontinued and the White E., with its broad and narrow pennants (or pennants) was estab. as the colours of the Royal Naval Service, the use of the red and blue colours being reserved for special occasions.

Ensilage, see HAY and ENSILAGE.

Ensisal, textile manufacturing com. in the prov. of Liège, Belgium. It stands on the Vesdre, N. of Spa. Pop. 6700.

Enstatite, silicate of magnesium, is translucent and white in colour, or sometimes has a greenish hue. It has been found in Moravia, Prussia, and other parts of Europe.

Entablature (Lat. *in*, and *tabula*, a tablet), the architectural term for the crowning part of a structure, carried by the columns in the classic orders. It usually consists of three distinct sections: the architrave, resting directly on the columns; the frieze, the decorative member; and the cornice, the projecting and protective member. There are, in all, seven forms: the Gk. Doric, the Rom. Doric, the Tuscan, the Gk. Ionic, the Rom. Ionic, the Corinthian, and the Composite, the last two being entirely Rom. The simplest, but also the highest in proportion, of these was the Gk. Doric. The group of three members which the term E. designates was original and constant in Gk. architecture, and was derived from

ENTABLATURE (IONIC)

the methods of construction. In certain countries, such as in Provence (France) and Italy (Rome, prov.), where classic forms survived or were imitated, the E. lasted during the Middle Ages. Occasionally the decorative member, i.e. the frieze, is omitted. In all probability it did not exist in the archaic temple of Diana at Ephesus, neither is it found in the Lycian tombs. It is easier to find examples in which the medieval artists reproduced separate parts of the E. than where the entire group was used.

Entail. An entailed estate or estate tail is an estate of inheritance in land settled on sev. persons successively in a strict line of devolution, such persons being exclusively the heirs male or female of the grantee or grantees. The word E. is derived from Fr. *tailler*, 'to cut,' because the succession to the estate was cut down to the grantee for his life and then to his issue. Estates tail are either *general*, i.e. are granted 'to A and the heirs of his body' without restriction as to sex or maternity; or *special*, i.e. restricted in one or other of the above ways, e.g. 'to A and the heirs male of his body,' or 'to A and the heirs female of his body,' or 'to A and the heirs of his body by his wife B.' The hist. of the development of estates tail may be said to be intimately bound up with the traditions and associations of co. families; the whole object of their legal creation being to tie up property in strict

family settlements so as to ensure that the estates should devolve from father to son for ever. The old common law judges always construed a gift 'to A and the heirs of his body' as a gift of the full disposable estate of inheritance or fee simple (*q.v.*) (see also DE DONIS), conditional on issue actually being born to A. Consequently when issue was born A could sell the estate and bar his own issue. Though it is now theoretically impossible to tie up lands in a family for ever, and though the tenant-in-tail can bar the rights of everyone by executing and enrolling a *disentailing deed* within six months of obtaining possession, the custom is for the eldest son of the grantee, on coming of age, to execute a deed with the consent of his father barring the E., and for the father and son then to enter into a deed of re-settlement by which they re-settle the land on the father for life, with *remainder* to the son for life, and then after the death of the son, to the son's eldest son in tail; this process being repeated every time an eldest son reaches twenty-one. The efficacy of this compromise in thus preserving the posthumous pride of ancestors depends entirely on the continuous desire of each father to tie up the lands in the family and on the continuous obedience of each eldest son on attaining twenty-one. If, however, the son prove disobedient, the father can, in theory, deprive him of all income while he (the father) remains alive, and so it comes about that the son generally abstained from his right to bar his own issue (which he can do without the consent of his father) and 'surrendered his birthright for a financial mess of pottage.' In this connection must be noticed the meaning of the term 'protector of the settlement.' A protector is a statutory creation, and denotes the tenant of the first life estate under the deed creating the E. (usually, of course, the eldest surviving ancestor), or some person or persons appointed by the deed itself to act as protectors. The existence of the 'protector' prevents a tenant-in-tail *not yet in possession* from barring the *whole* E. unless he obtains the consent of such protector, though, as seen above, he may bar his own issue. In modern times the system of E. has, by a succession of Acts of Parliament (particularly the Cairns Act, 1882, and the Law of Property Act, 1925) been greatly modified, and greater powers given to the actual owner of alienating the estates to which he has succeeded, a process which is called 'breaking the entail.'

Entebbe, administrative centre of the Uganda Protectorate, Brit. E. Africa, on the N.W. of Lake Victoria, with charming views over the is.-studded lake. There are Botanical Gardens and a cotton ginny, and cotton, cocoa, rubber, etc., are grown in the dist. The sleeping sickness has entirely disappeared. Many gov. depts. are located at the township of E., including the headquarters of the Agric. Dept., the Dept. of the Conservator of Forests, the Game Warden's Dept., Geological Dept. (with laboratory and museum), Land Survey and Mines Dept., Public Works Dept., Printing Dept., and

headquarters of the Treasury. The headquarters of the Commission appointed by the League of Nations for the study of tropical diseases is here, as also the new European Hospital, Gov. House and Court House. E. is a regular port of call for aircraft between England and South Africa. There is a seaplane alighting area at E. and a wireless station, used mainly for the aeroplane and meteorological services. Area (dist.) 2446 sq. m. (land and swamp 1980, open water 466). Pop. (dist.) (1931 census), 186,600 (natives 182,200, Indians 780, Europeans, 275).

Entellus Monkey, or Hanuman, the *Semnopithecus Entellus* of India. Its body is from 2 to 4 ft. long, and the non-prehensile tail is longer than the body. The general colour is a dirty yellow, but the full whiskers and beard are greyish-white. In character it is mischievous, noisy, and quarrelsome.

Entente Cordiale (lit. means 'cordial understanding'), term applied to friendly relations existing between Powers, most often used of the friendship between Great Britain and France that began early in the twentieth century and resulted in the alliance that carried on the First World War.

Enteralgia, see COLIC.

Enteric Fever, name given to a fever which mainly affects the intestines. It is also known as *typhoid fever*, and on the Continent as *abdominal typhus*. Typhus was a name formerly used to designate both typhus and typhoid. Whereas typhus is a virus disease, transmitted by the body louse, typhoid is due to a bacterium (*Bacillus typhosus*) which causes characteristic changes in the bowel, a different rash, and is water-born, from defective sanitary arrangements. The explanation of the methods of contamination of the water supply is one of the most complicated questions of sanitation, and the experience learned from every epidemic must be brought to bear to prevent a similar incident in other localities, where the water supply is apparently free from contamination. The period of incubation, or latency, of E. F. varies considerably in accordance with the number of bacilli swallowed. Consequently, it is often extremely difficult to trace the source and cause of contamination. Many people may have been infected and have travelled to distant parts before symptoms of the disease show themselves. Thus, epidemics may be very widespread, and isolated cases may occur far removed from their original source, and may themselves be the centre of fresh epidemics. The ravages of this disease emphasise the importance of a pure water supply for communities, and of proper sanitary arrangements in every house: of efficient drainage, and sanitary supervision of milk and other articles of food. The disease is recognised by symptoms seen at the patient's bedside, and by blood examinations (*Vidal's test*) in the laboratory. Anti-typhoid vaccination yields good results in preventing the disease and rendering its attacks less virulent and dangerous. In the tropics the germ may

be dust- or wind-born, and in hot climates the disease is more difficult of recognition where malaria is prevalent, as patients frequently suffer from both malaria and typhoid. House flies are also responsible for spreading the disease. E. F. mainly affects the small intestines, causing ulceration, and may lead to hæmorrhage and to perforation, even in mild cases when patients in apparent health are able to walk about. These cases, known as *ambulatory typhoid*, may suddenly without warning have perforation, which in the majority of cases is fatal. So that all cases of suspected typhoid should be put on starvation diet, as even a morsel of bread may bring about the catastrophe, to the lasting regret of well-meaning friends. Relapses are by no means infrequent: it would seem as if the immunity of the patients becomes exhausted after, say, one or two weeks, starting from the commencement of the disease, and then apparently the patients reinfect themselves and have a return of all their symptoms. In addition to typhoid being sometimes a mild affection and sometimes extremely severe, convalescence is usually prolonged, and patients who have apparently recovered may be infective for a period of years. These are known as 'typhoid carriers,' and may contaminate water supplies over wide areas or in different localities. Their detection is extremely difficult and in unsuspected cases the source is ascertained only by searching for them with extreme diligence, when suspected typhoid carriers can be proved by examination of the blood. Paratyphoid fever is similar to typhoid, but of shorter duration: there are two varieties, 'A' and 'B.' The vaccine 'T.A.B.' is prepared from bacteria of all three fevers.

Enteritis, inflammation of the intestine, i.e. of the small intestine. This is practically another name for diarrhoea, which in an ordinary case is the only symptom. In acute cases pain is usual, and is generally worse some little time after food has been taken. The appetite is either lost or capricious; the tongue is coated, and sometimes the abdomen may be inflated and gurgling sounds heard. In a cold climate, the condition, as a rule, passes in a week or so, but when there is some underlying cause beyond errors of diet, as in cases of tuberculosis or advanced liver or kidney disease, the condition may become chronic. In the tropics, the disease may exist for years, requiring for its cure removal to a cold climate. *Prevention* consists in the avoidance of those articles of diet which experience has shown disagree. With regard to wearing a belt (abdominal binder), that must be left to individual judgment and discretion, as so much depends on the muscular vigour of the patient and the kind of life that is led. *Treatment*—Nothing relieves pain more satisfactorily, and terminates diarrhoea better, than a teaspoonful of castor oil every two hours, until the solid contents are removed. If there is pain, five drops of laudanum can be added to each dose. Relief is also obtained by fomentations and other forms of heat. In no condition is

confinement to bed so beneficial. The diet should consist of boiled milk, barley water, yolk of egg and water, and rice water, the choice depending on the circumstances of the locality. The diarrhoea of children is often due to warmth; sometimes in cold weather from excessive clothing, and in warm weather to natural heat and the position of the cradle or cot near the floor. Much benefit results from tepid baths, or sponging with tepid water. In artificially fed children, unsuitable milk diet may maintain the condition. In addition to milk, the diet should contain similar articles to that of adults and after a time beef tea, jelly, or other meat preparations may be added. Contamination of food by house-flies is a very common cause of summer diarrhoea in children. It must always be borne in mind that diarrhoea is frequently merely the symptom of some other disease, such as cholera, dysentery, or typhoid, which call for their own lines of treatment; tuberculosis of the intestine is yet another possibility. For E. in horses, see under HORSES (DISEASES).

Entertainments Duty. This duty which was introduced in 1916 is charged on payments for admission to any entertainment, the only exemptions allowed being in cases of schools, educational and scientific institutions, and charitable purposes. There is no duty when the payment for admission (exclusive of duty) is not over 6d. The present rate is 1½d. where the payment does not exceed 7½d.; 2d. where it does not exceed 10d.; 2½d. where it does not exceed 1s. ½d.; 3d. where it does not exceed 1s. 3d.; where it exceeds 1s. 3d., the rate is 3d. for the first 1s. 3d., and 1d. for every 5d. or part of 5d. over 1s. 3d. Where all performers, whose words or actions constitute the entertainment are present and performing and the entertainment consists solely of a stage play, a ballet, a performance of music, a lecture, or recitation, a music hall or other variety entertainment, a circus or travelling show, the following rates obtain: Where payment of admission does not exceed 8½d., the rate is ½d., where it does not exceed 11d., 1s. 1½d., 1s. 4d., 1s. 6½d., 1s. 9d., the rates are 1d., 1½d., 2d., 2½d. and 3d. respectively; and where payment exceeds 1s. 9d., the rate is 3d. for the first 1s. 9d., and 1d. for every 5d. or part of 5d. over 1s. 9d. Certain exemptions are allowed to schools and educational institutions. The yield from the duty in 1935 was £9,724,280; in 1936, £7,806,080; in 1937, £7,572,280; in 1938, £7,985,000.

Entomology (Gk. *έντομα*, insects, *λόγος*, a discourse), the science that treats of insects. The term is often loosely used to include the study of other small animals, such as centipedes and spiders. The science began with Aristotle, who differentiated a class of animals, *éntoma*, and included in it the true insects, arachnids (spiders, scorpions, etc.), and myriapods (centipedes and millipedes). His grouping was followed for 2000 years. Modern E. has sev. branches, the chief being: (1) classification; (2) anatomy and physiology; (3) bionomics, or the

study of habits and life-hist.; (4) embryology, or the study of development; (5) cytology, or the study of cells; (6) ecology, i.e., the relation to the habitat; (7) paleoentomology, or the study of fossil insects. It had its beginning in the splendid work done in the seventeenth and eighteenth centuries. Mention must be made of Malpighi's work on the silk-worm (1669), Swammerdam's *Biblia naturæ*, in which he showed the true nature of the larva of an insect, and of Redi, the It., who disproved the theory of the spontaneous generation of maggots. At the same time John Ray was working on the classification of insects, and was the first to reach the modern lines of arrangement. In 1735 Linnaeus, working on the lines laid down by Ray, made a new classification of insects, which is the foundation of all modern work. The work of classification has been carried on by workers of all nationalities, and is now very complex and accurate. The anatomical work of Malpighi and Swammerdam has had many followers, the field becoming so large that workers at the present time have to specialise very strictly. The most famous work is perhaps that of Lavigny, who established the homology of the jaws of all insects in 1816, showing that in every species the mouth parts consisted of three pairs of jaws, more or less modified, namely mandibles, first maxillæ and second maxillæ (the last pair fused to form the labium or lip). Amongst Eng. workers in insect bionomics should be mentioned W. Kirby, W. Spence, Lord Avebury, and Miall. Much useful work was done by the Amer. C. U. Riley on the habits of locusts and his victory over the Phylloxera insect. The embryology, cytology, and ecology of insects and paleoentomology are essentially products of the last century, but already great strides have been made in these branches. Most of the recent embryological work has been done in Germany and the U.S.A. Brit., colonial, and Amer. entomologists have made considerable contributions to entomological cytology and ecology. Recognition of the economic importance of insects with regard to diseases of plants and animals has led to the appointment of gov. entomologists in the U.S.A., Canada, and Great Britain, and applied E. has made rapid progress during the present century.

As a result of the researches of many workers, notably Emin Pasha, Grassi, Laveran, Manson and Ross, the mosquito was recognised in 1898 as a carrier of the malaria parasite. Subsequently mosquitoes have been proved to carry organisms causing elephantiasis, yellow fever, and Dengue fever. The most effective method of extermination is to render uninhabitable the swamps which form the breeding-places of the insect. In England, extensive work on mosquito control is being carried out at Hayling Is.

House-flies are other active agents in spreading disease. In feeding on refuse, they collect on their mouth parts and legs organisms which they deposit, when walking or feeding, on the food of man.

In addition to various bacteria causing tuberculosis, typhoid fever and other diseases, flies may carry eggs of the hood-worm and of other worras parasitic in man. The gad-fly and tsetse fly transmit disease directly to horses and cattle.

The irritation and disease caused by flies to the troops in the First World War stimulated efforts to exterminate these pests. The methods used include the exclusion of air from the eggs by closely trapping the larvae; the addition of borax or of powdered hellebore to the breeding-grounds; and the preventive measure of the immediate destruction of all refuse. In America, Africa, and Asia investigations are being made on the habits of insects injurious to cotton and tobacco plants, fruit trees, and forest trees of economic value. In many cases, spraying with appropriate solutions, or the introduction into the dist. of an animal which preys on the insect pest, is beneficial. Good results have recently been obtained with new insecticides, notably 'D.D.T.' and 'gammexane.' In the Second World War the battle dress worn by Brit. troops was impregnated with D.D.T. as a protection against body lice, and similar methods enabled an outbreak of typhus amongst the civilian pop. of Italy to be brought quickly under control.

As a further instance showing how a knowledge of insect habits and ecology has enabled control to be effected, reference may be made to the locusts, which have been famous for hundreds of years as agents of destruction and which occur in over eighty countries of all five continents. There are eight or so species of locusts; in each of them (according to the theory first put forward in 1921 by Uvarov) there exist various phases. In the solitary phase the insect lives isolated as a short-horned grasshopper; if however a number of these solitary forms breed under crowded conditions, they develop into the gregarious phase, which is the true locust and which migrates in swarms. The two phases may differ widely in appearance as well as in habits, and between the two extremes are numerous intermediate phases. The attention of entomologists is directed to preventing the development of the gregarious phase, or to destroying it when detected before migration can take place. The 'hoppers' (immature individuals with rudimentary wings) can be dealt with by driving them into pits or trenches, or by the use of poison bait containing arsenic, sodium silicofluoride or 'gammexane'; the latter substance is particularly useful, since it is rapid in its action and does not harm cattle. Flame throwers and dusting from aeroplanes are also used. For destroying the adult winged individuals there is at present no effective method available. These activities are controlled and co-ordinated by the govts. of the countries concerned, and by the Anti-locust Research Centre estab. in 1930 at the Natural Hist. Museum in S. Kensington. Morgan and Bridges' work on the cytology and genetics of *Drosophila*, and Goldschmidt's investigations on the gypsy

moth, have led to new developments in the relation of cytology to genetics and to the problems of heredity.

Attention has also been directed to the problems of insect physiology, e.g., the mechanism of flight, the process of respiration, insect behaviour and the waking of the sense organs especially the compound eyes. It has been shown also that metamorphosis is initiated by a hormone produced in the head and transported by the blood stream to the organs concerned.

E., beyond all other sciences, affords an opportunity for the amateur worker. The Société Entomologique de France and the Royal Entomological Society of London admit professional and amateur members. The insects when collected are best killed by prussic acid in some form. When they are relaxed they must be set. *Setting* consists of pinning the insect on to cork, the body of the insect lying in a groove in the cork, the wings and other parts being arranged in the best possible manner by means of needles or *setting bristles*. Paper braces are then put on to keep the whole in position, and the insect is thoroughly dried. It is then ready to be put in the collection. See A. T. Gillander, *Forest Entomology*, 1912; J. H. Fabre, *The Life and Love of the Insect*, 1918; H. G. Reinald, *Applied Entomology*, 1921; A. Balochowsky and L. Mesnil, *Insectes nuisibles*, 1936; M. Burr, *The Insect Legion*, 1939; V. B. Wigglesworth, *The Principles of Insect Physiology*, 1939, 1942; R. Frost, *General Entomology*, 1942; A. D. Inuns, *General Textbook of Entomology*, 1923, and *Insect Natural History*, 1947. See also articles under industrial insects. For locusts see articles in *Endeavour*, 1943, ii., 56 and 1947, vi., 24. See also INSECTS.

Entomostraca (Gk. *ἐντομοστράκον*, insect, *στράκον*, shell), name given to a sub-class of Crustaceans, most of whose species are enclosed in a delicate, transparent, bivalve shell which can be opened or closed at the will of the animal. Many of them are very small, and are found in great numbers in stagnant, fresh, and salt water; some are parasitic. The E. comprise many thousand species which fall under four great orders, Phyllopoda or Branchiopoda (q.v.), Ostracoda, Copepoda, and Cirripedia (Barnacles).

Entophytes (Gk. *ἐντός*, within *φύτον*, plant), the term applied to certain plants, generally parasitic, which live inside other plants or inside animals. These are frequently harmless, but some have fatal results in animals, as is the case with many bacteria.

Entozoa, see **INTESTINA**; **PARASITES**.

Entrecasteaux, see **D'ENTRECASTEAUX**.

Entre-Douro-e-Minho, was originally a prov. of Portugal, its W. boundary being the Atlantic, with the R. Minho on the N. separating it from Spain, and the Douro on the S. The dist. is well cultivated and mountainous, and is also one of the most densely populated in Portugal. It is now divided into three parts: Viana do Castelo, Braga, and Porto. Area 2800 sq. m.; pop. 1,678,000.

Entremont, valley of Valais, Switzerland.
Entrenchment, general term applied to any earthwork which is thrown up to protect soldiers against an enemy. Es. may be made very hastily and simply, as in the case of the ordinary shelter trenches, or slit-trenches, or they may be of a much more complicated and permanent nature. In the case of the former the men are provided with implements so that they can easily and quickly dig up the earth to form a parapet behind which they can take shelter and over which they can fire. They are also so constructed that they do not form any obstruction to the artillery who may want to drive over the ground. *See further under FORTIFICATION.—Field Fortification.*

Entre Rios, prov. of the Argentine Republic, lying between the two rivs. Parana and Uruguay. Some parts of this dist. are low-lying and marshy, but others are well-watered and fertile, so that the inhabs. are chiefly engaged in cattle-rearing and agric. pursuits. Large tracts of the country are also covered with forests. Cap., Paraná; pop. 776,300.

Entresol, in architecture, a low storey or part of a storey in a building, between two higher ones. The E. consists of a low apartment usually placed above the first floor; in London, frequently between the ground floor and the first floor. Also called the mezzanine floor.

Entropion, curving in of the eyelids, the opposite of ectropion. It causes constant irritation by the eyelids coming in contact with the eye, with resulting interference with vision. One cause of E. is trachoma (a contagious eye disease), a condition which, in most countries, precludes the admission of immigrants.

Entropy, *see under* THERMODYNAMICS.

Entry: (1) Taking possession by the legal owner of lands and tenements when another person is wrongfully in possession of them. Formerly E. could be effected by force, but as this self-redress led to great abuses, forcible entries were, by two Acts of Richard II., made punishable by fine and imprisonment. To establish forcible E. it must be proved that the E. was accompanied with some circumstances of actual violence or terror, as e.g. by the aid of unusual weapons, a considerable number of persons, or with menace to life. Mere violence without such exceptional circumstances would amount to no more than trespass, giving rise to an action for damages. It is to be noted, however, that where possession has been obtained by a trespasser (as distinct from the position of a person who was rightfully in possession in the first instance but who subsequently became technically a trespasser through some default) the rightful owner, according to one decision, may use reasonable force in ejecting him, and need not appeal to the law for assistance. The remedy for forcible E. is either by an action for damages, by indictment, or by an information before justices of the peace. A forcible E. by more than three persons acting in concert might amount to and be punishable as a riot (*q.v.*). The Conveyancing Act, 1881, gives to a person

entitled to any rent charge or other annual sum charged upon or payable out of land, power, if the sum or any part is unpaid for forty days after falling due, to enter into possession of the land and take the income of it until all the arrears due at the time of E. and incidental expenses are paid. If he cannot enter peaceably his appropriate remedy is by action of ejectment (which has taken the place of the old remedy by *writ of entry*) to try the question of title. A valid E. to give possession must be upon some part of the property claimed, and it is safer for the person entering formally to declare that he takes possession of the whole. (2) In leases: Formerly, E. was necessary to complete the tenancy, and till E. a tenant had no more than what was called an *interesse termini* (a right to have the land), which, however, was a transferable right, though it could be surrendered or released. But the doctrine of *interesse termini* was abolished by the Law of Property Act, 1925, and now all terms of years take effect from the commencement of the term without actual entry. E. is also not necessary to complete a freehold title. As to a sheriff's power of E. *see under* EXECUTION.

Enugu, tn. of S. Nigeria, situated 151 m. from Port Harcourt: it is the headquarters of the Chief Commissioner of the E. Prov. Notable as a coal-mining centre. The mine began to yield coal in 1915 and is owned and worked by the gov. It is capable of producing 400,000 tons a year, and supplies the railway both in Nigeria and the Gold Coast, and also ships that call at Port Harcourt.

Enver Pasha (1881–1922), Turkish politician and leader of the 'Young Turks,' b. at Constantinople. Early triumphed over Abdul Hamid (*q.v.*) in his agitation for the restoration of the Constitution of 1876, and was then sent to Berlin as military attaché. He was in command of an army corps in the Balkan War, 1913 (*q.v.*), and during the peace negotiations brought about the assassination of the War Minister, which office he then filled himself, and placed his adherents in the other important state offices, his purpose being to override any possibility of interference by the W. Powers. In the First World War he became the virtual ruler of Turkey so far as domestic affairs were concerned, but was a complete failure in war policy, being unable to win the confidence of the Ger. adviser, Gen. Liman von Sanders (*q.v.*). After the collapse of Turkey, he was condemned to death, but having already fled the country, the sentence was nugatory. Always treacherous, he then appeared in Turkestan in 1922, where a rising against the Bolsheviks was in progress, and purported to act as mediator. After being imprisoned by the insurgents, he came out as emir and their leader against the Soviet, but only to suffer a series of defeats. It is not improbable that he was trying to play into the hands of the Bolsheviks, and though the manner and date of his death are uncertain, it seems that he was killed at Duchamba Rajiwan in July

1922. See O. Liman von Sanders, *Fünf Jahre in der Türkei*, 1920.

Environment, term applied to all conditions which are not part of the individual self of a person, and which tend to alter each individual, thus forming certain varieties and species. The E. may be physical, including such things as geographical or chemical conditions, the latter including the state of the air, the conditions of food, and many other such influences. There is also a social E. showing the influence of one individual upon another. This leads also to the estab. of new customs and new institutions, thus bringing about a new type of individual. See also EVOLUTION.

Envoy, see DIPLOMATIC SERVICE; PLENIPOTENTIARY.

Enzelli, (Pahlavi), seaport tn. situated on the Caspian Sea in the prov. of Gililan, Persia. It is about 15 m. N.W. of Resht, and is the port of that tn. After the Russian revolution of 1917 the Entente Powers tried to organise unaffected elements in Armenia and Georgia, and with this object Maj.-Gen. L. C. Dunsterville (q.v.) was sent from Mesopotamia with a small force early in 1918. He reached E. only to find the place in the hands of the hostile Bolsheviks and the neighbourhood dominated by a band of organised brigands some thousands strong. He therefore withdrew and marched by another route to Baku. Pop. 3000.

Enzina, Juan del, see ENCINA.

Enzio (1224-72), king of Sardinia and natural son of Frederick II. About the year 1238 he married Adelasia, an heiress, and the title of King of Sardinia was conferred on him by his father, as well as that of vicar-imperial in Italy. In the year 1241 he was victorious over the Genoese fleet, taking prisoner sev. church dignitaries. He followed this success by others, but in 1249 was himself conquered and made a prisoner, spending the rest of his life in captivity at Bologna.

Enzymes, ferments present in the digestive juices which render food substances soluble and diffusible. This process is termed *digestion*, and consists essentially in changing colloid food substances into crystalloid bodies, as in the latter condition they can dissolve in the fluid contained in the alimentary canal, and then diffuse through the mucous coat into either the blood vessels or lymphatics, and so become available for utilisation. E. are probably colloid bodies themselves, and they act as *catalytic* agents and commence the change in the chemical nature

of the food substances. They perform this function in the presence of acids and alkali, but for each E. there is an *optimum temperature* at which the action is most vigorous, and there are high and low critical temps. at which the action ceases. It is remarkable that the many complicated food materials yield but few compounds after digestion; proteins are changed into peptones, tyrosin, and leucine by the E. (*pepsin* and *trypsin*) of the gastric glands and pancreas; the fats are changed into fatty acids and glycerine, or emulsified, and saponified by the *steapsin* of the pancreas; carbohydrates are changed into glucose with, or without intermediate states by the *Ptyalin* of the salivary glands, the *amyllopsin* of the pancreas and *invertase*, *maltase*, and *lactase* of the intestinal glands.

Eoanthropus Dawsoni, see PILTDOWN MAN.

Eocene, in geology, is the lowest of the three groups into which Lyell divided the Tertiary system. His classification, based on the relative percentages of recent species of mollusca contained, has been modified by Beyrich, who inserted the Oligocene group, to include strata formerly classed as Upper E. and partly Miocene. The E. and Oligocene are sometimes classed together as the Palaeogene or Older Tertiary. In W. Europe the E. follows the Cretaceous so abruptly as to suggest that a break existed between the Cretaceous and Tertiary periods. In Europe, and in America and New Zealand, the deposits merge into one another, and no sharp line can be drawn between Cretaceous and E. rocks. During E. and Oligocene times, the floor of the Cretaceous sea was upraised into low lands with lakes and estuaries. The colossal disturbances of the earth's crust, by means of which this upheaval occurred, continued throughout Tertiary time, great mt. chains such as the Alps and Himalayas being formed. The Brit. E. strata are confined to the S.E. of England, where they occupy two synclinal depressions in the chalk, viz. the London and Hampshire Basins. The deposits are marine and estuarine, consisting of clays, sands, and marls, and have been arranged in the sequence shown in the table below. Outside the typical area the E. rocks occur in patches. The deposits of Bovey Tracy in Devonshire have been referred by some geologists to the E., and by others to the Oligocene. In Antrim and the Inner Hebrides occurs a magnificent development of Tertiary volcanic rocks.

Upper Eocene	{	Upper Bagshot Sands
Middle Eocene		Middle Bagshot Sands Lower Bagshot Sands (upper part)
Lower Eocene	{	Lower Bagshot Sands (part)
		London Clay
		Oldhaven Beds
		Woolwich and Reading Bed
		Thanet Sands

LONDON BASIN

Barton Sands
Barton Clays
Bracklesham Series (including the Bournemouth Beds and the Alum Bay Beds)
Bognor Series (equivalent of London Clay)
Plastic Clays (similar to Woolwich and Reading Beds)

HAMPSHIRE BASIN

These consist of basaltic sheets traversed by numerous bands of gabbro and basalt dykes, the date of their emission being fixed by the discovery of intercalated leaf beds of the same age as the Bournemouth beds (see table).

Two great E. regions may be distinguished in the European area. The first, termed the Anglo-Gallic prov., includes the E. of the Eng. area, of N. France and of Belgium, and the similarity of the deposits points to the fact that this was one great tract of sedimentation. The second, the S. European or Alpine E. area, is much more extensive. It includes the whole of S. Europe, extends southwards into N. Africa, to the Sahara and Egypt, and stretches eastwards to the Himalayas, and through Java and Sumatra to the Philippines. There existed, then, over this great area, a huge sea (of which the Mediterranean is a remnant) connecting the Atlantic and Pacific Oceans, and out of which the Alps, the Pyrenees, and part of the Carpathians rose as is. In the waters of this sea, the 'Mittelmeer,' massive systems of limestone were formed by Nummulites, a genus of gigantic disk-shaped Foraminifera, which attained a great development in early E. time. The nummulitic formations of N. Africa and India are very rich in fossils, yielding large corals of the reef-building type, molluscs, and echinoderms. The problematical 'Flysch' of the Swiss Alps or 'Macigno' of the Maritime Alps probably represents the littoral deposits of the Older Tertiary period, and consists of thick grey sandstones and shales with scarcely any organic remains. The E. of the Libyan desert, as well as being remarkably fossiliferous, are of special interest, since they show a perfect petrographical and palaeontological passage from the Cretaceous into the Tertiary beds in question. In N. America the E. rocks are mainly of the fresh-water type. The marine deposits are represented by the Alabama beds, and occur in the valley of the Mississippi from the gulf of Mexico to beyond the mouth of the Ohio. On the Californian coast these marine E. rocks attain a thickness of 3000 ft. Over the Rocky Mt. region, from Mexico to Brit. Columbia, is found the lignite-bearing, fresh and brackish water formation known as the Laramie beds. Deposits of a similar type are found between the Rockies and the Wahsatch Mts., i.e. in the waste known as the bad lands. In the Rockies these beds attain a thickness of 13,000 ft., and have been subdivided into the following divisions: (1) Wahsatch group, (2) Green R. group, (3) Bridger group, and (4) Uinta group. These rocks are of great geological importance because of their extraordinary richness in vertebrate and mammalian remains. The mammals suddenly developed during E. time, and are chiefly of the placental group, which preponderate at the present day. Preceding them, and making possible their rise, had come the flowering plants which emerged in the cretaceous period just previous. The hoofed beasts or Ungulates were dominant, and were

divided into two groups with paired and unpaired hoofs, as representatives of which we may mention the 'Paleotherium,' and the 'Anthracotherium.' The Dinocerata found in the Rocky Mts. form a special group of Ungulates, which resembled the 'Proboscideans,' except for the fact that they had three pairs of horns and were armed with long sabre-like upper canines. They were also characterised by a diminutive brain in comparison with the size of the skull. The Carnivores were represented by the primitive Creodonts, and Rodents and Insectivores have been found. Regarding the fossils of Invertebrates, we find that the Ammonoidea and Belemnites, which flourished in Cretaceous time, have wholly disappeared, and with them the sponges and the Hippuritidae. The great reptilian families which flourished from

A FOSSIL OF THE EOCENE PERIOD

Palaeotherium magnum

Triassic time onward are practically extinct during E. time. The Molluscoidea are represented by forms which exist at the present day and the Coelenterata by reef-building corals. The Flora of the E. consisted mainly of Dicotyledons (tropical and subtropical forms), Monocotyledons (such as the Palms), and Conifers. See M. Gignoux, *Geologie stratigraphique*, 1923; C. Nevin, *Principles of Structural Geology*, 1931; R. Field, *Historical Geology*, 1933; S. Shand, *Earth Lore*, 1933; K. Mather and C. Roy, *Physical and Historical Geology*, 1931. See also EARTH; GEOLOGY; TERTIARY.

Eon de Beaumont, Charles Genevieve Louise Auguste Andre Timothee d' (Chevalier d'Eon) (1728-1810), Fr. diplomatist, and trusted agent in Louis XV's secret diplomacy, serving him in Russia (1755), and in England (1762-65). In 1759 he fought bravely as captain of the Fr. forces in Germany. He had assumed woman's dress on his first mission to Russia, and was desired, by the gov. (1777) to wear it for the rest of his life in France, whence many held that he was really a woman. His political and historical essays appeared (1775) as *Loisirs du Chevalier d'Eon*... See L. P. Bachaumont, *Memoires secrets*, 1777; F. M. Baron de Grimm, *Correspondence*... 1829-31; J. B. Telfer, *Strange Career of the Chevalier d'Eon*, 1885; A. Lang,

Historical Mysteries, 1904; his *Life and Times* by O. Homberg and F. Jousselin, 1911; M. Coryn, *The Chevalier D'Em*, 1932.

Eos, Gk. goddess of the dawn (Lat. *Aurora*), daughter of Hyperion and wife of Tithonus.

Eötvös (or *Eoetvös*), József, Baron (1813-71), Hungarian statesman and author, b. at Buda, leader of the Centralist Liberal party (1844), and a supporter of Kossuth, contributing to his *Pesti Hírlap* numerous articles, collected later as *Reform*. He wrote the comedies *Kritikusok* and *Házasságok*, and the tragedy *Boszú* (1830-33). Of his novels, *Karthausi* (1842), *A falu jegyzője* ('The Village Notary', 1844-46), and *Magyarország* 1514-ben (1847-48) won much fame. He was minister of public instruction in 1867, and did much for elementary education and religious toleration in Hungary.

Eötvös, Roland, Baron (1848-1919), Hungarian statesman and physicist; b. at Budapest; son of Baron József E. Educated at Königsberg and Heidelberg. At Budapest: 1871, lecturer; 1873, prof. of experimental physics. From 1873, connected with Hungarian Academy of Sciences; president from 1889. He made many curious discoveries with regard to gravitation and capillary attraction. Life member of Hungarian House of Magnates. Minister of public worship and education, 1895-96.

Eozoon, peculiar structures of calcite and serpentine, something similar to Stromatopora and other hydroid corals, found among the early crystalline gneisses and schists of the lower St. Lawrence valley and the Archaean limestones of Canada. The researches of Möbius and others go to prove that they are a mineral concretion or segregation of purely inorganic origin. E. has been discovered in rocks of the same age in Bavaria and in limestone blocks thrown from the crater of Vesuvius.

Epacridaceae, a family of dicotyledonous plants closely allied to the Ericaceae (heather family) with the small-leaved genera of which they agree in habit, and from which they are scarcely distinguishable. They are to be found wild in Australia as shrubs with alternate or occasionally opposite leaves, and in Brit. greenhouses are cultivated for their showy flowers. Two of the chief genera are *Epacris* and *Draconophyllum*.

Epaots, intercalary (brought in) days, the excess of a solar over a lunar month or year in days. The E. for any year is the number of days in the moon's age on the first day of the year (January 1, in the Gregorian and early Lat. calendars; March 22, in the Dionysian calendar, or old style). The number varies for each year (usually increasing by eleven from one year to the next). E. are used for fixing the dates of movable feasts of the church. See GOLDEN NUMBER.

Epaminondas (c. 418-362 B.C.), brave and upright Theban general and statesman, of a poor but noble family. After the Thebans had recovered the 'Cadmeia' and expelled the Spartans (379), he speedily became a democratic leader, and was

sent to represent Thebes at the Spartan Congress (371). He refused to surrender the Boeotian cities, aiming at a Boeotian confederacy under Thebes. War followed and the Spartan supremacy was crushed at Leuctra (371). With Pelopidas he invaded the Peloponnesus, restored Messenia's independence, and founded Megalopolis (Arcadia) (369). During a fourth invasion of the Peloponnesus E. was slain in the Theban victory at Mantinea (362). He made great innovations in military tactics. See life by L. Pomptow, 1870.

Epaulement, a part of siege-works or a covering mass in military fortifications, raised to protect the troops from the enemy's fire. It differs from a parapet in making no provision for firing over it by the defenders. Siege batteries are usually shielded by one so constructed as to form an obtuse angle with the main line of battery, protecting the gunners from flank fire. It is used in general of any screen designed to protect the troops.

Epaulettes, or **Epaulets**, a fringed shoulder-piece or ornamental badge of rank worn as part of a uniform, especially naval or military, probably a survival of the medieval metal shoulder-plate (sixteenth century). It was adopted by commissioned officers in the Brit. navy (1795), and is usually of gold bullion with various devices and embroidered designs to mark the degree of rank. Formerly E. were worn by nearly all armies and navies, but after 1855 they were no longer worn in the Brit. army by all ranks, and in U.S.A. only general officers of the army wore them after 1872. After the Russian Revolution of 1917 E. were discontinued in the Red Army, but were restored before the Second World War. See UNIFORMS.

Epée, Charles Michel, Abbe de P' (1712-89), Fr. Jansenist, b. at Versailles. One of the founders of the system for instructing deaf-mutes largely by means of the manual alphabet and signs. He founded a school for the purpose (1755). His *Dictionnaire général des signes* was completed by Abbé Sicard. See lives by Vallette, 1857; Morel, 1833; Berthier, 1852; and P. Schumann, *Geschichte des Taubstummenwesens*, 1910.

Epéhy, Battle of, see FRANCE AND FLANDERS, FIRST WORLD WAR, CAMPAIGNS IN—1918.

Eperies, see PREŠOV.

Epernay (Aque Perennes), tn. of Marne dept., France, on the Marne, 18 m. from Rheims. It is an important entrepôt for Champagne wines, which are stored in vaults in the chalk rock. Spinning, tanning, and brewing are carried on, and corks, casks, and pottery manufactured. It was frequently bombarded during the First World War, but was held by the Fr. garrison aided by a Brit. contingent. Pop. 19,700, arron., 88,600.

Ephemera, a genus of insects belonging to the order, often known as Day-flies or May-flies (Ephemeroptera), which somewhat resemble dragon flies, and as adults live only for one day. They have a voracious larval existence in water, sometimes lasting for two or three years. The insect as it emerges from the water is

called the 'sub-imago,' and after shedding its delicate covering becomes a full-grown 'imago.' They haunt riv.-banks and ponds on summer evenings. The sub-imago and imago are used as baits by anglers, and called 'green drakes,' and 'grey drakes,' respectively. *E. vulgata* is the best-known species. Other genera of May-flies are *Palingenia*, *Cloe*, *Cenis*, and *Heptagenia* or *Bætis*.

Ephemeris, a table stating for successive days the predicted position of and other particulars concerning heavenly bodies. The *Astronomical Ephemeris*, or *Nautical Almanac* of the United Kingdom, is pub. annually, containing ephemerides of the chief stars and planets, data of eclipses, etc. France, Germany, Spain, and U.S.A. issue similar almanacs.

Ephesians, Epistle to the, a letter bearing the name of St. Paul, addressed to the Christians at Ephesus, one of the chief cities of Asia Minor, at which the Apostle had spent two years (Acts xix. 8 ff.) on an earlier occasion. The tone of the epistle, however, shows no restriction to a local church, and this, coupled with the facts that the words 'at Ephesus' in the first verse are omitted in some MSS., and that there is no reference to individual Ephesians, has led to the hypothesis that the letter is indeed an epistle general. The date of the epistle is usually placed during St. Paul's imprisonment at Rome, about A.D. 60-65, and there is now substantial agreement as to its authenticity. Its Pauline authorship was, however, denied by the Tübingen and Dutch schools. The subject of the letter, the mystic unity of the Church in Christ, closely resembles that of the Epistle to the Colossians, a fact which supports the theory which makes them almost contemporary. See J. Robinson, *Ephesians*, 1904; H. Bate, *Guide to the Epistles of St. Paul*, 1926; E. Goodspeed, *The Meaning of the Ephesians*, 1933; L. Chafer, *The Ephesian Letter*, 1935; F. Syngé, *St. Paul's Epistle to the Ephesians*, 1941.

Ephesus, famous anct. city of W. Asia Minor, probably founded about the eleventh century B.C. Its ruins still exist on the banks of the Cayster, near the gulf of Scala Nova, 35 m. from Izmir (Smyrna). It was chief of the twelve Ionic colonies from Greece, situated in Lydia. E. was subject in turn to Croesus (560 B.C.), the Persians (479-387), Athenians, Macedonians, and Romans. It was noted for its temple and worship of Artemis (Diana), the great nature-goddess of Asia Minor. This temple (rebuilt after 356 B.C.) was considered one of the wonders of the world; it was destroyed by the Gotus (A.D. 263). Besides its ruins, there are interesting remains of a fine theatre, odeum, and stadium. Excavations have been systematically carried on only since the nineteenth century (c. 1874) by the Austrian Archaeological Institute, and by Wood and Hogarth for England. E. was the bp. of Heraclitus, scene of the Legend of the Seven Sleepers, and seat of the Ionian school of painting. St. Paul visited it sev. times (see Acts xviii.-xix.). The railway from Smyrna to Aidin passes the

anct. site, and Ayasuluk is the chief vil. near it. See E. Falkner, *Ephesus and the Temple of Diana*, 1862; J. T. Wood, *Discoveries at Ephesus*, 1877; J. Ferguson, *Temple of Diana*, 1883; O. Benndorf, and others in *Forschungen in Ephesos*, i., 1906 (Austrian Archaeological Institute); D. Hogarth, *Excavations at Ephesus*, 1908; C. Picard, *Ephesus and Claros*, 1922; G. Cummins, *The Great Days of Ephesus*, 1933.

Ephesus, Councils of. The third ecumenical council, convoked by Theodosius II., under the presidency of Cyril of Alexandria, A.D. 431, was notable for the attendance, for the first time, of papal delegates from Rome, who were instructed to adjudicate on the opinions of the Council, but to abstain from debate. This Council condemned the heresy of Nestorius, but did not itself definitely state the prevailing doctrine. Theodosius also convoked the 'Robber' Council of A.D. 449 held under Dioscurus of Alexandria, which restored Eutyches as archimandrite and priest, from which office he had been driven by the Synod of Constantinople, and deposed Flavian, the Patriarch.

Ephialtes: (1) The Malian traitor, who showed the Persians the mt. defile of Anopra. Following this, they came up behind Leonidas and his Spartan band and overcame them at the Pass of Thermopylae (480 B.C.). (2) Athenian statesman, political friend of Pericles, and opponent of Cimon. He helped to pass democratic reforms (c. 462 B.C.), and limited the power of the Areopagus. He was probably assassinated at the oligarch's instigation (c. 456). See Plutarch, *Pericles*; *History of Greece*, of George Grote (1816-56), and Connop Thirlwall (1835-47). (3) A son of Poseidon and Iphimedia, one of the giants who revolted against Zeus, piling Pelion and Ossa upon Olympus. See ALOIDÆ.

Ephod (perhaps from Heb. *āphad*, to put on, clothe): (1) A Jewish priestly vestment, especially that worn by the high-priest, of blue, purple, scarlet and fine linen (byssus) interwoven with gold thread. Similar garments of plain white linen were apparently worn by any servant of the temple. They were sleeveless, with buckles of onyx stone on the shoulder-straps, the names of the twelve tribes being inscribed, six on each buckle. In front the high priests wore the jewelled breastplate with the oracle-pouch for the Urim and Thummim. See Exod. xxviii.; 1 Sam. ii., xxii.; 2 Sam. vii. (2) Apparently an image, forming part of the equipment of a sanctuary. It was revered and perhaps used in connection with the teraphim in divination.

See Judges viii., xvii., xviii.; 1 Sam. xxi., xxiii.

Ephori, or **Ephors**, chief magistrates of the anct. state of Sparta. They were five in number, and were elected by and from the people without any qualification of age or property. Their authority gradually widened until it included a superintendence over the whole commonwealth, including the kings, and they had the right of calling them to account for their

actions and of punishing them with fines and reprimands, and even of prosecuting them before the senate.

Ephorus (fl. c. 340 B.C.), Gk. historian, b. in Cymæ, Asia Minor. He was the author of a universal hist., which treated the hist. of the Gk. and barbarian world, during a space of 750 years, ending in 340 B.C. It was much read, and in spite of hostile criticism was admitted by many, among them Polybius.

Ephraem, or Ephraim (fl. A.D. 370), Syrian writer, b. at Nisibis. He spent the early years of his life in his native city, engaged in study, but after its surrender to the Persians by Jovian in 363 went to Edessa. Here he seems to have spent his life as a hermit outside the city, engaged in teaching and writing. He was ordained deacon, but refused to accept any further promotion in the church. At the time of the famine in Edessa he rendered great assistance to the suffering poor by urging the rich to deny themselves for their brethren's good. His writings were in Syriac, for he knew no other language, and consist of treatises on theological subjects, epistles and addresses to monks, apophthegms, homilies on parts of Scripture and characters in the O.T., and hymns. They were held in very high esteem, and most of them were translated both into Lat. and Gk. The standard ed. of his works is that of Assemani (Rome, 1732-46). An Eng. trans. of some of his pieces was pub. by Henry Burgess in 1853. By the Rom. Catholics he is numbered among the Doctors of the Church.

Ephraim, the younger son of Joseph, who was exalted by his father's benediction above his elder brother Manasseh. He was the ancestor, according to the Jewish tradition, of the tribe of Ephraim, which with the tribe of Manasseh formed the 'house of Joseph' (Josh. xvii. 14; 2 Sam. xix. 20, etc.). The tribe of Benjamin earlier separated from these two. Ephraim, which had within its borders many important places, was the chief of the tribes of the N. kingdom, and its name is often used as synonymous with that of Israel. Chief among these places may be named Shechem, the burial-place of Joseph, and the sanctuary of Shiloh. The tribe was a warlike one (Judges viii. 1, and xii. 1 ff.), and produced Joshua, the conqueror of the land of Canaan.

Epiplast, see EMBRYOLOGY.

Epicharmus (c. 540-450 B.C.), Gk. writer of comedies, b. in the is. of Cos. He spent the earlier part of his life in the study of philosophy, and did not begin writing comedies until his removal to Syracuse in 481. Of these thirty-five are extant, written in the Doric dialect, and to him is due the literary form of the Sicilian comedy. He introduced a regular plot and did away with the low buffoonery then current for comedy in Sicily. He took his subjects from the stories of gods and heroes as well as from life, and his plots seem to have been simple and the action rapid. His language was elegant, and he was celebrated for his choice of epithets; indeed, he was called by Plato, 'the prince of comedy.'

Epic Poetry (Gk. *ἐπος*, word, verse; *ἐπη*, poetry in hexameters), the name given to narrative or didactic poems of sufficient magnitude which are distinguished by beauty of thought and expression, and whose subjects possess both dignity and interest. Epics have sometimes been classified as sacred, heroic, allegorical, etc., but these divs. often merge into one another. Some again have been styled epics of growth, having been built up of old legends and traditions; others epics of art, created mainly by the poet's imagination.

Very early poetry consisted mainly of sacred hymns, tribal legends, and popular verses. The first narrative poems mentioned in hist. are those of anct. Greece. Designed for chanting and recitation, and for centuries poetry continued to be mainly oral, being carefully memorised by trained singers, who thus carried on from one generation to another the traditions of their race. Now and again some occasion would be marked by the production of a new poem, many a forgotten bard 'leaving great verse unto a little clan.' The *Iliad* and *Odyssey*, greatest of Gk. epics, are ascribed to Homer, but of that poet himself nothing is certainly known, not even his birthplace or the date of his existence. Even his authorship of the poems has been contested, some critics alleging them to be a collection brought together from anct. sources. A doubt whether writing was commonly used, if at all, in Homer's time, has been urged by some who maintain that works of such magnitude as the *Iliad* and *Odyssey* cannot have been the oral productions of one man. It is also contended that there are differences in character, manners, and ideas which show the *Odyssey* to be of much later date than the *Iliad*. But such scepticism has been overdone. It is agreed that these poems are not only the oldest but also among the noblest in the world, and they have greatly influenced the subsequent poetry of all Western nations. Hesiod, the second great poet of anct. Greece, though according to one tradition contemporary with Homer, probably lived some time later. His works are a mixture of epic and didactic verse, *The Works and Days*, being something like Virgil's *Georgics*. Another reputedly his, the *Theogony*, is on a grander scale, dealing with Gk. stories of the creation and of the early gods and demi-gods. Its revolt of the Titans helped to inspire the sixth book of *Paradise Lost*. In the dawn of Rom. literature writers often looked to Greece for their models. Ennius (239-169 B.C.), when writing his *Annals*, a poetical chronicle of Rom. hist., took his metre from Homer instead of adhering to the old Saturnian verse. Virgil (70-19 B.C.) wrote, also in hexameters, the *Æneid*, which has ever since been regarded as a type of perfect art: yet its author was so dissatisfied with it that when dying he left word for the MS. to be burned, but this was forbidden by Augustus. No other Lat. epic-writer ever approached the excellence of Virgil. As the sagas of Greece were wrought into-

great poems, so in medieval Europe legends clustering round the names of historical personages like Alexander or Charlemagne, or of national and sometimes mythical heroes such as Siegfried or King Arthur, became in many instances moulded into epics. Of the Teutonic lays, the *Nibelungenlied*, telling the story of Siegfried and Kriemhild, and the fatal Nibelung treasure, takes rank as one of the greatest of poetic romances. It has sometimes been paralleled with the *Iliad*, not for beauty of style or pictorial description, but as containing more human interest and development of character, and being more complete as a narrative. An earlier version of some part of the story, wilder and full of Scandinavian magic, is found in the *Volsunga Saga*. In the *Nibelungenlied* the pagan atmosphere is somewhat modified, but the whole is fierce and sad, and the closing scenes terribly tragic. Among other Teutonic epics the best is *Beowulf*; another fine one is *Havelok*, the scene of which is partly laid in Lincolnshire. Among the greatest of Icelandic sagas, which, in unrhymed poetry marked with frequent alliteration, related early Norse histories and legends, were the stories of *Burnt Njal*, *Grettir the Strong*, the *Laxdala-saga*, and *King Olaf*. The authors of many fine sagas are unknown; the last and greatest whose name has survived was Sturla Thordsson (1215-84). Fr. medieval epics were composed of song-cycles clustering round central figures or groups, the *Geste du Roi*, for example, relating the legends of Charlemagne and his warriors. To this set belong the *Chanson de Roland*, *Ogier the Dane*, and other great lays. The original chansons or gestes, the work of itinerant jongleurs, already displayed much of the clearness, eloquence, and force so characteristic of Fr. literature. The *Roland* is the finest lay of feudal chivalry. The one great epic of Spain was the *Poem of the Cid*, written in the twelfth century; the Cid Campeador himself died in 1099.

In more modern times epics have gradually been superseded by the drama and the novel, though Italy and England have produced two masterpieces, the *Divina Commedia* of Dante and Milton's *Paradise Lost*. These are the only modern poems which, for sustained beauty and grandeur both of thought and diction, take rank with the *Iliad* and *Odyssey*. Other It. epics of note are Tasso's *Jerusalem Delivered* (1575), and various romantic and burlesque poems by Pulci, Ariosto, and others. Sev. distinguished Fr. authors, including Voltaire, have written historical poems, but with no great success. Boileau's mock-heroic *Lutrin*, however, has been much admired, like Pope's *Rape of the Lock*. The famous *Lusiads*, so distinguished in the literature of its nation that Portuguese has been called 'the language of Camoens', is a spirited and fanciful epic on the adventures of Vasco da Gama. Various mythical and romantic episodes are introduced; Venus, Mars, Bacchus, Neptune, and Tethys taking part with Portuguese leaders and Oriental princes in the development of the plot.

Besides *Paradise Lost*, England has one great allegorical success, the *Faerie Queene*, and many ambitious failures. Who now remembers the 'epics' of Davenant, Cowley, and Blackmore, even by name? But of what may be called miniature epics, *Marmion* is a fine specimen, containing as it does one of the finest battle-scenes in all literature. There are also Morris's *Sigurd the Volsung*, and Hardy's epic drama, *The Dynasts*. A very curious national poem, the *Kalevala*, consists of a series of Finnish mythical and magical legends, collected and arranged into a written form by Dr. Topellius and later produced in a more complete and systematised form by Dr. Lönnrot (1835, 1849). His trans. was made in a metre which Longfellow copied in his *Hiawatha*. The whole poem, however, rather deserves the name of a book of rambling chronicles than an epic.

The most famous of Oriental epics are the Persian *Shah Nameh*, and the Indian *Mahabharata* and *Ramayana*.

Dixon, *English Epic and Heroic Poetry*, 1912; H. M. Chadwick, *The Heroic Age*, 1912 and *The Growth of Literature*, 1932; L. Abercrombie, *The Epic*, 1914; J. Bedier, *Les Légendes épiques* (2nd ed.) 1914-21; E. Nitchie, *Vergil and the English Poets*, 1919; H. J. Rose, *Handbook of Greek Literature* (3rd ed.), 1948.

Epictetus, Gk. philosopher, b. at Hierapolis in Phrygia. He lived a long time in Rome as a slave in the house of Epaphroditus, a favourite of Nero. Receiving his freedom from his master, he became a prof. of the Stoical system, which he learned from the lectures of Musonius Rufus. He taught first at Rome, but after the expulsion of the philosophers by Domitian in A.D. 94, went to Nicopolis in Epirus. Here he appears to have spent the rest of his life, for the discourses which Arrian took down in writing were delivered by E. when an old man at Nicopolis. He was favoured by the Emperor Hadrian, but little else is known of his life, except that he was lame and very poor. He formed numerous disciples by free conversations after the manner of Socrates, and one of these, Arrian, compiled the short manual *Enchiridion*, which bears the name of E. He also wrote the philosophical lectures of his master in eight books, from which some account of his doctrine may be gathered. The main point on which he laid stress was the independence of the human mind of all external circumstances, such being not in our power. This freedom is to be attained by patience and renunciation. The duty of man is to find all his happiness within himself, and the power of which he should be most sure is the deity in his own breast. For an account of his teaching, see E. A. Abbott, *Silvanus the Christian*, 1906. The chief ed. of the works of E. is that of J. Schweighäuser (6 vols., 1799-1800; Eng. trans. by Elizabeth Carter and G. Long). See also eds. by H. Schenkl (1894, 1895),

and by P. Matheson, 1917. There are studies by A. Bonhöffer (1890-1911) and T. Zahn, *Der Stoiker Epiktet und sein Verhältnis zum Christentum* (2nd ed.) 1895.

Epicureanism, system of philosophy in which human happiness was regarded as the highest good. It was founded by Epicurus, who claimed to be independent of all his predecessors, but he was in reality indebted both to the Cyrenaics and Democritus. His system, however, differed from that of the Cyrenaics in his conception of pleasure. This he regarded as something lasting and imperishable, consisting in pure and noble mental enjoyments, i.e. in the freedom from all influences which disturb our peace of mind, and thereby our happiness. His *summum bonum* was peace of mind, and this he based upon *aponévous*, which he described as the beginning of all good and the origin of all virtues. In his physics he followed the materialistic systems of Democritus, and his views are set forth in the *De Rerum Natura* of Lucretius. According to him we obtain our knowledge of things from *εἰδωλα* or images of things which are reflected from them and pass through our senses into our minds. Of the gods, too, he considers we obtain our knowledge in the same way, and he regards them as in the enjoyment of perfect happiness which would be interrupted if they took part in the government of the world, therefore they exercise no influence upon the world of man. Epicurus had numerous pupils who propagated his doctrines, and yet no system of philosophy has been so much attacked as his. This was probably owing to a great extent to the conduct of the men who called themselves Epicureans, and gave themselves up to the enjoyment of sensual pleasures. When St. Paul encountered the Epicureans, they had certainly become materialists (Acts xvii. 18). The word 'epicurean' survives in the speech of modern Palestinian Jews in the form of *Epikoria*, a term of opprobrium applied to apostates from the ancestral faith. See J. Watson, *Hedonistic Theories*, 1895; W. Pater, *Marius the Epicurean*, 1913 (Everyman's Library, 1934); A. Kelm, *L'Epicurisme*, 1924.

Epicurus (312-270 B.C.), a (Gk. philosopher, founder of the Epicurean school, which was so named after him, born in Samos, where he spent the first eighteen years of his life. He began the study of philosophy at an early age, and in 310 began to teach first in Mytilene and afterwards in Lampsacus. In 306 he went to Athens and purchased a garden, the famous *Κήποι Ἐπικούρου*, in which he estab. his philosophical school. Here, surrounded by his friends and pupils, and three brothers Neocles, Charidemus, and Aristobulus, he spent the rest of his life engaged in the study of philosophy. His mode of living was simple and his habits temperate; he was a kind-hearted friend and a patriotic citizen. Of his works only a few are extant, although he appears to have been a prolific writer and, according to Diogenes Laertius, was the author of 300 vols. All that remains of them are some fragments of his great work *Περὶ*

φύσεως, three letters, besides his will, and a compendium of his doctrine in forty-four short propositions, written for his scholars to learn by heart. Gassendi in 1646-49 pub. a Lat. Life of Epicurus and a defence of his philosophy. A good account of his teaching is given by J. E. Erdmann, *History of Philosophy*, vol. i.; A. Rogers, *History of Philosophy* (chapters on the later ethical period); A. Benn, *Greek Philosophers* (vol. ii., 2) 1882; W. Wallace, *Epicureanism*, 1880; see also P. Gardner, *New Chapters in Greek History* (xii.) and Courtney's chapter on Epicureanism in *Hellenica*; C. Bailey, *Epicurus* (the extant remains), 1927, and *The Greek Atomists and Epicurus*, 1928; and works by P. Von der Mühl (text and notes), 1922; E. Zeller (trans.) 1889; J. Meuwaldt, *Die geistige Einheit Epikurus'*, 1927.

Epicycle, in anct. astronomy, a small circle, which was supposed to move on the circumference of a larger one called the 'deferent.' It was used for representing the motions of the heavenly bodies and when the observed motion was so irregular and complicated as not to be resolved with one E., others were added, till a nearer approximation was obtained. Thus heaping of E. on E. resulted in a complex entanglement, and, as soon as astronomers came to understand and test the Copernican theory, this system sank into oblivion.

Epidamnus, see DURAZZO.

Epidaurum, see DUBROVNIK.

Epidaurus, tn. of anct. Greece, situated in a recess of the Saronic Gulf, on the E. coast of Peloponnesus in a dist. called Argolis, under the Romans. It was originally inhabited by Ionians and Carians, whence it was called Epicarus, but it was subdued by the Dorians under Deiphontes, who thus became the ruling race. It was the chief seat of the worship of Esculapius. The temple of this god lay on the highway to Argos, 5 in. W. of E., and was frequented by patients from all parts of the Hellenic world. A few ruins are still extant, and the sacred enclosure is even now called Hieron or the Sanctuary. The remains of the theatre (1st century B.C.) are well preserved. (See illustration, p. 394.)

Epidemic, general term to express common to, or affecting, a whole people, or many people; prevalent; general. It is applied to mental, moral, social, and physical phenomena, as an E. of suicide, E. folly. Technically, in sanitary science, it means a contagious disease, or generally a wide-spread disease. The term E. is equally applicable to disease occurring both in men and in animals. It has the advantage of directing attention to the fact that a disease affecting but few individuals in any one locality may have a very wide distribution, as E. meningitis and other diseases, which require great administrative consideration to adopt measures for limiting and eradicating a disease. Diseases caused by lack of vitamins, such as scurvy and beri-beri, often assume E. forms. The term E. is a disease coming on a people, and is used in

contradistinction to endemic, a disease in a community (*q.v.*). When an E. spreads quickly over whole countries or expanses of the earth, affecting large numbers of the pop., it is known as a *pandemic*. Such was the influenza E. of 1918.

Epidemic Hæmoglobinuria, see BLACK-WATER FEVER.

Epidemiology is the science of epidemics, and is concerned with the cause, infectivity, epidemic and pandemic manifestations of infective diseases, and their prevention. Epidemics and pandemics result from the conjunction of three essential factors: (1) An available store of organisms causing the disease. (2)

probable periods of recrudescence. Application of the results of E. should eventually lead to the prevention of infective diseases. See C. O. Stallybrass, *The Principles of Epidemiology*, 1931; Maj. Greenwood, *Epidemiology: historical and experimental*, 1932; *Epidemiological Report* (League of Nations), 1934.

Epidermis, see SKIN.

Episcope, magic lantern combined with an **episcopes** which can project opaque as well as translucent pictures. An episcope projects only opaque pictures.

Epido, mineral of a green or grey colour, which is composed of silica, alumina, lime, oxide of iron, and oxide of

THE RUINS OF THE THEATRE AT EPIDAUROS

Effective transmission of these organisms in sufficient numbers. (3) Other individuals with tissues susceptible to the organisms. Many secondary factors also operate, and the effect of an infective disease on individuals may depend on age, sex, relative immunity, climate, and other conditions. The co-operation of doctors, bacteriologists and other pathologists, and of mathematicians, is essential to advancement of E. In clinics, observations on the interaction of host and parasite (see PARASITE) are made, and the discovery that healthy people may act as carriers and may distribute organisms causing infectious diseases was one of the most important during the present century. The scientist who observes the life-history and reactions of these organisms contributes facts on which preventive measures can be based, and the statistician analyses such large numbers of results that he can detect, and sometimes correct, possible errors in observations and records. Curves obtained by graphing statistics make it possible to predict the probable course of an epidemic and its

manganese. Fine crystals, 3 in. in length, are found at Arendale in Norway, and also in Sweden, and at Franconia in New Hampshire; and some good specimens come from Piedmont.

Epiglottis, leaf-like lid of yellow elastic tissue which covers the glottis (the opening of the larynx) during the act of swallowing. A long stalklike ligament (the *thyro-epiglottidean*) connects it inside the larynx with the thyroid cartilages.

Epigoni, descendants of the seven heroes who perished before Thebes. Ten years after their death the E. marched against Thebes to avenge their fathers; took possession of the city, and razed it to the ground. The names of the E. are not identical in all accounts: but usually the lists contain Alcmaeon, Aegialeus, Diomedes, Promachus, Sthenelus, Thersander, and Euryalus. Aeschylus' *Seven Against Thebes* (467 B.C.) has as its theme the beleaguering of Thebes by these heroes in championship of the claim of Polyneices, and the mutually fatal single combat between the latter and his brother Eteocles.

Epigram, properly an inscription, such as was often written upon a tomb or a work of art to describe its character. Inscriptions of this sort were from early times put into metrical form, and the writer generally tried to put good sense and spirit into them. They were generally, though not always, written in the elegiac metre. The greatest master of E. was Simonides of Ceos, the author of almost all the sepulchral inscriptions on the warriors who fell in the Persian wars. One of the most famous of his E.s. was that written on the heroes who fell at Thermopylae. The form of the E. was also used to embody in concise and pointed language the clever ideas or the passing moods of the writer, often with a tinge of wit or satire, and it was a very favourite form of composition with the Alexandrian poets, some writers devoting themselves entirely to it. Indeed, some of the choicest gems of Gk. literature are to be found in the E.s.; the Gk. anthology has preserved 4500 E.s. The art was also practised in Rome from Ennius till the latest times, and in the second half of the first century A.D. Martial handled it with the power of a master. After the revival of learning the E. evolved into a short poem on a single topic, concluding with a witty or satirical remark. Voltaire is preeminent in this kind of E. Among Eng. poets there is no writer whose fame rests solely on his E.s. Many practised the art, e.g. Thomas Campion and John Owen (in Lat.), Sir John Davies, Gulliver, Bostard, Harrington, Weever, Donne, Peacham, Parrot, Davies of Hereford, Rowlands, Heath, Ben Johnson (in his *Underwoods*), Herrick, Dryden, Waller. Prior; but the best epigrammatical writer in Eng. literature was Pope. Coleridge epigrammatically defined an E. thus: 'What is an Epigram? A dwarfish whole, its body brevity, and wit its soul.'

Epigraphy, the study of inscriptions. It is mostly concerned with inscriptions on rigid materials, such as stone, metal, bone, shell and wood, or materials which may become rigid, e.g. clay. It includes incidental scratchings, such as graffiti like those on the anc. walls of Pompeii, but inscriptions on flexible materials such as papyrus, parchment and paper are the province of palaeography (q.v.).

Epilepsy, a nervous disorder characterised by sudden loss of consciousness and attended by convulsions. The disorder is specially noticeable as affecting individuals of great mental or physical vigour. Rightly or wrongly there are traditions that Hercules, Caesar, Mohammed, and Napoleon had E. In some cases it is hereditary. Epileptic fits are characterised by the nature of the convulsion, the alteration in the expression, the condition of the eyes, and subsequent exhaustion of mind and body. Sometimes the convulsions do not occur, or are so slight as only to be noticeable by experienced observers who are present at the time of the attack. These cases are known as epileptic vertigo (giddiness), minor E., masked E. or *petit mal*. In these cases the main characteristics are loss of consciousness and volition,

with loss of power to think and move. The onset of these cases is usually abrupt; their duration is short, lasting but a few seconds. Besides E. (i.e. major E. or *grand mal*, with convulsions and loss of consciousness; minor E., with loss of consciousness), there is also *partial E.*, with convulsions but not loss of consciousness. This partial, otherwise known as Jacksonian, E., is caused by a localised defect in the brain and when the locality is determined the defect, e.g. a tumour, can be operated on. *Aura*, literally a breath, is the feeling the epileptic has, as of a breath of air on some part of the skin, causing a shudder to reach the brain, and when the shudder reaches the brain, then the convulsions and (or) loss of consciousness occur. From its original meaning, an aura is applied to any warning of E.; the warning may be noticed by the patient, or sometimes only by others, as a change of habits or mental disposition. The dread of E. is due to the possibility that the mildest case may become grave, resulting in maniacal excitement and insanity. Though epileptics may maintain vigour of body, mental and moral integrity, there is always the possibility that the disease may become more serious, if not in the sufferer, then in a descendant. E. may follow any form of nervous defect or be followed by nervous defects in children. Such preceding or succeeding defects may be motor (i.e. causing paralysis), mental, or moral. Every epileptic and child of an epileptic should be under the best hygienic conditions conducive to health of both mind and body. Courses of treatment with potassium bromide are sometimes of benefit to sufferers from E., and luminal is also useful. During the attack the patient should be prevented, as far as possible, from injuring himself; a pad or piece of rubber placed between his teeth will prevent the tongue from being bitten. Those liable to frequent attacks are best treated in the special colonies described in the following article.

Epileptic Colonies, tracts of ground set apart for the care and training of epileptics. The idea was first conceived in 1887, and since that date numerous colonies have been formed in various countries. The first distinct attempt to provide for epileptics was inaugurated by a Lutheran pastor, Friedrich von Bodelschwingh, who founded at Bielefeld in Westphalia, Germany, the Bethel Colony, which has grown to be a vil. inhabited solely by epileptics. Here everything has been provided to meet their special needs. There are schools and industrial teachers, and physicians to study and treat their cases. Outdoor occupations are provided, special diet is arranged for, and there are all sorts of recreations and amusements. The first colony founded in England was at Chalfont in 1893; there are others at Liverpool, Godalming and Croydon.

Epilobium, a genus of Onagraceae, consisting of numerous species growing wild in colder climates; the Brit. species are commonly known as willow-herbs from

the similarity of the hairy seeds to those of the willow tree; in Canada they are called 'fire weeds.' *E. angustifolium*, the 'Rose bay' is very common on waste ground.

Epilogue, name given by the Gks. to the peroration of a speech, but is now generally applied to the appendix of any literary work, more particularly of a drama. As a literary form it has mostly been employed by Eng. writers; indeed, Ben Johnson made it a particular feature of his dramas, using it either to apologise for the defects of his play or to assert its merits. Later on the E. became very fashionable, and dealt with other subjects besides the preceding play, e.g. with politics, criticisms, etc., and at the time of the Restoration hardly a play was produced on the Eng. stage which did not finish with one. Dryden even wrote a *Defence of the Epilogue*.

Epimædium, see BARRENWORT.

Epimenides, poet and prophet of Crete, was a native of Phæstus, and appears to have spent most of his life in Cnossus. His hist. is largely mythical. All sorts of stories are told of his life, and he is said to have lived to a very great age. There is a legend that when a boy he was sent by his father in search of a sheep, and that sheltering from the sun in a cave he fell into a sleep which lasted 57 years. On waking and returning home, he found to his amazement, that his younger brother had grown to be an old man. But his visit to Athens is an historical fact and enables us to fix his period. He visited Athens about 590 B.C., at the invitation of its inhab., in order to undertake the purification of the city, which had been visited by a plague in consequence of the crime of Cylon. Many works were attributed to him by the ancients, and the Apostle Paul has preserved (*Titus*, i. 12) a celebrated verse of his against the Cretans.

Epimetheus (the man of afterthought) was the brother of Prometheus (the man of forethought). Zeus, in order to punish mortals, bestowed upon him Pandora, who was the cause of all the diseases and sufferings which befell mankind.

Epinal, tn. at the foot of the Vosges Mts., on the Moselle, cap. of the Fr. dept. Vosges. It is an important fort, and is also the centre of a cotton-spinning region, and manufs. cotton, machinery and iron goods. The water power of the Moselle is utilised for the iron works, the manuf. of the coloured pictures of saints and of textiles. Among its buildings are the Church of St. Maurice, with a twelfth-century tower, the museum, and the library, which contains some very valuable MSS. Taken by the Gers. in June, 1940. Occupied by U.S.A. forces on Sept. 26, 1944, a fortnight after a Seventh Army column driving N. against much opposition, had joined forces W. of E. with the right wing of Patton's Third Army which was partially immobilised through supply difficulties. Pop. 23,300, arron., 221,600.

Epinay, Louise Florence Pétronille Tardieu des Clavelles d' (1726-83), Fr.

writer, b. at Valenciennes. She was acquainted with the Fr. men of letters of her day, including Voltaire and Diderot, and was on an intimate footing with Rousseau (for whom she furnished a cottage in the valley of Montmorency) and afterwards with Grimm. Her publs. include *Mes Moments Heureux* (1752), *Lettres à mon Fils* (1758), *Conversations d'Emilie* (1774) which was crowned by the Fr. Academy; and *Mémoires et Correspondance*, her chief work, pub. in 1818.

Epiphanes, surname of Antiochus IV., who reigned over Syria from 175 to 164 B.C. Twice he seized Jerusalem, and the revolt of the Maccabees was the outcome of his cruel treatment of the conquered Jews.

Epiphanius, Saint (c. A.D. 315-402), a father of the church, b. in Palestine of Jewish parents, and after founding a monastery near Besanduan, his native vil., was in 367 appointed to the see of Constantia (formerly Salamis), in Cyprus. Although Jerome called him the 'Five-tongued,' in allusion to his linguistic powers, others account him ignorant, and all agree in finding his *Panarion* (ed. at Paris in 1622)—a hist. of eighty sects and heresies—the work of a bigot too zealous in condemning his opponents to weigh the justice of his ill-considered accusations. A violent controversialist, he condemned the doctrines of Origen in a Cyprian council of 401.

Epiphany. This word, in Gk., means an apparition of a divine being. The feast of the E. is a festival held by the Rom. Catholic and Anglican churches on Jan. 6, to commemorate the manifestation of Christ, and it includes three different events. From an early time in the East the feast was associated with the adoration of the Magi, the baptism of Christ, and the miracle of Cana. Many special observances were connected with the day, which under the name of Twelfth Night, in England, closed the Christmas festivities. The date of Easter for the year was formerly on this day solemnly announced to the faithful in the Rom. Catholic Church. The king of England still observes the day of the E. in the Chapel Royal by offerings of gold, frankincense, and myrrh at the altar. In both E. and W. the E. has always been a festival of the highest rank.

Epiphyllum, genus of Cactaceæ, indigenous to Brazil, but the showy flowers of the species make them favourite greenhouse plants in Britain. There are only four species, and these are generally epiphytic in habit. See EPIPHYTTES.

Epiphytes, plants which grow on others for support only; they do not absorb nourishment from the host as is the case with parasitic plants. A simple example of an E. is moss growing on the trunk of a tree. In forests, especially in the tropics, E. form quite a feature of the vegetation, and rare orchids are often found growing in the débris collected on the top of a tree; by this means they get more light than if they were growing on the ground. E. often have aerial roots which grow downwards, but never reach the ground;

they absorb nourishment and moisture from the air. See also PARASITES.

Epirus, div. of anc. Greece, corresponding to the S. of modern Albania, bounded by Illyria, Macedonia, and Thessaly, and stretching southward along the Ionian Sea to the Ambracian Gulf. The Gks. regarded the inhab. as semi-barbaric, but frequented the oracle of Dodona. The chief tns. were Ambracia (a colony from Corinth) and Phoenice. For a little over two centuries from 450 B.C. E. was ruled over by the Molossians, the most famous of whom was the redoubtable Pyrrhus, who offered a desperate resistance to the Roms. (295 B.C.). *Emilius* Paulus victimised the Epirotes with a most terrible policy of repression, when in

Constantinople, Larissa, and Janina, were founded by the lavish patriotism of Epirotes, who had made fortunes in other lands. Before the First World War, the Gks. of Northern E. had estab. more than 200 schools in that prov. The pop. of the 5000 sq. km. of Northern E. is about 200,000, of whom 60 per cent. are Gks.; but a great many others had been forced to emigrate between the two world wars. The pop. of the rest of E. before the late war was 363,000. In the It. invasion of Albania (1939) the chief centre of fighting in E. was Argyrocastro. See C. N. Cross, *Epirus*, 1932.

Episcopacy (from Late Lat. *episcopatus*, office of a bishop, *episkopos*), the term applied to the system of church organisation where a bishop possesses the chief eccles. authority within a defined dist. or diocese. In this way it differs from both Presbyterianism and Congregationalism. The former has a gov. by elders, and in the latter the community of worshippers is autonomous. E. represents a very special conception of the Christian church. In this system, the bishop, in his own person, sums up the collective powers of the church in his diocese, by divinely bestowed authority. Thus, both individually and collectively, the bishops are the essential ties of Catholic unity. In the judgment of many observers, this is observed in the Rom. Catholic Church by the development of the supreme power of the papacy, which was finally confirmed at the Vatican Council (1870). In the modern Rom. Catholic Church, bishops of the Lat. rite exercise their sway in defined territories and in subordination to papal supremacy. In differing degrees the same is true of patriarchs of the Oriental rites in communion with Rome. Since the Reformation, the word is more especially connected with those churches which have preserved the episcopal model, while ceasing to be in communion with Rome. The Church of England is by far the most important of these, and, since the Reformation, has been the chief champion of E. against papal, Presbyterian, and Congregational pretensions. Anglican opinion is considerably divided as to the divine origin of E., but a great modification has taken place in the character of the Eng. episcopate with the constitutional changes of the eighteenth and nineteenth centuries. The episcopal office in its essentials has practically disappeared from the Protestant communities of the Continent, though the Lutheran churches of Denmark, Norway, and Sweden still preserve the episcopal system in something of its historical sense. England is the country where the prerogatives and functions of bishops have remained the least impaired. The Reformation, being guided by the king's own hands, was effected in a very conservative spirit, and although E. was abolished by law under the Commonwealth, the bishops were restored at the Restoration, and the thought and time of the monarchy were closely connected with them. In the Protestant Episcopal Church of the United States, the functions of the

CHILDREN OF EPIRUS

168 B.C. they assisted Macedonia in her bid for independence. Henceforward their hist. is a blank apart from their modern struggle for possession of N. E. Thrice in the last three decades before 1915 the Gks. had liberated and then been despoiled of the infertile prov. of Northern E. which even their interested enemies have acknowledged to be theirs by right. So deep-rooted was the conception of Northern E. as forming a geographical unit with the rest of E. and W. Macedonia that Ismail Kemal, founder of modern Albania, concluded an agreement in 1907 with Greece by which he himself specified that Northern E. should not be separated from the rest of Greece. At the Peace Conference in Paris (1946) M. Tsaldaris, Prime Minister of Greece, claimed that this prov., given to Albania after the First World War, must be restored to Greece. E. has always been the heart of Hellenism; practically all the higher educational centres of Greece, the univ. of Athens, the Museum of Fine Arts, the marble stadium, the four great women's colleges in Athens

bishops are similar to those of Eng. prelates. The bishops of the Methodist Episcopal Church of America derive their orders from Thomas Colne, a presbyter of the Church of England, who was ordained by John Wesley in 1784 as 'superintendent' of the Methodist Society in America. In all the anct. churches, E. is regarded as of divine origin, and the bishops are looked upon as the guardians of the tradition of apostolic orthodoxy. See J. Lightfoot, *Saint Paul's Epistle to the Philippians*, 1868; E. Hatch, *Organisation of the Early Christian Churches*, 1881; J. Reville, *Les Origines de l'Episcopat*, 1894; R. C. Moberly, *Ministerial Priesthood*, 1897; C. Jenkins and K. MacKenzie, *Episcopacy, ancient and modern*, 1939.

Episcopius, Simon (1583-1643), Dutch theologian, b. in Amsterdam, his real name being *Simon Bischoff*. It was he who gave form and system to the doctrines of Arminius, and who bravely endured a life of persecution rather than stifle his protest against the excessive dogmatism of the fanatic Calvinists of his day.

Episode, an incident in the life of an individual or people which is irrelevant to the broad march of events, that is, a deviation or, to use another metaphor, an excrescence. It is a Gk. word (*ἐπεισόδιος*) meaning 'after-entrance,' and, as Aristotle explains in his *Poetics*, was descriptive in the drama of all that happened between the choric songs. From the nature of their later origin, the scenes between the actors were, theoretically at least, subordinate to the performance of the chorus, and a rift in their continuity.

Epistaxis, bleeding from the nose. Apart from injury, this is not infrequent, both in boys and girls, just before or about the age of puberty. In older persons, it may indicate the onset of a fever, or febrile condition, as in a common cold. In all cases it indicates that there is more blood in the system than the veins are capable of containing. It is sometimes due to changes in the blood vessels themselves, or to changes in the heart, lungs or other organs when the circulation of the blood is impeded or when the blood is at high tension. *Treatment*.—Nose-bleeding is often salutary, and tends to subside of itself. When frequent or severe it can be checked by the application of water, cold or iced, to the neck or forehead; a cold key, or other application, is beneficial. Other useful expedients are: closing the bleeding nostril with the fingers; drawing off the blood from the head to other parts of the body, as by the application of fomentation or mustard to the abdomen or legs. E. is avoided by attention to the alimentary canal, or anything that disturbs the circulation, as violent emotion and violent exercises.

Epistemology, branch of philosophy, denoting inquiry into knowledge, its source, nature, and limitations. See KNOWLEDGE.

Epistle, in essence a letter, that is, a communication written to an individual at a distance, because actual conversation is for the time being impossible. An

arbitrary though very real distinction, however, has been drawn between the two. Thus E. suggests dignity, and literary style, and flavours, moreover, of the archaic, so that no one would think of describing the wonderfully intimate and vivacious letters of Robert Louis Stevenson as Es. As early, at least, as Rom. times it was the fashion to write and also to preserve letters which were likely to interest future generations. Cicero certainly had some thought of posterity as he penned those E. which his faithful freedman Tiro ed. after his death. Historically they are the most valuable collection of letters ever made, and naturally suggest themselves to any one who wishes to furnish proof of the inestimable worth of this species of contemporary record at once personal and full of life. Other classical writers of E. were the younger Pliny, Plutarch, and Seneca, whilst in the imperial days the 'literati' amused themselves by composing Es. purporting to be written by great men like Plato and Demosthenes. The N.T. contains the Pauline Es. and the Es. of James and Jude, whilst in the time of the early fathers Cyprian, Jerome and Augustine committed their thoughts and purposes to Es. The Horatian *Epistles* are really highly finished essays, but they have inspired a crowd of skilful imitators, among them Boileau, Scarron, and Voltaire in France, and Ben Jonson and Dryden in this country. The *Epistle to Dr. Arbuthnot* exhibits Pope in his noblest mood. See also articles under names of Epistles.

Epistolary Writing, see LETTERS.

Epistolæ Obscurorum Virorum ('Letters of Unknown Men') appeared in 1516, and were followed the next year by a second part, the work of Ulrich von Hutten. In feeling they were intensely Protestant, and thus spurred on the Reformation. As they were full of vehement denunciations of monks and scholastics, it is natural that fear of persecution should have induced the author to conceal his name. He has been variously identified with Grotius Rubianus, Hutten, Erasmus, and Reuchlin.

Epistyle (Lat. *epistylum*), in architecture, the E. is the lowest div. of the entablature (*q.v.*), consisting of the main beam that rests immediately upon the abacus, i.e. the upper member of the cap, of a column, supporting the architrave.

Epitaph is properly an inscription engraved on a tomb, though in its wider meaning it embraces verse written in memory of the dead, which was never carved on any monument. Brevity is the mark which distinguishes Es. from elegies. Four or five thousand years ago the Egyptians inscribed upon their sarcophagi the name, lineage, office, and life dates of their deceased. No nation has excelled the Gks. in the tenderness, grace, epigrammatic finish, and twilight sadness of their literary Es. Such Lat. invocations as 'Siste Viator' (Stay, traveller!) were naturally suggested by the position of the burial places close beside the public ways. Until a few centuries ago Lat. was the language of Es. in this country, the native

Eng. being discarded in favour of what Dr. Johnson called 'classical stability.' But this fashion, which puzzles some visitors to Poet's Corner in Westminster Abbey, London, is fortunately dying out.

Epithalamium was the song invoking all blessings and happiness which boys and girls of auct. Greece used to sing to the bride and bridegroom on their marriage. Sappho, Anacreon, and I'ndar wrote epithalamia, which thus found a worthy niche in literature. The finest nuptial hymns that have survived from the classics are Theocritus's eighteenth idyll, and Catullus's *Marriage of Thetis and Pelcus*. Spenser's *Epithalamium* is one of the gems of Eng. verse.

Epithelioma, new growth occurring on the skin, or growing in connection with the skin. It is usually caused by continued irritation, as on the tongue from an irregular tooth, or on the lip from a pipe. It may occur on the skin from continued irritation, as of soot in chimney sweeps, etc. It may commence as an innocent looking pimple and remain as such for months or years. After a time the growth breaks down and forms a sore or ulcer, which may persist for months and years. All spots and sores, especially when subject to continued irritation, should have immediate attention, or they may be fatal. The word cancer is a lay term, signifying a tumour, which has been fatal, or probably will be, and E., if untreated, is frequently fatal.

Epithelium, or **Epithelial Tissue** is widely distributed. Its most important situations are: (1) On the surface of the skin; (2) on mucous membranes; (3) on the inner or free surface of serous membranes; (4) on the inner surface of the heart, blood vessels, and lymphatics. Every epithelial tissue is formed entirely of cells united together with cohesive matter, and the mass thus formed closely invests the surface on which it is situated. It contains no blood-vessels, though plasma may diffuse through the minute channels sometimes existing between the cells. Nervous fibrils are usually abundant. The component cells vary in structure and shape, hence the most convenient classification of epithelial cells is according to shape and arrangement, viz.: (1) simple epithelia, subdivided into (a) pavement or scaly, as in such a serous membrane as the peritoneum; (b) columnar, e.g. lining the mucous membrane of intestines. 'Challice or goblet' cells are columnar cells distended with mucus; (c) spheroidal or glandular, e.g. in the liver; (d) ciliated, i.e. bearing spontaneously-moving filaments on their basal ends, as in nasal membrane. (2) Stratified E. of various types having cells in layers, the deeper usually columnar and the superficial ones flattened as in the E. of the front of the cornea. (3) Transitional E. of several types, but intermediate in character between (1) and (2), e.g. lining the ureters.

Epoch (Gk. *ἐποχή*, a pause) has a special astronomical meaning. It is impossible to determine the position of a planet or other body in its orbit unless its

place at a given point of time is known. This given moment is called the 'epoch,' although this word often implies the mean longitude of the body at that particular moment.

Epode, an essential part of the chorus in Gk. drama. It followed the strophe and antistrophe, being sung when the choir had returned to its original place. The E. was also a form of lyric invented by Archilochus and finely handled by Stesichorus. Horace imitated Archilochus's metre in his fifth book of *Odes*, which he accordingly named *Epodes*. In these, iambic trimeters and dimeters alternate.

Eponym (from Gk. *ἐπώνυμος*, derived from *ἐπώνυμ*, a name), the mythical individual who has given his name to a people sprung from his descendants. Legend says that Pelops beget the Peloponnesians; Dorus, the Dorians; and Italus, the Italians.

Epping, par. and tn. of Essex, England, situated to the N. of Epping Forest, about 16 m. N.E. by N. of London. It has an elevation of 380 ft. above the level of the sea. The forest was once part of the auct. forest of Waltham, and originally covered the whole of Essex co. What remains of it now is preserved by the city of London, and forms one of the largest and most frequented pleasure grounds of the country. It was for many years the constituency of Mr. Winston Churchill, (q.v.). Pop. 4900. See W. Addison, *Epping Forest: Its Literary and Historical Associations*, 1948.

Epsom (a corruption of Ebbisham, the local manor), mkt. tn., 144 m. S.S.W. of London, in Surrey, England. The Royal Medical College on the Downs was founded in 1851 as a school for doctors' sons. There are sculptures by Flaxman and Chantrey in the Gothic church (rebuilt in 1824). In 1618 the springs containing sulphate of magnesia were discovered, and it seemed likely that E. would become a fashionable inland spa. To-day, however, the waters are forgotten, and E. is famous because the Derby and Oaks are run on the race-course on the Downs near Tattenham Corner. Pop. 19,000.

Epsomite, or **Sulphate of Magnesia**, used as a fertiliser, also in dyeing cotton goods.

Epsom Salts were called because they were first manufd. by evaporating the water of the mineral springs at Epsom. But they occur also in sea water, in the mineral springs of Pullna and Seidlitz, etc., in the Stassfurt mines (as reichardtite), and in America are procurable from limestone beds. The chemical formula is $MgSO_4 \cdot 7H_2O$, and they are therefore described as hepta-hydrated magnesium sulphate. Their needle-like crystals belong to the orthorhombic system. In medicine E. S. are commonly used as a purgative; the intensely bitter taste can be disguised.

Epstein, Jacob (b. 1880), Russo-Polish sculptor, b. in New York, educated at the School of Art Students' League, New York. Later, he completed his training at the École des Beaux Arts, Paris. Migrated to London in 1904. Has become the most

criticised sculptor of the present day. One of his first works in England was the series of figures on the frieze of the Brit. Medical Association's building in the Strand, London (1908). Still more symbolic, and consequently still more provocative, are his 'Rima' in Hyde Park, London, his Oscar Wilde Memorial in the cemetery of Père Lachaise in Paris, and his figures of 'Night' and 'Day' on the London Transport premises in Broadway, Westminster. Other famous works are his 'Two Doves' and 'Marble Venus,' executed in 1913 and 1914 respectively. The figures are striking in their naturalistic treatment, and almost always suggest the embryonic. The cry of 'immoral' has been raised, notably over the Strand figures and the Wilde memorial which is the figure of a nude man whose sphinx-like face twists in a smile of mingled despair and tragic bitterness. In some beholders it evokes horror and resentment, in others wonder at the strength of realistic suggestion. Probably his loftiest contribution to art is the noble and dignified 'Maternity' in the Tate Gallery. He has also executed a large number of bronzes, especially portraits. One of his most recent bronzes is the 'Madonna and Child,' in which there is revealed 'a great emotional and formal suavity' in the movement of the arms of the two figures, while the general impression of the faces and figures visualised in the group is that of 'intense vexation of soul coupled with a spiritual recognition of the obstacles to be encountered in reaching happiness.' E. has also produced a number of drawings, the most characteristic of which are the neurotic 'The Sisters,' and the 'Mother and Son' series. His 'Genesis' (1931), is a bold conception which produced the usual storm of criticism as well as imitations by other sculptors. In retrospect now, it is difficult to understand the outcry which his early work caused. The novelty has worn off and the world has learnt to expect the sudden dynamic assault of his powerful personality. Yet the controversy was not merely one between the Philistines and the enlightened: for Roger Fry denied that E. was a master of sculpture, and both Paul Nash and Eric Gill criticised him adversely; but among his influential champions were G. B. Shaw, Sickert (who resigned from the Academy because of his admission), Rickets, Muirhead, Modigliani, and Matthew Smith. There is a sense in which it seems that E.'s vision has its origin in all that is greatest in the Jewish character. His 'Genesis' is a striking apocalyptic comment on our times, in which mankind is brought forth as a monster, swollen with a lust for destruction, and his 'Adam' has the same quality—man steeling himself to resist a universe which threatens his existence. His autobiography, *Let There be Sculpture*, appeared in 1940. See studies by B. van Dieren, 1920; and H. Wellington, 1925.

Epworth, mkt. tn. and the bp. of John Wesley (b. 1703), 10 m. N.N.W. of Gainsborough in Lincolnshire, England. Pop. 2000.

Equal-Area Projection, see PROJECTION. **'Equality State,'** see WYOMING.

Equation, a statement in mathematical form of equality between known and unknown numbers which is true only for certain values of the unknown but not for all. To solve an E. means to find the value or values of the unknown number which satisfy the E., e.g., $x + 4 = 7$ is true when x is 3. An E. that is true for all values of the unknown is called an *identity*, e.g., $x + x \equiv 2x$. Simple Es. are of the type $2x + 3x = 100 - 5x$, and the general method of solution of a simple E. is to transpose all the terms containing the unknown x on to the left-hand side and the numerical quantities on to the right-hand side. This may be done by using the property of an E. that if any term is taken from one side to the other its sign must be changed. All the x 's, then, are added together, and the right-hand divided by the coefficient of the x , whence the value of x is obtained. It is important to remember that the symbol x stands for a *numerical quantity*. When an E. contains two or more unknowns, e.g. $2x + 3y + 4z = 6$, it is called *indeterminate*. To get a definite solution of this E. two other relations between x, y, z must be given. The number of Es. required to get a definite solution of any E. containing two or more unknowns is the same as the number of unknowns. Such a group of Es. are called *simultaneous Es.* All the Es. cited above are called Es. of the *first degree*. The *degree* of an E. is determined from the highest power of the unknown occurring in the equation. Thus $x^2 - 6 = 9$ is one of the second degree, $x^3 + 3x + 3 = 0$ is one of the third degree, and so on. An E. of the second degree is sometimes called a quadratic, one of the third degree a cubic, and one of the fourth degree a biquadratic. A quadratic E. has *two* solutions or roots, which are either both *real* or both *imaginary*, e.g. the E. $x^2 - 5x + 4 = 0$ has roots $x = 1$ or 4 (real), and the E. $x^2 + 1 = 0$ has roots i or $-i$ (imaginary). In general an E. of the n th degree has n roots, but some of these may be imaginary. Imaginary roots always occur in pairs. The solution of Es. of higher degree than the quadratic Es. opens up the large subject of the *Theory of Equations*. This subject embraces all questions connected with the solution of every type of E. The cubic was first solved in 1505 by Scipio Ferreo, although the general method to solution is known as Cardan's method. This solution is, however, not due to Cardan, but was obtained by him from Tartaglia. The solution of the biquadratic was first obtained by Ferrari, who was a pupil of Cardan. Abel has shown, to the satisfaction of mathematicians, that it is impossible to obtain a general solution of Es. higher than those of the fourth degree. It may be pointed out that by means of the relations between the solutions or roots of the E. and the coefficients of the terms of the E., Es. of a higher order may be obtained provided some other relations are also known, e.g. a relation between the

roots themselves. But this obviously is a particular type of E., and is not embraced by Abel's demonstration. Approximate values of the roots of E.s. in which the coefficients are numerical may be found by employing *Horner's method of approximation* to any degree of accuracy. See W. S. Burnside and A. Panton, *Theory of Equations*, 1881; H. W. Turnbull, *The Theory of Equations*, 1939.

Differential Equations (*q.v.*) are of a special type involving differential coefficients. They have proved to be an invaluable tool in mathematics as applied to engineering, electricity and radio, and in the development of Relativity (*q.v.*) and Quantum Theory (*q.v.*): N. Miller, *Differential Equations*, 1935.

A **Binomial equation** is an algebraical E. consisting of only two terms. Its most general form is $a_1x^p \pm ax^q = 0$. This may be reduced to the form $x^r \pm a = 0$, where $p - q = r$ and $\frac{a_1}{a} = a$. The solu-

tion of this would be $x = \sqrt[r]{\pm a}$, showing that $x^r + a = 0$ has imaginary roots and $x^r - a$ has real roots.

Equation to a curve.—A curve may be viewed as the path traced out by a point moving under a given condition. If the co-ordinate (*q.v.*) (see also GRAPHS) of any point on the curve be taken, this condition can be expressed by a relation between the x co-ordinate and the y co-ordinate; this relation is termed the E. to the curve, e.g. $x^2 + y^2 = a^2$ is the E. for a circle.

Astronomical equations.—All the motions of the astronomical bodies can be reduced approximately to a simple law. For accurate results certain corrections have to be applied to the results obtained from the simple law. These corrections are termed astronomical E.s.

Equation of time. Through causes explained in the article on day (*q.v.*), the length of the solar day varies. To get a fixed measure of time astronomers conceive of an imaginary sun which moves uniformly in the celestial equator, completing its circuit in the same time as the real sun. The time given by this means is known as *mean solar time*, and *mean noon* is that time when the imaginary sun is on the meridian, the time when the real sun is on the meridian being known as *apparent noon*. Clocks keep *mean* and *sun-dials apparent* time, and the difference between these is known as the equation of time. On four occasions in the year, about April 15, June 15, Sept. 1, and Dec. 24, these coincide, and then, of course, the equation of time is zero.

Equation, Chemical. A C. E. represents both qualitatively and quantitatively the substances which react together and those which are produced. Every reaction must obey the law of the conservation of mass; and, therefore, the masses of each element shown on the left-hand side of the equation must be equal to those shown on the right-hand side. The equation $\text{CaCO}_3 + 2\text{HCl} = \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2$ expresses the fact that 100 grams of calcium carbonate (CaCO_3) react with

73 grams of hydrochloric acid (HCl), producing 111 grams of calcium chloride (CaCl_2), 44 grams of carbon dioxide (CO_2), and 18 grams of water (H_2O) (atomic weights $\text{Ca} = 40$, $\text{C} = 12$, $\text{O} = 16$, $\text{H} = 1$, $\text{Cl} = 35.5$). The equation further shows the relative volumes of the reacting gases and of the products. Since a gram molecule of any gas (e.g. $\text{HCl} = 1 + 35.5 = 36.5$ grams) occupies 22.4 litres under standard conditions of temp. and pressure, the equation shows that 44.8 litres of hydrochloric acid gas would produce, from sufficient calcium carbonate, 22.4 litres of carbon dioxide. In these respects a C. E. is very useful, but it has certain defects. As ordinarily written it does not show the physical states of the substances, whether solids, liquids, or gases; it does not deal adequately with the many cases of balanced action, nor show the thermal changes which accompany reactions, though many of these points can be indicated by the use of additional symbols or figures.

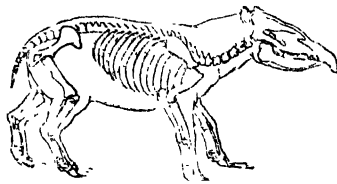

Equator (from Lato Lat. *aequator*, from *aequare*, to equalise), imaginary great circle drawn on the earth's surface in a plane at right angles to its axis, and equidistant from either pole. It is the dividing line between the N. and S. hemispheres. This E. is often called 'terrestrial' or 'geographical' to distinguish it from the 'celestial equator.' See EQUINOCTIAL.

When a ship crosses the E. or the 'line' it is customary for the crew to stage a mock ceremony on deck. Those who are making the passage for the first time, after making obeisance to King Neptune and his court, are lathered, shaved, and tossed into a bath of water; after which they receive 'Davy Jones's Certificate' in the form of a passport upon the high seas and conferring the 'Freedom of the Raging Main.' This now good-natured horse-play was once accompanied with much brutality.

Equatorial Current, see ATLANTIC OCEAN.

Equerry, in royal households, an officer in the dept. of the master of the horse, who accompanies the king or prince when he goes riding in state. The 'gentleman of the equerry' was originally in charge of the royal stables, the word E. being the Fr. *écurie*, stable.

Equidae. The horse family; in zoology a family of solidungulate perissodactyl

PALEOTHERIUM MAGNUM

This primitive ungulate of the Upper Eocene is regarded as being ancestral to the Horse family (hoofed animals). Middle digit and hoof enlarged, and alone support the body;

lateral more or less reduced in size and functionless. The first and fifth digits and corresponding metapodials, in living genera, are wanting; also the second and fourth, but the metapodials are present, though they are mere splint bones. The shaft of the ulna is atrophied, its extreme being consolidated with the radius; fibularis rudimentary and ankylosed with the tibia. Skull very elongated; lower jaw deep behind, and bony orbit of the eye is complete. Many fossil genera through the Tertiary, as *e.g.* *Hipparion*, *Mercurippus*, *Protohippus*, etc.

Equidistant Projection, see under PROJECTION.

Equilibrium, in mechanics, is the state of rest of a body under the action of two more forces. The E. may be *neutral*, *stable*, or *unstable*.

Neutral equilibrium.—If a body or a material system is balanced by the forces which act upon it in any position in which it may be placed, its E. is *neutral*. This is the case with a sphere or a circular cylinder of uniform material placed on a horizontal plane. Any body whose centre of gravity is at the fixed point of support, or is always at the same height above the point of support, is in neutral E.

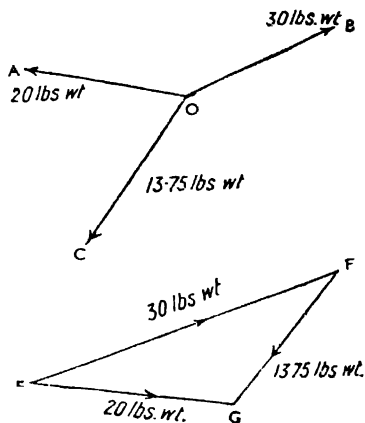

Stable equilibrium.—But if when the body is displaced very little in any direction from its E. position and left to itself it commences and continues vibrating without ever experiencing more than very small deviation from the position of E., the E. is said to be *stable*. This is the case with a pendulum, or with a sphere loaded in its lowest part.

Unstable equilibrium.—If, on the other hand, the system can be displaced in any way from a position of E., so that when left to itself it will not vibrate within very small limits about the position of E., but will move farther and farther away from it, the E. is said to be *unstable*. Thus an egg or a billiard cue standing on end presents a case of unstable E. In many cases the E. varies with the direction of displacement; but if it is unstable for any possible displacement, it is practically unstable on the whole. Thus a coin standing on its edge is in neutral E. for displacements in its plane, but is in unstable E. for those perpendicular to its plane. It is, therefore, practically in unstable E.

The conditions required for E. vary according to the number of forces and according as the forces are acting in the same plane or not. Thus two *co-planar* forces can only balance when they are equal in magnitude and directly opposed to each other. Three *co-planar* forces acting at a point will be in E. if they can be represented in magnitude and direction by the three sides of a triangle taken in order.

In the figure the forces of 20 lb. wt., 30 lb. wt., and 13.75 lb. wt. will balance, for they can be represented by the sides of the triangle EFG, EF being 3 in. long, FG being 1.375 in. long, and GE 2 in. long. Any number of *co-planar* forces acting at a point will be in E. if they can be represented in magnitude and direction

by the sides of a closed polygon taken in order. If the forces lie in one plane, but do not meet in a point, the conditions for E. are: (1) The sum of all the resolved parts of all the forces in any two directions at right angles must be separately zero; (2) the sum of the moments of all the forces

(or of their components) about any point must be zero. The condition (1) must be satisfied if there is to be no trans.; and the condition (2) must be satisfied if there is to be no rotation. If the forces do not act in one plane, we may make use of the Principle of the Virtual Work. If the points of application of the forces receive any very small displacements consistent with the mechanical connections, the total work done will be zero, when the forces are in E.

Equimultiples (from Lat. *æquus*, equal, and *multipl.*, manifold), products obtained by multiplying quantities by the same quantity. Thus 15 and 85 are E. of 3 and 17, and a^2b^2 and bc^2 of a^2c^2 and c .

Equinoctial, another name for the 'celestial equator,' which is the imaginary great circle traced by the points of intersection of the plane of the terrestrial equator and the celestial sphere. The 'equinoctial points' are the points of intersection of the ecliptic and terrestrial equator, this intersection indicating that the sun is exactly on the equator. Astronomical observers therefore choose this juncture as a convenient season to secure a uniform reckoning of time. See EQUINOXES.

Equinoctial Gales, popular superstition to which science lends no support. Winds and storms are not more prevalent at the equinoxes than at other seasons.

Equinoxes (from Lat. *æquus*, equal, and *nox*, night) are the two days in the year, March 21 and Sept. 22, when the days are equal to the nights all over the world.

Owing to the inclination of the axis, on which the earth rotates, as it journeys round the sun, the portion of its surface which is lightened by the sun's rays, the circle of illumination varies; but at the E. the sun apparently describes the equatorial circle, and exactly half of each parallel is illuminated. At the vernal E. (in March) the sun passes from S. to N., which results in the days lengthening in the N. hemisphere, and from N. to S. in the autumnal, when the days shorten.

Equisetum, genus of plants, popularly known as horsetails, belonging to the order Equisetaceae. Of the twenty species of the genus, about half are Brit. In general habit they all bear a strong family likeness to each other, all having stiff, upright, jointed stems, with whorls of little-developed leaves, those of each whorl being united to form a sheath around the stem. They have a creeping, much-branched rootstock which penetrates the ground to a great depth. The fructification is in the form of cones, each of which is borne at the end of an upright stem or branch. The commonest wild species is *E. arvense*. The rough stems of some species are used in several occupations for the purpose of giving certain woods a high polish; while the stems of other species are used for polishing metals.

Equitable Charge. An E. C. or mortgage arises either: (1) from the mortgage of an equitable as distinct from a legal interest, e.g. where a *cestui que trust* (i.e. beneficiary of an estate in real or personal property held by trustees) charges his property as security for a loan; or (2) by reason of the form of mortgage being recognised by equity and not at common law. A common law mortgage implies the conveyance by deed of the mortgagor's legal interest to the mortgagee; equity allows the creation of a charge (a) by mere deposit of title deeds, or (b) by an unsealed written agreement to deposit without actual deposit of deeds. Generally speaking, the incidents in both legal mortgages and E. Cs. are the same, but where property has been mortgaged by deed, whether before or after the creation of an E. C. on the same property, the legal has priority to the equitable mortgagee.

Equitable Estates, see ESTATE.

Equites (from Lat. *equus*, horse), horse-men or knights of anc. Rome. At first they formed part of the army. Servius Tullius increased the number of 'centuriae' (hundreds), into which they were divided, from six to eighteen. The first six were purely patrician; the latter twelve, plebeian. But beside the 'equites equo publico,' who received money for their mount from the state treasury, there were 'equites equo privato,' volunteers providing their own horse. After the second Punic war the knights exerted a political influence second only in importance to that of the senate. They farmed the provincial taxes and constituted the capitalist class. The democrat, Gaius Gracchus, used them as a foil to the aristocracy, a policy imitated without intermission up to imperial times, and guaranteed their

support by granting them control of the jury courts, as well as the revenues of Asia. Under Augustus many civil posts of honour, such as the prefecture of the corn supply, were open to them after military service. Once more, however, they became primarily soldiers instead of financiers.

Equity. In England E. is a science which in a general sense corresponds to natural justice. But as administered in the courts it has a narrower meaning as connoting merely that portion of natural justice which, crystallised into technical rules, and operating according to clear-cut principles, has found a definite place in the general legal system. The fundamental notions of Eng. E. are to be deduced from a series of leading maxims upon which the courts act in the administration of their equitable jurisdiction. These maxims are as follows: (1) E. follows the law (see below). (2) E. will not suffer a wrong to be without a remedy by reason of a merely technical defect. (3) He who seeks E. must do E. (4) E. looks to intention rather than form. (5) E. acts in *personam*, i.e. equitable rights are primarily based on the assumption that a court of E. does not, like a common law court, issue judgments to be executed by its own officers, if necessary by force, but grants decrees (*q.v.*) which the parties themselves are to execute on pain, in default of so doing, of being treated as guilty of contempt of court. (6) E. imputes an intention to fulfil an obligation. (7) E. looks on that as done which ought to have been done (see CHARITABLE USES). (8) Delay defeats E., i.e. a suitor in E. must not sleep on his rights when he knows what they are. (9) 'He who comes into E. must come with clean hands.' (10) Equality is E. (11) Where there are equal E.s. (equitable rights) the first in time shall prevail, e.g. a purchaser for value of the E. of redemption of a house takes subject to the mortgagee's interest, even though he thought there was no mortgage. (12) Where there is equal E. the law shall prevail, e.g. A mortgages his land to B by deposit of title deeds, and then without disclosing that fact executes a legal mortgage to C. If the proceeds on sale are insufficient to satisfy more than one of the loans, C. will have priority, because although he was second in point of time, he has as good an E. and the legal estate too.

In its widest sense, E. answers to the definition of justice given in the Rom. Pandects: 'The constant and perpetual wish to render every one his due.' In any system of law the general meaning corresponds to a sense of natural justice, and all the different shades of meaning which jurists have assigned to this variable term may be referred to that primary notion. These different shades have been enumerated by Austin as follows: (1) A species of interpretation of statute law, as denoting that the judges will generally construe a statutory enactment on the assumption that the legislature desired to be both uniform and consistent. (2) Judicial impartiality. (3) The mode of

formation of E. procedure or the matter whence the judges derive their equitable principles, whether natural law, international law, some standard of ethics, or a sense of justice, all susceptible of summarisation in the maxim *summum jus summa injuria* (Cicero, 'Extreme justice is often extreme injustice'). (4) Good principles of judicial legislation. (5) The cheerful performance of duties not legally enforceable. (6) Morality, positive or otherwise. (7) That portion of our law which is administered by a court of E.; and (8) rights in the nature of a set-off or counterclaim. But however variable the meaning of E. may be, in England it now connotes a body of technical principles which have been evolved in the course of centuries by successive chancellors and other E. judges (see CHANCELLOR). To follow out the hist. of the office of Lord High Chancellor and the Court of Chancery (q.v.) in England is practically to trace the growth and maturity of Eng. E. It is hardly possible to define E. as now administered in England, or to make it intelligible otherwise than by a minute enumeration of the matters cognisable in the courts in which it is administered in its more concrete and modified sense. (See as to matters assigned to the Chancery Division, under CHANCERY, COURT OF). E. in England is the very antithesis of common law (q.v.). The remedies for the redress of civil wrongs and the enforcement of civil rights were formerly always distinguished by division into two classes, those administered in courts of law, and those administered in courts of E.

Accordingly, rights may be distinguished into legal and equitable. Courts of common law formerly proceeded by certain highly technical forms of action, e.g. trespass (q.v.), trover (q.v.), detinue (q.v.), assumpsit (q.v.), and an error in the form of action was fatal; form was more than substance. But there were and, indeed, will always be many cases in which a simple judgment for either party will not do entire justice. The ordinary law courts had no machinery for such a purpose, but courts of E. adjudicated by decrees, so framed as to meet all the exigencies of the case, which varied, or qualified, the legal remedy so as to suit it to mutual and adverse claims and the substantial rights of all the parties. A court of E., therefore, always had jurisdiction in cases where a plain, adequate and complete remedy could not be had in the common law courts; and unless the common law remedy was such as to reach the whole mischief and secure the whole right of the party present or future, the courts of E. interposed and gave relief. Before the Judicature Act, 1873, the jurisdiction of a court of E. was sometimes concurrent with that of courts of common law; sometimes auxiliary to it; and sometimes exclusive. The concurrent jurisdiction was exercised in cases where the rights were purely of a legal nature, but where other and more efficient aid was required than a court of common law could vouchsafe. The most common exercise of the concurrent jurisdiction was

in cases of account, accident, dower, fraud, mistake, rectification, misrepresentation, partnership, and partition. A court of E. exercised its auxiliary jurisdiction in cases where the courts of law had no like authority. By this assistance it removed legal impediments to the fair decision of a question in issue at law, as by compelling a party to disclose documents which he makes part of his own case, and by compelling him to admit material facts on oath where a court of law was unable to enforce disclosure. The exclusive jurisdiction was exercised mainly in cases involving merely equitable rights, or rights not recognised at common law. Most cases of trust and confidence fell under this head. In particular this jurisdiction was exercised in granting injunction to prevent waste or irreparable injury; in appointing receivers of property which was in danger of being misapplied; in compelling the surrender of securities improperly obtained; in enforcing specific performance of contracts (i.e. literal compliance as opposed to damages for breach); and in supplying the defective execution of instruments by correcting them according to the proved intention of the parties. (For the manner in which a suit in the E. side of the old Court of Chancery was commenced, see under CHANCELLOR, LORD HIGH, and CHANCERY, COURT OF.) The old method of petitioning by Bill and Answer has fallen into disuse, and the proceedings in the Chancery Div. are now, like those of the common law courts, simplified as far as compatible with the circumstances of each particular case.

Since the passing of the Judicature Act, 1873, the distinction between law and E. has lost some of its importance, but the effect of that Act may easily be misunderstood if a literal fusion of the principles of law and E. be assumed. The practical effect of the Judicature Act was this: (1) It assimilated to a great extent the procedure of the Chancery Div. and the King's Bench Div. (2) It reconstructed the Chancery Court into a Chancery Div. of the High Court of Justice. (3) It fused the rules of law and E. to the extent that they are both now concurrently administered by all courts of law, whether nominally belonging to the King's Bench Div. or the Chancery Div. (4) It provided a general principle that where there is any conflict or variance between E. and common law, E. should prevail; and (5) it allocated to the Chancery Div. most of the subject-matter formerly peculiar to the old Court of Chancery (q.v.). In short, the fusion was a fusion merely of administration, the principles of E. being in no way affected; and even this fusion of administration is only partial when it is recollected that so large a number of causes and matters appropriate to the old Court of Chancery are still automatically assigned for hearing to the Chancery Div. 'The main object,' says Lord Watson in *Ind Coope & Co. v. Emerson*, 1887, 12 Appeal Cases, at p. 308, 'of the Judicature Act was to enable the parties to a suit to obtain in that suit, and without

the necessity of resorting to another court, all remedies to which they are entitled in respect of any legal or equitable claim or defence properly advanced by them so as to avoid a multiplicity of legal proceedings.'

English and Roman equity contrasted.—In England E. in its origin and development was essentially the same as Rom. E., or the system of law administered by the prætors. Both bodies of principles claimed to override the existing and stricter civil law by virtue of a supposed intrinsic superiority. There were differences, however, in material sources. In Rome the equitable jurisdiction of the prætors was referred to a specific source in the *jus gentium*, or law of nations, which the Romans regarded as nothing less than an emanation from the law of nature, a divine law harking back to an ideal past and owing its catholicity to the assumed equality of all men. In England the material source was never avowed. In point of fact the process was a surreptitious one. E. varied, according to Seldon's celebrated aphorism, 'with the length of the Chancellor's foot.' Historically it would seem that the Chancellor administered his E. with the tacit approbation of the king, such moral justification as it might have had being the assumption that the defendant in a harsh case was bound 'to purge his conscience' and do right where the common law could not compel him to do so. But phrase it as we may, both systems owed their efficacy to their expediency, their impartiality, and a natural sense of justice. Moreover, both systems had their authorisation in the royal or imperial prerogative (whether confessedly so in England or not), for in no system of jurisprudence can a judge, theoretically at least, claim to give decisions contrary to the statute law or civil law. Hence the paradox *æquitas sequitur legem* (E. follows the law). Rom. E. did, no doubt, in a far greater degree, meet social exigencies, and the fiction implied in the above maxim was far more transparent. There were differences in form, source, and manner of enunciation. Eng. E. was, and in practice now is, largely administered by an exceptional civil tribunal—the Chancery Div. Prætorian E. and the *Jus Civile* were administered by one and the same tribunal. Again, the E. of the Romans was statute law, whereas chancery law is judiciary for the most part; and finally the subjects with which each system is concerned differ widely, e.g. the urban prætor altered root and branch the whole law of intestate succession; but no Eng. chancellor would have ventured on such a revolution. The whole difference between the two systems, however, is unessential and merely historical if we regard E. objectively as a distinct system of law: it is a real difference, on the other hand, if we view it as merely the process of tempering all rigid law by principles of inherently superior fairness. See M. Garsia, *Equity in a Nutshell*, 1933; H. Hanbury, *Essays on Equity*, 1934; E. Shell, *Principles of Equity*, 1934.

Equity, Bill in, see **BILLS**.

Equivalent (of an element), see **COMBINING WEIGHT**.

Equivalents, Chemical, see **ATOMIC HEAT**.

Equuleus, a constellation, near Aquarius, in the N. hemisphere. The name means 'colt,' and Ptolemy called it 'hippopotamus.' It contains a remarkable double star (δ Equulei). After Capella it is the most rapid binary known, its period of revolution being 5.7 years. *Equuleus Pictoris* (Painter's Easel) was a new constellation introduced by Nicolas de Lacaille, 1763. It is near Canopus in the S. hemisphere, and is usually called Pictor.

Era, see **under CHRONOLOGY**.

Eran, see **IRAN**.

Erard, Sebastian (1752–1831), Fr. maker of musical instruments, constructed his first piano in Paris in 1780. During the Revolution he was in London, and again from 1808–12. He invented the harp with double pedals and the grand piano with double escapement. His instruments won high commendation from the foremost musicians of the day.

Erasistratus (b. c. 300 B.C.), famous physician and anatomist, born at Iulis in the is. of Ceos. He was the son of Cleombrotus and Cretoxene, and became a pupil of both Metrodorus and Theophrastus. About 294 B.C. he was physician at the court of Nicator, king of Syria, but he later settled in Samos and founded a school of medicine. E. discovered the difference between sensory and motor nerves, and believed the heart to be the origin of veins and arteries. His works only remain in fragments. See Hieronymus, *Erasistrati et Erasistratorum Historia*, 1790; and Fuchs, 'De Erasistrato Capita Selecta' in *Hermes*, vol. XXIX., 1897.

Erasmus, Desiderius (1466–1536), Dutch scholar and theologian, the illegitimate son of Rogerus Gerardus. He styled himself 'Rotterodamus,' a native of Rotterdam, though a contemporary document states that he was born in his father's native tn. of Gouda. He was educated at St. Lebuin's church, Deventer (1475–84), and was a chorister at Utrecht. On the death of his father in 1484, he went to a school at Hertogenbosch, and later joined a religious order in the house of St. Gregory's at Steyn, being ordained a priest in 1492. Shortly afterwards he became secretary to Henry of Bergen, bishop of Cambrai, and in 1495 entered the college of Montaigu, in the Univ. of Paris, where he won great fame as a scholar. He eked out his living by taking pupils, one of whom, Wm. Blount, Lord Mountjoy, persuaded him to visit England in 1498. At Oxford he discussed theology with John Colet and began his friendship with Linacre, Thomas More, and others, but returned to Paris to his Gk. studies in 1500. In this year he brought out his *Collectanea Adagiorum*, which contained extracts from the Classics and from the Fathers. E. travelled about the Continent considerably, teaching privately and studying wherever he went. In 1506 he went to Italy as the tutor of the two sons

of Baptista Boerio, Henry VII.'s physician. There he made new friendships with such men as Aldus Manutius, the Venetian printer, who pub. for him a new and enlarged ed. of his *Adagia*, entitled *Chiliades Adagiorum*. In Venice, Alexander Stewart, the natural son of James IV. of Scotland, at whose side he fell at Flodden, became his pupil and friend, and in Rome he was honoured by all the members of the papal circle. In 1509 he again came to London and stayed with his friend More. At this time he wrote his brilliant satire called *Encomium Moriae*, in which kings, popes, bishops, and the

DESIDERIUS ERASMUS
Engraving after a painting by G. Penn

like, all came under his lash. He now visited Cambridge, where he finished his work on the Gk. N.T., and on Seneca and St. Jerome, and where he taught Gk. and lectured on divinity. E. had now a large circle of disciples, both on the Continent and in England, who were proud to look up to him as their master and teacher. In 1511 he pub. *De Duplici Copia Verborum et Rerum*, a text-book of rhetoric, and his N.T. appeared in 1516. From 1516 to 1521 he lived chiefly at Louvain, near the court, though he not infrequently journeyed to Brussels or to Basle and in 1517 went for the last time to England. At Louvain he took an active interest in the founding of Hieronymus Busleiden's Collegium Trilingue, and there, too, he prepared his ed. of the *Christian Fathers*. About this time he formed a friendship with Johann Froben, a publisher of Basle, and in 1521 E. settled permanently in that tn. to become Froben's general literary adviser. Between 1516 and 1536 Froben's press issued a remarkable series of the *Fathers*, including Jerome (1516), Hilarius (1523), Ambrose (1527), Augustine (1528), and Origen (1536), which was largely the work of E., though he had

many coadjutors. Froben died in 1527, and two years later E. moved to Freiburg to avoid the religious dissensions that were disturbing Basle, but he returned to the latter tn. in 1533, where he died of dysentery in the following year. E. never left the Church of Rome, though he refused again and again to enlist in its service against the Reformers. The Lutherans he ridiculed in his *Diatribe de Libro Arbitrio* (1526) and Ulrich von Hutten in his *Spongia* (1523); but the papists suffered equally in his *Colloquia*, pub. between 1516 and 1536. He was accused of indifference and of wavering, but it was only natural that such a hard and sure litter should make enemies. E. was a great scholar, and had vast literary acquisitions. There are numerous Eng. trans. of his colloquies and other writings. Complete eds. have been pub. by the Froben Press, Basle, 1540, and J. Le Clerc (ed.), Leyden, 1703-6; F. M. Nichols (ed.), *The Epistles of Erasmus from his Earliest Letters to his Fifty-First Year*, 1901-18, and P. S. and H. M. Allen (ed.) *Opus Epistolarum Des. Erasmi Rotterdami*, 1906-34. See lives and studies by J. Jortin, 1758-60; R. B. Drummond, 1873; J. A. Froude, 1891; P. S. Allen (*The Aged Erasmus*), 1914; R. H. Murray (*Erasmus and Luther*), 1920; J. Hülzinger, 1924; J. A. K. Thomson (*Erasmus in England*), 1930-1.

Erastus, Thomas (1524-83), Swiss theologian, whose surname was Liebler, Lieber, or Luber, b. at Baden, Switzerland, of a poor family. He studied theology at Basle (1540), and later philosophy and medicine at Padua. In 1558 he became prof. of Medicine at Heidelberg and private physician to the Elector Palatine, Otto Heinrich. He was elected privy councillor and a member of the Church Consistory (1559), and occupied the chair of ethics at Basle in the last year of his life. E. was chiefly renowned as a theologian. At the conferences of Heidelberg (1560) and Maulbronn (1561) he upheld the Zwinglian doctrine of the Sacrament of the Lord's Supper or the view of the Eucharist as a merely symbolical ordinance, and, through the influence of the Calvinists, he was excommunicated on a charge of Socinianism. His most important work, written in 1568, pub. posthumously in 1589, was entitled *Explicatio gravissimæ questionis utrum excommunicatio, quatenus religionem intelligentes et amplectentes, a sacramentorum usu, propter admissum facinus arcel, mandato naturæ divino, an excepta sit à hominibus*, and upheld the right of the state to punish ecclesiastical offenders. Hence, 'Erastianism' is used to denote the doctrine of the supremacy of the state in ecclesiastical matters, though this was supported by Grotius rather than by E. He denied the right of the Church to inflict civil penalties, or to exercise discipline—the power of the keys—that appertaining, he maintained, to the province of the civil magistrate. E. also pub. treatises on the theories of Paracelsus and on astrology, alchemy, medicine, etc.

Erasure, or **Razure** (Lat. *radere*, to scrape or shave), the alteration or interlineation of a deed will, or other formal writing. According to Brit. law, an E. is presumed to have been made at or before execution in the case of a deed or other document. In the case of a will, however, the writing stands without the alteration, unless the witnesses have initialled such alteration and have made a note of it at the end of the will. An alteration made in a deed by a stranger without consent of the parties does not prevent its contents from having effect; if altered by a defendant, it may be given in evidence by him, but if by a plaintiff, he cannot enforce any benefit that may thereby accrue to himself. In Scotland, the law presumes that the E. was made after execution. If it is desired to make any alteration, addition, or deletion in a deed, such E. must be 'noticed in the body of writ' and must be 'subscribed by the attesting witnesses.'

Eratosthenes (c. 276-c. 194 B.C.), Gk. mathematician and scientific writer, b. at Cyrene. He was a pupil of Callimachus at Alexandria, and subsequently studied philosophy with Aristotle and Arcesilaus at Athens. About 235 B.C. he returned to Alexandria and succeeded Callimachus as chief librarian. His most famous work was a systematic treatise on geography, of which Strabo made great use. Strabo says that E.'s primary object in geography was to reform the *Map of the World*. E. invented a scientific chronology, fixing the conquest of Troy as the basis of his calculations. He also invented a 'sieve' by means of which prime numbers might be discovered. He measured the earth, and calculated that its circumference measured 252,000 stadia. His book on mathematics is lost, but fragments remain of his astronomical poems, *Hermes* and *Erigone*. See H. Tozer, *History of Ancient Geography*, 1897.

Erbium (symbol Er, atomic weight 168, atomic number 68), a metallic element of the rare earths. The rare earth metals are present in the minerals gadolinite, samarskite, euxenite, fergusonite, and cerite. It forms rose-coloured salts and a rose-coloured oxide, the former of which possess a characteristic absorption spectrum.

Ercildoune, Thomas of (*Jl.* c. 1220-c. 1297), Scottish poet and prophet, also called Thomas the Rhymer, to whom the surname Learmont has sometimes been given. From two existing charters of the thirteenth century, it appears he had lands at Ercildoune (now Earlstoun) in Berwickshire, which were given by his son to the foundation of the Holy Trinity at Soltra in 1294. He had a reputation almost equal to Merlin's as a prophet; and in the *Scotichronicon* he foretells the death of Alexander, and Wyntoun asserts that he prophesied the result of the battle of Kilblane. He also occurs in the works of Barbour, Harry the Minstrel, and Hector Boece. The old romance connected with the name of T. of E. was first attributed to him by Robert Manning de Brunne, but modern scholars have shown

that its dialect is S. in form and that the text probably dates from the early fourteenth century. It has been suggested that the extant version may be based on one actually written by Thomas, who borrowed freely from Fr. sources. See Sir J. A. H. Murray (ed.), *The Romance and Prophecies*, 1875, pub. by the Early Eng. Text Society; A. Brandl, *Thomas of Ercildoune*, 1880; J. R. Lumby, *Early Scottish Prophecies* (Early Eng. Text Society), 1870; *The Whole Prophecies of Scotland*, 1603 (reprint by the Bannatyne Club, 1833).

Erceldoune or Ercildoune, see EARLSTON. **Ercilla y Zúñiga**, Alonso de (1533-94), Sp. soldier and poet, b. at Madrid. He was attached to the train of Philip II., with whom he came to England in 1554. Soon afterwards he joined a small company of adventurers who sailed for Chile to crush the revolted Araucanians. Having suffered imprisonment at the hands of his comrades, he was released, and returned to Spain in 1562. His fame rests on his epic poem, *La Araucana* (1569-89), which has been highly praised by Cervantes and Voltaire.

Eckmann-Chatrian, the literary signature of two famous Fr. writers who collaborated in their work. Emile Eckmann (1822-99) was born at Phalsbourg and died at Lunéville. He practised law from 1842-58. Louis Gratien Charles Alexandre Chatrian (1826-90) was born at Soldatenthal, in Lorraine. He was first a teacher and afterwards a clerk in a railway office. The partnership dates from 1817, and continued till 1889. Their best known works are: *Histoires et contes fantastiques* (1849), *L'illustre Docteur Mathus* (1859), *Madame Thérèse* (1863), *Histoire d'un conscrit de 1813* (1864), *Waterloo* (1865), *Le Blocus* (1867), *Le Grandpère Lebigue* (1886). They also wrote dramas: *Le Juif polonais* (1869), *Les Iltantzau* (1882), etc. See lives by J. Claretie, 1883. and E. Hinzelin, 1922.

Erdmann, Otto Linne (1804-69), Ger. chemist, b. at Dresden; prof. of Chemistry at Leipzig Univ. from 1827. He devoted much time to the chemical analysis of indigo and other dyestuffs. His *Manual of Chemistry and Principles of Drugs* went through sev. eds. In 1827 he pub. an instructive treatise on nickel, and in 1861 a brochure on the study of chemistry, which was trans. into several languages. In collaboration with Werther, he directed the Ger. Journal of Practical Chemistry.

Erebus, in Gk. mythology, the son of Chaos, and the father of Æther (upper air) and Hemera (day) by his sister Nyx (night). The word denotes utter darkness, and is used by poets with regard to the gloomy subterranean region through which the departed shades must pass on their way to Hades.

Erebus, Mount, volcano in Victoria Land, Antarctica, discovered by Capt. (afterwards Sir James) Ross in 1841, and named after one of the vessels in the expedition. The volcano is active, and is 12,500 ft. in height. See ANTARCTIC OCEAN.

Erechtheum, a temple dedicated to the worship of Erechtheus (q.v.) on the Acropolis at Athens. The present remains, which are of great beauty, date from about 400 B.C.

Erechtheus, or **Erichthonius**: (1) An Athenian hero, the son of Hephaestus (Vulcan) and of Atthis, the daughter of Cranaus. As a child he was secretly brought up by Athene (Minerva), who concealed him in a chest which she entrusted to Agraulos, Pandrosos, and Herse. They opened the chest, though they had been forbidden to do so, and saw a large serpent twined round the body of a child. They were filled with fear and committed suicide by hurling themselves from the rock of the Acropolis. E. became king of Athens, and is said to have first introduced to Athens the worship of Athena, to whom he erected a temple on the Acropolis. He settled the dispute between Athene and Poseidon (Neptune) as to the possession of Attica in favour of the former. On his death he was placed among the stars, and his worship was celebrated in a temple called the Erechtheum on the Acropolis. (2) The grandson of the above and the son of Pandion, whom he succeeded as king of Athens. He waged war against Eleusis, and killed Eumolpus, Poseidon's son; whereupon he was slain by a thunderbolt by Zeus, at Poseidon's request. In anct. myth these two heroes were regarded as one person, but distinguished as two by later writers.

Eregli: (1) Tn. (anct. *Cyistra*) of Asiatic Turkey, situated midway between Konieh and Adana. In the neighbourhood are hot springs. It exports corn, wool, nuts, skins. Pop. 7000. (2) Also called *Benderekli* (anct. *Heraclia Pontica*), seaport in Asia Minor, on the Black Sea, about 128 m. E. of Istanbul. There are fine coal-mines in the neighbourhood, and it has a good port. Here Xenophon embarked with 10,000 Gks. on his return to Greece. Pop. 7000.

Erembodegem, tn. in E. Flanders, Belgium, on the R. Dender, S. of Alost. Agriculture and manuf. of lace and cotton. Pop. 9,000.

Eremecausis, gradual combination of the combustible elements of a body with the oxygen of the air. This process of slow combustion continually takes place when animal and vegetable substances become decomposed through exposure to the atmosphere. It differs from fermentation and putrefaction in that it cannot take place without the access of atmospheric air. The term was first used by Liebig, but is now seldom found.

Eretria (modern *Aletria*), anct. seaport of Euboea, Greece, on the Euripus, about 15 m. S.E. of Chalcis. It was of great commercial importance, and had many colonies, including the Cyclades. In 490 B.C. it was destroyed by the Persians before the battle of Marathon, for its interference in the Ionic revolt (498). During the fifth century B.C. it was subject to Athens, but regained its independence of Philip of Macedonia through its leader Phocion (354). It was the bp. of Achaëus and Menodorus. At the modern vil., sometimes known as Nea Psara, the Amer.

School of Athens carried out archaeological investigations from 1890 to 1895.

Erfurt, tn. of Saxony, Germany, situated on the Gera, 14 m. from Weimar; it is an important railway junction. The beautiful cathedral, Beate Mariæ Virginis, dates from the twelfth century. Other churches of interest are the Predigerkirche (twelfth century); the Reglerkirche, a fine example of the Romanesque style (twelfth century); the Barfüsserkerche, in the Gothic style. E. was once a member of the Hanseatic League. The old monastery of St. Augustine, in which Luther lived as a friar from 1505 to 1508, has been converted into an orphanage. The univ., at which he studied, was suppressed in 1816 and its funds devoted to the endowment of the Academy of Sciences and to the maintaining of its fine library. The palace was once the residence of the electors of Mainz. There are a municipal theatre, museum, and large library. E. before the Second World War was a flourishing industrial centre, its chief manufs. being boots and shoes, machinery, dress materials, furniture, musical instruments, chemicals, tobacco, malt, etc. During the Thirty Years' war, E. was held by the Swedes; in 1648 it was ceded to the elector of Mainz, but, refusing to submit, was forcibly taken in 1664. In the nineteenth century its fortifications were demolished and its limits extended greatly, as it developed into a busy industrial centre. The city was incorporated with Prussia in 1802. In the Second World War, in April 1945, following the trapping of Army Group B. in the Ruhr, an easy advance was offered from Kassel through E. and Leipzig to Dresden, and when this was accomplished, the Allied forces held the richest industrial area still remaining to the Gers. after the loss of the Ruhr and Silesia. E. was cleared on April 12. Pop. 165,600.

Erg (abbreviated from Gk. *ἔργον*, work), in dynamics, is the unit of energy or work necessary to overcome the force of one dyne as it acts through a distance of one centimetre. Thus the power of machinery may be measured by the number of Ergs. per second of which it is capable. It is also applied to the energy of two grams moving with a unit speed. See MECHANICS.

Ergasteria, or **Laurion**, mining tn. in Greece, 25 m. S.E. of Athens. It has anct. lead and silver mines, reopened in 1864, and cadmium and manganese are exported. Pop. 3800.

Ergeri, see ARGYRO-CASTRO.

Ergosterol, unsaponifiable part of a natural fat, sterol, so named from its occurrence in ergot of rye. Also found in yeast. It is present in very small quantities as an impurity of cholesterol found in animal cells. When irradiated by sunlight, E. in superficial tissue cells yields up the anti-rachitic vitamin D. vital to health. E. in solution, irradiated by ultra-violet rays, is used to supply deficiencies in vitamin D.

Ergot, or **Spurred Rye**, a diseased condition or fermentation of rye and of other cereals. A sweet yellowish mucus exudes

from the ears of the corn on its first appearance. The ears then lose their starch and the ovaries show a whitish tissue of the mycelium of the fungus. Bread that has been made of such infected rye often gives rise to certain nervous complaints, known as ergotism. The drug *ergola* or *Secale cornutum* is used medicinally. See C. Barger, *Ergot and Ergotism*, 1931. See also MATERIA MEDICA.

Eric, name of sev. Dan. and Swedish kings: *Eric VII.* (1412-59), the son of Duke Wratislaw of Pomerania, was b. in 1382. He succeeded Queen Margaret of Denmark, thus uniting the kingdoms of Denmark, Norway, and Sweden. The last named he lost in 1437 during the revolt of the peasants of Dalecarlia, and he was deposed from the throne of Denmark two years later. *Eric VIII.* (1155-60), called 'the Saint,' a pious Christian, fell in battle against the Danes. *Eric XIV.* (1560-68), the son of Gustavus Vasa, was b. in 1533. He was a cruel and capricious ruler, and brought much suffering upon his subjects. He limited the power of the dukes at the Arboga Riksdag in 1561, and extended his rule into Estonia. His matrimonial ambitions reached to Christina of Hesse, Mary Queen of Scots, and Queen Elizabeth of England, but he finally married Katriu, Mänsdotter, a Swedish peasant girl, who alone appears to have been able to control him in his fits of temper. He murdered the three Stures in 1567, thus causing the revolt of the nobles, who completely threw off his yoke in 1568, and elected his brother John to the throne. He died in 1571 from poison, said to have been administered by his brother. See Kruse's version of his story, *König Erich*, 1871.

Erica, the typical genus of Ericaceæ, includes more than 400 beautiful species, all of which occur in Europe, S. Africa, and the Mediterranean. The majority of these frequent the Cape of Good Hope, and are often cultivated in Brit. hot-houses; in their native land they form scraggy shrubs with little beauty, but when cultivated become extremely handsome. The plants have pendulous, bell-shaped flowers, which vary in colour from red, pink, and purple to white. There are only five Brit. species, and all require sandy peat earth and a moderately-shaded situation before they will grow. *E. cinerea* is a common plant found extensively on moors of Great Britain, while *E. tetralix*, the cross-leaved heath, is also well known. The other Brit. species, including *E. vagans*, occur only in Cornwall and in Ireland. In France the commonest heath is *E. scoparia*, a plant from which briarwood pipes are made.

Erioseem, large order of dicotyledonous plants of varied characters growing in nearly every part of the world, but avoiding tropical climates and showing a distinct preference for peaty soils. Four representative genera of the fifty are *Rhododendron*, *Arbutus*, *Vaccinium*, and *Erica*.

Ericht, Loch, lake situated partly in Inverness-shire and partly in Perthshire,

Scotland, in the dists. of Badenoch on the N., and Rannoch on the S. It lies 1153 ft. above sea-level. Its area is about 7½ sq. m., its length being 14 m., and its breadth varying from ½ m. to 1 m.; its greatest depth is about 512 ft. The lake is drained by the R. Ericht into Loch Rannoch. The neighbouring scenery is wild and rugged; the overhanging int. on the W. side of the lake is Ben Alder (3757 ft.). There is good salmon and trout fishing.

Erichthonius, see ERICHTHREUS.

Ericsson, John (1803-89), Swedish naval engineer, b. at Langhanshyttan, Wernland, Sweden. He was first employed as a draughtsman by the Swedish Canal Company (1815), but entered the army in 1820 and served for six years. From 1826 to 1839 he lived in England, where, in conjunction with John Braithwaite, he constructed a locomotive engine for the Liverpool and Manchester Railway (1829). He also invented the caloric engine (1833), a screw propeller (1836), and improved appliances for naval steam engines. In 1839 he sailed for the United States, where he became a naturalised citizen in 1848. He built the first Amer. armoured turret ship, the *Monitor*, which was launched in 1862, and fought a month later, with the Confederate ram, the *Merrimac*. E. also studied torpedo boats and sun motors and pub. *Solar Investigations* (1875), and *Contributions to the Centennial Exhibition* (1877). See life by W. C. Church, 1890.

Ericsson, Leif, son of Eric the Red, is said to have furthered the explorations made by his father in Greenland. According to a Norse saga he is said to have been blown off his course in about A.D. 1000 and found an unknown land to the W. Some say that this land included Helluland (Labrador), Markland or Woodland (possibly intended for Nova Scotia), and Vinland or New England. However that may be, other voyages followed, and apparently Norsemen got as far S. as the gulf of St. Lawrence, perhaps even farther. Eric the Red's Greenland settlement as a result, mysteriously disappeared in the thirteenth century, and only with the voyage of Columbus did Europe really discover the New World. See A. Williams, *Romance of Early Exploration*, 1904-06; J. Winsor, *History of America, Arctic Exploration and Greenland*, 1886-89.

Eric the Red, Norwegian chief who discovered Greenland in the tenth century and sent out expeditions to N. America.

Eridu, settlement of S. Iraq, near Ur. Excavations have revealed a Sumerian tower of the fourth millennium B.C. with, beneath it, earlier temples and a cemetery of brick compartments pointing S.E., also a neolithic substratum.

Eric Canal, in New York, U.S.A., connects Lake Erie at Buffalo with the Hudson R. at Albany and Troy and passes Utica, Syracuse, and Rochester. It was begun in 1817 and completed in 1825, at a cost of over seven million dollars, the construction being superintended by De Witt Clinton. The length is 361 m. and there are thirty-four locks. The original width and depth were 70 ft. by an average of about 9 ft., but much money has been

expended upon further improvement, in order to allow a shipping-way for vessels of 1000 tons and upwards, and it is now 150 ft. broad and has an average depth of 12 ft. Together with the Champlain, Oswego, and Cayuga-Seneca Canals, it constitutes the New York State Barge Canal System, which is the main route by which grain is brought to New York.

Erie City, co. seat of Erie co., Pennsylvania, U.S.A., on Lake Erie, 148 m. N. of Pittsburgh and 88 m. from Buffalo. It is situated on many railway lines. It has an excellent harbour, and is a well-built city. Its chief products are lumber, coal, iron-ore, petroleum, fish and the city's varied manufs.—foundry and machine, shop products, engines, silk goods and washing machines are shipped. One of its parks is the site of a fr. fort erected in 1749. This fort was built on Presque Isle by which the fine natural harbour is formed. Pop. 116,900.

Erie, Lake, the most southerly of the Great Lakes, forming the St. Lawrence system in N. America, lying between Canada and the U.S.A. It is bounded on the N. by Ontario, on the S. and S.E. by Ohio, Pennsylvania, and New York, and on the W. by Michigan. It is connected with Lake Ontario by the Niagara R., and with Lake Huron by the Detroit and St. Clair Rs. It is 241 m. long by 30 to 60 m. broad, its area being 9940 sq. m. It is 573 ft. above mean sea-level. Its waters are shallow, the greatest depth being 210 ft. On the Amer. side of the lake are the cities of Buffalo and Cleveland.

Erie Railroad Company operates a railway between New York City and Chicago, Illinois. It holds the capital stock of a number of subsidiary railway companies and of four coal companies. The latter are the source of much of its fuel supply, and their output forms a large portion of the coal carrying trade.

Eries, Iroquoian tribe of N. America, now extinct, who formerly occupied the E. and S. shores of Lake Erie. Their language resembled that of the Hurons. They were nearly exterminated by the Iroquois league in 1656, the survivors of the struggle afterwards joining the Senecas.

Erigena, Johannes Scotus (c. 800–c. 877), medieval philosopher and divine, probably a native of Ireland. His real name was Johannes Scotus, E. or Ierigena being an adopted surname, apparently connected with the word Erin (*q.v.*), and signifying Irishman. Nothing definite is known about his early life. About 843 he visited the court of Charles the Bald, where he became the head of the *schola palatina*. His earliest work that has come to us is *De divina prædestinatione*, which was vehemently attacked on account of its unorthodoxy, and was censured at the councils of Valence (855) and Langres (859). At the request of Charles the Bald, he then translated the writings of Dionysius the Areopagite. His greatest work was *De divisione nature*, which was described by Honorius III. (1225) as 'swarming with worms of heretical perversity'. E. argues that Universe or God is the ultimate unity of all things, and

that all things are worked out through the divine processes. Revelation or religion forms a prominent part in the divine process, while reason or *intellectualis visio* is the prime faculty of man. Haméau fixes E.'s death at about 877, the date of the death of Charles the Bald. There is a story, however, that about 882 he visited Oxford at the request of Alfred the Great and became the abbot of a monastic school at Malmesbury, where he was stabbed to death by his pupils. The complete ed. of his works was pub. by Migne in 1853 in *Patrologiæ cursus completus*, vol. cxxii. *De divisione nature* has been ed. by Thomas Gale (1861) and C. B. Schluter (1838). The *De divina prædestinatione* was pub. in Mauguin's *Veterum auctorum . . . opera et fragmenta* (1650) and his poems in L. Traube's *Poetæ Latini ævi Carolini* (vol. II., 1896). See St. René Taillandier, *Scotus Erigène et la philosophie scholastique*, 1843; T. Christlieb, *Leben und Lehre des Johannes Scotus*, 1860; and Alice Gardiner, *Studies in John the Scot*, 1900.

Erigeron, large genus of the Compositæ; most of the species are indigenous to N. America. *E. Philadelphicus* is found in the U.S.A., where it is used as a medicine, possessing stimulant and diuretic properties. *E. aceris* occurs in Great Britain, and with sev. other plants is known as fleabane; it has a strong scent which is said to keep away these insects.

Erin, anct. name for Ireland. The form was originally Eriu, of which Erinn was the dative case. Eriu later became a dissyllable, Eire. It has been suggested that the word originated from Eiro, the wife of MacCool, one of the kings reigning in Ireland at the time of the coming of the Milesians. The name gained popularity through the writings of Thomas Moore.

Erinaceus, see HEDGEHOG.

Erinite (arsenate of copper), occurring in concentric and mammillated layers, is bright green in colour, with a specific gravity of 4.0 to 4.1. It is found near Limerick.

Erinna (fl. c. 600 B.C.), Lesbian poetess, supposed to have been a contemporary and friend of Sappho. Only fragments of her poems remain, but these were held by the Gks. to rank with those of Homer. Her best-known poem is the *Distaff* which is written in a mixture of the Æolic and Doric dialects and of which only four lines remain. E. died at the age of nineteen. See the eds. pub. by J. Pellegrino, 1894, and T. Bergk in *Poetæ Lyrici Greci* (now ed., 1900).

Erinyes, see EUMENIDES.

Eriophorum, genus of Cyperaceæ, grows in N. lands of temperate climate. The Brit. species are called wild cotton, cotton-grass, or cotton-sedge, and have a sedge-like appearance. They are to be found in marshy and sedgy heaths, and the long cottony tufts of hair are sometimes used for stuffing cushions.

Eriostemon, genus of Rutaceæ which flourishes chiefly in Australia. The species are evergreen shrubs and are cultivated in greenhouses for their pretty pink and white blossoms.

Eriphia, genus of brachyurous crustaceans classed sometimes with the Xanthidae, sometimes with the Cancridae, and is closely related to *Cancer*, the edible crab. The species are found on tropical shores.

Eriphyle, daughter of Talaus, and the wife of Amphiaras the seer, who tried to escape from joining the expedition of the Argives against Thebes. E., bribed by Polyneices with Hermonia's golden necklace, betrayed her husband, and was murdered by her son Alcmaeon on his father's death in battle.

ERIPHORUM: COTTON-GRASS

Eris (Lat. *Discordia*), (Gk. goddess of strife, the friend and sister of Ares (Mars), and like him she delighted in war. She sowed dissensions among the gods, and was expelled from heaven by Zeus. It was she who, not having been invited to the nuptials of Peleus and Thetis, threw the golden apple, *detur pulchriori*, in the midst of the assembly and thus caused the jealous rivalry between Hera (Juno), Aphrodite (Venus), and Athene (Minerva). Thus she indirectly was the cause of the rape of Helen by Paris and of the Trojan war.

Eriith, urb. dist. of N.W. Kent, England, situated on the Thames, 12 m. E. of London. It was formerly an important naval station until the end of the seventeenth century. There are wharves, gun factories, and engineering works, also flour mills, brickyards, ballast works, and manufs. of oil, glue, gunpowder, etc. Pop. 33,000.

Eritrea, official name of It. colony on the African coast of the Red Sea. It extends from Ras Kasar, a cape in 13° 2' N., to Ras Demolra in 12° 42' N., a

distance of about 650 m. To the inland the Anglo-Egyptian Sudan, Abyssinia, and Fr. Somaliland form the boundaries; the boundaries towards Egypt were determined by a protocol in 1891, and towards Abyssinia by the treaties of 1889 and 1891. E. consists of a high mountainous hog's-back interposed between the Red Sea and the Sudan flanked on E. and W. by flatter regions. The mts. range up to 10,000 ft., and Asmara (the cap.) stands 7800 ft. above mean sea level. Three distinct climatic zones are found in the colony: that of the coastlands, that of the escarpments and valleys, and that of the high plateau and Alpine summits. The first one is characterised by great heat and humidity; the second has a more temperate climate, but considerable variation of temp. occurs owing to nocturnal radiation; a moderately cool climate prevails in the third zone. The flora in the zones is what would be expected from the climate, ranging from a tropical nature in the low country to temperate on the plateau. The lion, panther, elephant, camel, and numerous species of antelope are found. There are no navigable rivs. in the colony; the chief streams are the Setit, the Mareb, the Baraka, the Anseba, and the Hadass. Semi-nomadic shepherds form the pop. of the plains and foothills: Afars and Somalis are found chiefly in the S.; whilst the plateau is inhabited by Abyssinians. The nomadic tribes are largely of Arab or Hamitic stock, but include sev. tribes of negro origin. Sheep, goats, and camels are kept by the tribesmen, and the products include palm nuts and hides and some ostrich feathers. Some gold is mined in Hamasien. There are exports of salt. Pearl fishing is carried on at Massawah and the Dahlak archipelago. The prin. tns. on the coast are Massowa, Assab, and Zula; those of the interior, Asmara, Mogolo, Saganeiti, and Arrasa. The low country is suitable for pastoral purposes only, but the intermediate zone and the high plateau are well adapted for the cultivation of crops. Irrigation works were carried on, by the It., in the lower zone in order to help intensive production by It. farmer colonists. Pasture is abundant, and the pastoral pop. is partly nomadic. Massowa is connected with Asmara by railway, with Perim by cable, and with Addis Ababa by telegraph. Before the Second World War E. was governed by a civil governor who was responsible to the Ministry of Foreign Affairs at Rome. Italy took possession of the land in 1885, and it was formed into a Colony four years later. It was from E. that a great part of Mussolini's effort was directed which resulted in the capture of Adowa (Adua) and finally of Addis Ababa, and the estab. by the Act of June 1, 1936, of the new It. colony of It. E. Africa which also then incorporated E. as a State or gov. (See under ABYSSINIA). Since June 1, 1936, the dists. of Tigré, Danakiland, and Haussa, formerly part of Abyssinia, were added to E. The It. seat of gov. was Asmara, with 140,000 inhab. (40,000 It.). The religions of the native pop. are the Christian (Coptic rite)

and the Mohammedan, and there are some Roman Catholics and a few Pagans. There are 75 m. of railway from Massowah to Asmara, 64 m. from Asmara to Keren, 53 m. from Keren to Agordat and 140 m. from Asmara to Biscia via Keren and Agordat. The Its. made new motor roads from Massowah to Asmara and from Asmara to Keren, Agordat and Sabderat. Wireless telegraphy stations were opened at Asmara, Massowah, Assab, and elsewhere. The total area of E. is 64,000 sq. m. and the pop. about 810,000 (Europeans 50,000). Massowah (15,000), the chief port, has a good harbour. Other centres are Keren (11,000), where were fought the decisive battles in the Second World War campaign in E., Decameré (9000); Adi Ugri; and Agordat. Asmara was captured by the Allies on April 1, 1941 (for full details see ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941)). Thereafter E., together with the other occupied It. colonies, was administered by the Civil Affairs branch of the Army Staff, under a Chief Civil Affairs Officer with headquarters at Cairo.

The future of Italy's former empire in Africa, including E., remains to be decided by the United Nations Assembly. To help them to arrive at the facts, the govts. of France, Britain, Russia and the United States sent a commission to of inquiry on the views of the inhab. and other facts. To-day E.'s chief tns. Asmara and Massowah have an air of suspended animation. Asmara was developed by the Its. not only as a colony but a base for the invasion of Abyssinia. Now it is but a memorial to the vaulting ambition of Mussolini. So too with Massowah, where the Its. built a commercial harbour and naval base, though the port was also developed by the Amers, and used by the Brit. Navy during the World War. One use of this base was to service small vessels on their voyage from Britain to the Far Eastern theatre of war. The floating dock is still there, but the rest of the naval base is deserted and desolate. There are other evidences of It. resourcefulness, including a ropeway, said to be one of the longest in the world, to carry supplies from the port to the cap. Another link between the two tns. is a narrow-gauge railway. It. diesel trains, small single-carriage vehicles, twist and turn on this as they climb 8000 ft. in less than 4 hrs. Asmara as it now is, and Massowah, the splendid roads, railway and ropeway are all relics of the days of It. rule. On the question whether the Eritreans want the Its. to return, different views prevail. Some want immediate independence—particularly those whose opinions are voiced by the Moslem League: but it seems that even these do not really suppose that the country is ready for immediate independence and rather look to a United Nations trusteeship administered by Great Britain. The Muslim League's representatives admit that the Brit. give the people a good education and are interested in their health, whereas the It. gov., during sixty years did not do as much as the Brit. have done in only six years. Others advocate union with

Abyssinia, because the economy of E. seems to be bound up with that of Abyssinia. There is also a pro-Italy party in E. which demands a return to It. rule and this demand, too, is based on economic considerations. But of the politically-minded Eritreans, those who openly advocate the return of It. rule are probably the smallest section. These include, of course, the 27,000 Its. still in E. Not all Eritreans are unanimous in their praise of Brit. administration but most concede that the administration has been confronted by special difficulties—particularly the artificial prosperity produced by an expansionist motive. The Brit. administration has had to limit expenditure to the altered circumstances. Yet much has been done. The Brit. administration has made every effort to encourage local industries, including brewing, shoe-making, buttons, china and glassware, and matches. It has created a system of education and public health. Despite the check which it must perforce keep on the spending of Brit. taxpayers' money, the occupation of E. has cost Britain nearly £1,500,000 in the form of a grant-in-aid to the military administration between April 1941 and the middle of 1947.

Eriu, see ERIN.

Erivan, cap. of the Soviet republic of Armenia since the conquest of the short-lived independent republic of Armenia by the Bolsheviks. Situated 234 m. S.S.W. of Tiflis by rail on the edge of a hot dry plain, and dominated by Mt. Ararat. Wine is made, and fruit and tobacco are grown in the vicinity. Some manufacturing is carried on, and there is a hydro-electric station. There is an old Persian quarter and a Russian quarter, and the ruins of a sixteenth century fortress stand on a steep rock. Pop. is 112,500 of whom 56,000 are Armenians and 5000 Turks and Tartars. (2) Dist. of the Socialist Soviet republic of Armenia with a pop. of 180,000. It is noted for its wines and fruits.

Eriza, see ERZINGAN.

Erlangen, tn. of Bavaria in Franconia, situated on the Regnitz at its junction with the Schwabach, 114 m. N.W. of Nuremberg. A Protestant univ., the only one in Bavaria, is in the New Town, which is regarded as one of the best built tns. of Germany. The manufrs. for which E. is noted are hosiery, tobacco, leather, plate-glass, and there are large breweries. After the Edict of Nantes was revoked in 1685, many of the Fr. Huguenots settled here, and it is to this that the tn. owes the foundation of its success. Pop. 32,000.

Erlanger, Camille (1863-1919), Fr. composer; b. in Paris. At the Conservatoire, he was pupil of Decombes and Mathias for the piano, and of Durand and Tandon for harmony. He was in Léo Delibes' class for composition. In 1888 he won the Prix de Rome with the cantata *Velleda*. During residence in Italy he sketched out *Saint Julien l'Hospitalier* (a dramatic legend founded on a story by Flaubert), which came to be reckoned among his prin. works—composed by 1893, and performed 1896 at the Conservatoire. Operas: *Kernaria* (1897), *Le Juif Polonais* (1900),

Le Fils de l'Etoile (1904), *Aphrodite* (1906), *Hannele Mattern* (1908), *Noël* (1911), *La Sorcière*, (1912), *Cioconda* (1914).

Erlan, see CHEB.

Erlkönig, *Der*, or **Erl-King**, mythical character who appeared in Ger. literature towards the end of the eighteenth century. He is represented as a bearded giant with a golden crown, who lures little children and others to the unknown land of death. Goethe's ballad on the legend has been translated into English by Sir Walter Scott. Herder, in his *Stimmen der Völker* (1778) confuses *elle* (Danish *elf*) with *erle* (Ger. *alder*) in his trans. of *The Elfe King's Daughter*. This error was perpetuated and the Erl-King estab. as an alder writh.

Ermanric, see HERMANRIC.

Ermelo, small tn. of the Netherlands, in the prov. of Gelderland, situated 1 m. S. of Harderwijk. Pop. 6700.

Ermenonville, vil. of France in the dept. of Oise, about 7 m. S.E. of Senlis. It is noted as the place where Rousseau died. Pop. 540.

Erment, see HERMONTIS.

Ermine, name given to the stoat (*Putorius ermineus*) when it puts on its white winter coat. During the summer months the fur is a reddish-brown shading into white underneath, but in winter turns to pure white. The tail is black.

Ermine Street, old Eng. name for an ant. highway which ran from London via Lincoln to York and Hadrian's Wall (*q.v.*). It was one of some four which were traditionally said to enjoy royal protection, and it coincided in part with the Rom.-Brit. road system.

Ernakulam, tn. of India, in the Madras Presidency. It is the cap. of the native state of Cochin, and is situated on an inlet on the W. coast, opposite the tn. of Cochin, and 2 m. from it. Pop. 25,000.

Erne, or **Sea-eagle** (*Haliaeetus albicilla*), species of Falconidae widely distributed over the Old World. Its diet consists chiefly of fish, but it will also play much havoc with young lambs. In general character and habit it is much like *Aquila chrysaetos*, the golden eagle, but it is smaller, has a longer beak and fewer leg-feathers. The eyrie is built on sea-cliffs difficult of ascent, and in the early spring contains two or three white eggs.

Erne, **Lough** and **River**, situated in N. Ireland. The riv. rises in Lough Gowna, in co. Longford, and flows generally northward, through Lough Onghter until it enters Upper Lough E., which is a shallow piece of water about 13 m. long, containing numerous is. The riv. passes Enniskillen, and flows through Lough E. finally emptying itself in Donegal Bay. Lough E. is 18 m. long, is noted for its beauty, and contains trout and pike.

Ernest I. (the Pious) (1601-75), the founder of the dukes of Saxe-Gotha, was the son of John, duke of Weimar. He served with distinction in the Thirty Years' war, and in 1640 came into possession of the duchy of Saxe-Gotha.

Ernest II., **Augustus Charles John** (1818-1893), duke of Saxe-Coburg-Gotha, eldest son of duke Ernest I. was b. at Coburg.

He succeeded his father in 1844. He was the first Ger. prince to visit Napoleon III. Almost every European court received him, his position being strengthened by the fact that he was brother-in-law to Queen Victoria and the nephew of Leopold, king of the Belgians. Sev. musical works and books of travel were written by him.

Ernesti, **Johann August** (1707-81), Ger. philologist and Biblical critic, was b. at Tennstädt, Thuringia, and educated at the Saxon cloister school of Pforta and the univs. of Wittenberg and Leipzig. He was made prof. extraordinary of anc. literature at the univ. of Leipzig in 1742, prof. of rhetoric in 1756, and doctor of theology. By his erudition and manner of work he paved the way for a revolution in theology. He was the founder of the grammatico-historical school; his best work was in hermeneutics. By his influence and example he inspired men who were to be greater than himself; his numerous works include trans. of the classics, and criticisms and trans. of the Bible.

Ernesti, **John Christian Theophilus** (1756-1802), Ger. scholar, b. at Arnstadt. He pub. eds. of Silins *Italicus* and *Æsop*, and a Ger. version of the prin. works of Cicero. His *Lexicon Technologicæ Græcæ Rhetoricæ* (1795) and *Lexicon Technologicæ Romanorum Rhetoricorum* (1797) are very good works of their kind.

Ernestine Line, branch of the house of Saxe, which was founded by Ernest (1441-1488), the eldest son of Frederick II., the elector of Saxony. John Frederick, called the Charitable, lost the electorate and many of the possessions. In 1572 two sons of John Frederick II. divided the estates and formed the houses of Weimar and of Coburg. The former was divided into the houses of Weimar and Altenburg in 1603, the latter in 1592 into the houses of Coburg and Eisenach, which became extinct in 1633 and 1638 respectively. The chief of the line of Weimar died in 1605, leaving three sons; the eldest founded four branches of the family, which were re-united in 1748 under Ernest Augustine, duke of Weimar, to form the duchy of Saxe-Weimar-Eisenach. His youngest son, Ernest, duke of Gotha, died in 1675, and left seven sons, but most of the branches are extinct, and the E. L. now survives only in the houses of Weimar, Saxe-Meiningen, Coburg-Gotha, and Altenburg.

Ernie, **Rowland Edmund Prothero**, first Baron, Eng. man of letters (1852-1937), b. at Clifton-on-Teme; third son of Rev. Geo. Prothero, afterwards canon of Westminster. Educated at Marlborough and Balliol College, Oxford. Fellow of All Souls, 1875-81; proctor, 1883-84. He was ed. of the *Quarterly Review*, 1894-99; M.P. (Conservative), for Oxford Univ., 1914-19. Member royal commission on railways, 1913; on commercial and industrial reconstruction, 1916. President Board of Agriculture, 1916-19. Ennobled, 1919. His pub. include: *Pioneers and Progress of English Farming* (1887), *Life and Correspondence of Dean Stanley* (1893), *Letters and Verses of Dean Stanley* (1895), *Letters of Edward*

Gibbon (1896), *H.R.H. Prince Henry of Battenberg: a Memoir* (1897), *Letters and Journals of Lord Byron* (1898-1901), *The Poet in Human Life* (1903), *Letters of Richard Ford* (1905), *The Pleasant Land of France* (1908), *English Farming, Past and Present* (1912), *The Land and its People* (1925), *The Light Reading of our Ancestors* (1927).

Ernoldus, see ARNAUD.

Ernulphus, or ARNULF (1040-1124), Fr. Benedictine monk, was made prior of Canterbury by Anselm, abbot of Peterborough in 1107, and Bishop of Rochester in 1114. He was noted alike for his legal knowledge and his virtuous life. His mention in *Tristram Shandy* as a master of cursing is because of a curse which he mentions in his most famous work, a collection of documents concerning canonical law, etc., known as *Textus Roffensis*.

Erode, or Errood, tn. of India, in the presidency of Madras, situated about 54 m. N.E. of Coimbatore and 36 m. S.W. by W. of Salem. Pop. 23,000.

Erodium, genus of plants belonging to the Geraniaceae which grows in temperate lands. The two Brit. species are known as stork's-bill or heron's-bill.

Eros, god of love in Gk. mythology. Hesiod is the first to mention him, as one of the oldest gods, and one of the most powerful. He it is who brings harmony from chaos by uniting the elements. Chronos laid a world-egg in the bosom of Chaos, according to Orphic mythology, and from this egg sprang E. This conception of E. is an early one, and in later times he represents the god of sexual passion, and is said to be the son of Aphrodite by Zeus, Ares, or Hermes. He is a wanton child, tormenting gods and men by his arrows, and is often represented as blind. In art E. is always shown as a beautiful winged boy: his attributes are the bow and arrows, and a burning torch. For the Rom. version of E. see CUPID, and for the legend of Cupid and Psyche see PSYCHE.

Eros, name of a minor planet which was discovered by Witt at Berlin on Aug. 14, 1898. It is remarkable for the fact that it has an orbit between the earth and Mars, while every one of the other five or six hundred known asteroids lie between Mars and Jupiter. Its mean distance from the sun is 1.46 times that of the earth; but as the eccentricity of its orbit is large on those rare occasions when in opposition near perihelion, it could approach the earth to a distance of 0.16. It was therefore used for a series of experiments for determining the sun's parallax in 1900, which has taken ten years to work out. The results arrived at confirm those of Sir D. Gill, but add thereto a little more accuracy.

Erosion, Soil, see SOIL EROSION.

Erotic Literature, name given to that literature which has for its principal subject the passion of love. Human love is, of course, meant, as otherwise practically all literature would come under this heading, being inspired by love of nature, art, etc. Among the erotic poets of Greece the names of Alceus, Sappho, Mimnermus,

and Anacreon stand out as singers of passionate lyrics, whilst Callimachus and Philotas sang in a more scholastic strain. Nor must the delightful idylls of Theocritus be omitted. In Rom. times Petronius was the founder of E. L.; the poets Horace, Ovid, Tibullus, Propertius, and Catullus have all written much beautiful verse which come into this class. In France in the Middle Ages we have Canon de Béthune, Gace Brûlé, Bodel, etc., in the twelfth and thirteenth centuries; they were troubadours, and the form of their songs was by no means fixed. In the following century ballads, rondeaux, etc., were introduced, but there is not much talent until the time of the Renaissance. Then we have the voluptuously melancholy songs of Marot, the passionate lyrics of Ronsard, the spiritual strains of Louise Labé and the tender sensuality of J. du Bellay. The eighteenth century was the golden age of Fr. E. L. with such men as Gentil-Bernard, Dorat, Bernis, Antoine Bertin, A. Chénier, etc. The poetry of the succeeding century embraced too many elements to come under the head of 'erotic' work, though elements of eroticism were in it. In England the time of the Civil war and the Commonwealth produced some of our best E. L.; the lyrics of Herrick, Waller, Carew, Suckling, Lovelace, Cowley, etc., all belong to this class. Since then the same may be said as in the case of Fr. literature, though many of Shelley's lyrics might be termed erotic, and of later years much of Swinburne.

Erpenius (Latinised form of Thomas van Erpen) (1581-1624), Dutch Orientalist, who was prof. of Oriental languages at Leyden. Here he set up an Arabic printing press at his residence, and was made Oriental interpreter to the gov. His *Rudiments of Arabic*, 1620, is still one of the best books on the subject, and his *Arabic Grammar*, 1613, was for long the supreme authority. Among his translations may be mentioned his ed. of *El Meken*, 1623, and *Two Centuries of Arabic Proverbs*, 1611.

Erpetology, see REPTILES.

Erpeton, or properly Herpeton, name given to a genus of non-venomous serpents native to S. Asia.

Erratics, or Erratic Boulders (the term 'boulder' is nearly if not quite synonymous in geological terminology with the term 'erratic'), scattered blocks of rock which are found on the continent of Europe, and have evidently been removed by some agency from their original site. What this agency was for a long time employed the minds of scientists, and sev. theories were evolved. The earliest theory was that they had been dislodged from their original positions and transported by the agency of a flood; this is known as the diluvial hypothesis. This theory is now generally discredited. The next theory was brought forward by Sir C. Lyell, who thought that the transport and distribution had been effected by floating icebergs. A widespread submergence of the land of the European continent must have been necessary before this could have

occurred. This, the drift hypothesis, still finds some supporters. The third theory, that of glacial action, is now generally held as the result of the investigations which were carried out among the Alps, where such erratics abound. According to this theory E. B. are isolated masses of ore which have been borne along by ice-sheets for some distance from their original position; the ground moraine which accompanied them has been washed away in course of time. E. B., or perched blocks, as they are sometimes called, are very familiar objects in Alpine glacier dists., but are also easily recognised in regions where there is now no ice. They bear all the characteristic marks of the action of ice, such as erosion, striation, and smoothness of outline. Not only are boulders of hard rock transported by ice, but huge masses of stratified rock have been torn from their beds by the same agency. Thus large blocks of Scandinavian rocks are scattered over the plains of Denmark, Prussia, and N. Germany; the masses of chalk in the cliffs near Cromer are well known, and a mass of chalk of about 2,000,000 cub. ft. in bulk has been transported a distance of about 9 m. at Eirkenwalk. The statue of Peter the Great at St. Petersburg (Leningrad) had for its pedestal an erratic boulder hewn into shape. The boulder at Mouthey in the canton of Valais contains 7063 cub. ft., and is large enough to support a small house on the top; it is known as the 'Pierre de Marmettes.' This huge mass has been transported by the action of ice for a distance of over 30 m. down the valley. Erratic boulders are very numerous on the shores of the firth of Forth, Scotland. Other well-known examples are the fragments of Shap Granite which have been transported by land ice from the Lake District of England to various parts of the Midlands.

Er Rif, see **RIF**.

Erroad, see **ERODE**.

Erromanga, is. of the New Hebrides (q.v.), about 35 m. long and 25 broad. It is well watered and extremely fertile. It has been called 'the Martyr's isle' on account of the many missionaries who have laid down their lives there, including John Williams and James Harris, killed in 1839, George and Ellen Gordon, killed in 1861, and James Gordon, killed in 1872. Pop. about 1800.

Error, in law, is any mistake in fact, in law, or in the form of process which needs to be rectified either by the court before which the action was tried or by a Court of Appeal. Since 1875 all appeals in civil suits must be made to the Court of Appeal. In criminal procedure, an E. in the indictment may be cured by the Court which tries the case, or recourse may be had to the Court of Criminal Appeal.

Errors of Observation. The results of any determination of a physical or chemical quantity are always affected by errors due to the inaccuracy of the observation. The sources of error may be classified broadly as:—(1) Inaccurate methods; (2) defective instruments or impure materials; (3) influence of conditions;

(4) defects of the observer. Errors due to the first cause can only be detected by special investigations, but may and can be removed by a modification of the method. Instrumental defects can be detected by special tests and a correction can be applied. Thus a balance may not be correct; but a careful investigation will show how far it is inaccurate, and what correction should be applied, provided the error is not due to a lack of sensitiveness, for which no allowance can be made. Fluctuations of the weather and of the temp. may cause temporary alterations of the value of the quantities measured. In astronomy the changes of the weather will disturb the amount of refraction; and in the processes of weighing and measuring, alterations of temp. will have a very marked effect. If it is possible to do so, the conditions should be reduced to the standard value, or the conditions should be noted and the necessary corrections calculated from a knowledge of the numerical relation between the quantity required and the conditions. The errors due to the observer are of two classes: (1) Mistakes which consist in a wrong registration of the value measured. Such errors are preventable and can be detected by repetition or checking by another observer. The second class are due to the imperfections of the senses, such as defective vision, lack of ability to seize the exact instant of an occurrence, etc. The errors of an observation are usually very numerous, but they differ in their influence on the final result. Some always affect the result in the same direction (though not to the same extent) and are called *constant errors*. Others sometimes increase and sometimes diminish the result, and are called *accidental errors*. Mistakes and constant errors can be removed; and it is therefore more advantageous to give time and attention to their removal than to make an effort to allow for these errors by calculation. Constant errors can be detected by change of material, of method, of instruments, or of the observer. When the presence of a constant error has been detected, its cause must be found and steps must be taken to remove it. Accidental errors are often subdued by making a large number of observations and taking the arithmetical mean or average of the results obtained; the assumption being made that the number and magnitude of the errors in one direction are probably equal to the number and magnitude of the errors in the other direction. But this method of subduing accidental errors is not applicable to all cases; and recourse must sometimes be had to the method of least squares (see **PROBABILITY**). Many determinations of physical and chemical quantities involve subsidiary measurements. It is important that the subsidiary measurements should be made in such a way that the errors of those measurements have the least effect on the final result. Thus in experiments involving the use of a tangent compass or galvanometer the error in making a reading will have the least influence on the result if the deflection is about 45°.

Erse, corrupted form of 'Irish' which was applied to the Gaelic dialect of the Highlanders by the Scottish Lowlanders. In the eighteenth century E. was used to signify the Gaelic of the Scots, now it is used more for the Irish Gaelic. An attempt has been made in recent years to revive the use of E. or Gaelic in Éire, the language being taught in the schools and used officially. See also GAELIC LANGUAGE AND LITERATURE.

Erskine, Ebenezer (1680-1756), founder of the Secession Church in Scotland, b. in Berwickshire. He was preacher at Portmoak in Kinross-shire from 1703. After taking part in the Marrow Controversy on the evangelical side, he was transferred to Stirling in 1731. With three others he was suspended in the patronage dispute for upholding the right of the people to choose their own pastor. He was deposed in 1734, and although the sentence was recalled, he would not return, and was finally deposed in 1740. Before this he had formed the Associate Presbytery, the origin of the Secession Church, in 1733. The latter was split up in 1747 into Burghers and Anti-Burghers, of which E. headed the former.

Erskine, Henry (1746-1817), famous Scottish lawyer, b. at Edinburgh, was the second son of the earl of Buchan. After a distinguished career at the Bar he became Lord Advocate. In politics he was a very earnest Whig, and it was owing to his influence that many useful legal reforms were brought about. He was noted both for his wit and his oratorical powers.

Erskine, John, of Dun (1509-91), Scottish reformer, son of the laird of Dun, Sir John E.; was educated at King's College, Aberdeen. He was obliged to go abroad in 1530, having accidentally caused the death of a priest, and there he came under the influence of the Reformation. The reformers Wishart and Knox were his personal friends, and all through the reign of Mary Queen of Scots, and part of the following, E. was a leading man and a reconciling influence in the religious quarrels of the time. He held the office of superintendent of the Reformed Church of Scotland for Angus and Mearns from 1560 to 1589, and was sev. times elected moderator of the General Assembly, although a layman. He was a member of the King's Council from 1579, and aided in the compilation of *The Second Book of Discipline* in 1578.

Erskine, John (1695-1768), eminent Scottish jurist, was called to the Bar in 1719. After a distinguished career there he was made professor of Scots law at the Univ. of Edinburgh in 1757, and held this post till 1763, when he resigned. His two prin. works were very famous, and are still amongst the authorities on Scots law; they are the *Principles of the Law of Scotland*, 1754, and the *Institutes of the Law of Scotland*, 1773. He d. at Cardross, near Dumbarton.

Erskine, Thomas, first Baron Erskine (1750-1823), lord chancellor, served at sea, first as midshipman and then as lieutenant, from 1761 to 1767, when he retired from the senior service and pur-

chased a commission in the 1st Royal Regiment of Foot. Returning to England in 1772, he, at Lord Mansfield's suggestion, studied law. Six years later he was called to the Bar, and at once achieved a great success. So high was his reputation that within eighteen months of his donning wig and gown he was selected to represent Adm. Lord Keppel on his trial by court-martial, when the sailor was acquitted on all counts. In 1783 he took silk, and within eight years was earning £10,000 a year, the greatest income hitherto made by any lawyer. He it was who first refused to go on circuit except for a special fee—a practice since followed by all leading men at the Bar. He entered Parliament in 1783, but lost his seat in the following year. He was, however, again returned to Westminster in 1790, but was too much occupied with his professional duties to take an active part in the proceedings of the House. In the Grenville administration (1806) he became lord chancellor, and he was one of the commissioners appointed to inquire into the charges brought against the Princess of Wales. He retired with the ministry in the next year, and did not again hold office. As lord chancellor his ignorance of the law of equity militated effectively against his success in that great office. In 1820 he took an active part in securing a fair trial for the queen. For his biography, see J. C. Campbell, *Lives of the Lord Chancellors and keepers of the Great Seal*, 1815-69.

Eruptive Rocks, see IGNEOUS ROCKS.

Ervine, St. John Greer (b. 1883), playwright, journalist, dramatic critic, and novelist, b. in Belfast; manager of the Abbey Theatre, Dublin, 1915. A vigorous and controversy-loving dramatic critic, with no love for the standards of commercial theatre managers. His two Irish domestic tragedies, *Mixed Marriage* (1911) and *John Ferguson* (1915) had a fair measure of success, especially in America. Both these plays, powerful and moving, reveal good character drawing, though a strain of hopelessness runs through their picture of the invincible and devastating stubbornness of men in the grip of religious and political "convictions" (A. C. Ward, *Twentieth Century Literature*). Wrote also *Jane Clegg* (1911), a play based on his own novel of the same name, *Anthony and Anna* (1928), *The First Mrs. Fraser* (1929), *Robert's Wife* (1937), and *Private Enterprise* (1947). Novels include *Changing Winds* (1917), *The Foolish Lovers* (1929), and *The Wayward Man* (1931). He has written political sketches, of *Parnell* (1925), and *Sir Edward Carson and the Ulster Movement* (1927). He is dramatic critic of *The Observer*.

Erymanthus, high mt. of Greece, situated in Arcadia, 20 m. S.S.E. of Patras. It is now named Olonos, and is about 7320 ft. in alt.

Eryngium, genus of umbelliferous plants, occurs in tropical and temperate lands, and consists principally of perennial spiny herbs with flowers in dense heads. *E. maritimum*, the sea-holly or Eryngo, is a native of sandy sea-shores of

Europe, and is found in Great Britain; in England it bears the additional names of sea holver and sea holme. The root is candied as a sweetmeat, and has been used in medicine as a tonic and diuretic.

ERYTHRINA CRISTA-GALLI

Erysimum, genus of cruciferous plants, contains herbs with many-flowered racemes, all of which flourish in Europe, Asia, and round the Mediterranean. *E. cheiranthoides*, the worm-seed or treacle-mustard, occurs in Britain, and bears numerous small yellow flowers. Formerly used as a remedy for intestinal worms.

Erysipelas, see SKIN—Diseases.

Erythema, superficial, non-infective inflammation of the skin, with characteristic redness, disappearing when pressure is made by the finger or a piece of glass, and promptly re-appearing on removal of pressure. The first cause of E. is dilatation and accumulation of blood in the minute vessels of the skin. It may be due to local causes, as heat or cold, friction, accumulation of sweat, or other local irritants; the result of changes in the blood vessels themselves; to substances absorbed through the alimentary canal, such as special articles of diet, and other causes of alimentary toxæmia. After the condition has lasted for some time, pigment is deposited in the skin, and the colour due to this does not disappear on pressure. E. is seen as an accidental complication in fevers, particularly smallpox, measles, scarlet fever, typhus, typhoid, and cholera. The treatment of E. itself consists in the application of spirits, or other cooling lotions, powders, or a bland ointment. The appearance of E. is very variable, both in different individuals and in different parts of the body. *Erythema nodosum* is a special condition, with red, oval, raised spots, chiefly on the lower extremities. The lumps are painful, and run their course in from two to four weeks. Although painful, they do not suppurate or burst, and are most common in young persons of delicate physique. Rheumatism is a common cause, and should be treated as such.

Erythraea, genus of Gentianaceæ, inhabits dry sandy places of temperate lands. *E. centaurium*, the lesser or common centaury, is found in Britain by the waysides and edges of fields.

Erythrina, leguminous genus of tropical trees and herbs, with bright red flowers and frequently with prickly stems. *E. Caffra*, the Kafirboom, produces a good timber.

Erythronium, see DOG'S TOOTH VIOLET.

Eryx, genus of oviparous snakes, closely allied to the genus *Boa* in the family Boidæ, but the species of E. differ from those of *Boa* in having a very short obtuse tail and narrower ventral plates. They occur in Asia and Africa.

Eryx, name of a high mt. of N.W. Sicily, and now named Mont St. Giuliano. A temple of Venus once was on the summit, whence the goddess was called Erycina.

Erzberger, Matthias (1875–1921), Ger. politician, who came into prominence during the First World War. In his earlier years he took up teaching and journalism. Entered Reichstag 1903. During the First World War worked for peace and as Secretary of State conducted the Armistice negotiations on Germany's behalf with the Entente, the terms of which he signed. In 1919 became Finance Minister in new republican gov. He brought an action for slander against Dr. Helfferich, and during the course of the trial he was wounded by an assassin. Erzberger's power in politics was based upon his being the mouthpiece of the Catholic working class. His articles in the Press aroused great animosity against him in his political opponents, and this led to his assassination on Aug. 26, 1921. One of his assassins, Heinrich Tillessen, was arrested in 1946 by the French authorities and sent for trial before a Ger. judge at Freiburg-in-Breisgau, but, although he admitted his guilt, he was acquitted, the court upholding the legality of the amnesty declared by Hitler in 1933. Protests at so dangerous a precedent were sent by Ger. professional organisations to the Fr. military Gov. at Baden-Baden, and the Fr. authorities announced that they would re-try Tillessen. Others implicated in the murder were said to be von Killinger, Ger. ambas. in Bucharest and a leading Nazi; and a man named Schulz, who was sent for trial in 1946 at Wiesbaden.

Erzerum, **Erz-Rum**, or **Arzerum**, vilayet and tn. of Asiatic Turkey, 110 m. S.E. of Trebizond, occupying the centre of the Armenian plateau. The country (pop. 395,800) is mainly agric., though salt and coal are found; there are iron, saline, and sulphur springs. An extensive trade in cattle, horses, mules, furs, wheat, etc., is carried on. The tn. has a citadel, founded about A.D. 415 by the Emperor Theodosius the Younger, many mosques and former Dervish monasteries; the former industries have declined; there is petroleum in the vicinity. The chief industries are iron and copper working. In 1517 it was acquired by the Turks, and the Russians took it in 1829 and 1878

respectively, but by the Treaty of Berlin it was restored to Turkey. During the 1914-18 War E. was seized by the Russians in Feb. 1916 in their campaign against the Turks. After the Russian revolution the Turks recaptured the place in March 1917. In June 1919 a provisional gov. was set up at E. by the Nationalist party, headed by Gen. Mustapha Kemal Pasha (late Atatürk (q.v.)). Pop. 32,000.

Erzgebirge (meaning ore mountains), chain of mts., which separate Bohemia and Saxony. It extends about 120 m., at length meeting the Riesengebirge range. On the N. slopes there are fertile valleys; the central part of the chain forms a plateau, while the S. slopes are very steep, in some places almost perpendicular. The highest summits are the Fichtelberg, nearly 4000 ft., situated in the N.E., and the Keilberg, over 4000 ft., in the S.E. Between these stands (Gottesgab), the most elevated tn. in Bohemia. The geological formation of the chain is gneiss, granite, and clay slate. It is especially rich in ores: lead, silver, copper, tin, mercury, gold, and iron abound, also quantities of sulphur, bismuth, cobalt, arsenic, coal, etc. There are sev. holiday resorts among the heights, such as Bärenfels, Kipsdorf. Following the loss of Jena and Erfurt (q.v.) in April 1945, the Gers. retired S.E. into the E. along the frontier of Czechoslovakia, although they still clung to the tn. of Chemnitz as a pivot to the N., where the South Saxon armies were still putting up a stiff resistance to the Amer. First Army. On the central Ger. front, although elements of the allied forces continued to push forward to meet the Russians at Torgau, it was necessary to halt the main allied forces on the lines of the Elbe, and Mulde through the E.

Erzingan, Erzincan, or Eriza, tn. of Turkish Armenia, situated on the Kara Su, or the W. upper branch of the Euphrates, about 80° m. W.S.W. of Erzerum, exports fruit, sheep, oxen, and horses. It was taken by the Russians on July 26, 1916. There are frequent earthquakes. In those of Dec. 1939 which occurred over much of E. and N. Anatolia, E. was for the most part destroyed and 10,000 persons are said to have perished. The reconstruction of the tn. was begun soon afterwards slightly N. of the old tn. Pop. (tn.) 25,000; (vilayet) 171,800.

Esau, son of Isaac and Rebecca, and elder twin brother of Jacob. His name signifies 'hairy' (Hebrew), and he was so called because he was red and hairy at birth. In Gen. xxv. is given the story of how he sold his birthright to his brother Jacob for a 'mess of red pottage,' and Gen. xxvi. relates the story of how Jacob impersonated the hairiness of his brother and succeeded in deceiving his blind father, thus gaining the blessing intended for the first-born. E. became a hunter, and eventually the leader of a tribe inhabiting Mt. Seir, S. of the Dead Sea.

Esbjerg, seaport in Denmark on the N. Sea, on the W. coast of Jutland. A harbour was constructed here in 1868 to give

Jutland an export haven in place of Schleswig-Holstein, lost in 1864, and to this it owes its rapid rise. It has valuable fisheries, and is an important export centre, chiefly for fish, eggs, bacon, and cattle. Pop. 43,200.

Escalators, moving stairways for transport of passengers. Owing to the fact that stairways can carry more passengers an hour than lifts, Es. are rapidly taking the place of lifts on underground railways. The E. consists of a number of steps fastened to an endless belt which follows the incline of the stairway. Each step consists of a separate small trolley running on four rollers, which are staggered at the angle of the stairs: the top of the trolley consists of an inverted L-shaped step, which sinks to level at the top and bot-

ESCALATORS

One of the standard types of escalators in use on London's Underground system, showing three staircases

tom of the stairway. A hand-rail travels round at the same speed as the stairs and is of flexible composition. Powerful electric motors work the moving stairways and self-operating brakes are fitted to meet the possibility of a sudden breaking of a coupling or of a gear wheel.

Escallonia, genus of Saxifragaceae, consists of about fifty shrubs with alternate evergreen leaves and red or white flowers. All the species inhabit S. America, on the high grounds especially in Alpine regions, while a few, e.g. *E. rubra*, a species of wild currant, are cultivated in Britain.

Escanaba, co. seat of Delta co., Michigan, U.S.A. It is situated on a promontory at the mouth of the R. Escanaba, on the little bay de Noquette, 60 m. S. of Marquette. It has an exhilarating climate and is a summer resort and touring centre. It possesses a good harbour and commodious docks and ships six million tons of iron ore annually. The

fisheries and manufs. are important. Lumber and furniture are exported. Pop. 14,800.

Escapement, see under HOROLOGY.

Escar, see ASAR.

Escarpment, see GEOLOGY.

Escart, see SCHELDT.

Esch, or **Eschan der Alzette**, tn. situated in the grand duchy of Luxembourg, with coal and iron mines. Pop. (1939) 22,000.

Eschalot (botanica), the shallot—*Allium ascalonicum*. An onion-like plant allied to garlic but much milder in flavour and used in making pickles. Said to have been brought down from Ascalon in Syria by the Crusaders.

Eschatology, derived from two Gk. words, meaning 'last' and 'a discourse.' This is the term under which the doctrines of Christian theology are grouped, concerning the four last things, Death, Judgment, Heaven, and Hell. E. was in existence among all the great nations of antiquity, dark and ill-defined, as in the Greek, and elaborate as in the Egyptian religion, and with it grew up, more or less definitely, the idea of retribution. Protestant E., however, is generally confined in practical discourses to a consideration of the Return of Christ, Resurrection of the Dead, the Last Judgment, and the Final Recompense. Speculations regarding the after-life were prevalent among the anc. peoples, but the Christian teaching has its roots in the O.T. and the apocryphal and apocalyptic literature. The chief religious parties who do not recognise eternal punishment as a scriptural doctrine are treated as UNIVERSALISTS (q.v.) and CONDITIONAL IMMORTALITY (q.v.), and the question of an intermediate state at PURGATORY (q.v.). The trend of recent theology is towards an attitude of reserve on the subject, and some schools prefer to speak of the 'Christian hope' rather than of E. Eschatological speculations are to be found in More's *Utopia* and Plato's *Republic*. See S. D. Salmond, *Christian Doctrine of Immortality*, 1901; E. Dobschütz, *Eschatology of the Gospels*, 1910; A. Schweitzer, *The Quest of the Historical Jesus*, 1911; F. Bennet, *E.specto*, 1926; G. Dennis, *The End of the World*, 1931.

Escheat (Fr. *echoir*, from Lat. *cadere*, to fall or happen). This term is applied to an incident of feudal tenure whereby, when there was no tenant qualified to perform the services, land reverted or fell back to the lord. In theory, at all events, there is no such thing as absolute ownership of real property, the most extensive estate one can possess being looked upon as a subordinate estate, held of a superior landlord, to whom it will eventually return. Up till 1870 E. took place in England when the tenant was convicted of a cap. felony, but after that date this kind of E. was abolished. E. still takes place for want of next of kin when the owner of land dies intestate.

Eschenbach, see WOLFRAM VON ESCHENBACH.

Eschscholtz, or **Escholtz Bay**, name of an inlet of Kotzebue Sound, situated in

Behring Strait, Alaska. Through this passes the parallel of lat. 67° N., which is the Arctic circle boundary.

Eschscholtzia, genus of beautiful yellow-flowered plants, belongs to the order Papaveraceae. The species are natives of N. America, but they are frequently cultivated as border plants in Britain; two of these are *E. crocea* and *E. californica*. The fruit has an explosive mechanism.

Eschwege, tn. in Hesse, Germany, has industries, including coal, iron and zinc mining, rolling mills, cable works. Pop. 26,000.

Eschweiler, tn. of Rhineland, Germany, situated 8 m. to the N.E. of Aachen. It possesses valuable coal-mines, and is an important manufacturing tn., being the seat of large iron-works, tanneries, breweries, etc. In the Second World War an allied offensive, launched on Nov. 16, 1944, eastward from Aachen towards E., brought about the fall of that tn. Amer. troops penetrating into it on Nov. 21. It fell after heavy fighting on the next day. Pop. 28,000.

Escobar y Mendoza, Antonio (1589–1669), Sp. churchman and writer. Educated by the Jesuits, at the early age of fifteen he took the habit of that order. He was famous as a preacher. His writings, which fill forty folio vols., belong to the field of moral theology, and were not popular with Catholics, who considered they tended to inculcate a loose system of morality. His statement that purity of intention may be a justification of actions which are contrary to the moral code and to human laws was much ridiculed in France by Molière, Boileau, La Fontaine and Pascal.

Escoffier, Auguste (1847–1935). Fr. maître-chef, began his culinary career in his uncle's restaurant in Nice. Later he was in the service of a Russian Grand Duke, and then *chef de cuisine* to the general staff of the Rhine Army in the Franco-Prussian War, 1871, and to Marshal MacMahon at the Champs Elysées. His career in England began after he had left the Grand Hotel, Monte Carlo, to accompany Mr. Ritz to the Savoy, London. The acme of his career was reached at the Carlton, and to him belongs the credit for inventing the *bombe Nero* or flaming ice, *entremets fraises à la Sarah Bernhardt* and *pêche Melba*. Wrote *The Guide Culinaire* (1903) and *Ma Cuisine* (1934).

Escorial (Sp. from *escoria*, slag; from Lat. *scoria*, slag), the place of ashes, celebrated monastery and palace in Spain erected by King Philip II. in gratitude to St. Lawrence, on whose day (Aug. 10, 1557) the victory of St. Quentin was gained. The E. stands 2700 ft. above sea-level, and is built of solid granite. It is designed to resemble the famous gridiron on which St. Lawrence was martyred. It was begun in 1563 and finished by the famous architect Herrera in 1584. It has numerous rooms and passages, mostly gloomy and small, but the chief attractions are the magnificent church, royal palace and tombs, monastery and college. There is also a valuable library. In 1808

the E. was plundered by the Fr., and it has been frequently visited by fire and lightning, so that it has been many times repaired and added to, but it still stands as a monument to its original builder.

Escosura, Patricio de la (1807-78), Sp. novelist and poet, b. in Madrid. He wrote sev. plays of very unequal merit, amongst which may be mentioned: *Barbara de Blomberg, Las Flores de Don Juan*, and *El Tio Marcelo*. His best-known novel is a tale of Philip II., entitled *Ni Rey ni Roque*.

Escrow, see **DEED**.

Escuage, or **Seutage** (Lat. *scutum*, shield), in feudal times, was a tax of a pecuniary nature, frequently levied by the crown as a substitute for the personal service of a knight or vassal. This tax was first exacted in 1159 and was restricted by Magna Charta. It was quite usual for a knight to pay this fee by way of compensation for his personal service.

Esouintla, tn. of Guatemala, situated 30 m. S.W. of the city of Guatemala, with which it has railway communication. It is the cap. of the dept. of the same name, carries on a considerable trade, and is a popular winter resort. Pop. 14,000.

Esculapius, see **ÆSCULAPIUS**.

Esculle (*Æsculle*) **Acid**, acid obtained from the bark of horse chestnut (*Æsculus Hippocastanum*) and similar trees.

Escutcheon (Fr. *écusson*), in contradistinction to *écu*, an ordinary shield, this term, in heraldry, signifies the shield on which arms are painted. The term inescutcheon is used to denote a shield charged upon the E. either as an ordinary charge or as an augmentation of honour. An inescutcheon of pretence or *en surtout* is placed in the centre of an E. and is charged with the arms of an heraldic heiress married to the bearer of the E.

Esdraelon, or **The Plain of Jezreel**, noted plain of Palestine, lying to the S.E. of Acre. It is bounded by Mt. Carmel on the W., Gilboa on the S.E., and the Galleian highlands on the N., and stretches across central Palestine with an average width of ten or twelve miles, forming a break between the mts. of Galilee on the N. and those of Samaria on the S.; it is exceedingly fertile and capable of a high state of cultivation. The R. Kishon waters the plain, which in the spring is clad in a mass of verdure. Many battles have been fought here, both in ant. and modern times, including those which ended in Lord Allenby's victories over the Turks in 1918.

Esdras, **The Books of**. There is considerable confusion as to the nomenclature of the various Ezra books. According to the A.V., the First and Second Books of Esdras appear among the apocryphal books. According to the Septuagint Version, the First Book of Esdras appears as Esdras A, while under the heading Esdras B appear the canonical books of Ezra and Nehemiah. Through the influence of Jerome, this arrangement was not followed in the Vulgate. Here the Book of Ezra is styled Esdras I.; Esdras II. is the Book of Nehemiah, while Esdras I. and II. are re-named Esdras III. and

IV. The date of Esdras I. is probably the second century B.C. It is a compilation consisting of: (1) Trans. of part of Ezra, (2) part of Nehemiah, (3) part of Chronicles, and (4) an original portion giving the discussion of Darius and the three young men. The trans. is free and in superior Gk. to that of Esdras B in the Septuagint. The Second Book of Esdras, the most pathetic of the Jewish apocalypses, dates from the last years of the first century A.D. It contains sixteen chapters, of which ch. i., ii., xv., xvi. are later additions, the first two chapters certainly being by a Christian author. The rest of the book tells of seven visions shown to the prophet Ezra, the whole being in the extreme pessimistic tone of the school of Shammai. It is not yet settled in what language Esdras II. was originally written. It now survives only in versions in Lat., Syriac, Ethiopic, etc. See C. Torrey, *Ezra Studies*, 1910.

Esh, tn., Durham, England, situated on a height 4 m. N.W. by W. of that city. There is a famous college of St. Cuthbert for the training of Rom. Catholic priests, which contains a fine library and museum. E. colliery is in the vicinity. Pop. 11,000.

Esher, vil. and urban dist. in co. Surrey, England, about 15 m. S.W. of London. A 300 year-old clock is keeping good time in the church. To the east of the vil. is Claremont, built by Clive of India. It was purchased in 1816 as a residence for the Princess Charlotte on her marriage with Prince Leopold of Saxe-Coburg, and she died there on Nov. 6, 1817. Her husband, who became king of the Belgians in 1831, transferred his rights to the Crown. Louis Philippe, the exiled Fr. king, died there in 1850, and his queen in 1866. Cardinal Wolsey once lived in a mansion built here by Wm. of Waynflete, bishop of Winchester (1447-86), of which the gateway remains. Sandown Park race course adjoins the station. Pop. 17,000.

Esher, Reginald Balliol Brett, second Viscount (1852-1930), son of first viscount, to whose title he succeeded in 1899. In 1903 he became Chairman of the War Office Reconstitution Commission. He acquired some distinction as a writer, having pub. *Footprints of Statesmen* (1892), *The Correspondence of Queen Victoria* (1907), *The Tragedy of Lord Kitchener* (1921).

Esher, William Balliol Brett, Viscount (1815-99), Eng. lawyer, b. in London, son of the Rev. Joseph Brett of Chelsea. Educated at Westminster and Caius College, Cambridge. Called to the Bar in 1840; became a Q.C. in 1861. In the House of Commons he was prominent in promoting bills relating to the administration of law and justice. As a justice of the Court of Common Pleas he provoked criticism for some of his sentences in strike cases. On the reconstruction of the Court of Appeal he was made a Lord Justice. Succeeded Jessel as master of the rolls (1883). Retired from the bench in 1897, when he was created a viscount. The Solicitors Act of 1888, which enhanced the powers of the Incorporated Law Society owed much to E.'s influence.

Esibomvu ('red soil'), new township for natives on the veld, 29 m. from Bulawayo, S. Rhodesia. A wide street has been built and sev. buildings have been completed in the business area, together with dwelling-houses. Another area has been set aside for secondary industries, including tanning, boot making, and furniture. Around the township are 2-ac. plots for crops and vegetables.

Eshowe, or **Ekwowe**, or **Echowe**, small tn. of Natal, S. Africa, situated about 30 m. N. of the estuary of the R. Tugela, overlooking the Indian Ocean. There are sev. hotels and the remains of the old fort where Col. Pearson was shut up by the Zulus. Pop. (white) 1000, (others) 1800.

Esk, name of numerous Scottish and Eng. rvs. Among the chief are: (1) The N. Esk flowing through Kincardineshire and Angus, Scotland, rising near Edzell, and flowing into the North Sea, 4 m. from Montrose; length about 30 m. (2) S. Esk, rising in the Grampians, flowing through Strathmore to Montrose harbour, with Brechin and Montrose on its banks; length about 50 m. (3) A riv. of Dumfriesshire, formed by the confluence of the Black and the White R. in Eskdalemuir, flowing 35 m. to the Solway Firth, near Sarkfoot. (4) Two small streams, N. and S. Esk, rising in Peeblesshire, and flowing through Middlebie. They unite at Dalkeith, flowing into the firth of Forth at Musselburgh. The N. branch passes Roslin Castle, Hawthornden, Habbie's Howe, Melville Castle; the S. branch, Dalhousie Castle and Newbattle Abbey.

Eskdale, valley of the Cumberland Esk, England, which rises between Scutell Pikes and Bowfell, forms the Esk Falls at Throstlegarth, turns W. at Butterket below Hardknott Castle, and flows between Muncaster Fell and Birkby Fell to Ravenglass. From Ravenglass a narrow-gauge railway runs up the valley to Dalegarth. At the head of the valley are Scutell (3162 ft.) and the three Scutell Pikes (3210 ft.). Part (586 ac.) of the valley is owned by the National Trust and part (827 ac.) is protected against afforestation or other development, so that all the upper part of the valley is preserved.

Eskdalemuir, par. of Dumfriesshire, Scotland, about 12 m. from Langholm. There is a National Magnetic Observatory to replace the one which was formerly at Kew. Pop. about 400.

Eski-Djuma, tn. in Bulgaria. It lies 18 m. W. of Shumla. The inhab. breed silkworms and make pottery. Pop. 12,000.

Eskilstuna, tn. in Sweden, 57 m. W. of Stockholm. Sometimes called the Sheffield of Sweden on account of its iron, steel, and copper works. Pop. 13,500.

Eskimo, or **Eskimaun** Indians (commonly called **Eskimos** or **Uqumonds**), race dwelling in the N. coasts of America, from Labrador to Mt. St. Elias, and also occupying Baffin Land and the shores of Greenland. They are known as Innuits, a word signifying 'man' in their own tongue; the word 'Esk.' being said to be a term of reproach meaning 'eaters of raw meat,' applied to them by some Indian

neighbours, the Algonquins, living S. of them. The Es. are a race of the yellow type, but of a lighter colour than the Algonquins and rather smaller in stature. Their sustenance is chiefly derived from the capture of seals, which are their staple food and very valuable to them in numerous other ways, supplying them with dog-food, boots, clothing, tents, light, heat, and harpoon lines. They also procure food by pursuing the chase on land and by fishing. The *kayak*, a small slim boat for one man, is their most interesting and best-known invention for hunting. Its framework is covered with skin, and with

New York Times Photos
ESKIMO WOMEN

the waterproof jacket worn by the man, completely protects him from the waves, so that even if he capsizes he is able to rise unhurt by means of his paddle. The dogsledges is in use everywhere amongst the Es., except by those in S.W. Greenland, and the E. dog is admirably adapted for transport by sledge, being strong and powerful. The Es. are a cheerful and generous race, and are friendly and hospitable to strangers. Their pastimes are athletic sports and dramatic entertainments, and their children mimic the elders on a small scale. Their dwellings are of two kinds, tents for summer, and houses or huts for winter use. The tents are generally made of sealskin; but the winter dwellings are usually built of stone, covered with moss and banked up with snow, the entrance consisting of a

long passage, only high enough to admit a man crawling on hands and knees; indeed, in some parts, N. Alaska, for example, the huts are half under ground. Some of these winter dwellings shelter as many as forty or fifty persons. The E. men and women are clad alike in trousers of seal or deer skin, according to the season, and in a loose-fitting shirt, surmounted by a hood, which is enlarged for women and children. The Es. are very ingenious in their manufs., and during the long winter days indoors the men make carvings of walrus ivory, horn and wood, for use as well as ornament. The women spend most of their time in making the clothing and tents. As to the religion of the E., he believes all things to be ensouled, and spirits innumerable to abound everywhere. The E. pop. of Canada is about 7200. See F. Nansen, *Eskimo Life*, 1893; V. Stefansson, *My Life with the Eskimos*, 1913; E. M. Weyer, *The Eskimos: their Environment and Folkways*, 1933; R. Finnie, *Canada Moves North*, 1942, 1948. A. Gilberg, *Eskimo Doctor*, 1947. See also AMERICAN INDIANS; GREENLAND; RASMUSSEN, K. J. V.; THULE.

Eskimo Dog, sledge-dog used in the Arctic regions. It is broad chested, with a stout, thick neck, erect ears, and long, sharp muzzle, not unlike the grey wolf of the prairie. It is only half domesticated, and does not bark, but howls like a wolf. E. Ds. have a great deal of staying power; they are rarely fed by their Eskimo masters, which perhaps accounts for their sharp uncertain tempers. There are two breeds, the Ostiaks and the Samoyeds. The former is wolf-like, but the latter is entirely white and resembles a large Pomeranian.

Esksehir, tn. in Asiatic Turkey, connected by rail with Scutari, and the centre of the Anatolian Railway system. It has celebrated warm springs and valuable deposits of meerschaum in its immediate vicinity, pipes of the material being manufactured in the tn. The Gks. were defeated here by the Turkish Nationalists in April 1921. The Moslems were defeated near here by Godfrey de Bouillon in 1097. Pop. 61,000 (vilayet 244,600).

Eski Zagra, or **Eski Sagra**, see STARA-ZAGORA.

Esmeraldas, tn. in Ecuador, S. America, bordering on Colombia on the nr. of the same name and cap. of the prov. of E. (area 5465 sq. m.). The name is derived from the old emerald mines in the vicinity. Vessels anchor outside the bar (depth, high tide, 10 ft.) and load and discharge by means of launches. It is the centre of a rich agric. dist., and the headquarters for a number of merchants and mining companies. Straw hats are manuf. and gold is mined. Pop. (prov.) 58,900, (tn.) 7000.

Esna, tn. of Upper Egypt, 25 to 30 m. S. of the ruins of Thebes, on the l.b. of the Nile. It is celebrated for the ruins of a vast anct. temple to the ram-headed god Khnum, built in the time of the Rom. emperors Claudius and Vespasian and others, and also possesses a Coptic monastery. Its chief manufs. are pot-

tery, shawls, and cotton, in which commodities it carries on an active trade. A barrage was built and opened in 1909 to hold up the Nile water in low floods. Pop. about 20,000.

Esop, see AESOPUS.

Esoteric and **Exoteric** (Gk. *esotērikos*, inner and *exotērikos*, outer), terms originally derived from the act. 'mysteries', the first designating doctrines intended only for the initiated, the second those intended for the uninitiated or general public. By analogy these words have been used to mark distinctions thought to exist between certain classes of the writings of Aristotle and other philosophers. Aristotle himself only uses the term 'exoteric,' which Grotto takes to refer to the 'didactic' as opposed to the 'didactic' method.

Esox, or *Esox lucius*, the generic name of the pike, which belongs to the family *Esocidae*. It is characterised by the absence of scales on the head, by a long narrow body terminating in a forked caudal fin, and by a long, broad, depressed snout in which the upper jaw exceeds the lower in length. The pike inhabits the fresh waters of Europe, America, and Asia, and not uncommonly attains a length of 45 or 46 in., with a weight of 35 or 36 lb. It is the most voracious and greedy of all fresh-water fish, and will devour all kinds of smaller fish, even the young of its own kind.

Espalier (Fr. railing for fruit-trees; It. *spalliera*, from *spalla*, a shoulder), railing on which fruit trees are trained. The term E. is also applied to the system of training plants to grow as Es. on a trellis (espalier). Es. may be constructed of wood, iron, or, more cheaply, by means of strong wire, supported by upright wooden or iron posts. Es. have the advantage of protecting the fruits to a great extent from the wind, and thus preventing a large quantity being shaken off before they are properly ripened. The most suitable fruit trees for Es., commonly grown in Great Britain, are apple and pear trees. Their treatment is usually similar to that of wall trees, but they are generally trained to form horizontal branches. For the raising of Es., plants of one year should be chosen and planted at distances that will allow of each one covering a surface of about 20 sq. yds. The stem should be cut about 12 in. from ground-level in about a year from planting, immediately above three buds. Lateral branches will then be formed by two of these buds, while the highest one will form the extension of the stem, and these three stems must be kept in an equal condition of vigour during the summer. During the second year no more lateral branches must be allowed to grow, but after this a fresh pair of lateral branches can be allowed to grow each year. The wood of the tree will be fully estab. in about sixteen years.

Espartero, Baldomero (1792-1879), b. at Granatula, La Mancha, was the son of a cartwright. He played an important part in the Carlist wars, and as commander-in-chief concluded the Carlist

Convention in 1839, which brought the war to an end. In 1811 he became regent, from which position he was driven two years later by a counter-revolution. In 1854, however, he was recalled to save Isabel II.'s throne, and for a time he became dictator and able to conciliate all progressive parties. He retired from public life in 1856. See life by E. Florez, 1844-45.

Esparto Grass, or *Stipa tenacissima*, species of Gramineæ closely allied to the feather-grass, and occurs in N. Africa. It is a graceful plant often cultivated in Britain for its beauty, and is largely used in the manu. of paper. Two other species of grass, *Lyneum Spartum* and *Ampelodesma tenax*, both of which are to be found in Africa and round the Mediterranean, serve the same purpose as E. G.

Esperanto, international auxiliary language invented by Dr. L. L. Zamenhof, an oculist of Warsaw, and first pub. in 1887. The first journal in the language, *La Esperantisto*, which was issued in 1889 from a press in Nuremberg, was suppressed, as the Russian Gov. forbade its entry into Russia on the ground that the jour. contained contributions by Tolstoy. The language, which in 1895 had spread to France, began an era of rapid progress from the first international congress, held in Boulogne in 1907. In construction, E. differs fundamentally from its predecessor, Volapük. Every word, before incorporated into Volapük, underwent a process of mutilation, and the author (Abbé Schleyer) did not even hesitate to create words arbitrarily. ('Volapük,' e.g., is a corruption of two Eng. words, 'world' and 'speech.') On the other hand, E. is based, broadly speaking, on the principle that, with a view to attaining the maximum of internationality, the vocabulary of the international language should consist of root-words which are found to be common to sev. languages of Romance and Germanic origin, due attention being paid to other factors.

International words (e.g. theatre, nature, park, character, centre, form, telephone) are incorporated into the language without change, beyond conformity with the orthography. E., too, is strictly phonetic, its twenty-eight letters representing distinct sounds, and there are no digraphs. Each part of speech has a distinct termination, e.g. nouns end in *o*, adjectives in *a*, derived adverbs in *e*: there is only one conjugation to the verb, which has twelve terminations; the prepositions have a clearly defined meaning, and by the aid of some thirty prefixes and suffixes the language assumes a wonderful flexibility. The 'constitution' of E., according to its protagonists, guards the language from arbitrary or capricious changes, while at the same time allowing great latitude in the adaptation of new words to the international setting. The author of E. (see the 'Declaration' of Boulogne, etc.) disclaims any rights of ownership or control of the language. This attitude is of vital importance, as it was on the question of ownership that Volapük came to grief. The headquarters of E. in England is the

Brit. Esperanto Association, 140, Holland Park Avenue, W. 11. The Universala Esperanto-Asocio is an association founded to utilise the auxiliary language for tourist and commercial purposes. The following is the Lord's Prayer in E.: 'Patro nia, kiu estas en la ciela: Sankta estu Via nomo: Venu reĝeco Via: Estu volo Via, kiel en la ĉielo, tiel ankaŭ sur la tero: Pardon nian ĉiutagan donu al ni hodiaŭ: Kaj pardonu al ni ŝuldojn niajn, kiel ni ankaŭ pardonas al niaj ŝuldantoj: Kaj ne konduku nin en tenton: sed liberigu nin de malbono: ĉar Via estas la regado, la forto, kaj la gloro, eterne. Amen.' Its old rival, Ido, is virtually extinct. E. has a considerable following and has had an experience in use which no other so-called international language has now or ever had. The League of Nations in 1924 recommended that the States Members should grant to E. 'as a practical auxiliary language for international communication side by side with the national language in use,' the treatment and charges in force for a language *en clair* in telegraphic and wireless communications. In 1925 the International Telegraphic Union accordingly recognised E. as a plain language. Regular broadcasts have been given in E. from a number of radio stations. See also Ido (Revised Esperanto).

Esperet, Franchet d', see FRANCHET D' ESPEREY.

Espinal, tn. in Colombia, S. America, 75 m. S.W. of Bogotá. It has pottery works and tobacco plantations. Pop. 10,000.

Espionage. The organised employment of secret agents by govts. to obtain information concerning other countries which cannot be obtained by open methods. It also includes the dissemination of false information intended to deceive other countries. As the essence of espionage is secrecy, it follows that any treatise upon the subject, purporting to give details of the inner workings of any particular current system, must be regarded with doubt. The value of secret information is immense, because it gives the receiver a definite advantage over the opposite party, and by no one is this appreciated more than by military commanders. An early example of spying is to be found in the O. T., where Moses sent men to 'spy out the land of Canaan.' One novel method of conveying information to the authority concerned is that employed by Histæus when at the court of Darius, king of Persia. He was watched so minutely that he hit upon the idea of shaving his servant's head, writing a message on the head, and then, when the hair had grown again, sending him to the person concerned.

Before the First World War Germany had a well-developed secret service, and it is estimated that over 20,000 of her agents were in France in various occupations. There is always a note of picturesqueness connected with spying, mainly due to the fact that it appeals only to the more adventurous spirits who have the dual gift of caution and boldness. Among the First World War spies Colonel T. E. Lawrence

and Mata Hari will be remembered. The former was Brit. and operated in Egypt and Palestine; whilst the latter was a Javanese woman, who operated in France on behalf of Germany. She was caught and executed.

In Great Britain the organisation entrusted with the security of the state is Military Intelligence No. 5 (M.I.5), part of the War Office. Its task is to stop agents of foreign Powers, or even misguided Brit. subjects, from knowingly or unknowingly transmitting the secrets of Britain to any country abroad, whether that country be hostile, neutral, or even friendly. The chief function of M.I.5 is counter-espionage. Foreign agents, or terrorists, who operate in this country with a fixed plan of campaign, are usually foiled by M.I.5 sooner or later. On such occasions M.I.5 normally co-operates with the Special Branch of Scotland Yard.

Prior to the outbreak of the war German secret service agents or Nazi spies were actively engaged in undermining public allegiance in most countries of the world, and securing bands of Nazi sympathisers ready to co-operate with Germany as soon as any particular country was invaded. This wholesale system of E. was, to some extent, responsible for the rapid military collapse of Poland; it was even more effective in the downfall of Norway and Holland, in both of which cases Norwegian and Dutch collaborators helped to bring about the collapse of their countries resistance to invasion. During the invasions of all these countries the Gers. adopted the practice of dropping in parachutes soldiers, persons disguised in the uniforms of the Allies, and persons habited as civilians behind the invaded country's battle lines and even in the heart of the country itself. In International Law there can be no doubt that parachutists, if not regular soldiers, should be treated as spies. Since the war there has been sensational evidence of the activities of Soviet agents all over the world, especially in U.S.A. and Canada in connection with the atom bomb. See M. Ritchings, *Espionage: The Secret Service of the English Crown*, 1935; J. Thompson and S. Padover, *Espionage: Secret Diplomacy, 1500-1815*, 1937; R. Hirsch, *The Soviet Spies*, 1947; I. Gouzenko, *This was my Choice*, 1948. See also FIFTH COLUMN.

Espirito or **Espiritu Santo**, maritime state of Brazil, first occupied by the Portuguese in 1535. It is bounded N. by Bahia, W. by Minas Geraes, S. by Ilho de Janeiro, E. by the Atlantic. There are tropical forests on the slopes of the Serras dos Aimorés and Negra. It is swampy near the coast. Rio Doce, the chief riv., divides it into two: the Parahiba do Sul is on the S. boundary. The area is about 17,310 sq. in. The cap., Victoria, on Espirito Santo Bay, is the best harbour. It is well watered and very fertile, and produces coffee, sugar, corn, and timber. There are iron ore deposits in the State. The State is well served by the central group of railways. There are 30,000 German colonists with their own schools and

churches, and also many Italians. Pop. 843,100.

Espiritu Santo, largest is. of the New Hebrides (q.v.), 75 m. by 45 m., heavily wooded and well watered. The highest point is Santo Peak, 5520 ft. There are a number of Brit. and Fr. settlers. Coconuts, cotton, cocoa, and maize are grown. Santo, as it is usually called, has a numerous native pop., but of late the death-rate has been very great. Cannibalism is still occasionally practised.

Esplanade (from Lat. *explanare*, to level), in fortification, the glacis of the counterscarp, or sloping of the parapet of the covered way towards the country. Also the open space separating the citadel of a fortress from the tn. It is especially used of a level terrace, intended as a public promenade, such as the open walks along the 'front' at seaside places.

Espirit, St., see BAYONNE.
Espronceda, José de (1810-42), Sp. poet and revolutionary politician. He was early imprisoned by the gov. for his radical views (c. 1825), and banished shortly afterwards. E. wrote the historical romance, *Don Sancho Saldaña o el Castellano de Cuellar* (1834). Returning to Madrid, he took part in the revolutionary contests (1835-36). Byron's influence in his writings is very marked. His best work was lyrical poetry, such as *El Diablo-Mundo*, *El Estudiante de Salamanca*, *El Verdugo*, *A la Patria*, *Hymn to the Sun*, and *El Mendigo*. His ambitious *Dona Blanca de Borbon* was not so successful.

Esquimalt, or **Esquimault**, seaport tn. of Vancouver Is., Canada, important as a naval station on the Pacific. It contains a naval yard, dry dock, arsenal, and hospital. There are a salmon cannery and a ship-building yard and an extensive harbour on the Juan de Fuca Strait. Pop. 7000.

Esquimaux, see ESKIMO.

Esquire (Old Fr. *escuyer*, from Lat. *scutarius*, shield-bearer), originally the attendant on a knight and bearer of his shield or armour. He ranked below the knight bachelor, and his office served as the apprentice-stage of knighthood. The title was one of function, not birth, and was not hereditary. It came to be a title of honour, implying a rank between that of knight and valet. According to Coke (2 *Institutes*, 688), any one may be called E. (usually written Esq.) who has a legal right to call himself a 'gentleman,' i.e. one who lawfully bears a coat-of-arms. The title is widely used now by courtesy for men of all ranks, and indeed is so used without discrimination, that many prefer simply to be addressed as 'Mr.' Those legally entitled to bear it include sons of peers or knights and their eldest sons, officers of the army and navy, and members of the Bar. E. has followed much the same course as the word 'gentleman.' See also SQUIRE. See John Selden, *Titles of Honour*, 1672.

Esquiros, Henri François Alphonse (c. 1812-76), Fr. poet, politician, and historian. He wrote both poems and novels of a strong socialistic tendency, and was imprisoned for his *L'évangile de*

peuple (1840). E. went to Holland and then to England, sending studies to the *Revue des deux Mondes*, afterwards known as *L'Angleterre et la vie anglaise* (1859-70). Other works are: *Les Hirondelles* (1834), *Charlotte Corday* (a novel, 1840), *Songs of a Prisoner* (1841), *Les Vierges martyres, les Vierges folles, les Vieilles sages* (1841-42), *Histoire des Montagnards* (1847), *La Morale universelle* (1859), *L'Emile du XIX^e Siècle* (1870).

Essad Pasha (c. 1875-1920), Albanian chieftain who, during the Balkan War (1912-13), defended Scutari against the combined Montenegrin and Serb forces, and who, at the conclusion of that siege, proclaimed himself prince of an autonomous Albania owning the suzerainty of Turkey. The family of Essad, the Top-tanis, came from Tirana, near Durazzo, and was of considerable wealth and power.

—Essad's brother, Gani, being the special friend of, and executioner to, the Sultan Abdul Hamid. Gani, losing the sultan's high favour, was done to death—a deed which made Essad the sworn foe of the Hamidean régime. He joined the Young Turk revolution in 1908, and from then till 1912 represented Durazzo in the Turkish parliament. His support of the Young Turks was of a very qualified nature, and he even tried to negotiate a Brit. protectorate. When Prince Wilhelm of Wied became Mpret in March 1914, E. became his minister of war and of the interior; but was exiled for disaffection—returning to become President of the Albanian Provisional Gov. Oct. 5, 1914; which he accomplished by terrifying the senate. When enemy forces drove him from Albania, he retired to Salonika. He afterwards presided over the Albanian delegation in Paris. At the close of the war he managed to overthrow the Italianised gov. estab. at Durazzo. He was murdered in a Paris street, June 13, 1920, by an Albanian named Aveni Rustani.

Essay (Fr. *essai*, attempt). What is now generally understood by an E. is a literary composition of moderate length on any given subject other than purely scientific. It should treat of life in general, and not of any specialised subject. It originally implied a want of finish, and Dr. Johnson defined it as 'an irregular, undigested piece.' An E. is strictly rather a series of personal comments than a finished argument or conclusive examination of any matter. As a separate form of Eng. literature, it dates from the close of the sixteenth century. The name appears to have become common on the pub. of Montaigne's *Essays* (1580). The first great name connected with the hist. of the English E. is that of Bacon (1561-1626). Abraham Cowley may, however, perhaps be more truly regarded as the father of Eng. E. His *E. of Myself* may be taken as a typical example of what such compositions should be. Other essayists of the seventeenth century were Sir Thomas Browne, Sir William Temple, and Dryden. The eighteenth century was the great age of essay-writing. In 1711 Joseph Addison and Richard Steele founded the *Spectator*,

thus popularising the E. as a form of literature in England. The *Tatler* and the *Guardian* also contained numerous examples of typical Es., mostly the work of Steele and Addison. Fielding's Es. appeared in the *Covent Garden Journal*, 1752, Dr. Johnson's in the *Rambler*, 1750, the *Adventurer*, 1752, and the *Idler*, 1759. Other essayists of this period were Jonathan Swift and Goldsmith (in the *Bee* and the *Citizen of the World*). Such terms as review, memoir, or treatise, apply better to more exhaustive studies, such as Locke's *Essay Concerning Human Understanding*, or Burke's *Essay on the Sublime and Beautiful*, while the journalistic 'article' may be used for slighter sketches than those entitled to be called Es. Names of the earlier period which deserve mention as writers of works closely approaching the E. in style are those of Sir Thomas More, Sir Philip Sidney, Robert Burton, Sir Thomas Overbury, Bernard Mandeville, Laurence Sterne, Daniel Defoe. A

HAZLITT

One of the great essayists of the nineteenth century

great revival of the E. took place early in the nineteenth century, and with this movement Charles Lamb's name is always closely connected. His *Essays of Elia* appeared in 1823, the *Last Essays of Elia* in 1833. Other essayists of note of the nineteenth century are Hazlitt, Leigh Hunt, Carlyle, Macaulay, Thackeray, Bagehot, Pater, and R. L. Stevenson. De Quincey, Southey, and Shelley also belong to the nineteenth century. The E. in modern times has not been quite so popular. Men are less often essayists first and foremost, but poets, historians, or novelists, who write Es. occasionally in leisure hours, and who have little or no interest in the didacticism which was so marked in, and indeed formed such an integral part of, the Es. of their predecessors. Some of the chief names are Augustine Birrell, A. O. Benson, E. V. Lucas, Andrew Lang, G. K. Chesterton, Austin Dobson, George Saintsbury,

Max Beerbohm, Hilaire Belloc, A. G. Gardner, Robert Lynd, Harold Nicolson. Pope alone in the eighteenth century conceived an E. in heroic verse. His *Es. On Criticism* and *On Man* are really treatises, but the *Moral Essays*, if in prose, might have appeared in the *Spectator*. Apart from this all Es. are understood to be prose writings. In America the chief essayists include W. Irving, R. W. Emerson, N. Hawthorne, and J. R. Lowell. In Germany, Lessing, Schlegel, and Hermann Grimm are among the best. The E. took firm root in France at a comparatively late period, the chief representatives being Montaigne, Voltaire, Rousseau, Lamartine, Cousin, Michelet, Sainte-Beuve, Gautier, Anatole France, and E. Faguet. See A. Chalmers, *British Essayists*, 1817; H. Walker, *The English Essay and Essayists*, 1915; E. Rhys, *Modern English Essays, 1870-1920*, 1922; J. B. Priestley, *Essayists, Past and Present*, 1925; M. G. Sagar, *Essays from Eighteenth Century Periodicals*, 1947.

Essays and Reviews. In 1860 a remarkable vol. was pub. under this title. All the contributors, excepting one, were clergymen of the Church of England, and the book was severely censured for heterodox views by nearly all the bishops and formally condemned by convocation in 1861. Bishop Thomson (afterwards archbishop of York) and Bishop Wilberforce replied to the *Essays and Reviews* in their works *Aids to Faith* (1861), and *Replies to Essays and Reviews* (1862). The vol. contained the following seven papers: (1) 'The Education of the World'; (2) 'Bunsen's Biblical Researches'; (3) 'On the Study of the Evidences of Christianity'; (4) 'The National Church'; (5) 'The Mosaic Cosmogony'; (6) 'Tendencies of Religious Thought in England'; (7) 'The Interpretation of Scripture.'

Esschen, tn. in Belgium, 18 m. N. of Antwerp, near the Dutch border. Pop. 8,700, engaged in agriculture and manuf. of sugar, wax, and tobacco.

Esseg, see **ESZEK**.

Essen, Hans Hendrik von, Count (1755-1824), Swedish field-marshal and statesman. He was a favourite of Gustavus III., fighting under him (1788-90). He warned the king against his assassination, but was unable to prevent it (1792). E. was governor of Stockholm (1796), becoming grand equerry in 1800. Charles III. made him councillor of state, with the title Count, and sent him as ambas. to Paris, where he negotiated peace (1810). See L. A. Thiers, *Histoire de l'Empire*, 1873.

Essen, old tn. a few miles to the N. of the Ruhr, in the centre of the Rhenish-Westphalian Coal Measures, Germany, which are among the most prolific in the world. Its famous Krupp works (before the Second World War) were the largest steel works in Europe; they also manuf. locomotives, goods-trucks, electric cranes, machinery, cash registers, cinematographic apparatus, surgical instruments, etc., but no war material until the advent of the Nazi rearmament policy, when they soon restored their great armament industry. Besides these works there were

numerous machine-shops, foundries, chemical factories, and coal mines. The Münsterkirche, seriously damaged in the Second World War, one of the most anct. churches in Germany, the W. choir, with its tower, dating from the tenth cent. The Protestant Marktkirche, now practically destroyed, was probably completed in 1066. E. had 3480 inhabs. in 1803 and 666,700 in 1940. As a railway and communications centre of great importance to the Gers. E. was the target of deadly raids, one of the heaviest being on July 25, 1943, when 2000 tons of bombs were dropped by the R.A.F., photographic interpretation showing that the damage to Krupp's works was greater than all that wrought in the previous raids of that year, 116 buildings being hit and the Diesel engine works being totally destroyed by fire. It was equally important an objective as the home of Krupp's armament works. The heaviest air raid on E. was that of March 11, 1945, when the Allied armies were advancing into Germany. Gen. Eisenhower states that on that day a record was estab. for the load of bombs dropped on a single target in one raid when 1079 heavy bombers of the R.A.F. rained some 5000 tons on the E. rail centre (though the record was surpassed on the 12th when 1108 heavies dropped 5487 tons on Dortmund). These attacks were energetically supported by fighters and fighter-bombers of the R.A.F. Second Tactical Air Force and the U.S. Tactical Air Command. The resulting chaos was such as to prove far beyond the powers of the Reichsbahn repair organisation to remedy, despite its immense efforts to keep the lines open (see *Report by the Supreme Commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force*, H.M.S.O. 1946). The combined effect of all these attacks was that the vast arms factories, marshalling yards, railways and inland docks were out of action or actually obliterated. After the Amer. armies had encircled the Ruhr (April 1, 1945) the fall of E. soon followed (April 6). See K. Ribbeck, *Geschichte der Stadt Essen*, 1915; H. Spethmann (ed.) *Essen die Stadt*, 1938. See also **RUHR** and **WESTERN FRONT IN SECOND WORLD WAR**.

Essence (Lat. *essentia*, from *esse*, to be): 1. In philosophy, the equivalent of Gk. *οὐσία*, and was originally used in the same sense as 'substance'. Later 'substance' came to be used for the undetermined substratum of a thing, E. for the qualities expressed in the definition of a thing. Locke neatly defines it by saying: 'Essence may be taken for the very being of a thing, whereby it is what it is.' 2. In pharmacy, Es. are solutions of essential oils in alcohol, and are capable of being prepared in two ways: (1) By adding refined spirit to the odiferous parts of plants or to the essential oils, and distilling. (2) By adding the essential oil to the refined spirit and agitating till a uniform mixture is obtained. Thus E. of lemons is merely a solution of volatile oil in rectified spirit. The term E., however, has received a more comprehensive

significance and is applied to a liquid possessing the properties of the substance of which it professes to be the E. *Quintessence* (Lat. *quinta essentia*, fifth E.), the pure E. of anything, a solution of an essential oil in alcohol. The name applies to the purest essence obtained after five distillations, and was originally used to denote ether.

Essendon, tn. of Victoria, Australia, situated in Bourke co., on the Moonee Ponds, at a distance of 5 m. from Melbourne. Pop. 20,000.

Essenes, Jewish religious brotherhood of the time of Christ. Though it played a somewhat important part in the hist. of Jerusalem, very little is accurately known about the E. The Rom. historian, Pliny, the Jewish Josephus, and Philo the Alexandrian are the authorities who speak of them from personal knowledge. They are nowhere mentioned either in the Bible or in the Talmud, though it has been commonly held that the Nazirim referred to in the Talmud are the E. under another name. On the one hand, the E. were highly-developed Pharisees, laying exceedingly great stress on the maintenance of ceremonial purity. Ceremonial washings formed an important part of their practice, and white garments were worn. Their food was specially prepared by the priests, and the common meal was eaten with great solemnity. Asceticism was the keynote of their system; every form of sensual enjoyment was held to be sinful. Marriage and intercourse with women were entirely forbidden. The E. were communists, mostly engaged in agriculture. The proceeds of all labour went into the common purse, from which all expenses were paid. Entrance to the order could be obtained only by a three years' novitiate. The E. objected to animal slaughter, and this fact prevented many of them from joining in the temple service. Moreover, it is said that they engaged in sun-worship. The sect came to an end in the second century A.D. Owing to resemblances to the E. in life and teaching, John the Baptist has been regarded as one of them, but there are important facts against this theory. The E. represented Judaism in its purest essence, and in the spirit of their teaching came nearer Christianity than did any other contemporaneous sect. See J. Lightfoot, *Epistles to Colossians and to Philemon*, 1876 and G. Moore, *The Brook Kerith*, 1916.

Essential Oils, oils which possess the odours in a concentrated form of the plants or vegetable substances from which they are obtained. These oils are generally contained in a special gland or cell within the plant. The E. O. are generally insoluble in water, but they dissolve freely in alcohol, ether, or fatty oils. They contain a large proportion of carbon which causes them to ignite easily, but as a rule they leave no permanent grease spot. They possess an aromatic smell, a hot burning taste, and can be distilled unchanged.

Essequibo, riv. of Brit. Guiana, which has its source in the Acaari Mts., about

45 m. N. of the Equator. It is a riv. of many rapids, and therefore very difficult to navigate. The most noted falls of the E. itself are the Aretaka cataracts. There are sev. tribs., the Cuyuni with the Mazuruni, the Rupununi, and the Potaro. After flowing for a distance of 620 m. the E. enters the Atlantic, and at its mouth it measures a width of 20 m. Among the natural wonders of the Essequibo R. region are the Kaieteur Falls (the old man's fall) on the Potaro R. These have a clear drop of 741 ft., or nearly five times the height of Niagara Falls. Owing to the difficulty of the journey, few people from other parts of the world have visited this spot, and its remoteness and seclusion greatly enhance its impressiveness. The Potaro R. here has a width of 400 ft. and a depth of 35 ft., plunging down a valley of nearly 800 ft., whence it flows away amid ravines of thickly wooded sandstone cliffs on a winding course, broken in places by falls and rapids, which have to be circumvented by portages, until eventually it reaches the Essequibo. The dist. round the falls has now been proclaimed by the gov. of Brit. Guiana as the Kaieteur National Park, and steps have been taken to prevent destruction of birds and animals. The altitude of the setting is from 1200 to 2000 ft. and hopes are entertained of making it a health resort for Brit. Guiana. The riv. gives its name to one of the three counties into which Brit. Guiana is divided. (See BRITISH GUIANA.) The central colony of Demerara was an offshoot from Essequibo, and was estab. in 1615.

Essex (A.-S. East-Seaxe), maritime co., S.E. England, bounded by Cambridge and Suffolk on the N., E. by the N. Sea, S. by the R. Thames, W. by London, Middlesex, and Hertfordshire. The surface is flat and marshy near the coast, but richly wooded in the centre and N. Among the chief rivs. are the Thames, Stour, Lee, Colne, Crouch, and Blackwater. Farming is good, and splendid wheat-crops flourish in E. Cereals, leazels, saffron; hops are largely grown and livestock raised. The manufs., include silk, lace, and straw-plats. There is a gov. powder-factory at Waltham Abbey. Oyster-fisheries and breweries are important. The Tilbury and Victoria and Albert Docks of the Port of London are on E. coast. Harwich is the port for continental traffic, and the cap. is Chelmsford. Pop. 1,314,000. See T. Wright, *History and Topography of Essex*, 1831; *Victoria County History, Essex*, 1903-7; A. C. Kelway's ed. of *Memorials of Old Essex*, 1908; P. Reaney, *Essex*, 1928; H. W. Tompkins, *Companion into Essex*; Clifford Bax, *Highways and Byways in Essex*, 1939; A. Moe, *Essex*, 1942; W. Addison, *Essex Heyday*, 1949.

Essex, Earl of. This title was conferred in 1572 on Walter Devereux, the scion of an old Hertfordshire house, but was originally borne by Devereux's ancestors (the Mandevilles, Bohuns, Bouchiers), and by Thomas Cromwell. In 1539, King Stephen created Geoffrey Mandeville earl of Essex, and the family of Bohun was the

next to bear the title, but on the death of Humphrey Bohun, 1373, the peerage seems to have reverted to the crown. In 1461 Edward IV. created Henry Bouchier earl of Essex, but on the death of his successor, the earldom became extinct, and in 1540 it descended upon the Cromwell family in the person of Thomas Cromwell (*q.v.*). The family of Parr obtained the earldom after the execution of Cromwell, but forfeited it in 1553. Thus the title was borne by six different families in Eng. hist. Two members of the Devereux family had the honour conferred upon them, viz. Robert (*q.v.*), earl marshal of England and one of Queen Elizabeth's favourites; and Robert Devereux (*q.v.*), commander-in-chief of the parl. forces in the Civil war. The earldom expired in 1646 at his death, but Charles II. conferred the title on the Capel family in 1661 (*see* CAPEL, ARTIUR), and the present earl is a representative of this family.

Essex, James (c. 1723-84), Eng. architect, son of a carpenter, *b.* at Cambridge; he was educated there at King's College. He showed great skill in Gothic architecture, and restored and altered many public buildings. These include King's College Chapel; Ely and Lincoln Cathedrals. He also designed the Ramsden building at St. Catherine's College (1757), the stone bridge at Trinity College (1766), and the Sidney Sussex College Chapel (1784).

Essex Regiment, formerly the 44th and 56th regiments, which were linked in 1881 to form the present regiment. The 44th was raised in 1741. Served in N. America under Gen. Braddock, and remained in Canada until 1765. Returned to America 1775 and served against the Fr. also in West Indies. Fought under Abercromby in Egypt in 1801. Joined Wellington's army in Peninsula in 1811; and captured a Fr. 'Eagle' at Salamanca; fought at Waterloo; thence in Burma and Afghanistan, Crimean and China campaigns. The 56th was raised in 1755, served at Havana in 1762, and was in the defence of Gibraltar, 1779-83. Served again in W. Indies; then went to India (1805). Served in Crimea and then in Egypt. Fought in S. African campaign, 1899-1902. Raised thirty-one battalions during First World War and served in France, Flanders, Gallipoli, Egypt, Palestine. As a unit of the famous 4th Indian Div. the regiment played their part at Sidi Barrani in the first great victory won by the Brit. Army in the Second World War, and later they took part in the capture of Gen. von Arnim and his forces in N. Tunisia (1943). In the battle of Normandy (1944) the 2nd Essex were part of the 45th Territorial Div. and fought in the battles for Venlo. The regiment also fought on the It. front. This is one of the few regiments which bears an 'Eagle' on its colours, which commemorates that captured at Salamanca. At Oxford Point, Bermuda, there is a quaint monument of tools, bayonets, and iron hoops erected by the men of the 56th Regiment (2nd Battalion, E. R.), who were isolated there during an outbreak of yellow fever many years ago.

Essex, Robert Devereux, second Earl of (1567-1601), Eng. nobleman and favourite of Elizabeth, son of Walter (*d.* 1576). He was educated at Cambridge, and accompanied Leicester's expedition to Holland in 1585. E. became master of the horse (1587) and took part in Drake's expedition to Portugal (1589). In 1591 he commanded an expedition to Normandy, and the land-forces at Cadiz in 1596. He married Sidney's widow in 1590, became Privy Councillor, 1593; earl marshal of England, 1597; and chancellor of Cambridge Univ., 1598. E. was also commander on 'the islands voyage,' an expedition to the Azores. In 1599 he was appointed lord-deputy of Ireland, but fell into disgrace for the failure of his operations against the Irish rebels (*see* note on Shakespeare's *Henry V.*, prol. to Act. v.). He tried to force a hearing from the queen, and falling in that, formed a plot to compel her to dismiss his enemies from power. For this he was accused of treason and executed, Bacon being his prosecutor. Elizabeth was said to have been inconsolable for his loss. *See* Earl of Clarendon, *The Characters of Robert, Earl of Essex, and George, Duke of Buckingham*, 1700; D. Hume, *History of England*, 1789; *The Devereux papers with R. Broughton's Memoirs (1575-1601)* ed. by H. Malden, 1923; G. B. Harrison, *The Life and Death of Robert Devereux, Earl of Essex*, 1937.

Essex, Robert Devereux, third Earl of (c. 1591-1646), Eng. general, son of Robert (executed in 1601), *b.* in London. James I. restored to him his father's rank and titles (1604). He was a companion of the Prince of Wales (later Charles I.), but by 1626 had joined the parl. party. E. was lieutenant-general in the army sent against the Scottish Covenanters (1639). He refused to accompany Charles in his flight from London, and became leader of the Presbyterian party. In 1642 he commanded the parliamentary army, and fought at Edgehill; captured Reading, and relieved Gloucester (1643). E. won the first battle of Newbury in 1643. His invasion of Cornwall (1644) proved unsuccessful, and his army capitulated at Lostwithiel. E. resigned his commission (1645) on the passing of the 'Self-denying Ordinance.' He was the last of his family to bear the title. *See* R. Codrington, *Life of Robert, Earl of Essex*, 1646; Sir R. Cust, *Lives of the Warriors of the Civil Wars of France and England*, 1867.

Essex, Walter Devereux, first Earl of (c. 1541-76), Eng. nobleman and statesman, son of Sir Richard Devereux. In 1569 he raised troops to suppress the N. rebellion under the earls of Westmorland and Northumberland, and was created earl of E. in 1572 for this service. A favourite of Elizabeth, he was sent as commander (1573) to conquer the Ulster rebels. His attempts to subdue and colonise Ulster were not very successful. E. resigned his command in 1575, but returned as earl marshal of Ireland, and died at Dublin. *See* D. Hume, *History of England*, 1789; W. Devereux, *Lives of the Earls of Essex*, 1855.

Essington Port, bay of N. Australia on the N. side of Coburg peninsula. The shores of the bay are low and destitute of vegetation. The climate is unhealthy. On the W. side, 17 m. from its entrance, the Brit. settlement of Victoria was founded in 1839. It was abandoned in consequence of its insalubrity in the year 1845.

Esslingen, anct. tn. of Württemberg, Germany, with 40,560 inhabs., dominated by a castle. It has three churches of the thirteenth and fourteenth centuries and a fine late Gothic tn. hall of 1430, the Katharine hospital founded in the thirteenth century, and the remains of the tn. walls. The industrial quarters are outside the old tn., there are machine, textile (especially gloves), leather toys and furniture industries. It is celebrated for its wines. Pop. 43,100.

Essonnes, Fr. tn. in the dept. of Seine-et-Oise, on the Essonne, half a m. S.W. of Corbeil. It has important paper mills. Pop. 10,000.

Est, canal in the N.E. of France, starting from the Meuse near Givet, and traversing the valley of the Meuse to Port-sur-Saône. It includes canalised portions of the Rs. Meuse and Moselle. The total length is 285 m.

Established *Char.* *sec.* ENGLAND, CHURCH OF; SCOTLAND, CHURCH OF; STATE CHURCH.

Estaing, Charles Hector Théodat, Comte d' (1729-94), Fr. admiral, a native of Auvergne. In 1778 he went to help the U.S.A. against Britain, and in the following year took St. Vincent and Grenada. At Hospital Hill Forts on a plateau 400 ft. high adjoining St. George's, the Brit. under Sir George (afterwards Lord) Macartney made a brilliant stand against the Fr. under d'E. in July 1779. D'E's force of 3000 only succeeded in carrying the lines after losing 300 to a garrison which over the whole island only numbered 500. D'E. however failed to capture St. Lucia and was beaten off by a strong force landed on the is. through the advice of Rodney (1778). D'E. was, however, wounded in a subsequent engagement, and returned to France, where he was eventually put to death for supporting Marie Antoinette. See B. Edwards, *The History, Civil and Commercial, of the British Colonies in the West Indies*, 1793.

Estaires, Fr. tn. in Nord, on the Lys. 12 m. W. of Lille. In the First World War, captured by the Gers. In their final effort of 1918 on April 10; two days later Gen. Haig issued his fateful Order of the Day containing the sentence 'every position must be held to the last man; there must be no retirement.' Pop. 4500.

Estancia, tn. of Brazil, 25 m. S.W. of Sergipe on the Piauy. It exports cotton and tobacco. Pop. 12,000.

Estate. An E. signifies that title or interest which a person has in lands, tenements, hereditaments, or other property. It is either real E., which comprises freehold lands, tenements, or hereditaments, and copyhold lands; or personal E.,

which comprises all other kinds of property or rights in or over property, including leasehold interests in lands, tenements, and hereditaments (*see also* ENTAIL, FEE, FEE SIMPLE, and FEE TAIL). This is the modern legal connotation of the term, and it signifies not the subject of ownership itself, but the proprietary interest subsisting in it. Es. are either in possession or in expectancy. Es. in expectancy are divided into Es. in remainder or reversion (*see* CONTINGENT REMAINDER, REVERSION (in law)). An E. in reversion arises either expressly, or by mere implication of law, as where a tenant in fee simple grants a life E. to another, and thereby impliedly reserves to himself the E. ownership in reversion. Es. may be enjoyed by one person only, or by more than one either severally (*see* COMMON, TENANCY IN) or jointly. Es. are also either legal or equitable. A legal E. subsists in the owner when he is in actual possession, and is also either entitled to the beneficial interest himself or holds in trust for some other person. A mortgagee by deed is the legal owner of land, the subject of the mortgage, but holds the residue of proceeds, where a sale takes place for the realisation of his debt, in trust for the mortgager, or equitable owner. An equitable E. subsists in a person who, though not the actual and legal owner, is entitled to the beneficial interest of the property of which some other person is in possession as legal owner. Es. in popular language have come by a process of metonymy or extension to mean the actual lands and premises of a landowner of some territorial pretensions. The word was also used formerly as a synonym for status, or a man's condition in life. It is still used with a somewhat similar connotation in respect of the hierarchy of political classes, which in Great Britain are the three Es. of Lords Spiritual, Lords Temporal, and Commons. *See* ESTATES OF THE REALM.

Estate Duties, name given in the U.K. to the duties paid on the estates of deceased persons. They date from 1894. Real property, hitherto exempt from charges of this kind, was made to pay at the same rate as personal property, and the duties were levied on a graduated scale. The legacy duty, which was in force before 1894, was sometimes classed with the E. D. Gifts made within three years of death, unless part of the deceased's normal expenditure, were charged with duty. Payment may be made in real or leasehold property; also in war loan, which is taken at its nominal value. Interest on the duty on personal property is charged at the rate of 4 per cent, reckoned from the day of the death. On real estate this can be paid by instalments, on which interest is charged only after a year (*see further under* DEATH DUTIES). Since 1949 legacy and succession duties have been consolidated into estate duty, which was increased by the budget of that year in order to raise £20,000,000 more. The table, on p. 430, shows the present rates of estate duty and the rates proposed in 1949:—

Net capital value of total estate			Rate per cent of duty	Net capital value of total estate			Rate per cent of duty
Exceeding £	not exceeding £			Exceeding £	not exceeding £		
—	2,000		nil	—	2,000		nil
2,000	3,000		1	2,000	3,000		1
3,000	5,000		2	3,000	5,000		2
5,000	7,500		3	5,000	7,500		3
7,500	10,000		4	7,500	10,000		4
10,000	12,500		6	10,000	12,500		6
12,500	15,000		8	12,500	15,000		8
15,000	20,000		10	15,000	17,500		10
20,000	25,000		12	17,500	20,000		12
25,000	30,000		14	20,000	25,000		14
30,000	35,000		16	25,000	30,000		16
35,000	40,000		18	30,000	35,000		18
40,000	45,000		20	35,000	40,000		20
45,000	50,000		22	40,000	45,000		22
50,000	60,000		24	45,000	50,000		24
60,000	75,000		27	50,000	60,000		27
75,000	100,000		30	60,000	75,000		30
100,000	150,000		35	75,000	100,000		35
150,000	200,000		40	100,000	150,000		40
200,000	250,000		45	150,000	200,000		45
250,000	300,000		50	200,000	300,000		50
300,000	500,000		55	300,000	500,000		55
500,000	750,000		60	500,000	750,000		60
750,000	1,000,000		65	750,000	1,000,000		65
1,000,000	2,000,000		70	1,000,000			70
2,000,000			75				80

The rates of the legacy and succession duties, which it was proposed in the budget of 1919 to abolish, are as follows:

Relationship of the Beneficiary	Rate of duty
Husband or wife, child or lineal descendant of child, father or mother or any lineal ancestor . . .	2
Brother or sister, lineal descendant of brother or sister . . .	10
Any other beneficiary (excluding charities . . .)	20
Charities . . .	10

The net receipts from estate duty between 1946-1948 were as follows:

Year ended	Estate Duty	Legacy and succession duty
March 31	£	£
1946	108,559,893	9,708,629
1947	135,925,929	11,483,716
1948	156,622,912	12,552,344

Estate Duty, see DEATH DUTIES.

Estate Tail, see ENTAIL.

Estates of the Realm means the classes or orders of men invested with political rights in a nation or state. In Great Britain, for example, the three E. of the R. are the Lords Spiritual (or bishops), the Lords Temporal (peers entitled to vote in the House of Lords), and the Commons. The sovereign and these three estates together form the corporation or body politic of the kingdom. The Commons or third estate comprises not only the members of any given House of Commons but the whole of the electorate, i.e. every

one who has a voice in Parliament whether personally or by his elected representatives. Originally the phrase denoted the nobles, the clergy, and the commons, but the growth of parliament and the consequent elimination of the clergy as a separate political body gradually tended to stereotype the phrase in the above and narrower meaning. Analogous estates are, of course, to be found in most countries with an estab. polity. The term Fourth Estate of the Realm has often been applied to the public Press, on account of the enormous influence exerted by it in regard to public matters.

Estaunié, (Louis-Marie-) Edouard (1862-1942), Fr. novelist; b. at Dijon; son of a mining engineer. Educated at Jesuit Coll. of Dijon, and Lycée St. Louis; old pupil of École Polytechnique. After science-teaching in Paris, employed in engineering section of dept. of posts and telegraphs, became director of construction, and finished as inspector-general of telegraphs. He began novel-writing with *Un Simple*, (1891), followed in the same year by *Bonne Dame*. E. became celebrated with *L'Empire* (1895) suggested by his Jesuit education. Other works include: *L'Épave* (1902), *La Vie Secrète* (1908), *Les Choses Vient* (1913), *Solitudes* (1917), *L'Ascension de M. Baslevre* (1921), *L'Appel de la Route* (1923), *L'Infirmes aux Mains de Lumière* (1923), *Le Labyrinthe* (1924), *Tels qu'ils furent* (1927). He was elected member of the Academy, 1924. See life by J. Charpentier, 1932.

Estcourt (3833 ft. high), seat of magistracy for Weenen co., Natal, S. Africa.

has large bacon and cheese factories. The climate is one of the finest in Natal and the scenery charming. Stock-breeding is carried on on a large scale. (White) Pop. 1000

Este, tn. of Italy, in Lombardy. It gave name to a noble family, very prominent in It. hist., of the fifteenth and sixteenth centuries, from whom the present royal family of England is descended. The tn. has picturesque battlements and walls from the Venetian period. Pop. 13,000.

Este, House of, one of the most anct. and famous princely families of Italy, founded by Oberto II. (d. c. 1015), Margrave of Casal Maggiore. To Azzo II., his grandson, the Emperor Henry III.

divided into two branches, one of which died out in 1838. The three existing branches into which one of the original ones was divided are the Csesznek, Altsohl, and Forchtenstein. The chief members of the family are: *Paul IV.* (1635-1713), who became a field-marshal at the age of thirty, and was made a prince of the empire. *Nicholas IV.* (1765-1833), a great promoter of art, and the man to whom Napoleon is said to have offered the throne of Italy. *Paul Anthony* (1786-1866), a diplomat, who was Austrian ambas. in London until 1842, and in 1848 became minister for foreign affairs under Batthyani. *Moritz* (1807-90) and *Moritz* (b. 1881) earned fame also as diplomats, and statesmen.

THE TOMB OF BEATRICE D'ESTE AND HER HUSBAND

Although this lady lived only twenty-two years (1475-97), she is one of the most celebrated members of the House of Este

granted Este and other It. fiefs. Azzo was created Duke of Milan, and assumed the name of Este. His two sons Welf (Guelph) IV. and Fulco I. founded respectively a Ger. and an It. branch of the H. of E. The It. branch furnished the leaders of the Guelphs in the thirteenth and fourteenth centuries. The male It. line became extinct on the death of Hercules III., 1803. The Estensi were mostly good and enlightened rulers, and founded the universities of Padua and Ferrara. See G. Crawford, *History of the House of Este*, 1681; A. Ciscato, *Storia d'Este dalle Origini al 1839*, 1890; L. Planiscq, *Die Estensche Kunstsammlung*, 1919.

Estella, tn. in the prov. of Navarra, Spain. It figured largely in the Carlist wars of 1833. Pop. 6000.

Estepa, tn. in the prov. of Seville, Spain, which figured in Rom. times under the name of Astapa. Pop. 8000.

Estepona, seaport tn. in the prov. of Malaga, Spain. It produces large quantities of fruit and vegetables. Pop. 10,000.

Esterhazy de Galantha, the name of an anct. Hungarian family dating from the thirteenth century, at which time it was

Esters, Ethereal Salts, or Acidic Ethers, are compounds formed by the replacing of the hydrogen in acids by alkyl groups; they occupy the same position in organic chemistry as the metallic salts do in inorganic. They are formed by the action of an acid or acid chloride on an alcohol, and are, as a rule, pleasant, fruity-smelling liquids, non-miscible with water, which are hydrolysed on heating with alkalis, an alcohol and the salt of an acid being formed. The fats consist of the palmitic, stearic, and oleic E. of glycerin, and on boiling with soda, the sodium salt of the acid (soap) and glycerin are formed. The process is known as 'saponification.' Many E. are used for flavouring purposes, e.g. amyl acetate (jargonelle pear), ethyl butyrate (pineapple), etc., the former also being used as a solvent for celluloid.

Esther, Book of, tells how in the reign of the Persian king Ahasuerus, Haman, the king's minister, was at last bringing to a successful end his intrigues for the extermination of the Jews. But Ahasuerus had just married Esther, a Jewess, though her nationality is kept secret from her husband. She and her uncle, Mordecai, make a counterplot, which is ultimately

successful. Mordecai is made minister and raised to great honour; Haman is hanged on the gallows 50 cubits high, which he has prepared for Mordecai, and instead of the massacre of the Jews, a massacre of the Persians takes place by royal edict. The book then tells of the institution of the feast of Purim to commemorate this great deliverance. Ahasuerus is the Gk. Xerxes, and Mordecai is represented as becoming minister in the twelfth year of his reign, i.e. in 474 B.C. The date of composition, however, is the third or second century B.C., and the historical setting is so untrustworthy that many critics regard it as entirely the invention of the writer, a romance intended to further the observance of the feast of Purim. The work was in much favour among the Jews, and later became incorporated into the Christian canon of the O.T. Luther, in later years, did not scruple to express the small account in which he held the work. The tone is, indeed, violent and secular. It is noteworthy that the name of God does not appear once, while the name of the Great King appears about two hundred times. See commentaries by L. B. Paton, 1908, and G. Smith, 1930; and J. Hochander, *The Book of Esther in the Light of History*, 1923.

Estienne, family of Fr. printers, see STEPHENS.

Eston, urb. dist., 4 m. S.E. of Middlesbrough, with extensive blast furnaces, iron foundries, and steam sawing mills. The Cleveland iron-stone was first discovered here. Pop. 31,000.

Estonia, *Estivabariik*, *Estland*, or *Eesti-Maa*. The most N. Baltic prov. It was admitted to the U.S.S.R., Aug. 6, 1940. The is. of Dago, Oesel, and other smaller is. in the Baltic, form part of the ter. During the thirteenth century was under the sway of Denmark but in 1346 was handed over to the Teutonic knights. In 1561 it came under the rule of Sweden, and in 1781, by the treaty of Nystadt, Russia became its ruler, until, on the outbreak of the Soviet revolution, it became a republic. It has an area of about 18,000 sq. m., and is bounded on the N. by the gulf of Finland, on the S. by Latvia (q.v.), on the W. by the Baltic Sea, and on the E. by Lake Peipus and the R.S.F.S.R. The pop. (1939) was about 1,150,000 persons, of whom about 90 per cent are Estonians and the remainder Russians, with a small sprinkling of Gers. and others. The surface of the land is generally low and flat, and it is subject to great extremes of temp. The chief industry is agriculture and dairy farming, employing over half the workers, rye, oats, barley, flax, and potatoes being the chief crops, and butter, bacon, and eggs the chief dairy farm products. The most important manufs. are cotton, woollens, paper, matches, and distilling, and the Kreenholm cotton mills near Narva are among the largest in Europe. There is a univ. at Tartu (Dorpat), founded in 1632 and enlarged in 1802, and a technical univ. at Tallinn (1936). The cap. city Tallinn (Reval), with a pop. (1938) 146,400, is an important Baltic

port connected by railway with Leningrad; other tns. are Tartu (60,000); Narva (25,000); and Parnu (21,000), on the gulf of Riga.

A new constitution came into force in 1938, replacing an 'authoritarian' regime under which E. had been ruled since 1934. All political parties were abolished and the Diet replaced by 'corporations' (see CORPORATIVE STATES). The only political organisation was then the 'popular front,' which was created by the gov. to support the new constitution. E.'s position, like that of the other Baltic States (see BALTIC STATES) grew hazardous as the international situation deteriorated, it being obvious that they were but pawns on Russo-Ger. chessboard. In Oct. 1938 E. introduced a neutrality law modelled on that of the Scandinavian states. This was followed in June 1939 by a non-aggression pact with Germany simultaneously with that country's pact with Latvia—pacts which at once moved Russia to 'guarantee' Estonian independence—an offer which E. rejected. Trouble soon came when the Gers. invaded Poland, Russia charging E. with harbouring in their waters Polish submarines which, it was alleged, had attacked Russian steamers. The sequel was a pact of mutual assistance in which Russia was granted the right to estab. naval and air bases on Estonian ter. Soviet troops crossed the border and warships entered Tallinn harbour. The Ger. reaction to this move was to 'reparatize' the Ger. minority of some 16,000 persons whose ancestors had dwelt in E. for generations. In 1941 E. was occupied by Ger. forces, but early in 1944 the Russians were driving rapidly westward toward the Estonian border; by mid-Sept. one section of Gen. Govorov's forces struck the W. shore of Lake Peipus while another converged on Tallinn, which city fell to the Russians on Sept. 22 and the subsequent fall of Baltiski and Parnu led to the evacuation of the country by Ger. troops. During the first year of Russian occupation (1940) nearly 61,000 Estonians were killed, arrested or deported to Siberia. Later under Ger. occupation came compulsory mobilization, which was defied, and ruthless conscription for forced labour. Thousands were sent to concentration or slave labour camps. In the autumn of 1941 the Baltic States' tragedy reached its climax with the second Russian occupation. Hundreds of thousands of Balts fled to Germany, Poland, Czechoslovakia and Austria and to-day a great many of these are to be found in the Displaced Persons' camps of W. Germany. Forced collectivisation of farms has deprived an essentially individual people of their inheritance. In early 1948 there were seventy collective farms in E. now there are 300. See A. Pullerits, *Estonia, Population, Cultural and Economic Life*, 1937; B. Newman, *Baltic Roundabout*, 1939, and *Baltic Background*, 1948; F. W. Pieck, *The Baltic Nations*, 1945; J. H. Jackson, *Estonia*, 1948. See EASTERN FRONT, OR RUSSO-GERMAN CAMPAIGN IN SECOND WORLD WAR.

Estoppel, the legal term which is applied to anything which prevents a person from denying or confirming a fact on account of his own actions. The three kinds of E. are: (1) Those of record, which prevent either of the parties from offering any statements contrary to the recorded judgment; (2) E. by deed, which prevents a man from denying any statement made by him in a written deed; (3) E. in pais or by conduct, which includes such instances as a tenant's inability to deny his landlord's title, once the tenant is in possession.

Estovers, term applied to the supplies of wood which a tenant has the right to take for purposes of fuel or repair from the estate on which he lives.

Estrays, animals which are not wild but are found wandering without an owner in any public place or on some one else's property. They become the temporary property of the lord of the manor if found within the confines of a manor, or if in any other place, they become subject to the Crown. Should they not be claimed within a year and a day this proprietorship becomes permanent.

Estreat, term in Eng. law applied to a true copy of some writing, particularly a fine or amercement entered in the records of a court of law. It is also applied to recognisances when the conditions of the latter are not kept. Under these circumstances only are recognisances estreated, and the parties are considered as debtors to the Crown.

Estrees, Gabrielle d' (1573-99), daughter of the Marquis Antoine d'E., and mistress of Henry IV. of France. She married Nicolas d'Amerval, Seigneur de Liancourt, but she left him on account of her preference for Henry. The latter, it is said, wished to divorce Marguerite de Valois and to marry Gabrielle, but her sudden death prevented the carrying out of his plans.

Estrella, Serra da, mt. range of Portugal, stretching from the S.W. to the N.E. for about 75 m. through the old prov. of Beira. It is a granite range and culminates in Mahão, 6,540 ft. high.

Estremadura: (1) Originally a prov. of Portugal, now the dists. of Santarém, Leiria, and Lisbon. The Tagus divides the dist. into two parts, the N. one being mountainous. The chief products are wheat and wine. The chief tns. are Lisbon and Setúbal. Area about 6,937 sq. m. Pop. 1,379,500. (2) Anct. dist. of S.W. Spain, now occupied by the two provs. of Badajoz and Cáceres. Area about 16,000 sq. m. Agriculture is very little attended to, but the people are engaged in breeding domestic animals. There are also copper, silver, and lead mines. Pop. 1,258,600.

Estremoz, tn. in the prov. of Alentejo, Portugal, situated to the N.E. of Évora. Pop. 5,000.

Estuary (Lat. *æstuarium*, from *æstus*, the tide), an inlet of the sea at the mouth of a riv. where the water of the riv. and the sea meet, and the fresh and salt are mingled. The riv. seeks an exit in the sea, and the tide flows in towards the riv.,

so that some estuaries are subject to tidal waves of great force.

Ezek or Easag (Osjek), tn. of Yugoslavia, situated on the R. Drave, about 13 m. from its junction with the Danube. It is a trading centre and manufs. silk and flour. It is built on the site of the Rom. tn. of Mursia. Pop. 40,300.

Etah: (1) Dist. of India, in the United Provinces. Area about 1740 sq. m. Pop. 828,000. (2) Eskimo settlement, situated on Smith Sound, Greenland.

Etampes, tn. in the dept. of Seine-et-Oise, France. It is interesting on account of its old churches, tn.-hall, and castle ruins. Pop. 10,400.

Etaples, watering-place and fishing port in the dept. of Pas-de-Calais, France, situated near the mouth of the Canche R., about 15 m. S. of Boulogne. Its antiquities bear testimony to its importance in Rom. times, while in the Middle Ages it was noteworthy. A treaty was signed here in 1492 between Henry VI. of England and Charles VIII. of France. E. was severely damaged in the First World War. Pop. 6800.

Etaples, J. Lefèvre d', see FABER, JACQUES.

Etawah, cap. of the dist. of Etawah, United Provinces, India, situated on the l. b. of the Jumna in a picturesque locality. This tn., which is an important trading centre, contains many fine streets, Hindu temples, and steps or ghats leading down to the riv., affording facilities for the pilgrim's ablution. Pop. (tn.) 42,000.

Etching, the art of engraving by eating into the metal with a mordant. The so-called 'Dutch bath' (hydrochloric acid and potassium chlorate), dilute nitric acid, or a solution of perchloride of iron is the mordant commonly used. A thin layer composed of gums, waxes, and resins is spread over the metal plate to form the 'etching-ground.' One method of applying the ground is as follows. The gums, etc., are squeezed into a ball covered with silk. If the heated copper is brought into contact with the ball, the composition oozes through the silk, and as it melts, may be spread over the plate with a silk pad or dabber. Usually the etcher holds the ground over a flame so as to blacken it with smoke. The object of this is to show up the lines he opens. If he wants to transfer a design, all he need do is to cover a thin sheet of paper with chalk and then trace over the design on the paper, when it is laid upon the copper plate. When the drawing is indicated on the ground, the plate is immersed in the acid bath, and the mordant 'bites' into the lines. After the most delicate strokes are sufficiently etched, the plate is taken out and these strokes are filled up with a stopping-out varnish, like Brunswick black. This process of immersion in the bath and stopping-out the lighter gradations is continued until the acid has bitten in sufficiently to make the blackest lines. If he likes, the etcher can proceed in a different way. At first he uses his needle to open only the darkest lines and then dips his plate into the mordant so as to

get these partly bitten. He next draws in the parts which are to be a shade lighter, and allows the acid to corrode these. This process is persisted in till he comes to the lightest parts. It will be seen that the corrosion is in proportion to the depth of tone required. If a soft ground E. is required, that is one imitating the texture of a crayon drawing, tallow is mixed with the E. ground and the design is firmly traced through a sheet of paper, when the grain of the latter and the kind of pencil used will leave their mark.

History.—Albrecht Dürer was a pioneer in this field and etched his 'The Cannon' upon iron. Van Dyck (1599–1641), who was 'the solitary great etcher' of the Rubens school, depended for his splendid effects on the use of the open line and vigorous, dotted work, and aimed always at broad effects. Rembrandt (*d.* 1669), on the other hand, who is the perfect 'painter-etcher' relied on close-hatching, and discovered how, by leaving ink on the surface of the copper, he could cope with the difficult task of reproducing the chiaroscuro of his paintings and ensure a rich and liquid surface tone. His etchings embrace portraits, landscapes, and religious themes, 'Christ with the Sick around Him, Receiving little Children,' being widely accepted as his masterpiece. Other and notable painter-etchers of Holland were, Adriaan van Ostade (1610–85), Paul Potter (1625–54), and Nicolas Berchem (1683). In the eighteenth century the It. school of etching reached its high-water mark in the delicate 'Capricci' of Giovanni Tiepolo (1693–1770), and the architectural designs of Piranesi (1720–1778). A school of satirical etching developed in England. Hogarth (1697–1764) etched his own paintings, such as the 'Rake's Progress,' whilst Thomas Rowlandson (1756–1827) illustrated the story of Dr. Syntax and the *Vicar of Wakefield*, and proved himself a brilliant caricaturist. George Cruikshank (1792–1878) may well be mentioned in connection with Rowlandson, as he has won universal favour by his sympathetic interpretation of Dickens' odd characters. Early in the nineteenth century (1807–19), appeared Turner's *Liber Studiorum*, which contained some excellent plates of his own as well as the etchings of a number of less famous engravers. Francisco Goya (1746–1828) is the finest Sp. etcher; his power to seize upon all hypocrisies and affectations is well exemplified in his 'Caprichos,' whilst his 'Desastres de la Guerra,' are remarkable, if almost repulsive, expositions of the terrors of war.' In the last century the work of Eugène Delacroix (1799–1863), and of A. Decamps (1803–1868), did much to revive the art, which in some respects seemed to have grown stagnant. Other notable Fr. etchers were A. Legros (1837–1911) and C. Meryon (1821–1868). But the greatest etcher of the day was probably the Amer. J. A. McNeill Whistler (1834–1903), whose charming and exceptionally individualistic work is seen at its best in 'Battersea,' and the 'Venice set.' In recent years E. has been favoured greatly by prominent Brit. artists such as

Sir D. Y. Cameron, Frank Brangwyn, Walter Sickert and Sir Muirhead Bone. See also ENGRAVING; PHOTOGRAPHY; PROCESS WORK.

Etching of Crystals is achieved artificially by subjecting crystals to the action of such solvents as caustic alkalis or acids, although rock salt often becomes etched by a natural process. This salt, being deliquescent, becomes coated, after crystallisation, with a layer of water. In course of time tiny rectangular depressions are formed all over the surface. When a crystal is immersed in some solvent 'etch figures' are formed. The crystallographer frequently uses the etching marks to assist him in his classification of a certain piece of crystal; for they are found to be closely related to its crystallographic form.

Eteocles, in Gk. mythology, was the son of Œdipus and Jocaste. He, with his brother Polyneices, succeeded to the throne of Thebes on the flight of their father. They undertook to rule in turns, but could not agree over this arrangement, which led to the flight of Polyneices to the court of Adrastus to obtain vengeance. The result of this was a war known as the Seven against Thebes, which figures largely in Gk literature. In this war E. and Polyneices met in combat and killed each other. This story is told in *The Seven against Thebes* by Æschylus. See also EPICONT.

Eternal Punishment, see HELL.

Etesian Winds are those which are prevalent, during summer, over the S. part of Europe. Their direction is N. across the Mediterranean Sea to N. Africa, and they seem to be caused by the rising of the heated air over the Sahara and the consequent influx of cooler air to replace it.

Étex, Antoine (1808–88), celebrated Fr. sculptor, architect and painter, *b.* in Paris. Studied sculpture under Dupaty and Pradier, painting at the Ingres School, and later, architecture under Duban. In 1829 he took the second prize for sculpture at the School of Fine Arts, with his 'Hyacinthe mourant.' He also won in the same period prizes for a painting of a nude bather shown in the Lebrun Gallery, and other awards. His chief work is that which he was commissioned by the Fr. Gov. to do for the Arc de Triomphe and the colossal groups on the rear face of the Arc. These groups represent the *Resistance* of France to the coalition of 1814, and *Paix*, 1815, but though impressive, suffer to some extent by such close juxtaposition with 'La Marseillaise,' the masterpiece of Rude, which is to be seen on the opposite side. Other fine pieces of E. include a marble figure, 'Olympia,' inspired by Ariston and now at Trianon, and a marble group of 'Hero and Leander,' now in London. His work was, however, criticised by G. Planché, as lacking in simplicity, though revealing all the secrets of the art. Pubs. include *Étude sur la vie et les ouvrages de J. Pradier* (1859); *L'Institut et l'Académie des beaux-arts* (1860); *Les Trois Tombeaux de Gérardin* (1885) and a biography *Les Souvenirs d'un Artiste*, 1877–87.

Ethal, also called **Cetyl Alcohol**, for it seems to be the hydroxide of a radical called cetyl. It is a solid, transparent, white crystalline mass, which melts at about 50°C. , and is contained in spermacetti.

Ethane (C_2H_6), a gas composed of hydrogen and carbon, is contained in the gas which rises from the earth. It is colourless, without smell, and will burn in air with a luminous though pale flame, and is insoluble in water. E. is the second number of the paraffin series, the first being methane or marsh-gas (*q.v.*).

Ethelbald (*d.* 860), king of Wessex, second son of Ethelwulf. He rebelled against his father and took the kingdom, leaving him only Kent (856). E. ruled well, putting Danes to flight. He married (858) Judith, his father's widow, and at the instigation, it is said, of St. Swithun, he left her.

Ethelbert (*c.* 552-616), fourth king of Kent, succeeded his father Ermeric in 560. His marriage with Bertha, daughter of Charibert, king of the Franks, led indirectly to St. Augustine's mission, and by him E. was converted to Christianity in 597, and he in his turn influenced thousands of his subjects to turn Christian. He destroyed pagan temples and built churches, and also estab. the first written Saxon set of laws. This brought about a rebellion under Redwald which was successful.

Ethelbert (*d.* 866), third son of Ethelwulf. By his father's will he was to have Kent as under-king. On the death of Ethelbald he took the whole realm (860), contrary to his father's will, which had named Ethelred.

Ethelbert, or Albert, Saint (*d.* 794), king of E. Anglia during the Mercian supremacy under the rule of Offa. Offa's wife was afraid that E. would marry their daughter Alfrida, and possibly supplant her husband, so she prevailed upon Offa to have E. put to death.

Etheldreda, Saint (*c.* 630-*c.* 679), abbess and founder of the religious house of Ely. She was married twice, but preferred the religious life, and so withdrew from married life into a convent. She was also known by the name of St. Audrey, the origin of the present word *laundry*, originally applied to a cheap kind of lace purchasable at St. Audrey's Fair.

Ethelfleda (*d.* *c.* 919), daughter of King Alfred, and the wife of the earldorman of Mercia. She was successful in helping to subdue the Danes, and on the death of her husband (*c.* 912) assumed the rule over his lands. She had the title 'The Lady of the Mercians.'

Ethelfrid, or Ethelfrith, king of Northumbria (*d.* 617), son of Ethelric. Having succeeded in 593, he gained a victory over the Britons of the N. at Dawstone in 603. In 617, however, he was defeated and slain in a battle against Redwald of E. Anglia.

Ethelred I. (*d.* 871), king of the W. Saxons. He was the son of Ethelwulf and elder brother of Alfred. It was in his reign that the Danes first attempted to make settlements in England. He con-

quered them at Reading and Ashdown, and was conquered by them at Merton, where he was fatally wounded.

Ethelred II. (968-1016), surnamed 'the Unready' (lacking in 'redo' or counsel). He succeeded his half-brother, Eadward the Martyr (978). At first he tried to repulse the Norsemen by bribery, but finally he massacred the Danes (1002) in time of peace in a brutal manner, which led Sveyn to gather a large force to avenge the slaughter, when E. was conquered and obliged to flee to Normandy, his father-in-law being the duke. He was recalled by his former subjects in 1014, which was the year of the death of Sveyn.

Ethelred, St., see Alfred.

Ethelwold, St., bishop of Winchester (963-984), b. during the first quarter of the tenth century. He was the companion and helper of St. Dunstan, and these two together, with the king's authority, helped to reform the monasteries, replacing the canons by monks, and enforcing the rule of celibacy.

Ethelwulf, ruler of Wessex and Kent (*d.* 858), the son of Egbert. He succeeded to the throne in 839, and his reign was occupied with constant incursions of the Danes, by whom he was defeated at Charmouth about 842, and over whom he was successful a few years later at Ockley.

Ether, in physics, see ETHER.

Ether waves (radio), a name sometimes given to the systems of moving electric and magnetic forces under which are included the electro-magnetic radiators known as X-rays, heat, light and wireless waves. A single E.W. is one complete cycle of change of state in the medium. See ETHER.

Ether, Ethyl Ether, or as it was formerly called, **Sulphuric Ether** ($\text{C}_2\text{H}_5\text{O}$), is prepared by the so-called 'continuous process,' by the action of sulphuric acid on ordinary alcohol: 9 parts of concentrated sulphuric acid and 5 parts of alcohol are heated to 140°C. in a retort, whereby ethyl hydrogen sulphate is formed ($\text{C}_2\text{H}_5\text{OH} + \text{H}_2\text{SO}_4 = \text{C}_2\text{H}_5\text{HSO}_4 + \text{H}_2\text{O}$). A slow stream of alcohol is then run in, which reacts with the ethyl hydrogen sulphate to form E. ($\text{C}_2\text{H}_5\text{HSO}_4 + \text{C}_2\text{H}_5\text{OH} = (\text{C}_2\text{H}_5)_2\text{O} + \text{H}_2\text{SO}_4$). The sulphuric acid which is regenerated reacts with more alcohol according to the first equation, and so the process may be regarded as 'continuous.' At least, until the water formed dilutes the sulphuric acid to such an extent as to render it ineffective. The crude E. which distils over is washed with caustic soda solution, the top layer containing the E. being dried over lime and redistilled. E. is a colourless, mobile and volatile liquid, with a peculiar smell, it is lighter than water (sp. gr. 0.72) and boils at 35°C. It is somewhat soluble in water, and readily dissolves fats, resins, and oils, for which purpose it is largely used in the arts. E. is very inflammable, burning with a somewhat luminous flame, and forming an explosive mixture if its vapour is mixed with air. Chemically it is stable and not readily reactive. Owing to its low boiling point (below blood heat) it vaporises so

rapidly in the air as to produce intense cold. Use is made of this in some freezing machines, and also in producing local anæsthesia by freezing. Medicinally it is also used as a heart stimulant, in small quantities; and more generally as an anæsthetic when inhaled, for which purpose it is safer than chloroform, though accidents have frequently occurred owing to its great inflammability.

Etherege, Sir George (c. 1635-91), dramatist, was a man in easy circumstances, who wrote plays merely to amuse himself, in those hours that he could snatch from the pleasant saunterings of a man about in. He wrote three comedies: *The Comical Revenge, or Love in a Tub* (1664), *She Would if She Could* (1667), and *The Man of Mode, or Sir Fopling Flutter*, (1676). These plays had wit, but their indecency was such as to bring upon them the censure of Steele, though in this respect they were no whit worse than those of many of his contemporaries. Shortly after the production of his last comedy he was knighted, though why this honour was bestowed upon him has not transpired. He was sent as minister to The Hague by Charles II., and by James II. in 1685 to Ratisbon, where his private conduct was disgraceful and his diplomatic value nothing. His works were collected and ed. by A. W. Verity (1888), and H. F. B. Brett-Smith (1927 f.). See lives by V. Meindl, 1901 and F. S. McCamie, 1931.

Ethers, or Alkyl Oxides, class of compounds of which ordinary or Ethyl E. (q.v.) is the best known. They are related to the metallic oxides in the same way as the alcohols are to the hydroxides. Their formulae may be represented by ROH^1 , where R and R^1 are two hydrocarbon radicals. They are prepared by the action of the alkyl halides on silver oxide, or of the alkyl hydrogen sulphate on the alcohol, and in other ways. Chemically the Es. are neutral, inert bodies varying from volatile liquids to waxlike solids. The term E. is often applied to esters, which may be regarded as Es. in which one of the radicles is of an acidic character.

Ethical Societies. At the end of the nineteenth century E. S. to promote the study and application of ethical principles without theological commitment were formed, first, in America, and then elsewhere, mainly in Britain, Germany, and Austria. The headquarters of the Brit. societies is The Ethical Union, Incorporated, 4a Inverness Place, London, W. 2. The Union publishes a monthly journal *News and Notes* and a quarterly *The Plain View*, and initiates social research, public conferences, summer schools, lecture courses, and pubs., in furtherance of its object, that is, the improvement of human relations and the quality of living on a humanist basis. For more than forty years the Union has been specially interested in the moral aspect of education, and its pubs. in this field have been officially recognised and used. In addition, the Union supports and promotes the formation of local groups. Presidents

of the Ethical Union have included: J. A. Hobson, L. T. Hobhouse, Graham Wallas, Gilbert Murray, G. P. Gooch, H. N. Brailsford, and Sir Richard Gregory.

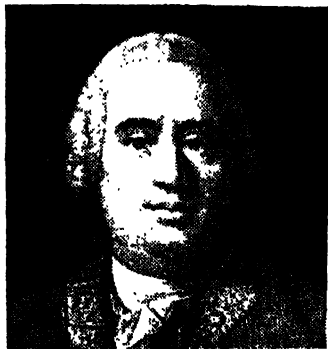

Ethics, the science which deals with human character and conduct, not considering them in the light of their own nature, but in respect of the moral judgments which have been diversely passed upon them. Like logic, therefore, it is a universal and practical science, dealing with elements common to the whole of the human race. This definition will at once show its intimate relations both with psychology and sociology, though it is noteworthy that the anc. philosophers all regarded ethical questions from the individual rather than the social standpoint. But although E. and psychology are closely related, there is a clear distinction between them which may be shortly expressed by saying that while psychology deals with the explanation and analysis of mental processes, and with the world as it is, E. concerns itself with the judgments, either condemnatory or laudatory, passed on these processes and their resultant actions, with the world, not only as it is, but also as it ought to be. An ethical bearing is thus pre-supposed for the many psychological questions which come under discussion in E. Thus we have the question of the nature of volition itself, and the relation of will and character, which is considered substantially apart from the various acts of will which go to form it and which result from it. Character has been defined, indeed, as 'the habit of the will.' Then come the questions of Hedonism, conscience, and the freedom of the will, and among modern writers the question of the relation of the social life to E. E., as we have seen, deals with two subjects which are inseparably related: (1) Character, in relation to which it investigates the nature of duty and virtue; (2) conduct, in relation to which it attempts to differentiate between the various virtues and vices, and to discover the extent and range of obligation. Thus E. is seen to deal not only with the problems of action as they exist, but also the more critical question of the principle or principles by which conduct should be regulated. The basis of E. is, indeed, the search for the *summum bonum*, the quest of man's highest good. It is by their varying conceptions of this highest good that the various schools are chiefly differentiated.

Thus, broadly classifying, we distinguish two great schools, the hedonistic and the rationalistic, to be found among both anc. and modern thinkers. The *Pyrronics* and *Stoics* were rationalists, that is to say, they held the life of virtue or reason to be the sought-for end, beside which nothing is to be considered. But Socrates, before this, when attempting to define virtue, had found himself compelled to do so in terms of pleasure. The chief good must also be the greatest happiness. Emphasis is laid on this by the hedonistic schools of *Cyrenaics* and *Epicureans* (see *EPICUREANISM*), where virtue is considered as leading to the highest pleasure, or, to

use the Aristotelian term, *eudaimonea*, somewhat misleadingly trans. happiness by modern ethicists. With Plato and Aristotle the Socratic view is kept in its entirety and explained in a still deeper sense, and it is thus found that hedonism takes a lower place. Plato, indeed, in certain of his dialogues, explicitly condemns it. Aristotle taught that the highest good for any being is the perfect development and full exercise of its function; and since man is differentiated from the lower animals by reason, it is in the development of his moral and intellectual abilities that his end consists, the life of virtue and knowledge. The life of virtuous activity is subordinate and inferior to the life of the philosopher. It will be seen from this explanation that the Gks. treated of E. mainly from the individualistic standpoint, though the relation of E. to politics is not ignored. The scholastic philosophy, based as it was on Aristotle and his commentators, did not materially alter this view, save that in the latter the contemplation of the Deity was not explicitly propounded as man's final end and *summum bonum*. E. was brought into close union with religion, and the conception of duty was that of obedience to the commands of God. Later, however, attention was chiefly devoted to casuistry, and instead of new theories on the subject being broached, energy was chiefly expended in the application of the principles and recognised laws to conduct under all possible variations of circumstances. E. shared, however, in the new birth of the Renaissance, and the doctrine of Utilitarianism took its rise.

Utilitarianism, called also Universal Hedonism, in contrast to the Egoistic Hedonism of the Epicurean schools, is essentially social in its attitude. We have already remarked on the development of the doctrine of pleasure by Epicurus, and this conception had not been wanting from the scholastic system, for here the consideration of reward and punishment went always side by side with the consideration of obedience and disobedience to duty, of virtue and of vice. The Utilitarian philosophers frankly took up again this view, but with them it was the pleasure of the greatest number, rather than of the individual, that was to be sought. Now, too, a definite attempt was made to estab. E. on some basis other than the theological, but the idea of rewards and punishments still survives to a large extent. Hobbes and the naturalistic school founded their E. on the natural results of human action. E. to them was the codification of the results of actions according as they finally gave pleasure or pain. As this conception becomes more and more altruistic, we see that virtue becomes equivalent to utility, and so the successors of Hobbes are commonly known as the Utilitarian school. A somewhat similar view, though expressed in the language of rationalism, was that of Cumberland, who, in his *De legibus Naturæ* (1672), gives 'the common good of all' as the final end, though he expresses

'good' in terms of perfection as well as of happiness. Many ethicists of the following period, such as Shaftesbury and Butler, make use of similar phraseology. But it was in David Hume (1711-76) that the Utilitarian school found its first capable exponent, almost, one might say, its founder. Virtue he defined as the quality which an onlooker approves, and vice as that which the onlooker blames. With this as his basis, he proceeds to examine the virtues and vices, showing that in every case that quality is approved which is useful or directly agreeable. Thus utility becomes the sole criterion of virtue.

DAVID HUME

Wm. Paley, in his *Moral Philosophy* (1785), though taking his stand on the basis of Christianity, was a notable exponent at a later period of the utilitarian principle. The period of the Fr. Revolution was one of considerable activity in this dept. of thought, and here again Utilitarianism is the main principle.

Jeremy Bentham widely extended the sphere of its operation, and caused the complete reunion of E. and politics, by applying it to the latter of these. The names of Ricardo and J. S. Mill are even more important. The latter was principally occupied in the defence of his theory, rather than in its exposition, for Bentham's works had evoked a large number of attacks. All these writers regarded man as a social being, and insisted on the fact that the most necessary virtue was benevolence or unselfishness, but it was objected that no reason was ever given why the advancement of the general happiness should be the duty of the individual. Paley, as we have seen, met this objection by theological motives, while Bentham did so by regarding the community as the unit. But no truly satisfactory proof of the principle has yet been adduced. Meanwhile, though Utilitarianism was the more prominent, Rationalism also appeared in various forms, as interpreted by the Cambridge Platonists and the eighteenth century

Intuitionist school, of which Joseph Butler may be regarded as the founder. It regards conscience as the final judge of actions, but its weakness lies in the failure to give a complete definition of conscience. The ethical system of Emanuel Kant, given to the world chiefly in his *Groundwork of the Metaphysics of Morals* (1785) and the *Critique of Practical Reason* (1788), was an attempt to clear away the many difficulties of the intuitionist system. Thus, through the transcendentalism of Germany, came into England the ethical idealism which has exercised so powerful an influence on the development of Eng. thought in every dept. of philosophy during the past century.

The question may be asked whether E. is the sort of subject which a professional moral philosopher can discuss in a spirit of nearly sceptical detachment. This detachment, though proper for the professional moralist in the academic exposition of E., does raise a real moral problem for him as a human being, and also as a teacher. For as a teacher he may be called upon to say something about principles on which he decides between right and wrong; he must try to say how questions of decision arise in his professional work; and ultimately he must admit that intellectual integrity is something at least partly moral in character. In order to teach E., a professional moral philosopher must care about the difference between right and wrong, between good and evil. No serious moralist can, ultimately, be satisfied with the philosopher who avers that questions concerning the meaning and end of human life signify nothing. In this context Butler in his *Dissertation on the Nature of Virtue*, raised the question of whether goodness consists simply in a general concern for human welfare. This, as he saw, was the attitude of the reforming sentimentalists. It is no doubt hard to distinguish charity from sentimentality and it is hard for the same reason to distinguish tolerance from intellectual indifference; and even the honest intellectual is in danger of repeatedly confusing these opposites. See the works of the ethicists referred to in the text, and also H. Spencer, *The Data of Ethics*, 1879 (part 1 of *Principles of Ethics* in 2 vols. completed 1893); T. H. Green, *Prolegomena to Ethics*, 1883; H. Sidgwick, *Outlines of the Hist. of Ethics*, 1886; C. E. Moore, *Ethics*, 1912; A. Schweitzer, *Kultur und Ethik*, 1923; A. Dyroff, *Religion and Moral*, 1925; E. Brunner, *Das Gebot und die Ordnungen*, 1932; W. Lillie, *An Introduction to Ethics*, 1948. See also COMPARATIVE ETHICS.

Ethicus, or **Æthicus**, reputed author of a cosmography, and also perhaps of a fable, though less ambitious, work, entitled *Alia Totius Orbis Descriptio*. Internal evidence, such as the mention of the gate of St. Peter in Rome, and of other signs of Christian supremacy, assigns the cosmography to the latter part of the fourth century. It is mentioned by Isidorus of Seville (seventh century) and other writers, and in abridged form of the second book is found in Orosius. The

compendium is an abstract of anct. geographical lore, and may well have been put together from the results of the survey undertaken, at the instance of Julius Cæsar, by the three geometers, Polycaetus, Zenodotus, and Theodotus.

Ethiopia (Abyssinia) (Gk. *Aiθiopia*, the 'Kush' of the Bible), classical name for a part of N.E. Africa, confined on the E. by the Red Sea, and to the N. by Egypt. The provs. of Abyssinia, Kordofan, Sennaar, and Nubia roughly cover the anct. E. The etymology of the word is unknown, although it may well be Egyptian, but the Gks., with their passion for derivations, referred it to two words *aitō*; and *ōph*, and said it meant 'swarthy faced.' Homer refers to the 'blameless Ethiopians,' whom he thought of as the men dwelling far away on the furthest borders, and tells how the gods went to their banquets. Herodotus recounts with evident delight a number of fairy tales about E., which he gathered from Egyptian priests. Thus, he divides the country E. and W. into the lands of the straight-haired and woolly-haired races, and discourses at some length on the elephant- and fish-eaters, the tortoise- and serpent-eaters, the Troglodytes ('dwellers in caves'), and the Blemmyes ('hideous men'), etc. Originally occupied by independent tribes, it became an Egyptian prov. under the eighteenth dynasty, and paid tribute in negroes, ivory, gold, etc. During the eleventh century B.C. E. was formed into an independent kingdom with the cap. at Napata. In 750 B.C. she was so strong that Egypt was obliged to acknowledge her yoke. When Egypt successfully rebelled in 660, the Ethiopians continued free till the Persian conqueror, Cambyses, forced them in 530 to recognise his rule. The is. of Meroë, famous for the oracle of Jupiter Ammon, now became the cap. In the course of the third century B.C. Ergamenes destroyed the theocratic gov. and estab. a military domination in its stead. Meroë fell before the armies of Augustus when Queen Candace was counted among his victims. The great city of Meroë was a ruin in Nero's day, and in the sixth century its kingdom was supplanted by Christian Nubia. From the first century A.D. up to about 1000 the so-called Axumite dynasty reigned at Axum, and this was succeeded by another Christian power, that of the Zagwes. From about 1300 the hist. of modrn Abyssinia (*q.v.*) begins. Scanty Egyptian stele and records, and a few Ethiopic, trilingual, and Sabaean inscriptions, are almost the only sources of Ethiopic hist.

Ethiopic Enoch, see ENOCH, THE BOOK OF THE SECRETS OF.

Ethiopian Languages, **Thē**, were spoken by the Ethiopians who from very early times inhabited parts of N. Africa. The language which they used up to the fourteenth century, and which remained the language of writing and the church, was the 'Lesana Ge'ēz.' The word 'Ge'ēz,' which means 'free,' or perhaps 'migration,' itself suggests the truth, namely that this tongue is a development

of a foreign one—in this case Arabic—the actual alphabet of twenty-six letters being directly borrowed from Sabeen or S. Arabic. There are seven vowels, represented by hooks, which cannot be written without their consonants. Two dots separate adjoining words, and all the letters are disconnected. No other Semitic dialect has so flexible or elaborate a syntax. It was written from left to right and contains a number of words in common with Aramaic, Heb., Gk., and the African dialects. For speech the Ge'ez was superseded by the Amharic.

Ethmoid Bone ('sieve-like') is somewhat spongy in texture and cubical in form. It lies at the root of the nose between the two orbits of the eye sockets, and is one of the constituent bones of the cranial box, the orbital plate of it being situated immediately behind the lacrymal bone.

Ethnography. See ANTHROPOLOGY—*Ethnography*; ETHNOLOGY.

Ethnology. E. and Ethnography are primarily sciences which deal with man as a racial unit, and with the distribution over the earth of racial units. The word 'Ethnology' has a somewhat vague connotation, but is, more particularly, defined by Thomas Huxley as 'that science which determines the distinctive characters of the persistent modifications of mankind; which ascertains the distribution of those modifications in present and past times, and seeks to discover the causes, or conditions of existence, both of the modifications and of their distribution.' It is, therefore, as he points out, a branch of anthropology (*q.v.*), which in its turn is a branch of zoology (*q.v.*), one of the natural subdivisions of biology (*q.v.*). It also touches philology, psychology, and sociology. E. again may be said to 'treat of the various large and small groups of human beings distributed over the face of the earth, and describe their mental, moral, and physical characteristics' (Haberlandt). All communities which have existed, whether still existing, or having become absorbed in conquering or neighbouring tribes, or, having lost one of their most distinguishing features—their language—for that of another people, are considered under *Historical* or *Paleo-Ethnology*. Beyond this period of tradition, however, there are evidences of human groups, and this gives rise to the study of *Primitive History*. (See Dr. M. Hoernes' *Primitive Man*). It is possible to classify races according to languages, physical features, or according to culture. By classifying according to physical marks, like the colour and quality of skin and hair, we arrive at an anthropological div. Classifying according to culture gave rise to an obsolete method of classifying according to civilisation. By this method the races were divided into hunters, breeders of cattle, and agriculturists. All these methods, however, while possessing their own particular advantages and disadvantages, commonly suffer from the fact that they often separate related classes and *vice versa*. *Ethnography*, or *Descriptive Ethnology*,

however, uses the divs. of the earth and its natural configuration, and these are found to correspond in general to the fundamental divs. of the human race. (Ethnologists now divide the human race into four main groups: the *Ethiopian* or *negro*, the *Mongolian* or *yellow*, the *American*, and the *Caucasian* or *white*.) So we may proceed along this line studying the various historical and other connections of the race, while using any distinctions that language, structure, or culture may give us.

The science of E. is comparatively modern, because, although a vague knowledge of foreign lands and races has always been possessed, it is of comparatively recent date that the discovery of lands has been practically completed, so enabling us to take a survey of the whole earth. In the Middle Ages the science was not expanded greatly, although men like Marco Polo and Mendez Pinto, gained a knowledge of the Far E. Then dawned that period during which Columbus discovered the New World, so giving us access to a knowledge of the Peruvian and Mexican civilisations. This, which is sometimes known as the *First Period* of E., it is interesting to note, was passed amid such fierce fighting occasioned by the hunting of gold and animals and the exploiting of the new countries for their stored up wealth, that the natives of these countries became looked upon as possessing no feeling or intelligence. In fact a Papal Bull was required to decide that they were rational beings. The discovery of the is. of the S. Sea and of Australia by Capt. Cook marks the *Second Period* of E. The state of Europe at that time induced a desire for knowledge of other races, and their customs and culture. Rousseau, Johann Forster, and Voltaire stand out as leaders of this movement. As time passed China and India became more familiar, and the colonising efforts of the various European countries led to the discovery and study of the peoples, of the S. Seas and of S. and Mid-Africa. It is possible now to give a fairly complete description of the human inhab. of the earth, with their mental, moral, and physical characteristics.

Descriptive Ethnology or *Ethnography*.—According to an approximate calculation, the pop. of the earth is (1910) 2,174,000,000 of which it was dogmatically averred by ethnologists not more than four decades ago, that six-sevenths were civilised and one-seventh belonged to the lower orders. This conveniently divided man into races possessing hist. and those with none, and almost entirely agreed with the contrast between light and dark coloured races. But apart from the rapid spread of education over the globe which tends to stultify an *a priori* div. into civilised and uncivilised, research has yielded tolerably full hist. of the races and tribes of Africa much of which has been handed down by oral tradition. But it still remains true to say that the highest stages of form and culture appear in the N. hemisphere, which is the most favoured by nature and where, consequently, man is most widely

distributed. It may further be stated that in the N. hemisphere dwell the white races and the related Mongolians, while in the S. dwell the dark-coloured races. Anthropology (q.v.) divides man according to his physical qualities, such as colour of skin, quality of hair, and shape of skull. The hair is distinguished as ivory, smooth, woolly, curly, corrugated, and spiral, while the forms of skull are evolved from the comparison of height with length; in this manner three types of head are noticed: (1) Dolichocephaloi, or long; (2) mesocephaloi, or average; and (3) brachycephaloi, or short. The subdivs. of the races are continually changing according to the signs observed in them. According to the monogenetic view, mankind sprang from one primary form, which has since developed into species according to the influences of climatic and other forces. This view is far more generally held than the polygenetic theories. Neither the limits nor the distinguishing features of species can be regarded as fixed. Blumenbach, the founder of scientific anthropology and E., recognised five races: Caucasian, Mongolian, Ethiopian, Amer., and Malay, and of these the Malay is now regarded as being the result of a comparatively recent mixture in which the Mongolian element predominates while the Amer. may also be regarded as a remote branch of the same group. Thus we may reduce these divs. to the first three. Quatrefages, the Fr. anthropologist, attaches most importance to the colour of skin and form of the skull, and divides men into three races: white, yellow, and black, with two mixed races, viz. Amer. and Oceanic. Modern ethnologists would seek to eliminate the word race and classify either according to civilisations or according to domestic conditions. For fuller information and a classification of the races, see *Ethnology* by Haberlandt; J. L. Quatrefages, *Histoire des races humaines*, 1889; J. G. Frazer, *The Golden Bough*, 1890; E. B. Tyler, *Primitive Culture*, 1891; G. L. Gomme, *Ethnology in Folklore*, 1892-4; F. Ratzel, *History of Mankind*, 1896-98; A. Keith, *Nationality and Race*, 1919; G. Montandon, *La race—les races*, 1933; J. B. S. Haldane, *Heredity and Politics*, 1938. See also MAN; also ANIMISM; ENDOGAMY; EXOGAMY; FAMILY; MARRIAGE; POLYANDRY; POLYGAMY; TABU; TOTEMISM.

Ethyl, an alkyl, or organic radical, having the formula C_2H_5 ; which, although it does not stably exist by itself, forms part of many compounds, such as ethyl alcohol, ethyl ether, etc., in which certain properties of the ethyl radicals persist.

Ethyl Acetate, see ACETIC ETHER.

Ethylamine ($C_2H_5.NH_2$), a substance resembling ammonia in its odour and many of its properties. It may be obtained from coal tar, but is best prepared in a pure state by the reduction of methyl cyanide (acetonitrile). It is also formed, along with diethylamine ($C_2H_5)_2NH$), and triethylamine ($C_2H_5)_3N$), by the action of ethyl bromide or iodide on

alcoholic ammonia. E. is a colourless, volatile liquid, boiling at $18^\circ C$. It has a strong ammoniacal odour, and when in a dilute state is reminiscent of stale fish. It is very soluble in water to an alkaline solution, and with hydrochloric acid forms a salt which is deliquescent and soluble in alcohol, thus differing from the corresponding salt of ammonia.

Ethyl Carbinol, see PROPYL ALCOHOL.

Ethyl Chloride ($C_2H_5.Cl$) is obtained by passing hydrogen chloride into alcohol, in the presence of anhydrous zinc chloride, and condensing the product which passes over in a cooled receiver. E. C. is a colourless, ethereal liquid, boiling at $12^\circ C$., which is soluble in alcohol, and only sparingly so in water. It is used as a local or refrigerating anæsthetic in dentistry and minor operations, and also as a general anæsthetic in place of nitrous oxide.

Ethylene, or **Olefant Gas** (C_2H_4), a hydrocarbon prepared by heating alcohol with excess of sulphuric acid, whereby the ethylhydrogen sulphate, which is first formed, is broken up into E. and sulphuric acid. A better method is to pass the vapour of ethyl alcohol over heated alumina, the latter acting as a catalyst: $C_2H_5.OH = C_2H_4 + H_2O$. E. is a colourless gas with a faint ethereal odour, and is insoluble in water. It burns with a very luminous flame, forming carbon dioxide and water. Chemically E. is an 'unsaturated' substance, uniting directly with an equal volume of chlorine to form ethylene dichloride or 'Dutch liquid,' and also with bromine, hydrogen, chloride, sulphuric acid, etc. It is present in small quantities in coal-gas. E. is used to some extent as an anæsthetic, but more largely as an artificial ripening agent for oranges, grape-fruit, etc. It is also important as an 'intermediate,' i.e. a compound prepared not so much for direct use as for conversion into other compounds. 'Polythene,' an extremely useful insulating plastic, is prepared from ethylene by polymerization (q.v.).

Ethylene Alcohol, see GLYCOL.

Ethyl Ether, see ETHER.

Ethyl Formate, see FORMIC ETHER.

Ethyl Nitrite, see NITROUS ETHER.

Etienne, a family of Fr. printers, see STEPHENS.

Etienne, Church of St., see ST. ETIENNE.

Etienne-de-Baigorry, chief tn. of the valley of Baigorry, in the Basses-Pyrénées, France. There are copper and iron mines in the dist. Pop. 2200.

Etiolation, see BLANCHING.

Etiology, the consideration of the causes of disease. These are divided into: (1) Predisposing or remote, (2) exciting or proximate, (3) determining. The various causes act in different ways sometimes as remote, proximate, or determining: (a) *Age*. It is common knowledge that certain diseases are always regarded as children's ailments. (b) *Heredity*. The importance of this factor is apt to be confounded with the habits and customs acquired by children from their parents. (c) *Intermarriage*. This cause is so remote that it is more closely related to statistical

investigations than to practical medicine. (d) *Sex*. As anæmia and hysteria, more common in females than males. (e) *Temperament*. Some individuals are described as sanguine, others as phlegmatic, many, however, have the nervous temperament. (f) *Climate and locality, town, and country life*. (g) *Hygienic conditions*. Under this head, importance must be attached to occupation, air, previous disease, mental and moral states, physical conditions, temperature, diet, etc. All these factors must be borne in mind when considering the causation and prevention of disease.

Etiquette is derived from the O.F. *estiquette* 'a label,' another and closer Eng. derivative being 'ticket.' The *estiquette* seems to have been a kind of card of introduction, a meaning which offers some explanation of its later sense. The behaviour dictated by good breeding, the formal ceremonies prescribed by authority as appropriate to various social, court, and other official functions, and especially the observance of the rules of precedence, and to the other proprieties of rank and office, are all part of E., which may briefly be described as 'conventional decorum.' See also ADDRESS, FORMS OF.

Etiquette, *Madame*, see ANNA-ELIZABETH NOAILLES

Etive, a salmon riv. and sea-loch of Argyllshire, Scotland. The riv. rises on the Moor of Rannoch and finally is merged in the frith of Lorne. The loch into which it flows is some 20 m. long, and is a submerged valley noteworthy for its natural beauty.

Etna, flourishing industrial bor. of Allegheny co., Pennsylvania, U.S.A. It is a suburb of Pittsburg, 2 m. to the S., and lies on the W. bank of the Allegheny R. and produces iron, steel, brass, and enamelled ware. Pop. 7200.

Etna, or **Monte Gibello** (from Gk. *Αἴτω*, which comes from *αἶψα*, I burn), a volcano, 10,758 ft., in the prov. of Catania on the E. coast of Sicily. By rail the circumference of its base measures 86 m., and it is estimated to cover over 450 sq. m. In shape it is truncated cone, and has as many as 200 craters. On the W. side the symmetry of its slope is interrupted by a deep gully, 3 m. wide, known as Valle del Bove. The ant. geographer Strabo mentions the three distinct zones of vegetation. Most of the highest region, down to a level of 7000 ft., is barren except for some stunted Alpine shrub, and is usually covered in snow, besides scoriae and ashes. The next zone is the zone of forests, the upper part of which is covered with birch trees, whilst the lower reaches (up to 6000 ft.) are dense with evergreen pines and chestnuts. The lowest region, which extends up to about 3000 ft., has the splendid fertility natural to volcanic soil. Here olives, vines, and all kinds of vegetables flourish, and the slopes are dotted everywhere with populous cities and villas. From 476 B.C. there have been repeated and serious eruptions. Catania was overwhelmed by the eruption of 1169, and in 1669 a great abyss, 12 m. long, was

opened up in the side of the mt. See also POMPEII, HERCULANEUM.

Eton, tn. on the l. b. of the Thames, opposite Windsor, in Buckinghamshire, England. Pop. 3300.

Eton College, one of the most notable of Eng. public schools, was founded in 1440 by Henry VI. under the title of 'The College of the Blessed Mary of Eton beside Windsor,' but, in consequence of the political chaos, it was not completed till 1523. The first headmaster was Bishop

John H. Stone

THE QUADRANGLE, ETON COLLEGE

Waynflete. The original foundation consisted of a provost, ten priests, four clerks, six choristers, a schoolmaster, twenty-five poor scholars, and twenty-five infirm bedesmen, but, by the Public Schools Act of 1868, this was altered to a provost, ten fellows, who form the governing body, two chaplains, and seventy king's scholars or collegers. The number of pupils averages 1100. The 'Oppidans,' i.e. boys not on the foundation, form the great body of students. There are twelve vacancies a year for collegers, filled by selection. Until 1831 the education was purely classical, but in that year mathematics was introduced, and physical science was added in 1869. The Gothic stone chapel, with its rich and varied stained glass and its fine carving, is the chief architectural beauty of the college. Collegers live within the walls, but most of the boys live in masters' houses, which are built of brick and picturesquely grouped about the older buildings and

quadrangles. There is a special chapel for the younger school, a museum, and a fine library with a good collection of Oriental manuscripts. In 1908 King Edward VII. opened the much-needed school hall, and a domed octagonal library in memory of the Etonians who fought in the Boer War. There are also science schools, a school of mechanics and an observatory. Speech Day is celebrated on George III.'s birthday, June 4; there is an annual cricket match at Lord's between the school and Harrow, and on St. Andrew's Day the oppidans play the collegers at football. Twenty-four foundation scholarships at King's College, Cambridge, are reserved for E. boys, and there are, besides, several exhibitions and scholarships at both Oxford and Cambridge. Both Oxford and Cambridge rely much on Etonian oarsmen in their boat races. The eccentric custom known as 'Montem' was abolished in 1846. In the air raids of 1941 a bomb struck the Upper School, whose panels contained hundreds of names, some very distinguished, carved on the wood, and demolished the headmaster's room adjoining. Another bomb struck Savile House in Weston's Yard, the seventeenth-century house of the precentor. See W. L. Collins, *Etoniana, Ancient and Modern*, 1865; H. C. Maxwell-Lyte, *A History of Eton College*, 1440-1910, 1873, 1911; A. Clutton Brock, *Eton*, 1900; R. A. Austen-Leigh, *Guide to the Buildings of Eton College*, 1921.

Étretat, favourite seaside resort in the dept. of Seine-Inférieure, France. The church of Notre Dame is interesting for its fine Norman work, and there are Rom. remains. Pop. 1700.

Etruria, name of the country of the Etruscans. Etruria Propria, through which the Arno flowed, lay W. of the Apennines and the Tiber; Etruria Campaniana lay S. of the Tiber; and Etruria Circumpadana embraced the valley of the Po. The famous confederation of twelve cities in Etruria Propria included Veii, Tarquinii, Clusium, Cere, Cortona, Volterra, Vulci, Volsinii, and Perusium; in the N. prov. were Felsina (Bologna), Mantua, Ravenna, and Adria, which gave its name to the Adriatic; and in the S. was Capua.

Varro dates the Etruscan era back to 1041 B.C., so that the Etruscans are of far greater antiquity than the Romans. They called themselves Rasena, whilst their Gk. name was Tyrrheni. Most Gk. historians agree in regarding them as emigrants from Lydia—a belief supported by the structural similarity of the tombs found in Tarquinii and elsewhere in E. and near Sardis in Lydia. Yet Dionysius of Halicarnassus is right in emphasising the difference between the Etruscan and Lydian civilisations, and it seems difficult to believe that at such an early period a whole people should have sailed so many m. across the seas in search of a new home. Since the Etruscan language has not been deciphered the extant inscriptions afford no clue to the problem. See also ALPHABET; ETRUSCAN LANGUAGE AND LITERATURE; EUGUBINE TABLES.

But if the Etruscans did not voyage W. all the way from S. Asia Minor, it is almost certain that they settled in Italy as conquerors—a conjecture which many facts combine to support. Thus even in the days of Herodotus the cities of Cortona and Cere had what was called a 'Pelasgic' stamp, that is to say, they bore traces of a more primitive settlement than the Tuscan, and were still inhabited by aborigines. Moreover, Livy notes that the country folk spoke a different dialect from that of the townsmen, which may well have been if the cultivation of the soil were left to an autochthonous and servile pop. But above all the recognition of the Etruscans as an intrusive and victorious nobility offers a simple explanation of the speedy collapse of their power and the rapid disappearance of both their language and civilisation. As a type the Etruscans were thick-set and small, with black hair and dark complexion. The characteristic Tuscan skull differs from that of any other Italic tribe, and the one people with whom ethnologists have compared them are the Kheta or Hittites of the Bible, who, curiously enough, have left sculptural records in Sardis, the chief tn. of Lydia.

E. was an empire when Itome was still an insignificant city among hundreds in her dominion. Thus the Tarquin kings and the famous Lars Porcena of Clusium were probably Tuscan officials or magistrates sent to Rome in token of her subjection, and the Servian wall, the Capitoline temple, and the Cloaca Maxima still bear testimony to the reality of the Etruscan occupation. It was, moreover, to their conquerors that the Romans owed their colleges of augurs, their triumphs, their gladiatorial shows, their 12 lictors, their purple-bordered toga praetexta, their curule chair, and above all their regard and respect for women. The Etruscans attained their highest glory in the sixth century B.C., when they figure in Gk. hist. as the allies of the Carthaginians, who, in 538, expelled the Gk. colonists from Corsica, and again when they (the Etruscans) were defeated in a famous naval battle against the tyrant Hiero I. of Syracuse (474), and once more when they sent ships to help the Athenians during the siege of Syracuse (414). Indeed they were celebrated in ant. times, like the Phoenicians, as a great sea power. But as early as 423, when the Samnites seized the stronghold of Capua, Etruscan supremacy had begun to decline. The inroads of the Gallic hordes affected E. even more than Rome, and in 396, after a ten years' siege, the veteran Camillus finally captured and destroyed the populous and splendid city of Veii in spite of its cyclopean walls. The S. prov. swore allegiance to Rome in 351, and, after a series of crushing defeats, the fate of the Etruscans was finally sealed by the decisive Rom. victory of Cornelius Dolabella at the Vadimonian Lake (283), when Tarquinii was obliged to put an end to her stubborn resistance. Henceforward, as with Greece after Charonea, E. has no hist. Consult G. Dennis, *Cities and Cemeteries of*

Etruria, 1848. See also ETRUSCAN ARCHITECTURE.

Etruria, dist. of Hanley in the co. bor. of Stoke-on-Trent. In 1769 Josiah Wedgwood and Thomas Bentley opened here their famous E. potteries; there are also large iron works. E. gives its name to certain beds of marls and clays in the N. Midlands, useful for pottery manuf.

Etruscan Architecture and Art. Archaeological evidence suggests that the most primitive buildings of the Etruscans were one-roomed, rectangular structures with thatched roofs and wattled walls. These were replaced by wooden cottages with sloping roofs of planks running longitudinally and also transversely. Their temples which were not in essentials different from

ETRUSCAN ART: AMPHORA

the Gk. except in the ground plan, were usually square whereas the Gk. temple was greater in length than in breadth, with the 'cella' divided into three compartments, the decorations, like acroteria and friezes, being of terra-cotta nailed to wooden walls. Underground sepulchral monuments, like 'la Cucumella' in Volsci, are akin to similar 'tumuli' in Lydia, whilst most Etruscan ornament, such as caps., mouldings, and metopes, was but a crude and almost barbaric transcription of Gk. originals. The Romans would speak of colonnades with the pillars far apart as in the 'Etruscan style,' which shows that the Tuscan architects had reproduced their borrowed models not in stone but wood, which permits of a greater span for the architrave. There are still ample remains of the massive cyclopean walls which surrounded the chief tns., sometimes for 6 or 7 m.

Excavated tombs have yielded rich examples of Etruscan art in sculpture, pottery, goldsmith's work, bronze-ware, and wall-paintings.

Etruscan Language and Writing. Etruscan was the language spoken by the pre-Roman pop. of Etruria (q.v.). It has come down to us in over 9000 inscriptions, which have been discovered in Etruria proper, roughly corresponding with modern Tuscany, as well as in other It. regions, such as Umbria, Campania, Emilia, Sicily, Sardinia, and so forth, or even beyond the borders of Italy, in Styria, at Carthage, and in Egypt, where the most important Etruscan document was found. This remarkable inscription, containing about fifteen hundred words, is written on the linen wrappings of an Egyptian mummy, and belongs to the Græco-Rom. period; it is preserved in the museum of Agram (or Zagreb), Yugoslavia. There are not many other long inscriptions extant. The most important of them are the tile from S. Maria di Capua (now in the Berlin museum), of the fifth century B.C.; about 300 words are preserved; the much more recent Perugia cippus contains about 120 words. The Tablet of Magliano (now in the Archaeological Museum of Florence), an inscription engraved on lead, is assigned to the sixth century B.C. The last datable Etruscan inscriptions belong to the early years of the Christian Era.

Notwithstanding the relatively great number of inscriptions (the great majority consisting of a few words only), the many attempts to decipher the Etruscan language have been unsuccessful. It is certain, however, that it is neither Indo-European in structure or vocabulary, nor does it resemble any other known language, although it might have had some affinity with the anct. group of the Caucasian languages. On the other hand, the simple reading of Etruscan inscriptions does not present great difficulties, because the Etruscan script is fairly well known. Etruscan writing goes, like the Semitic and early Gk. and Lat. alphabets, nearly always from right to left; there are, however, inscriptions written in *boustrophedon*, i.e. in alternate lines from right to left and left to right.

The original Etruscan alphabet (eighth century B.C.) derived from the early Gk., and contained twenty-six letters (twenty-one consonants and five vowels). As time went on, there were reductions and various modifications, and about 400 B.C. the classical Etruscan alphabet took its final form, having twenty letters; that is four vowels (*a, e, i, u*, but no *o*) and sixteen consonants. Etruscan speech knew no distinction between the voiced and breathed sounds *b* and *p*, *d* and *t*, *k* and *g*, therefore, the classical Etruscan alphabet had no *b* or *d*. At a later stage, also *k* and *q* disappeared, and the letter C (Etruscan *gamma*) was employed for *g* and *k*. See also ALPHABET.

Etsch, see ADIGE.

Etterbeek, industrial suburb of Brussels, Belgium. Pop. 50,000.

Ettlingen, tn. 4½ m. S. of Karlsruhe, on the Alb, in the free state of Baden, Germany. The tn., which is on the Mannheim-Basel Railway, is both quaint and attractive. Pop. 10,000.

Ettnmüller, Ernest Moritz Ludwig (1802-1877), Ger. philologist. His great work was his patient research into Middle, High, and Low Ger., and into the anc. Norse literature. From 1829 to 1852 he pub. scholarly eds. of old texts, including *Beowulf* (1840), and he also brought out a *Lexicon Anglo-Saxonicum*, and trans. the old Norse songs from the *Nibelungen saga* (1837).

Ettrick: (1) Riv. which waters part of Selkirkshire, Scotland. It rises in Capel Foll (2223 ft.) in the S.W., and flows almost due N.E. for over 30 m., receiving the waters of the Yarrow only before joining the Tweed, 3½ m. below Selkirk. It passes through a country full of literary associations, for the 'E. Shepherd,' James Hogg, lived in the par. of E.; and Deloraine, which recalls the hero of Scott's *Lay of the Last Minstrel*, lies below Buccleuch. E. Water, upon which E. stands, is part of the riv. (2) Forest, once covered all Selkirkshire and parts of the shires of Edinburgh and Peebles. It was once a favourite hunting ground for kings. Trees have long since given place to green pastures.

Ettrick, Baron, *see* NAPIER, SIR FRANCIS.

Etty, William (1787-1849), Eng. painter, was the son of a miller. After 7 years in a printer's works, he at last (1806) realised his ambition and attended the Royal Academy Schools in London, having for one year the advantage of Sir Thomas Lawrence's tuition. 'Sappho' (1811), which was hung at the Royal Institution, was his first success, but the delicacy of his flesh tints and the graceful tenderness of his women soon procured him a wide recognition. One consequence of his study of the Venetian masters during his It. tour of 1821 was that he became famous as a colourist, and especially for the rich glow of his draperies and for the skill with which he harmonised his backgrounds with his central figures or subjects. His masterpieces, include 'Youth on the Prow and Folly at the Helm,' 1832; 'Cleopatra's Arrival in Cilicia'; and 'The Sirens.' They may be seen in the Manchester, Edinburgh, Glasgow, Liverpool, and London art galleries. *See* lives by A. Gilchrist, 1855, and W. C. Monkhouse, 1874.

Etymologicum Magnum, Byzantine Gk. lexicon. In 1848 Dr. Gaisford pub. his eds. as the result of many years' arduous research.

Etymology (Gk. *ἐτυμολογία*, and *λόγος*), an investigation into the origin and original significance of words. It forms a subsidiary part of the science of comparative philology, but has only been scientifically studied since the nineteenth century. False *Es.* have been often suggested through ignorance and half-knowledge. Folk-*E.* has played an important part in the development of languages. Words that people have known from their childhood are taken for granted, but it is quite different with the new terms they meet. These arrest their interest and, believing that every word has its signification, they seek for this, guided by resemblances of

sounds with words already known, thus reaching false conclusions through false analogies. Various examples of the same illogical process are found in the O.T., in the Homeric tales, in quaint *Es.* of medieval writers, and even in some of the present-day dictionaries. Scientific *E.* was made possible by the birth of philology and study of the languages of the *E.* It no longer sought the relation between the words of a single language, exclusively within itself, but extended its view to a whole group of cognate tongues, or, wider still, to a whole family. Thus a new science arose under the title of Comparative Grammar. The evidence that the group of languages known as the Aryan languages forms a family, i.e. are all sister-dialects of one common tongue, consists in their grammatical forms being the same, and in their having a great many words in common. In judging whether an individual word in one of these tongues is really the same as a word in another of these tongues, one is no longer guided by similarity of sound. Words are constantly undergoing changes, and each language follows its own fashion in making these changes. Corresponding words, therefore, in the sev. languages, must have, in the long course of ages, come to differ greatly; and these differences follow certain laws which it is possible to ascertain. Of the laws of interchange of sound, Grimm's Law, named after the great Ger. philologist, is the most important. It exhibits the relations found to exist between the consonant sounds in the three groups of the Aryan languages. Followers of this theory were Curtius and Fick. The Teutonic revival in the nineteenth century in England commenced a hist. of Eng. upon an historical method from which has grown a really scientific Eng. *E.*, as seen in the dictionaries of Prof. Skeat and Dr. Murray.

Etzel (or *Attila*), king of the Huns, *see* ATTILA.

Eu (the Rom. *Augusta*), tn. on the l. b. of the Bresle, 64 m. N.N.E. of Rouen, in the dept. of Seine-inférieure, N.W. France. It is noted for the fine Gothic church of St. Laurent (twelfth century), and for its château (begun in 1578) of the Prince of Orleans, destroyed by a fire in 1902. Pop. 5700.

Eua, or *Eoa*, one of the Tonga Is., S.E. of Tongatabu, in the Pacific. It was discovered by Tasman in 1643.

Eubœa, also called *Egripos* and *Negroponte* (It.), largest is. of the Grecian archipelago, having a length of some 90 m., and a breadth varying from 4 to 30 m. It lies in a direction N.W. to S.E., is separated from the mainland by the narrow strait Euripus, and protects the coasts of Attica, Boeotia, and S. Thessaly. In Homer the inhab. are called *Abantes*. In the N. of E. dwelt the *Histiæi*; below these were the *Ellipoli*, and in the S. were the *Dryopes*. The centre of the is. was inhab. chiefly by Ionians. The promontory of *Artemisium*, where the Gks. gained a great victory at sea over the Persians (480 B.C.) forms a N.E. extrem-

ity. Part of the same mt. range which guards the E. of Thessaly, traverses the is. from end to end, Mt. Dirphys, now Delphi (5725 ft.), in the centre being the highest peak. Chalcis and Erotria, the chief tns., were both Ionic settlements from Attica, which in their turn founded Cumæ and Rhégium, etc., in Magna Græcia. Erotria was destroyed and its inhab. carried off to Persia during the great invasion of 490 B.C. In 506 B.C. the Athenians estab. a hated cleruchy in Chalcis because that city had joined the Spartan league. After an ineffectual revolt, Pericles reduced the is. to submission to Athens in 446. After some years of independence E. fell successively under Macedonian, Rom., and, during the Middle Ages, Venetian rule. From 1470 onwards it was subject to Turkish domination, but in 1830 it was incorporated with independent Greece. All the conquerors have found E. useful for its corn and cattle, and also for certain mineral ores such as iron pyrites. Pop. (is.) 180,000, dept. (including N. Sporades) 200,000.

Eubulus (*fl.* 350 B.C.), Athenian politician, was an orator and a man of some force, but it is impossible accurately to gauge his merits, as the pages of Demosthenes, his arch-enemy, are the most reliable source of our information concerning him. E. was largely influential in securing the acquittal of Æschines, and further advocated peace at any price, a policy hateful to Demosthenes.

Eucaine, synthetic drug, comparable to cocaine in many of its actions, which is used as a local anæsthetic in place of the latter, since it is less poisonous. Two Es., the α and the β , are prepared, the latter being preferable; they are both derivatives of oxymethylpiperidine, and are prepared originally from acetone. E. is most frequently used in operations on the eye and nose, where it is applied to the surface in solution.

Eucalyptus, a genus of Myrtaceæ, contains over two hundred lofty trees occurring in Australia—where they are a characteristic part of the flora—and the Malayan Archipelago and India; while certain varieties are cultivated elsewhere, e.g. Algeria and Italy, for commercial purposes. Many reach a height of 150 ft. and a girth of 30 ft. or even more, and they frequently become hollow; *E. amygdalina* attains a height of 300 ft. The species are of great economic value, yielding oils, kinos, and useful timber, while the well-known oil of E. is obtained from *E. globulus*, the blue-gum tree. The hydrocarbon 'mellitose', a saccharine compound, is derived from the sap of various species of Tasmanian E. Gum and gum resin are yielded by *E. paniculata*, *E. huoniana*, and other species.

Eucharist. The Christian offering of praise and thanksgiving is known by many titles, though that which we are now considering seems to have been the most used in early times. In the Book of Common Prayer, the terms used are the 'Lord's Supper' and the 'Holy Communion': among Rom. Catholics and

some Anglicans, the term 'Mass' is generally used, while members of the E. Orthodox Churches would speak of the 'Liturgy' or the 'Holy Sacrifice.' From the beginning of the Christian church, the Holy E. has been regarded as the greatest of all the sacraments, and round it has gathered the richest ceremonial of the church. But as we trace through the ages the hist. of Eucharistic doctrine, we are faced with the sad fact that the sacrament of unity has been turned by men, generally over-anxious to dogmatise, into a source of controversy and discord. There are, in the N.T., 2 distinct narratives of the institution of the E., each appearing in 2 forms. The first is that of Mark (xiv. 22 ff.) and Matt. (xxvi. 26 ff.), the second is that of Luke (xxii. 17 ff.) and Paul (1 Cor. xi. 23 ff.). A reference to the institution occurs in the fourth gospel, and this reference dates the Last Supper on the day before the Passover, whereas the Synoptic narratives state that it took place on the 'first day of unleavened bread, when they killed the passover.' No solution of this discrepancy is known. The word *Eucharist* is connected with 2 parts of speech in Gk., a noun and a verb. The verb *eucharistein* means 'to feel thankful' and 'to give thanks.' It is the very word used of the thanksgiving of our Lord at the Last Supper. St. Matthew says λαβὼν ποτηριον εὐχαριστήσας ἔειπεν (xxvi. 27), and St. Paul εὐχαριστήσας ἔκρασεν (1 Cor. xi. 24). As Justin Martyr tells us, the disciples of the second century continued to give thanks over the bread and the cup, and hence the term *eucharistein* came to mean to consecrate, and the term *eucharistia* was employed to denote the consecrated elements themselves. Thus St. Irenæus says that after the consecration the bread is no longer common bread but *eucharistia*, consisting of 2 parts, an earthly and a heavenly. At a very early date the liturgical nature of the E. developed considerably, and it has even been held that St. Paul's account of the institution was taken from a previously existing order of service. From N.T. times onward, however, we do find liturgies in an advanced stage of development. The extent of the earliest fixed order can be seen by a comparison of the distinct groups of liturgies. It is impossible here even to touch on the development of liturgiology, but these groups may be mentioned: the Rom., the Gallican, the Alexandrine, and the Antiochene, containing the liturgies of St. Basil and St. Chrysostom. There is no doubt that the E. was at first celebrated in the evening after supper in imitation of Christ's own procedure. But it is equally certain that the change from evening to morning was universally made at a very early date. It is sometimes held that this change was made by St. Paul in the Corinthian Church. St. Augustine (*ad. Januar.*) makes no reference to the occasion of the alteration, but says, 'It has seemed good to the Holy Spirit that, for the honour of so great a sacrament, the Lord's Body and Blood should enter the Christian's mouth before other food.

It is for this reason that the custom is observed throughout the world.' Fasting communion made a morning celebration the ordinary procedure, though it is probable that on fast days, when the faithful were fasting till 3 p.m., it would take place later. In all the earliest references to the Holy E., it is considered that those who are present at the Consecration will all communicate. All those who had been present at the early part of the service but were unable to communicate had already departed at a given signal before the central act of the service began. Those who had departed would include the insane, the catechumens, and certain classes of penitents. The faithful all remained and all communicated with the priest.

The first falling away from this standard is shown in the second canon of the Council of Antioch (A.D. 344) when it is ordered that those who attended the service as far as the lections, but refused to communicate, should be cast out of the church until they repent and confess. The separation being effected by the exorcist. Until the twelfth century, it is admitted by all writers that the laity received the sacrament under both kinds in all solemn public administrations, though the species of bread alone was used under special circumstances. In certain parts, the custom of receiving the species of wine through a tube sprang up on account of the great fear which was felt lest any of the sacred element should be split. The greatest care was taken that no portion of the consecrated bread should fall to the ground. In the E. the custom of receiving the Blood of Christ by the method known as *intinction* early began. Here the particles of the consecrated bread were placed in the chalice, the two elements being given together into the communicant's mouth by a spoon. This practice was condemned in the W. as schismatical and against apostolic tradition. It is generally agreed that the early Christians received the sacrament standing, this being the usual posture for all prayer on the Lord's Day and during Eastertide. It was necessary that all communicants should be baptised persons and that they should not be undergoing ecclesiastical censure. It is noteworthy that the importance of private confession to a priest is insisted on in sev. places before the end of the eighth century. An Eng. example occurs in the *Penitential* of Archbishop Theodore (c. A.D. 700), where a profession is made for dispensation from the rule if necessary. After special cases of excommunication and penance, reconciliation by the bishop or his deputy was, of course, necessary.

As for the days on which the E. was celebrated, our starting point is the celebrated passage in the Acts (ii. 46) which is sometimes held to imply daily celebration. Particular mention, however, is later made only of the Lord's Day (ix. 7), and later allusions in the early writers make it comparatively clear that the Lord's Day was long regarded as the special day for 'the breaking of bread,' even as it now is.

The days next fixed for communion were the 'Station Days,' i.e. Wednesdays and Fridays. Daily celebrations were, however, in use by the time of Chrysostom. We may infer from a canon of the Council of Eliberis (c. A.D. 300) that at that time weekly communion was the regular rule of the church universal, and such it continued to be in the E. until the end of the seventh century. Bede, when writing to Egbert, says that even the more devout amongst the Eng. laity do not communicate except at Easter, Christmas, and Epiphany, but advises insistence on daily communion, which he speaks of as the custom among many of the continental churches. At the present time the Church of England insists on communion 'three times a year of which Easter shall be one.' The Rom. Catholic Church, while encouraging frequent communion requires under pain of sin only once a year 'at Easter or thereabouts.' See B. Frischkopf, *Die neuesten Erörterungen über die Abendmahlsfrage*, 1921; M. de la Taille, *Mysterium Fidei*, 1922; Y. Brilhoit, *Eucharistic Faith and Practice*, 1930; W. Simpson, *Eucharist, Sacramental Principles*, 1932; A. O'Neill, *Mystery of the Eucharist*, 1933.

Euchlorine, explosive, yellowish-green coloured gas, first prepared by Davy by heating hydrochloric acid with chlorate of potash. It has an extremely irritating odour, and is a powerful oxidising agent. It consists of a mixture of chlorine and chlorine peroxide, ClO₂.

Euchre, game of cards, popular in America, but not played until the end of the nineteenth century. Thirty-two cards are used, all cards below seven being rejected. The cards rank as at whist with the exception of the 'Bowers.' The knave of trump suit (right bower) is the best trump; the knave of the same colour (left bower) is the next best, that card belonging to the trump suit. Each player receives five cards from the dealer by two or three at a time, the top card turned up being trumps. When two play, the non-dealer either 'orders up' the trumps or passes. If he passes then the dealer either takes up the trump or passes. If both pass, the non-dealer may call other trumps or may pass again when the dealer makes. If both pass again the hand is thrown in and the cards are dealt again. If the hand is played the non-dealer leads and the dealer plays and must follow suit if possible. The game then continues as at whist, a player 'ordering up,' or taking up, or making the trump wins five tricks (a march) and scores two points; if three tricks (the point) he scores one. If he fails to make three tricks he is enchured, and his opponent scores two. Game is five up. Four-handed K. is generally played. Then the players cut for partners. If the first hand passes, the second may assist, when his partner the dealer takes up the trump and the hand is played. If a player has a very good hand he may play alone against the other three. But he can only play alone when his partner 'orders up,' or when his partner assists, or when he

takes up the trump, or when he orders the trump. The scores are reckoned as before, except that a player playing alone scores four points if he wins five tricks.

It may be noted that E., under very different rules, is a very popular game in the sordid messes of the Brit. Army. In this form of E., the number of cards in the pack varies according to the number of players. For four players, the cards are the joker, red deuce, black deuce (the Bonnies), and Ace to Ten of each suit; for five players, add to the foregoing, the nines of each suit; for six players, add the eights of each suit and two black sevens, and so on. The cards change value according to the suit which is trumps. With a red suit: joker, red benny, black benny, the two red knaves, (Howers) and the other cards in whist order. With a black suit the black benny and the red benny change places, the black knaves take the place of the red knaves, which drop into their usual place as in whist. The knave of the suit called as trumps takes precedence over the other knave. Each player receives five cards, dealt two or three at a time; the top card of the remainder is turned up and becomes trumps. Each player in turn has the choice of calling, the dealer being last. If the suit turned up is called, then the dealer picks the faced card up and discards. If the nominated suit is not called, then the dealer turns it down and the call again goes round in any suit except the turn-down. Five card E. is the form usually played, in which there are partners. The caller calls two suits: the first, trumps; the player holding the highest card of the second suit is his partner (Butty), but does not declare himself. If the caller and his partner take five tricks (a march), two points are scored; if three tricks, one point; if they fail to take three tricks they are cunbred, and all their opponents score two each. When a player is 'low man' (has scored fewest points), he may 'call on his own' (without a partner). A march in this case scores one point for every player, and for three tricks, half this number (three points for five players, etc.). The first player to reach seven points drops out of the game and the others follow at the same figure. When only three or two players remain, there are no partners.

Euchroite, basic arsenate of copper occurring as a distinct mineral. It is related to clinoclase, cornwallite, and tyrolite, all of which are generally isomorphous with the corresponding phosphates of copper.

Eucken, Rudolf (1846-1926), doctor of philosophy, b. at Aurich, educated at Göttingen. His works deal chiefly with the hist. of philosophy. In 1903 he was elected D.D. of the Univ. of Göttingen and in 1910 of the Univ. of Glasgow. In 1908 he won the Nobel prize for literature. He wrote many works, amongst which may be mentioned the following: *Geschichte und Kritik der Grundbegriffe der Gegenwart* (1878), *Die Einheit des Geisteslebens in Bewusstsein und Tat der Menschheit* (1888), *Der Sinn und Wert des Lebens*

(1908), and *Können wir noch Christen sein?* (1911); *Mensch und Welt* (1918), and *Lebenserinnerungen* (1921). His most valuable work, however, was his earliest: *A History of Philosophical Terminology*. See W. R. Boyce Gibson, *Eucken's Philosophy of Life*, 1906. and *God with Us*, 1909; R. Siebert, *Eucken's Welt- und Lebensanschauung*, 1904-1911; W. Tudor Jones, *The Philosophy of Eucken*, 1909; H. Schack, *Denker und Deuter*, 1938.

Eucrase ('easily fracture'), very rare mineral bearing some relation to beryl, and found in Brazil and the S. Urala.

Euclid (fl. c. 300 B.C.), Gk. mathematician, lived, according to Proclus (A.D. 412-485), in the days of Ptolemy I. of Egypt, was older than Archimedes (b. 287 B.C.) and Eratosthenes (b. 276 B.C.), and younger than Plato. His life is practically a blank, but many of his treatises, including the famous *Elements* (*Στοιχεία*), have come down to us. This work, which includes five books on plane geometry, one on proportion, three on the properties of numbers, one on incommensurable magnitudes, and finally three on solid geometry, was for centuries the textbook on geometry in all schools, and has only in comparatively recent years been superseded on the Continent and in the United States. His *Data* (*Δεδομένα*) contains ninety-five theorems, in which it is shown that, given certain hypotheses, other things are deducible. The *Phaenomena* deals with the appearances produced by celestial motions. The musical treatises, entitled *Introduction to Harmony*, and *Section of the Scale*, and the *Optics* and *Katoptrics*, etc., are of doubtful authenticity. See also GEOMETRY.

Euclid, or **Eucleides** of Megara (c. 450-371 B.C.), one of the most zealous disciples of Socrates, and also the founder of that school of philosophy variously called the Megarian, dialectic, or eristic. His philosophy prepared the way for the sceptics, for he delighted in proving contradictory propositions and so encouraged doubt. His writings have all perished.

Eucratides, king of Bactria, lived in the second century B.C. Demetrius, son of Euthydemus, having disputed with E. the succession to the throne and besieged him for five months, was at length completely defeated by E., who thereafter had several victorious campaigns in Asia over the Ind. But, unwisely attacking Mithridates, king of the Parthians, he was defeated and perished at the hand of his own son, who was associated with him in the gov. of Bactria.

Eudæmonism (from Gk. εὐδαιμονία, which describes the condition of a man under the care of a kindly spirit or genius), a much abused term in philosophy in the sense that every writer has contorted or enlarged its meaning to express his own ideas. As a system of philosophy E. upholds happiness as the chief goal of man, the confusion arising from the diverse conceptions of what is essential to that state. According to Aristotle the truly eudæmones are those who enjoy a contemplative existence without material anxieties, and without an impeding to

the full and complete realisation of their highest self. Plato conceived a magnificent social 'eudemonia,' to which every member of the state contributed, and in which everyone shared. For the Epicureans E. was equivalent to hedonism (see ETHICS).

Eudemus of Rhodes (fl. 330 B.C.) associated with Theophrastus as an earnest follower of Aristotle. His *Eudemian Ethics* (seven books) are still extant.

Eudialyte, or **Eudyalite** (Gk., easily dissolved), a vitreous bisilicate of calcium, sodium, iron, zirconium, and other elements found in Greenland in the form of pink rhombohedral crystals.

Eudiometer (from Gk. *eu*, well, and *dos*, the root of Zeus), was primarily an apparatus to determine the purity of air, that is the amount of oxygen in it, but it is now generally used for the analysis of gases and especially of gaseous mixtures. A E. consists essentially of a graduated glass tubular vessel fitted at the top with platinum electrodes for the introduction of the electric spark. As a measure it depends on the observation of the amount of shrinkage after one or more chemical reactions in the vol. or vols. of the gas or gases under consideration. In the case of air the reaction is set up by the explosion caused by the introduction of an electric spark. A known vol. of the atmosphere is confined with about half its vol. of hydrogen. After an electric current has been passed through the mixture, all the oxygen of the air unites with some of the hydrogen to form aqueous vapour, which soon condenses. The shrinkage therefore measures 3 times the vol. of the oxygen, this gas combining with twice its own vol. of hydrogen to form water.

Eudocia, (1) or **Athenais** (c. 401-c. 460), wife of Theodosius II., Byzantine emperor, was the daughter of an Athenian sophist. When her brothers denied her a share in her father's inheritance, she sought and won the protection of Pulcheria, sister to the Emperor Theodosius, whom she (E.) eventually married (421). She repaired to Jerusalem, and became implicated in the Monophysite controversy (453), but St. Euthymius finally reconciled her to the 'true faith.' Among her works were a paraphrase of the Book of Daniel and a poem on her husband's Persian conquests. E. is sometimes wrongly referred to as Eudoxia. (2) (d. 462), the younger, the daughter of the above and of Theodosius II. When her first husband, Valentinianus III., was murdered by Petronius Maximus, she fell an unwilling victim to the usurper and, in revenge, invited Genseric, king of the Vandals, to Italy. The barbarian sacked Rome, and took E. to Africa. (3) (c. 1021-96), widow of the Byzantine emperor, Constantine X.

Eudoxus, (1) Gk. navigator, was dispatched in 125 B.C. by Ptolemy Euergetes, king of Egypt, to explore India and the Arabian Sea. His adventures are recounted by Strabo, who included E.'s discoveries in his great geographical work.

(2) of **Cnidus** (c. 407-c. 355 B.C.), Gk.

astronomer, studied under Plato for some time, spent many years in Egypt, learning from the priests, and later opened a school in Athens which rivalled that of Plato. According to Ptolemy and Strabo he first fixed the length of the year as 365½ days, whilst Vitruvius ascribes to him the invention of the sun-dial. He was also a mathematician and philosopher, and won golden opinions from Cicero.

Euganean Hills, in N. Italy. They are a low volcanic range forming a small group extending for about 10 m. from the neighbourhood of Padua to Este. They are covered with woods, and contain many hot springs. The culminating point is Mt. Venda, 1890 ft. high.

Eugene, city of Oregon on the Willamette R. The chief industries are iron works, machine shops, flour mills, manufs. of wagons, furniture, and woollens. It is the seat of the Univ. of Oregon. Pop. 28,800.

Eugène, François, Prince of Savoy (1663-1736), renowned Fr. gen.; was b. at Paris. He was youngest son of the count of Soissons, grandson of the duke of Savoy and related, on his mother's side, to Cardinal Mazarin. Originally intended for the church, but his tastes were more for military renown. After his father's death, and on the refusal of Louis XIV. to give him a commission, he left France and served under Emperor Leopold as a volunteer against the Turks. He displayed great courage and tactical talent and rapidly rose. In the Coalition war in Italy against France, he covered himself with glory, became a field-marshal in 1693, and put an end to Turkish power in Hungary by winning the famous battle of Zenta in 1697. He commanded the It. army in the War of Succession in 1701, but effected little of importance, owing to the smallness of his forces. In 1703 he became president of the council of war, took over command of the Ger. army, and assisted Marlborough to win the battle of Blenheim, 1704. After being chocked by the Fr. gen., Vendôme, and twice wounded, he defeated the Fr. and drove them out of Italy. He shared with Marlborough, the victories of Oudenarde and Malplaquet. After the retirement of England and Holland from the struggle, Prince E. was unable to withstand the enemy on the Rhine, and was defeated by Villars in 1712. In 1716 war with the Turks recommenced, and the prince was everywhere successful. He defeated an army twice the size of his own at Peterwerdein, took Temesvar, and after a desperate battle took Belgrade by assault. After the Peace of Passarowitz, he laboured with unwearied energy in the cabinet. He died at Vienna. See *Illos* by G. B. Malleson, 1883; and H. von Sybel, 1937.

Eugenia, genus of Myrtaceae, contains numerous species, all of which grow in the tropics, and many bear edible fruits. The best-known plant in the genus is *E. carvophyllata*, which produces the cloves of commerce; they are the dried flower-buds of the tree. *E. Malaccensis* is known as the Malay apple, or rose apple.

Eugenic Acid, see EUGENOL.

Eugenics is that science which has for its aims the perpetuation of those inherent and hereditary qualities which aid in the development of the human race. (See *BIOLOGY—Practical Value of Biology*.) Sir F. Galton—who first coined the word eugenics in his work on *Human Faculty* (1869)—by his valuable research work and his many publs., added considerably to the importance and value of the science. Not only this, but in his will he left sufficient money to found the Galton Chair of Eugenics at the London Univ. Attached to the chair is a valuable library and laboratory. The Galton Laboratory for National Eugenics publishes the *Annals of E.*, the *E. Laboratory Memoirs*, the *E. Lab. Lecture Series*, and the important *Treasury of Human Inheritance*, an extensive collection of family pedigrees, illustrating the inheritance of physical, mental, and pathological characters in man. Besides the works of Galton, there is an extensive literature on E.: See F. Galton, *Probably the Foundation of Eugenics*, 1907; K. Pearson, *Grammar of Science*, 1911; L. Doncaster, *Heredity*, 1921; S. J. Holmes, *Studies in Evolution and E.*, 1923; L. Darwin, *Need for E. Reform*, 1926; J. A. Thomson's *Heredity*, 1926; F. Schiller, *Social Decay and Eugenic Reform*, 1932; C. Neurath, *Modern Man in the Making*, 1939; also G. K. Chesterton's counterblast, *E. and Other Frits*, 1922. The Eugenics Society was formed in London in 1911, to promote the study of national eugenics and publishes a quarterly review. See also HEREDITY; MENDEL AND MENDELISM.

Eugénie, Marie Ignace Augustine de Montijo (1826–1920), daughter of the count of Montijo, empress of the Fr., was b. May 5, at Granada, Spain. In 1853, at Notre Dame, Paris, she was married to Napoleon III., and three years later she became the mother of the Prince Imperial. In 1870, on the fall of the empire, came to England and took up her residence at Chislehurst, afterwards removing to Farnborough. Three years after her coming to England, Napoleon died, and she lost her son in the Zulu War of 1879. While on a visit to her nephew, the duke of Alva, she died in Madrid, July 11. See E. Legge, *The Empress Eugénie*, 1910.

Eugenin (C₁₁H₁₀O), substance which is obtained from oil of cloves.

Eugenius, name of four popes: Eugenius (St.) I., pope from 654–8, festival, Aug. 27; Eugenius II., pope from 824–27; Eugenius III., pope from 1145–53; and Eugenius IV., pope from 1431–47. The latter's pontificate was marked by a schism created by proceedings in the council of Basle towards the reform of the church and the limitation of papal authority. He excommunicated the council and the council deposed him, but he succeeded in re-uniting the Church round his own person and office. Holding a council at Florence, he concluded a re-union with the Gk. Church (1439), and later with Armenians (1439), Jacobites (1443), and Nestorians (1445).

Eugenol, or **Eugenio acid**, an aromatic oil, obtained by combining oil of cloves or

oil of pimento with alcoholic potash. Used as a remedy for toothache.

Eugubine (or **Iguvine**) **Tables**. These tablets, numbering seven, were found in the fifteenth century at Iguvium, the modern Gubbio (Umbria, Italy). They contain large texts, which are engraved on both faces of the tablets, and have been deciphered as parts of the liturgy of a sacred brotherhood of Iguvium. Tables I–IV and part of the Vth are written in Umbrian script, which is not only an offshoot of the Etruscan (q.v.) alphabet, but is so close to its classical form, that eminent Etruscologists, such as the late It. Prof. Giulio Buonamici, consider it as Etruscan. These tablets are attributed by some scholars to the fourth or even to the fifth century B.C., by others to the second or third century B.C. The rest of Table V and Tables VI and VII, are written in Rom. characters and are assigned to the first century B.C.

Euhemerus and **Euhemerism**, the latter is the name applied to the historical theory of the origin of mythology, from its founder Euhemerus, a native of Messene about the fourth century B.C. While voyaging to the Indian Ocean he professed to have discovered a new is. called Panchala. Here he is supposed to have found a number of inscriptions representing the prin. gods of Greece as mere earthborn beings, deified after death for their superior strength and abilities. His work *Hiera Anagraphe* was lost, but for it he was accused of Atheism and his name became a byword for mendacity. Many eminent men, among them Polybius, Lactantius, and St. Augustine, adopted its theory. Later Gk. writers simplified the theory, eliminating extravagant things and leaving a list of commonplace and credible stories. Thus *Æolus* became an anct. mariner; the *Cyclopes* a race of savages inhabiting Sicily; *Atlas*, an astronomer; and *Scylla* and *Pegasus*, fast-sailing pirates. The system still exists in some current handbooks of mythology. Euhemerism was the favourite theory of the so-called philosophical historians of the eighteenth century in France. It was extended to England by a trans. of Abbé Bauer's great work, *The Mythology and Fables of Antiquity Explained from History*. Vossius, Bochart, and Huot belong to this school; Mr. Gladstone was the latest and ablest exponent of sacred Euhemerism. Herbert Spencer also embraced the theory in his explanation of the origin of religion.

Euhemerus, see also ANCESTOR WORSHIP. **Eulenspiegel** (Ger. 'owl-glass'), the prototype of all knavish fools of later times, b. at the end of the thirteenth century, near Schöppenstein, in Brunswick. He was 3 times baptised, once in the font, secondly in the mud, and the third time in hot water. He wandered over Europe, experienced many wonderful and comical adventures, and perpetrated many knavish tricks. His place of burial is not certain, as two places claim to have his bones in their respective churchyards. One stone stands to his memory at Mölln, near Lübeck, where he

is supposed to have died in 1350. His bones are also at Damme in Belgium, where his death is placed about 1307. In modern times his story is embodied in one of the masterpieces of Belgian literature—*Till Eulenspiegel en Lamme Goedzak* by C. de Coster. The first ed. appeared in 1868. It is really a kind of epic which celebrates the struggles of the people to secure freedom from Sp. tyranny. Gerhard Hauptmann, the great Ger. poet and dramatist, pub. a vast poem called *Eulenspiegel*, in parts so mystic that it puzzled his critics.

Euler, Leonhard (1707–83), Swiss mathematician, b. at Basle, and studied under John Bernoulli. He went to St. Petersburg, where he became Prof. of Physics, and in 1733 of mathematics in the Academy. In 1741 he was invited to Berlin by Frederick the Great, and he pub. many valuable papers during this period. His later years were spent in St. Petersburg in total blindness, but his servant wrote at his master's dictation. The *Introduction to Algebra* (trans. 1840) was completed in this way. His chief works are: *Theory of Planetary Motion* (1765), *Institution of Differential and Integral Calculus* (1755), *Introduction to Analysis of Infinities* (1748). See lives by F. Rudol., 1884; S. Schulz-Euler, 1907; A. Speiser, 1934. See also EULERIAN NUMBERS; HYDROKINETICS. — *Euler's Equations of Motion*.

LEONHARD EULER

Engraving after a painting by L. Lorgne

Eulerian Numbers. Named after Euler (1707–1783), the Swiss mathematician. The expansion of $\cos x$ is $\cos x =$

$$1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots, \text{ and the expansion}$$

$$\text{of } \sec x = \frac{1}{\cos x} \text{ may be written}$$

$$1 + \frac{A_1 x^2}{2!} + \frac{A_2 x^4}{4!} + \frac{A_3 x^6}{6!} + \dots \text{ where } A_1,$$

$A_2, A_3, \text{ etc.},$ are known as E. Ns., the first nine of which were first computed by Euler. The first five are 1, 5, 61, 1385, 50521, and the 50th contains 127 figures. Some of the properties of these numbers may be noted here, viz., every E. N. is a positive odd integer; the sum of any two successive E. Ns. is divisible by 3. The chief usefulness of E. Ns. is in the summation of certain series.

Eumæus, faithful swineherd in the *Odyssey*, who recognises Ulysses on his return from Troy, and aids him in destroying the suitors of Penelope (q.v.).

Eumenes (c. 360–316 B.C.) Macedonian gen., and a native of Cardia in the Thracian Chersonesus. At a very early age he was employed as private secretary by Philip II. of Macedon, and, on the death of that prince, by Alexander. When Alexander died, Cappadocia and Paphlagonia were assigned to E. He was put to death by Antigonus.

Eumenes I., king of Pergamum. He succeeded his uncle, Philetarus, in 263 B.C. The only event of importance in his reign was his victory near Sardis over Antiochus Soter, which enabled him to secure possession of the districts round his cap.

Eumenides (the 'well-wisher'), euphemistical name for the Erinyes, the Rom. Furies, or Diræ, 3 fearful maidens who dwell in the depths of Tartarus. Their function is to punish men for crimes such as perjury, murder, inhospitality, and violation of filial duty. Their names are Allecto, Megera, and Tisiphone. In the poets they sometimes appear as one, and one finds, in the tragedies of Æschylus, a whole chorus of Erinyes. Later, they were considered as goddesses, and sacrifices of sheep and libations of nephalia (honey and water) were offered to them. Later poets and sculptors represented them as winged virgins, dressed in the garbs of huntresses, with serpents encircling their heads. Milton confuses them in some of his works with the three Fates, Clotho, Lachesis, and Atropos. See J. G. Lawson, *Modern Greek Folklore and Ancient Greek Religion*, 1910.

Eumenius: (1) Trojan killed by Camilla in Italy (see Virgil, *Æneid*, II.). (2) Gallic rhetorician, b. at Autun about A.D. 280. He was grandson of Glaucus, the Athenian rhetorician who had settled in Gaul. E. practised rhetoric successfully both at Autun and at Rome, and was appointed to the court of Constantius Chlorus, and put at the head of a new college in Autun. Of the panegyrics attributed to him, one was made before the Emperor on the occasion of the retaking of Britain; another on the foundation of colleges, and a panegyric on Constantia Augusta, spoken at Treves and full of hyperbole. These speeches have frequently been reprinted, especially in the collection known as the *Duodecim panegyrici veteres*.

Eumolpus ('sweet singer'), in Gk. mythology the son of Poseidon and Chione, a legendary priest, poet, and warrior. The Eleusinian mysteries were generally considered to have been founded by E. As priest E. purified Heracles from the murder of the centaurs; as

musician he instructed him in the playing of the lyre. He is said to have been the first priest of Dionysus, and to have introduced the cultivation of the vine and fruit trees.

Eunapius (b. c. A.D. 347), Gk. anti-Christian historian and a native of Sardis. He is the author of *Lives of the Philosophers and Poets*, ed. by J. F. Boissonade, 1849; and also of a hist. from c. A.D. 268 to c. A.D. 404.

Eunomius, leader of an extreme sect of Arians who were called after him Eunomians. His confession of faith to Theodosius in 383 was rejected. His theory was that of Arius carried to an extreme. After his death his followers disbanded through internal quarrelling.

Eunuoh (Gk. *ευνουχ*), one who has charge of a bed, etymologically, one who has charge of women's apartments in the E. countries. The term, however, applies particularly to a person who has been castrated in order to serve as attendant in a harem. Sometimes E. occupied high official places in the state, so that the word E. was applied to a high official, the chamberlain. The barbarous custom of castration was probably earliest practised in Africa, but it was also a custom among the Romans. As late as the seventeenth and eighteenth centuries male castrati were employed in church choirs and on the operatic stage to sing soprano and contralto parts.

Eunus (d. 133 B.C.), Syrian slave and leader of a revolt of slaves in Sicily in 135 B.C. While working at Enna he led the slaves of a slave-owner, Damophilus, in a successful attack on the tn., and before the revolt was crushed it had spread all over the Is.

Eunonymus, genus of shrubby and arborescent plants in the family Celastraceae, is indigenous to Europe and Asia. The species are used in the manuf. of spindles. *E. europaeus* growing in hedges is the only Brit. representative; the fruit (capsule) is red when ripe, and splits open to show the 1 seed, each enclosed in an orange-coloured fleshy aril.

Eupatoria (Towpatoria), Russian sea-port and health resort, on the W. coast of the Crimea. It is a peaceful seaside tn. with what is probably the finest beach in Europe. There are a great many Jewish inhabs., and it contains the residence of the spiritual head of the Karaites sect. Trades are carried on in cereals, skins, cowhair, felt, tallow, and salt. Formerly, in 1736, it was Turkish ter. Taken by the Gers. in 1942, it was retaken by the Russians in April 1944. Pop. 16,000.

Eupatorium (Gk. *εὐπατόριον*), a genus of Composite, which takes its name from Mithridates Eupator, king of Pontus, who first recognised its medicinal properties. There is only one Brit. species, *E. cannabinum*, the hemp-cotton, which grows in marshy soil. Formerly it was highly valued as a medicine. It is very abundant in America. *E. perfoliatum*, or cross-wort, is used as a substitute for Peruvian bark.

Eupatrides, literally trans. means 'sons of noble fathers,' the anct. nobility of

Athens, the autochthonous pop., the dwellers in the city, the descendants of royal stock. The E. represent the only nobility that had any political recognition in early times. They were at the height of their power in the period during the limitation of the monarchy.

Eupen, industrial tn. with a hydro-pathic estab., in the prov. of Liège, Belgium, 9 m. S. of Aachen. By the Treaty of Versailles (1919) it was stipulated that the dists. of Eupen and Malmédy should be transferred from Germany to Belgium, if the inhabs. wished it, as a subsequent plebiscite indicated. The ceded dist. has an area of 400 sq. m. and a pop. of 60,000. When Belgium capitulated to the Gers. in May 1940 E. once more fell to Germany. In Oct. 1944 Amer. First Army troops entered Germany in the Aachen area east of E. which tn. was soon afterwards captured. Most of the inhab. speak Ger. Pop. (In.) 14,500.

Euphemism, in speech or writing, the avoidance of an unpleasant or indelicate word or expression by the use of one which is less direct, and which evokes a less disagreeable image in the mind. Thus for 'he died' is substituted 'he fell asleep' or 'he passed away.' Thus, the Gks. substituted 'Eumenides' (q.v.) benign goddesses, as a synonym for the 'furies.'

Euphorbia, see POINSETTIA.

Euphorbia, prin. genus of Euphorbiaceae (q.v.), contains over 700 species, widely distributed in the warmer parts of the globe, and a few in Britain. Both herbs and shrubs are common, while some of the plants occurring in the hotter and drier countries have succulent stems and greatly resemble the cacti. These, however, may be distinguished from cacti by their omitting a milky latex when punctured, and by the fact that the spines, when present, never form clusters. The inflorescence is most curious and forms a *cyathium* resembling a single flower: five bracts surround a number of male flowers, each reduced to a solitary stamen, and in the centre is a single female flower which forms an ovary of three carpels. *E. lathuris*, the caper spurge, is a common weed in cottage gardens, and *E. amygdaloides*, the wood spurge, is also well known in Britain.

Euphorbiaceae, a family of Dicotyledons, contains over 4000 species of trees, shrubs, and herbs, and is distributed over the whole globe. Many contain dangerously poisonous substances, while some are used as purgatives, others have a farinaceous substance used as food, e.g. cassava, and rubber, castor-oil and cascarrilla bark are well-known products. Few of the characteristics are common, but the flowers are always unisexual and regular. There are generally 5 perianth leaves, the stamens may be united or free, one to many in number, and the ovary is superior usually with three united carpels, is trilobular, and there are always one to two ovules in each loculus. Some of the chief genera are *Euphorbia*, *Ricinus* (castor oil), *Croton*, *Manihot*; *Poinsettia* (q.v.), is cultivated in hot houses.

Euphorbium, derived from the *Euphorbia officinarum* growing in N.W. Africa, a violent, irritant, and acrid substance, formerly much used in medicine, especially as a remedy for angina pectoris, as it acts on the nerve-centres for breathing and for the heart. It is dangerous to use *E.* except in minute doses. The term is sometimes inaccurately applied to the various species of gum-resin.

Euphorbus, son of Panthous, one of the bravest of the Trojan heroes slain by Menelaus (*Iliad*, xvii. 1-60). In support of his theory of the transmigration of souls, Pythagoras declared he had once

considerable distance it forms the boundary between Mesopotamia and Syria; thence it flows S.E. to its junction with the Tigris, and the joint riv., now called Shat-el-Arab, empties itself by sev. arms into the Persian Gulf, after a course of about 1700 m. The present place of junction with the Tigris has been shown by Sir W. Willcocks to be at Garnat Ali, 30 m. higher up than Kurna, the former place of confluence. Formerly the Tigris and the *E.* preserved each a separate course to the sea. The distance between the two rivs. varies from 18 to 19 m. The prin. tribs. of the *E.* after it

EUPHRATES

E.N.A.

A ferry near Deir-ez-Zor, Syria

been *E.*, whose shield hung up on the temple of Argos. Pythagoras claimed this shield as his own.

Euphrasia, genus of Scrophulariaceæ, contains about fifty species of plants which are semi-parasites, i.e. they have green leaves and carry out photosynthesis, but their roots are attached to other plants from which water and salts are obtained. *E. officinalis* is the common euphrasy, or eyebright.

Euphrates (Babylon. *Puraltu*; Hebrew *Peralu*; Arabian *Frat*; largest riv. of W. Asia. It rises in Armenia in two branches, the Kara Su and the Murad; the former rises about 20 m. N.E. of Erzerum, in the Tcheldis Mts., the latter 45 m. N.E. from the nearest point of Lake Van. Both these rivs. flow in a S.W. direction till they unite near Kebban in about 39° N. lat. and 39° 25' E. long. The united stream flows S.W. then to Sunaysat, having forced a passage through the main range of the Taurus Mts. and formed a succession of rapids and cataracts. For a

emerges from the mts. are, on the r. b. the Sagar; on the l. b. the Balik Su and the Khabur. The prin. tns. on the banks are now Sunaysat, Bir, Ana, Hit, and Hilla, but the greater part is inhabited only by roving tribes of Bedouins. The riv. is navigable for small craft as far as Bir, a distance of 1200 m., whilst larger vessels can ascend as far as the confluence with the Tigris. The *E.* has played a conspicuous part in the hist. of the world, as the many ruins of great cities on its banks bear witness; besides Babylon, 'the glory of kingdoms,' Ur, Zarsa, Nippur, and Sippara were situated there. The canal system of the riv. was very complete in early times, and contributed not a little to the amazing fertility of the region. Our information on the *E.* has of necessity increased greatly by reason of the Brit. occupation and administration of Iraq for some years after the First World War. Characteristic floods have often occurred during this period; that of 1929 was probably the highest for nearly

forty years, and illustrated the effect that riv. floods have had on the life of Iraq since the dawn of hist. Warning is now given by wireless from Syria of the daily rise and fall of levels at Deir-ez-zor, so that at least all available labour for the defence of the dykes can be secured. The provision of labourers for the dykes is decreed by law to be the duty of the agric. community. Whirlpools, as in 1929, caused severe erosion and undermined the embankments. The damage by floods to crops may be severe, and if the floods are very high, the riv. becomes indistinguishable from the sheets of water spread over the land; while, as in 1929, a small quantity of E. water may travel some 40 kilometres across country and flow into the Tigris. Owing to the fact that the prevailing N.W. wind acts with the current of rivs. in Iraq, sailing craft have to be towed up-stream; the E., like the other rivs., is very shallow in autumn, so that the draught of ships has to be limited to 3½ ft., and this is so even on the Tigris which is deeper than the E. No steamers ply on the E., owing to its shallowness, which is particularly marked in the Hammar Lake; but sailing craft carry local freight; and motor boats can be hired on the Middle E. See A. Musil, *Middle Euphrates*, 1927; M. G. Imdes, *Régime of rivers Euphrates and Tigris*, 1937. See also BAGDAD RAILWAY; and for further details of the Tigris, see TIGRIS.

Euphrosyne, one of the Graces, 'The Joyous One,' see CHARITIES.

Euphuism, the florid mode of speaking and writing towards the end of the reign of Queen Elizabeth. It was brought into fashion by the romance *Euphues*, written in 1578 by John Lyly, who in addressing his writings chiefly to women said he would rather see his works 'he shut in a lady's casket, than open in a scholar's study.' His idea was not to improve, but to amuse. E. did not attempt to render the simplicity of nature, but to be artificial and affected in its desire for refinement. Dr. Laudmann (New Shakes. Soc. Tran. 1880-86) gives the following sound description of E.: (i) An equal number of words in collateral or antithetical sentences, well balanced often to the number of syllables, the corresponding words being pointed out by alliteration, consonance or rhyme; (ii) "Unnatural Natural History," which he (Lyly) learned from Pliny; (iii) An oppressive load of examples taken from ancient history and mythology, as well as apophthegms from ancient writers. Some commentators on Shakespeare have suggested that in *Love's Labour's Lost* the dramatist was satirising the euphuists in the character of Don Adriano de Armado, and Scott in his character of Sir Piercio Shafton in *The Monastery* speaks of the 'Euphuist Don Armado,' as he calls him in the Introduction to that novel. But neither Sir Piercio nor Armado talk the E. of its masters, Lyly, Greene, and Lodge. Doubtless this peculiar affectation was at its height when Shakespeare's play was written to satirise all manner of affectations such as Spanish high-flown diction,

bombast, excessive alliteration and hyperbole; but the very fact that there is but little E. in the play is a strong argument against the validity of Blount's statement, made in 1632, in an address prefixed to an ed. of Lyly's plays, that it was the language of the ladies of Elizabeth's court.

Eupion, highly inflammable liquid of the paraffin series, discovered by K. Reichenbach. It is formed from many substances, such as wood, coal, caoutchouc, bones, resin, and the fixed oils.

Eupoda (Gk. *εὐποδία*, strength of foot), the name given to a section of Coleoptera noted for the thickness of their hind legs. The genus *Sagra* especially is so developed, and is therefore known as the kangaroo beetle.

Eupolis (c. 446-411 B.C.), Athenian poet of the old comedy who flourished in the time of the Peloponnesian war. He is ranked by Horace as one of the greatest writers of his school. In the elegance and purity of his diction he was reputed to be equal to Aristophanes, and in command of irony and sarcasm to rival Cratinus. His plays, of which only fragments survive, included *Kolakes*, *Marikas*, *The Baplae*, *The Demoi*, and *Poleis*. It is not true that he was drowned by Alcibiades, who is said to have thrown him into the sea for having attacked him in one of his plays.

Eurasian, term used to denote children born of a Hindu mother and a European father. For more than half a century it was confined to India, but is now descriptive of any half-caste.

Eure, dept. of N.W. France, formed in 1907 from a portion of the old prov. of Normandy. It has three arrons., Evreux (the chief tn. of the dept.), Les Andelys, and Bernay. The ter. of Eure is broken up by its rivs. into well-wooded plateaus. The climate is mild, but most variable. Chief products, wheat, flax, and beetroot, cattle and horses of pure Norman breed, for which the dist. is famous. Fruit is abundant; the minerals are marl and brick-clay. Pop. 315,900.

Eure-et-Loir, dept. of N. France, situated to the S.E. of the dept. of Eure, is divided into the three arrons. of Chartres (the chief tn. of the dept.), Chateaudun, and Dreux. The E. portion is a gently undulating plain, called the Beauce, the W. called the Perche, is of a more diversified nature, with hills, forests, and numerous rivs. The chief riv. in the N. is the Eure, in the S. are the Loire and the Huisne. None of the rivs. is navigable save the Eure for a short distance. The Perche dist. has a slightly colder and healthier climate than the Beauce, where fever sometimes occurs, caused by the pools of rain water which form the only water supply in summer for many vills. Wheat and oats are the prin. crops, and apples are largely grown. Textile goods and boots are manufactured and there are foundries. Area of prov. 2293 sq. m. Pop. 258,100.

Eureka, city of California, U.S.A., on Humboldt Bay, co. seat of Humboldt co., and the most westerly city in the U.S.A.

Great quantities of redwood lumber are shipped. Pop. 17,000.

Eureka Springs, city of N.E. Arkansas, U.S.A., in the Ozark Mts., a health resort, with radio-active springs. Pop. 2400.

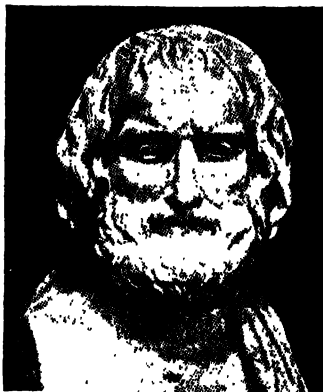

Eureka Stookade, see under BALLARAT; DIGGER'S CONGRESS.

Eurhythmic (Gk. εὐρ, well; ῥυθμός, flow) is a method, developed by M. Jacques-Dalcroze, of teaching music through its realisation and interpretation by movements of the body. By a succession of exercises carefully graded and directed, an intellectual appreciation of rhythm is attained, based on the natural perception of rhythm illustrated by the movements of many people in response to a barrel organ playing a march or dance music. Later exercises develop the imagination and encourage its expression by free descriptive movements. Attention and concentration, in addition to physical control, are exacted by all the exercises, by means of which the sense of hearing and the judgment of direction and intensity of sound are trained. Concentration is essential, for even momentary wandering causes the movements of the body to be out of time with the music. Moreover, without concentration, the high degree of physical control that can be gained would be impossible, for the more difficult exercises demand separate control of each arm, the legs, and head, so that each can move at a different rate from the other and simultaneously express four different rhythms. The eurhythmic method of teaching music incorporates the development of mental and physical control, thereby increasing efficiency. See E. J. Dalcroze, *Rhythm, Music, and Education*, 1921.

Euripides (Εὐριπίδης) (c. 480-406 B.C.), last of the great trio of Gk. tragedians (Æschylus, Sophocles, Euripides). The Parian marble gives the date of his birth as 485 (i.e. 480). He was probably b. in the is. of Salamis (whither his parents had fled, from Athens on the invasion of Xerxes, on the day of the famous battle), according to tradition, of humble parents. (See Aristophanes, *Acharnæ*, 478; *Equit*, 17; *Rana*, 840.) Ancient authorities state that his father, Mnesarchos, was of a respectable family and his mother, Kleito, perhaps of noble family. His wife seems to have been one Mulo, daughter of Mnesilochos, and possibly a relative. The legend of E. as a misogynist, which owes its origin to the fact that he was the first Gk. to portray woman realistically, is probably apocryphal; but the infidelity of two wives in succession is said to explain his tone in reference to the majority of their sex. There seems to be little ground for supposing that he was twice married. His life was spent in study, and he early came under the influence of the Sophistic teaching—whence his appreciation of the conflict between traditional theology and scientific judgment. Fiery and eager, he reaped the reward of his acid tongue, was forced to leave Athens, and lived for some time as a guest at the comparatively barbarous Macedonian court, where he died.

The best study of E.'s character will

be found in U. von Willamowitz-Moellendorf's *Herakles*. In his youth he cultivated gymnastic pursuits, and won the prize at the Eleusinian and Theban contests. He received a good education, and became the friend of Protagoras, Anaxagoras, Socrates, and others. He acquired great oratorical skill under Prodicus, beginning his career as a writer, about 455, winning third place with the *Pleiades*. Not till 441 did he secure the first prize, and only about five times in all. The scientific and philosophic thought expounded in his plays, often approaching religious scepticism, did not find favour with his contemporaries. He represented the new moral and social influences that were affecting Athens, and in the next century his popularity increased ten-fold,

EURIPIDES

and many considered his dramas superior to those of Æschylus and Sophocles. He is noted pre-eminently as a master of pathos and for his delineation of female character. He is interested in the experiences of the ordinary individual, rather than in that of legendary beings, drawing his characters with a fine realistic touch. E. has been called the most modern of the three great Athenian dramatists, and 'the forerunner of Rationalism.' The anc. criticisms of Aristophanes and others are very prejudiced, but Quintilian and Cicero both admired E.

E. was essentially a realist whose art reflected the humours and passions of daily life and the vehicle he sought as his medium was a drama of archaic plots and simple style, not unmingled with sheer incongruities; but, seen through his rationalism, the plays became a formidable weapon of propaganda for the fifth century illumination. For E. plot is almost immaterial, for several of his plays, seen, in point of plot, to be much the same as the compositions of Phrynichos.

He introduced changes in Gk. drama; notably in the prologue which, in his plays, assumes the form of versified programme; and in his employment of the device of the *deus ex machina* or god who comes on at the end to wind up the plot whether artistically or not. Unfortunate in both his first and second marriages he finally left Athens, about 409, and died at the court of Archelaus of Macedonia. A noble cenotaph erected to him at Athens declared that 'all Greece was his monument.'

About eighteen of his plays only are extant, but titles of many more are known. Arranged in approximate chronological order, the extant plays are: *Alkestis*—which appeared in 438 B.C., together with the *Cretan Women*, the *Alkmeon in Prophis* and *Telephos*, the *Medeia*, brought out in 431 B.C. with the *Philoctetes*, *Diktys*, and the satire *Harpageters*; *Hippolytos*, *Crowned*, 428 B.C., *Hekabe*; *Kyklops*—sole surviving specimen of a satyr-play; *Children of Herakles*; *Mad Herakles*; *Andromache*; *Suppliants* (the protection given by Athens to the mothers of the Argives who fell at Thebes); *Trojan Women*; *Iphigenia in Tauris*; *Ion*; *Elektra*—E.'s version of the tale told by Aeschylus in the *Choephoroi*; *Helene*; *Phoenician Women*; *Orestes* (408 B.C.); *Iphigenia in Tauris*, *Bacchantes* (posthumously produced, with the *Alkmeon in Corinth*, in 407 B.C.); and *Ithosos*. In more modern times great homage has been paid to the genius of E.; Milton, Browning, Schiller, and Alfieri were all ardent admirers. Among numerous eds. may be mentioned those of Lascaris (1496, four plays), Musurus (Aldine ed., 1503), A. Kirchhoff (1867), C. Dindorf (5th ed. 1870), A. Nauck (3rd ed. 1871), and Paley (1874-80) have also produced complete eds. There are admirable verse trans. by A. S. Wray (1894-98) and G. Murray (1902-07).

See J. P. Mahaffy, *Introduction to the Study of Euripides*, 1879; J. E. Sandys, *Bacchae*, 1880; J. A. Symonds, *Greek Poets*, 1893; A. W. Verrall, *Euripides the Rationalist*, 1895; A. E. Haigh, *Tragic Drama of the Greeks*, 1896; W. Nestle, *Euripides, der Dichter der griechischen aufklärung*, 1901; G. I. Norwood, *Life of the Bacchae*, 1908; H. Steiger, *Euripides*, 1912; E. Rowald, *Die griechische Tragödie*, 1930; H. Murray, *Athenian Drama*; *Euripides*, 1931; A. Rivier, *Essai sur le tragique d'Euripide*, 1941; R. P. Winnington-Ingram, *Euripides and Dionysus: An Interpretation of the Bacchae*, 1948. For fragments of E. see Weil, *Nouveaux fragments d'Euripide*, 1879; F. Blass, *De Phaethontis Eurypidis Fragmentes*, 1885; A. S. Hunt, *Tragicorum Graecorum Fragmenta Papyracea Nuper Reperta*, 1912; R. J. Walker, *The Macedonian Tetralogy (Alcmena, Lemenus, Teneides, and Archelaus, with trans.)* 1920; A. Nauck, *Fragmenta Tragicorum Graecorum* (ed. by R. J. Walker, 1923).

Euripus, or Euripos, see EUBŌKA.

Euroclydon, a N.E. wind in the Mediterranean now called Gregalia. It is mentioned in Acts, xxvii, as being the

cause of the shipwreck of the vessel in which St. Paul was sailing.

Europa, daughter of Agenor, or of Phoenix, king of Phoenicia, and sister of Cadmus. The Gk. legend was that she was beloved by Zeus, who assumed the form of a white bull and carried her away to Crete, where she became mother of Minos, Ithadamanthus, and Sarpedon. After death she was worshipped at Crete as 'Hellotis.' There is considerable discussion as to the etymology of her name. Cf. the myth of Persephone. See Horace, *Odes*, iii. 27; Ovid, *Metam.* ii. 833; A. Pauly-Wissowa, *Realencyclopädie der klassischen Altertumswissenschaft* (vol. vi.) 1909.

'Europa,' The, quadruple-screw turbine-driven passenger liner of the German mercantile marine (1939). Gross tonnage 49,746; length, 890·2 ft., breadth 102·1 ft.; speed 26 knots. Built 1928. Owned by the Norddeutscher Lloyd, the E. was the crack liner of the Ger. merchant service. In 1945 the E. was docked at Southampton and taken over by the U.S. Shipping Administration.

Europa Point, the most southerly point of the Straits of Gibraltar.

Europe is situated in the North Temperate zone. It is, except Australia, the smallest of the continents, but is both historically and politically the most important. Its area is 3,800,000 sq. m., about one-fourteenth of the total land area of the globe, the greatest length being 3400 m., and the greatest breadth 2400 m. Geographically, E. should be regarded as forming with Asia one great div. of the land surface of the globe. Its E. boundaries are the Caspian Sea, Ural R., and Ural Mts. These boundaries do not, however, mark a distinct difference either in flora or fauna; or of political divs., as Russia in E. and Siberia are united in the R.S.F.S.R. The other boundaries are: on the N. the Arctic Ocean, on the W. the Atlantic Ocean, on the S. the Mediterranean Sea, Black Sea, and Caucasus Mts. The boundaries of the R.S.F.S.R. however, extend beyond the Caucasus. The coast line of E. is greater in proportion to its size than that of the other continents, being some 50,000 m. The land is penetrated by large seas and gulfs, and its coast-line contains sev. large peninsulas, conditions which greatly favour its trade. The surface is divided into two parts, the great central plain, occupying two-thirds of its surface, stretching from the Ural Mts. to the Atlantic, and the highlands in the centre and the S. Apart from these two divs. is the mountainous dist. of Scandinavia, including the Brit. Isles. The S. system consists of the Alps, Pyrenees, Sierra Nevada, Apennines, Balkans and Carpathians. The great transverse watershed runs from N.E. to S.W., and the rvs. therefore flow generally N.W. and S.E. The two chief centres of this watershed are the Valdian uplands and the Alps. From the bogs and lakes of the moraine Valdes Hills flow the Volga (2100 m.) into the Caspian Sea, the Don into the sea of Azov, the Dnieper into the Black Sea, the N. Drwina

into the White Sea, and the W. Dwina into the Baltic. From the Alps flow the Danube (1700 m.) into the Black Sea, the Rhine into the N. Sea, the Rhône, Po, and Adige, into the Mediterranean. There are three prin. groups of lakes, viz. the Alpine lakes with Geneva, Constance, Lucerne, Neuchâtel in Switzerland; Maggiore, Garda and Como in Italy; Balaton in Hungary, the Scandinavian group with Wiener, Wetter, and Mälär in Sweden and Miosen and Randsfjord in Norway; the lakes of the central plain, Ladoga, Onega, Peipus, and Ilmen in Russia; and Saima and others in Finland. The is., with the exception of Iceland, lie near the mainland, the prin. being Great Britain and Ireland, Sardinia, Corsica, Sicily, Iceland, Nova Zemly, and Crete.

GEOLOGY.—In earliest geological times the coast of E. appears to have had a greater extension towards the N. and N.W., whilst the S. and E. dists. were under the sea. The oldest rocks, those of the Archæan and Palæozoic periods, are most continuous in the N. part of the continent, and extend over a large part of N. Russia, Finland, the Scandinavian Peninsula, and the N. and W. parts of the Brit. Isles. They also occur in Brittany, Central France, and Spain. In the rest of E. they form isolated clusters, but appear to be the foundation of the Alps, Pyrenees, Caucasian, and Ural ranges. The newer rocks of the Mesozoic and Cainozoic periods are generally found on the lower lying lands, but occur, nevertheless, in the Pyrenees, Alps, Caucasus, Carpathians, and Apennines. Their most continuous belt is in the central plain from the N. Sea into Russia. During the Cambrian period the S. part of E. was covered by a shallow sea, with a few is. of Archæan formation; while a large inland sea existed in the N. of Scotland, and apparently also in Wales. In the following, Silurian, period the continent was further submerged, the Brit. Isles disappearing almost entirely. This was apparently a period of great volcanic activity. Next came the Devonian and Old Red Sandstone periods. The latter was deposited in lakes and inland seas, while the former is of marine origin. Between the Silurian and Devonian periods the sea had receded and left great masses of land uncovered. The Atlantic Ocean, however, still stretched over the S. of England and the centre of E., while submarine volcanic eruption was frequent in Germany. The Carboniferous period marked a further extension of the sea, which covered Ireland and England, the low grounds of Central E. and a great part of Russia. Volcanic disturbance was frequent, and eventually the sea receded, leaving vast tracts of newly exposed lands. At the beginning of the Mesozoic era, large inland seas appear to have covered parts of E., including the S. portions of the Brit. Isles, and the lower course of the Rhine. Towards the close of the Triassic period, however, the land subsided, and allowed these lakes to become connected with the open sea. During the Jurassic period the Brit. Isles

seem to have risen above sea-level, with the exception of S.E. England. Similarly S. France and E. Spain were submerged, and the lower parts of N. Germany and Russia, Italy, Austria-Hungary, and the Balkans were also partly under water. This submergence appears to have lasted for a very lengthy period, but towards the close of the Jurassic period the land again rose, and in the early Cretaceous period Middle E. was generally dry. Later on, however, the land again subsided, leaving a vast sea over Central E., while the Mediterranean Sea was of far greater extent than at present, and covered part of France, Spain, Italy, and Greece, and was probably connected directly with the Indian Ocean. At the beginning of the Cainozoic period the land had again risen and left the centre of E. above sea-level. The S. lands were, however, represented only by is. and narrow peninsulas, a condition which persisted until the late Miocene period. During the Eocene period, the Alps, Pyrenees, and Carpathians were thrown up, and a further elevation of the same ranges was effected in the Miocene period. During the Pliocene period the bed of the Mediterranean was elevated, uncovering the lands of S. Europe. Violent changes of surface do not seem to have taken place in the Pleistocene period, but there were successive elevations and depressions. During this period the Brit. Isles appear at one time to have formed part of the continent, while at a later period large tracts of them again lay under water.

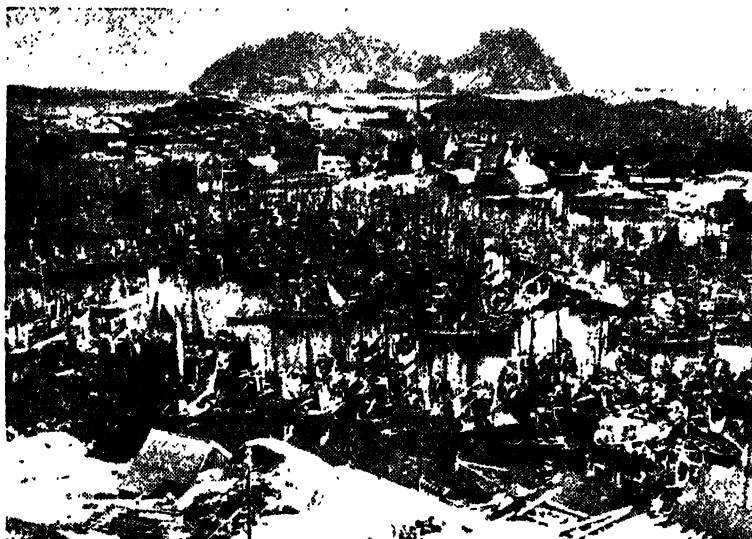

CLIMATE.—The climate of E. is very favourable. The major portion of the continent lies within the N. temperate zone, only parts of Norway, Sweden, and Russia being within the Arctic Circle. Owing to the fact that there is a long coast-line facing the Atlantic, and also to the presence of big inland seas, the climate is to some extent of an insular character. The Gulf Stream washes the W. shores and keeps their ports open all the year round. The prevailing winds come from the S.W., and are genial in character. In spring, however, cold E. winds blow from Siberia and lower the temp. considerably even in Western E. On the other hand hot winds blow across the Mediterranean from the sandy regions of N. Africa and impart to the S. shores of E. a sub-tropical climate. There are four regions of climate which may be distinguished: the S. along the shores of the Mediterranean, where there is seldom frost except in the mts.; the W., along the shores of the Atlantic and inward as far as the Oder, in which frost is not of long duration, and is not intense in degree; the E. or continental region, where the frost is more prolonged and the extremes of temp. are greater; and the N. region, along the N. coasts, where the climate is sub-Arctic. The rainfall diminishes from W. to E. Ireland has an ann. average of 208 rainy days, Scotland 170, and the region of the Volga 90.

POPULATION AND LANGUAGE.—The pop. of E. is some 550,000,000, or an average of 263 to the sq. m. The inhab. are divisible

into three main types. The Teutonic or Nordic type—long-headed, blond, tall, eyes blue, and nose aquiline—is spread over N.W. Europe, disseminating from Scandinavia and, in pre-historic times, from Russia. The virile Nordic people have unfortunately been much reduced through the ages by wars. Other long-headed men who in early times migrated into S. Europe now form the Mediterranean or Iberian type—long-headed, dark hair and eyes, medium height, slender, and broad of nose. The Pyrenean

elements among the E. European peoples are either of Mongolian or Tartar-Turkish origin. The former are represented by the Lapps and Samoyeds in the N. and the Kalmuk and Kirghiz peoples of the Caspian steppes in the S. Tartar-Turk is the name given to the scattered Turkish-speaking peoples found in Russia and the Crimea.

The prin. languages of E. belong to the Aryan family. Celtic is spoken in the extreme W., its branches being Cymric in Wales, Manx in the Isle of Man, Gaelic in

THE NORTHERN COAST: NORWAY

A fishing fleet in the harbour of Værøy, Lofoten Islands

Basques are a sub-type of the Mediterranean stock. These two races of Europe are separated by the intermediate Alpine type of Central Europe—round-headed, broad-faced, light hair, grey eyes, medium height, rather stocky. This type prevails in N. Italy, Auvergne, Savoy, Switzerland, the Tyrol, Alsace-Lorraine, Württemberg, S. Germany, and Bavaria. Of the same stock as the Alpine race are the Slav-speaking peoples of Eastern E., divisible into two branches—the N. Slavs (Russians, Slovaks, Czechs, and Wends) and the S. Slavs (Serbs, Croats, Slovenes, and Bulgarians). Both are broad-headed, but the S. Slavs are taller and darker. The Slavs originally penetrated Russia from the S.W., overlaying the primitive, indigenous types, now represented by the long-headed Nordic Esths and Finns, to whom the Magyars and Letto-Lithuanians are racially related. The other primitive

the Highlands of Scotland, Erse in Ireland, and Armorican in Brittany. Teutonic is spoken in the centre, N., and W. Its main divs. are High Ger. in Germany proper, Low in the plains, including Eng. and Dutch; Scandinavian in Iceland, Denmark, Norway, and Sweden. Slavonic is spoken in the E. countries by Russians, Poles, Lithuanians, Letts, Wends Czechs, etc., and the Rumanian languages in France, Spain, Portugal, Italy, Wallachia, Greece, and Rumania. Non-Aryan tongues are Magyar in Hungary, Basque in the Pyrenees, and Turkish in the peninsula.

RELIGION.—The European nations, with some exceptions (*see below*) are Christians. The three branches of Christianity are the Rom. Catholic, prevalent in Southern E., the Orthodox, known loosely as the 'Greek Church' in the E. countries, and the Protestant Churches in the N. and central countries. Soviet Russia has

no official religion. There were some 10,000,000 Jews in E. (1930) and 5,000,000 Moslems (Turks, Russian Tartars, Albanians, and some of the Slavs). The Kalzuks in S. Russia are Buddhists, while the Samoyeds and some of the Lapps and Finns are idolaters.

VEGETATION.—Vegetation is generally very rich in the S. and central countries, but is not so plentiful in the N. E. may be divided into three zones in this respect: the S., central, and N. In the S. countries, S. of the Alps, the trees are chiefly evergreens; among the cereals, rice, maize, millet, and wheat are grown, as well as the olive, grapes, oranges, lemons, figs, and

chestnuts, and to some extent the cotton shrub, date palm, and sugar cane. Most of these plants appear to have been introduced from Africa and Asia, while maize and the Amer. aloe have been brought from America. In the central countries the chief cereals are wheat, barley, oats, and rye. Here are found the richest wheat areas of the world, notably in the valley of the Danube and the blacklands of S.W. Russia. The chief fruits are the apple, plum, pear, and cherry, while the vine is cultivated to 50° N. The trees are deciduous, being chiefly oak, beech, birch, elm, and alder. In the N. countries the chief trees are pines, larches, firs, birches,

and willows, which become more stunted in size as the N. is reached, and give place to mosses, lichens, and dwarf shrubs. Barley, rye, oats, and potatoes are the prin. objects of cultivation. In the N. of Russia exists the region of the Tundras, dreary wastes of ice and rock, where only stunted shrubs, lichens, and mosses are found. In the S.E. of the same country is another well-marked region, the Steppes, broad treeless plains, which, during the winter, are covered with snow. In the early summer, however, the Steppes are covered with grasses, which afford a rich supply of hay.

ANIMALS.—There are very few species of wild animals now left in Europe, and those that still remain are few in number. The bison exists in Lithuania and the Caucasus; the brown bear, wolf, and wild boar are found in the larger forests. The reindeer and elk dwell in the northern countries, while the stag, fallow deer, and roebuck exist in Central E. The chamois is hunted in the Alps and the Carpathians, and the ibex in Sardinia. The fox and lynx are also found. The Barbary ape exists only on the Rock of Gibraltar, and the beaver is sometimes seen in S. Russia. Of domestic animals the chief are the horse, donkey, cow, sheep, pig, goat, dog, cat, and reindeer. Silkworms are also reared in Italy and France. Web-footed birds, such as the wild duck and the goose, abound in the N. seas, while the vulture and the eagle may be seen in the Alps and S. ranges. The seas contain numerous kinds of fish, which are of great value as foods. In the N.W. seas the herring, mackerel, cod, haddock, sole, and pilchard are caught; in the Mediterranean the tunny, sardine, and anchovy. Salmon is abundant in N. and W. rivers. In the Arctic seas the whale, seal, porpoise, and walrus are obtained. Oysters are especially cultivated round the coast, and other shell-fish, such as the lobster and crab, are caught in large numbers.

MINERALS.—E. possesses vast deposits of minerals, but is very poor in precious stones. Coal is abundant in Great Britain, Germany, France, Belgium, Austria, and Russia. Iron is found chiefly in Great Britain, Germany, France, Belgium, Sweden, Austria, Russia, and Spain. Copper is found in Spain, Portugal, and Germany, and lead in Germany, Spain, and England. Zinc is chiefly found in Germany, Belgium, Great Britain, and France. Gold is mined in the Ural Mts. and silver in Germany and Austria. Platinum comes from the Ural Mts., quicksilver from Spain. Salt is produced in the Great Britain, Germany, Russia, France, Spain, and Italy. Sulphur is obtained from Sicily, and graphite from Bavaria and Austria. Transcaucasia is rich in oil, copper, and manganese.

POLITICAL DIVISIONS AND CONSTITUTIONS.—The countries of E. with their areas and pop. are shown in the table opposite. The First World War, 1914–18, resulted in the creation of seven 'succession' states out of the former Tsarist and Hapsburg empires:—in N.E. Europe the four Baltic Republics of Finland, Estonia,

Latvia, and Lithuania, and in Central Europe, Poland, Czechoslovakia, and Yugoslavia. In 1940, however, Finland lost a great part of its E. ter. in the Russian invasion of that year, it being constituted as the Karelo-Finnish S.S.R. The E. Baltic States (Latvia, Estonia, and Lithuania) were absorbed by Russia in the Second World War after being overrun in 1941 by the Gers. Poland was partitioned in 1941 between Germany and Russia but restored to nominal independence in 1945 subject to losses of ter. to Russia in the E. and gains in the W. at the expense of Germany. The remainder of Russia-in-E. consists of Russia proper or R.S.F.S.R. (part), Armenia, Azerbaijan, Byelorussia or White Russia, Moldavia, Georgia, and the Ukraine. In the Balkans the Serbs, Croats, and Slovenes were united in the kingdom of Yugoslavia, while Rumania and Greece were enlarged, Bulgaria reduced, and the small kingdom of Albania created. Albania was annexed by Italy in April 1939, but in 1944 the country was liberated by Allied and patriot forces. Austria and Hungary were made two small independent republics, and an enlarged Italy now borders on Yugoslavia. On March 13, 1938, Austria was annexed by Germany and incorporated into the Reich under the name of Ostmark, but liberated in 1945. Alsace-Lorraine was restored to France. The dominant factor in the reconstruction of E. has been racial nationality, but Memel and Danzig were, for a time, Free Cities, and the demilitarised straits of Constantinople were placed under international control. Both Memel and Danzig have now reverted to Germany, while Turkey received the right to fortify the straits. Trieste was constituted as a Free Ter. in 1947.

For the gov. of the various states of E., see separate articles.

HISTORY.—From the Greek *Communities to the Crusades.*—The hist. of E. begins with the Gk. communities, and its subsequent culture has been to an incalculable extent indebted to Grecian standards. When in the fifth century B.C. E. was threatened by the Asiatic hordes of the king of Persia, the Gk. communities united against the common foe and averted the danger by their signal victories at Marathon (490 B.C.), Salamis (480), and Plataea (479). Though capable of joint action in times of great peril, Greece was not a corporate whole, but a collection of small independent cities, each striving for supremacy over the others. This supremacy was at first obtained by Athens. Her power was, however, envied by the other Grecian cities, and at the end of the Peloponnesian war, which lasted twenty-eight years, Athens was taken by Lysander, the Spartan general, and its democratic gov. destroyed (404 B.C.). The Spartans, owing to the rigid military training of their citizens, managed to remain supreme for some thirty years, when Epaminondas, the Theban general, inflicted a series of defeats upon them. The internal struggles of the peninsula made it an easy prey for the rising power of

Macedonia, and when Philip was succeeded by his son, Alexander, the latter was master of almost the whole of Greece. His marvellous victories in Asia (334-323 B.C.) led to no decisive result, and his empire was upon his death speedily broken up by the contending generals.

With the fall of Greece came the growing might of Rome, which, in the fourth and third centuries B.C., had conducted a series of successful wars against the neighbouring Lat. and Samnitan tribes, and thereby made itself the leading state in Italy. Its expansion brought it into conflict with the Grecian cities in the foot of Italy, and they sought help from Pyrrhus, king of Epirus, the most renowned general of his time (281 B.C.). Even Pyrrhus's ability was, however, no match for the tenacity of the Romans, and when he left Italy (274 B.C.) the remaining states soon acknowledged Rome's supremacy. The latter's triumph only brought her into conflict with Carthage, which, situated upon the African coast near the modern Tunis, was at that time mistress of the E. Mediterranean. The contest that ensued was one between the two rival civilisations of the Semites and the Aryans, and determined the future hist. of the world. The first Punic war lasted from 264 to 241 B.C. Success at first fluctuated, owing to the superiority of the Carthaginians upon the sea. The Romans, however, with undaunted energy, built fleet after fleet, utterly defeated their opponents upon their own element, and obtained as their reward the adjacent is. of Sicily. Carthage, however, again returned to the attack, and the military genius of Hannibal, during the second Punic war (218-201 B.C.), shook the power of Rome to its foundations. But in spite of awful disasters at Trasimene and Cannae, the Romans never yielded, and when Hannibal's brother, Hasdrubal, was defeated and slain with a second invading army at the battle of the Metaurus (207 B.C.), the tide turned steadily against the Carthaginians. A third war saw the total destruction of Carthage (156 B.C.). Its greatest rival vanquished, Rome went from conquest to conquest; Greece, Spain, Macedonia, Asia Minor, and N. Africa fell under her sway. Her political institutions were introduced throughout S. Europe. Her conquests, however, only aggravated the cleavage between the aristocratic and democratic portion of her populace, while her huge armies prepared the way for a military dictatorship. Julius Caesar's ambition and the astuteness of Augustus estab. the Rom. empire.

The transfer of the cap. to Constantinople in A.D. 323 led subsequently (A.D. 395) to the div. of the Rom. dominions into the empires of the E. and W., and both portions were soon to suffer the irruptions of the savage hordes from the N. The direct cause of these irruptions was the invasion of E. by the Asiatic tribes of the Huns under Attila (A.D. 451), which set the tribes of Central E. in motion and flung them upon the Rom. frontier. In the general upheaval, Britain fell to the

Angles and the Saxons, Gaul to the Visigoths, Burgundians, and Franks (the latter of whom also conquered W. Germany), Italy to the Ostrogoths, and N. Africa to the Vandals. These barbarians, though they overthrew the Rom. power, nevertheless had respect for Rom. institutions, and kept up the fiction of the Rom. empire long after the reality had passed away. In the midst of the disruption the Christian church maintained its unity, and the pope finally claimed the right of disposing of the imperial crown. During the sixth century Italy was perturbed by the invasion of the Lombards, while in the eighth century the Moslems swarmed into Spain and Gaul, to be checked ultimately at Tours by Charles Martel (732). The latter's triumphs were continued by his grandson Charlemagne, who succeeded in establishing a powerful empire throughout Central E. from the Elbe to the Danube, and was crowned emperor of the W. by Pope Leo III. (Dec. 25, 800).

Charlemagne's vast empire was divided by his grandsons into France, Lotharingia, and Germany, Lotharingia ultimately being parcelled out between France and Germany. The next centuries were occupied by struggles between the monarchs and their feudal lords, the latter increasing their power at the expense of the former. During the ninth and tenth centuries occurred the raids of the Northmen, who, sailing from Scandinavia, estab. themselves in Normandy and S. Italy and harassed Great Britain, which, during the following century, was destined to fall to one of their descendants, Wm. of Normandy. From the end of the eleventh century till the latter half of the thirteenth, E. was agitated by the organisations of the crusades, which had the effect of bringing the warriors of various nations into touch with one another, and thereby did much to promote medieval culture. The fourth crusade (1202-4) was especially remarkable, because the crusaders were diverted from their true goal to the capture of Constantinople, and estab. a Fr. empire in the Balkans which lasted some sixty years. The Ger. kings still claimed for themselves the title of emperors of the W., but their power was very unsubstantial and their influence greatly weakened by the conflict with the popes over the question of investiture. In Spain a succession of small states was formed as the country gradually freed itself from the Moorish yoke, while in the E. of Europe the knights of the Teutonic order, whom the failure of the Crusades had left without occupation, turned their attention to the neighbouring country of Prussia and converted the Wends to Christianity.

From the Hundred Years' War (1337-1453) to the Seven Years' War 1756-63.—The Hundred Years' war (1337-1453), which the Eng. kings waged against France in prosecution of their claim to the Fr. throne left that country far more unified than it had been before, and the crafty policy of Louis XI. broke down the power of the big feudal lords. His successors were therefore free to devote themselves to foreign conquests. Their attacks

on Italy, however, brought them into conflict with Charles V., who had inherited the Netherlands, Spain, Naples, and Austria, and was elected emperor of Germany in 1519. His son, Philip II., succeeded to the hereditary dominions, but the imperial crown passed to the Hapsburg family. During the fifteenth century the Ottoman Turks captured Constantinople (1453), and spreading northward, conquered the whole of the country up to the walls of Vienna. Their severance of the connection of E. with the east, led to the great overseas discoveries by the nations of the W., while Gk. fugitives carried to Western E. the accumulated treasures of learning of the eastern empire, and so brought about the Renaissance and later the Reformation. Spain, the most ardent defender of Catholicism, was weakened by the loss of the Netherlands and by Eng. attacks upon her colonies, while in the seventeenth century the Portuguese reasserted their independence. In France the religious wars led to the estab. of the Bourbon dynasty and paved the way for the reign of Louis XIV. In Germany the Protestant states were for a time in serious jeopardy, but were rescued by the military genius of their Swedish ally, Gustavus Adolphus. The treaty of Westphalia (1648) left the land in a most exhausted condition. Sweden, however, gained Upper Pomerania, Wismar, Stettin, and Bremen. By the defeat of Denmark in 1643 it had also increased its dominions, and was now the leading Protestant power in E. In a later war (1657-58) Denmark was forced to surrender all its remaining Swedish provs., and a further war stripped Poland of Estonia and Livonia. Sweden's power was, however, broken by its king, Charles XII., who after successfully defeating a coalition of Russia, Saxony, and Denmark, led his army into S. Russia, where he was utterly defeated by Peter the Great at Pultowa (1709). France, which by the treaty of Westphalia had received the prov. of Alsace, was the strongest power in E., and shortly afterwards defeated Spain, forcing her to the disadvantageous peace of the Pyrenæes (1659). Shortly afterwards Louis XIV. married the Sp. Infanta Maria Theresa, who became the heiress of the Sp. throne upon the extinction of the male line. The Fr. invasion of Flanders had, however, already raised the jealousy of the other Powers and led to a triple alliance between England, Sweden, and Holland. When Louis's grandson, the duke of Anjou, was proclaimed heir to the Sp. throne, a new coalition was formed (1701) between England, Holland, and Austria. In the campaign which ensued, the military genius of the duke of Marlborough proved superior to that of the Fr. generals, and after defeats at Blenheim, Ramillies, Oudenarde, and Malplaquet, Louis made peace. The King of Spain renounced his right of succession to the Fr. throne, and surrendered the Netherlands, Naples, and Milan to Austria.

While Louis's wars were exhausting France, Prussia was gradually growing in strength. This duchy fell by inheritance

to the Elector of Brandenburg in 1618, and its independence of Poland was estab. by the great elector Frederick Wm. in 1656. In 1700 Frederick III. took the title of king of Prussia. Later on, in 1740, Frederick the Great suddenly invaded Silesia, and brought on the Seven Years' war (1756-63), in which he successfully defended his capture against Austria, France, and Russia. The latter country had steadily risen in importance since the battle of Pultowa had overthrown Swedish supremacy. Peter the Great had extended his dominion to the Baltic, founded St. Petersburg, and introduced the methods of W. civilisation. In 1772 Frederick the Great agreed with Austria and Russia to divide Poland among their three kingdoms. During the Seven Years' war, England had taken the side of Prussia, and had captured Canada and India from France. The reign of Louis XV. was marked by misfortune and extravagance, and brought France into a state of impoverishment and bankruptcy from which it only emerged by the convulsion of revolution.

From the French Revolution to the Franco-Russian War, 1871.—It is impossible to appraise accurately the importance of the Fr. Revolution. For France itself it meant a complete rupture with the monarchy tyranny of the past. With the monarchy succumbed the aristocracy and the clergy. The intensity of the convulsion was so great that the rest of E. thought that the country must be prostrate, and was surprised and alarmed to find it arise to a career of conquest. The enthusiasm of the people created a succession of victorious armies with capable generals to lead them. Hoche, Pichegru, and Moreau were only eclipsed by the far greater genius of Napoleon, whose military daring changed the map of E. He extended his rule over all Germany W. of the Rhine, a considerable part of N. Germany, and the major part of Italy; made his brother-in-law Murat king of Naples, his brother Joseph king of Spain, and another brother, Louis, king of Holland. He also placed one of his marshals, Bernadotte, upon the throne of Sweden. England remained free from attack as a result of the naval victories of the Nile (1798) and Trafalgar (1805), and was able to keep Napoleon's ablest marshals well occupied in Spain during the Peninsular war. Prussia and Austria suffered terribly, however, and the lesser states were formed into a Confederation of the Rhine under Napoleon's patronage. The attempt to ruin England, by the so-called Continental system of refusing to allow her to trade, was quite unsuccessful and only galling to Napoleon's unwilling confederates. Upon the weakening of his power by the disastrous Russian campaign of 1812, the vanquished nations again rose into revolt and the campaigns of 1813 and 1814 determined the issue in their favour. Napoleon's escape from Elba and his brief return to imperial power only culminated in the disaster of Waterloo, and cost Ney and Murat their lives. At the

Congress of Vienna, France was reduced to the limits of 1790 and the map of E. redistributed. The Netherlands became a separate kingdom which lasted until 1830, when the Belgians threw off the alliance and estab. a kingdom for themselves. The Ger. states formed a loose confederacy under the presidency of Austria, while Italy was partitioned under princes, the Venetian provinces remaining under Austrian control. The Holy Alliance formed between Russia, Austria, and Prussia for the administration of their respective kingdoms according to the principles of Christianity became the greatest factor in furthering reactionary measures and impeding the

the jealousy of Austria, found expression in the Vor-Parliament of Frankfurt and in the formation of the Ger. National Assembly. In 1849 the Hungarians revolted from Austria and waged a successful conflict until Russian troops reduced them to surrender. In France a wave of enthusiasm had resulted in the nephew of the great Napoleon being elected president, and by the end of 1852 he had succeeded in becoming emperor. To retain his position he kept the nation's thoughts fixed upon foreign affairs. In 1854 he joined with England to prevent Russia from aggrandising itself at the expense of Turkey, and so brought about the Crimean War. In 1859 he helped the

Louvre

NAPOLEON'S RETREAT FROM MOSCOW

growth of constitutional liberty. In 1827 Greece recovered its freedom by the intervention of France and England, whose fleets defeated the Turks at Navarino. In 1830 the Fr. rose against the reactionary rule of Charles X. and chose Louis Philippe, the son of Philippe Egalité, as their ruler. In spite of attempts at liberal administration, the reign of the citizen king became increasingly unpopular, and he was forced into exile in 1848.

This was the signal for which E. was waiting. The whole period from 1815 to 1848 was one in which the nations had endeavoured unsuccessfully to wrest constitutional liberty from their despotic rulers. With the formation of the second Fr. republic, the symptoms of unrest became too ominous to be stifled. The smaller Ger. states wisely gave way, and in 1850 the king of Prussia granted a constitution, the king of Denmark having already done so in 1848. The desire for Ger. national unity, though thwarted by

king of Sardinia, who had become the champion of the movement for a united Italy, in his war against Austria, and received Nice and Savoy as his reward. The It. national movement, fostered by Mazzini, was powerfully helped by Cavour, the Sardinian statesman, who earned the gratitude of Franco and England by his help during the Crimean War. The victories of France and Sardinia in 1859 at Magenta and Solferino added Parma, Modena, and Tuscany to Sardinia, while Garibaldi's expedition of 1860 led to the further addition of Naples and Sicily. Austria, however, was still left in possession of the Venetian dominions, and the pope held the papal states. In 1863 Napoleon was induced to set up Archduke Maximilian of Austria as emperor of Mexico under Fr. protection, and the latter's capture and execution by the rebels greatly injured the Fr. emperor's prestige. In the meantime, Prussia had gradually ousted Austria from supremacy

in Ger. affairs. The attempt of Denmark to incorporate the Ger. duchy of Schleswig into the kingdom led to the declaration of war by Prussia and Austria, and to the capture of Schleswig-Holstein. The administration of the latter soon provided Prussia with an excuse for war, which was declared in 1866. The Austrians were completely defeated, and the Its., who sided with Prussia, captured Venice. Hanover, who had supported Austria, was annexed to Prussia. The question of the Sp. Succession in 1870 led to the Franco-Prussian War. The peace of 1871 added Alsace-Lorraine to the Ger. empire, which was formed during the course of the war under the leadership of Prussia, Austria having henceforth no voice in Ger. affairs. The withdrawal of the Fr. garrison from Rome enable the It. state to make that anc. city her cap. and seat of gov. By the Lateran Treaty (1929) the pope acquiesced in this arrangement.

From the Balkan War (1912) to the 'Armed Peace.'—During the latter years of last century, the principal readjustment of European ter. was in the Balkan peninsula. In 1859 the duchies of Moldavia and Wallachia were united into the kingdom of Rumania. The independence of Rumania and Serbia was recognised by the Treaty of Berlin in 1878, after the Russo-Turkish War, when Bulgaria was made a principality under the suzerainty of Turkey. In 1885 Bulgaria annexed E. Rumelia, and in 1908, taking advantage of the annexation of Bosnia and Herzegovina by Austria, formally asserted her independence of Turkish rule. During the autumn of 1912 an alliance was formed between Bulgaria, Greece, Serbia, and Montenegro against Turkey, and the whole of the Turkish dominion in E. captured, with the exception of a small ter. around Constantinople and the sea of Marmora. The question of apportioning the captured ter. led to a quarrel in which Bulgaria attacked Greece and Serbia, and after a month of fierce fighting (July, 1913) was compelled to come to terms by the treaty of Bucharest (see BALKAN WARS). Austria, supported by a Conference of Nations, prevented Serbia from gaining access to the Adriatic through Albania, thus further stimulating the anti-Austrian propaganda already strong in Serbia (see also FRANCIS FERDINAND OF AUSTRIA). Turkey-in-E. was restricted practically to Constantinople, but Turkey was befriended diplomatically by the Central Powers, Germany and Austria, while England's former support of Turkey against Russia was withdrawn after the Armenian atrocities of 1895. The div. of sympathy in the Balkans was the epitome of the state of affairs throughout E. Germany and Austria had formed a Dual Alliance since 1879, and in 1882 this had been extended to include Italy, forming a Triple Alliance (q.v.) of which the terms were secret. On the other side there was the Entente Cordiale (q.v.) between France and England, an agreement (1904) which settled old quarrels, leaving France a free hand in Morocco and England in

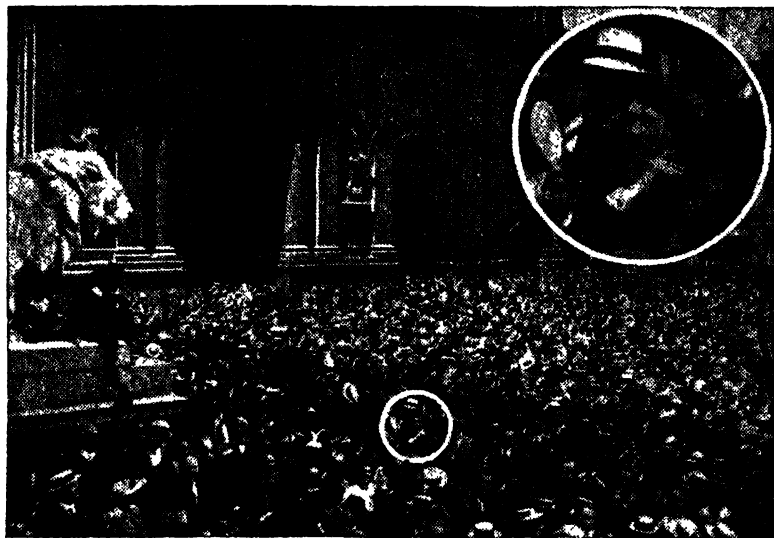

Egypt. England had sought this agreement with France as a reply to the Ger. naval policy, which was to challenge England's supremacy on the seas. Germany came forward as the champion of Morocco against Fr. intervention, and in the indecisive diplomatic struggle which ensued at the Conference of Algeiras (q.v.) (1906) Eng. sympathy was with France. England, however, by the terms of the Entente, was not bound, except morally, to undertake concerted action with France against Germany or any other country. A more definite agreement assuring mutual aid in the event of Ger. aggression had existed between France and Russia since 1894, and this was followed in 1907 by an Anglo-Russian treaty, somewhat counterbalanced by the Anglo-Japanese Treaty (q.v.) contracted in 1902. England formed these alliances, as Germany had already refused a *rapprochement* at the beginning of the century, and for the first decade there was such growing distrust between the Powers that this period is known as being one of 'Armed Peace.'

From the opening of the First World War (1914) to the Battle of Jutland (May 31, 1916).—The only gov. which viewed the prospect of war with complacency was that of Count Berchtold (q.v.) in Austria-Hungary. Serbia had been cheated by Austria of the full fruits of victory in the Balkan Wars, and one of sev. Serbian plots resulted in the assassination of the Archduke Francis Ferdinand, heir apparent to the Austrian monarchy, and his wife on June 28, 1914, at Sarajevo in Bosnia. On July 23 Austria delivered an ultimatum to Serbia, with an order of compliance within forty-eight hours. To the impossible terms dictated Serbia was conciliatory, but despite Eng., Fr., and It. mediation and half-hearted pacification by Germany, Austria declared war on Serbia on July 28, Russia mobilised, and on July 31 war was declared between Germany and Russia. France determined to stand by her Russian alliance, and Germany declared war on France on Aug. 1. The same day the Ger. ambas. in London attempted to obtain Brit. neutrality on the promise of respecting Belgian ter., but England gave no guarantees, and the Ger. Chancellor came to regard the treaties assuring Belgian neutrality as a 'scrap of paper' for which England ought not to go to war. However, when Germany invaded Belgium, England declared war on Germany on Aug. 4, 1914. The Belgian route was only one direction of the Ger. march on Paris; a second div. of the Ger. army advanced through Luxembourg, and a third through Lorraine towards Nancy. Belgium offered a stout resistance, but was speedily overcome, and the Ger. advance continued until checked within 52 kilometres of Paris. On Sept. 6 began the battle of the Marne (q.v., and see also under FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN, 1914-18). Meanwhile the pact of London was signed on Sept. 5 between England, France, and Russia, whereby each country engaged not to make a separate peace. Japan, which had come into the war on Aug. 15 by the

terms of the Anglo-Japanese Alliance, acceded to the Pact a year later. Germany was relying on the sultan of Turkey, who was bound by a treaty of Aug. 2, 1914. This treaty was secret, and Allied diplomacy was directed towards securing Turkish neutrality. Attacks on Russian Black Sea tns. caused Russia to declare war on Turkey, and France and England followed suit. Turkey was by this time fully mobilised. Bulgaria, although Ger. in sympathy, remained neutral.

In Feb. 1915 the Allies attempted to win the Balkans by an attack on Constantinople. In March the naval effort

the Ger. counter-offensive, and there was no hope of Austria collapsing between a combined Russian and It. invasion. The Allies had had great hopes of Russia since the beginning of the war, hopes which had been somewhat fulfilled by the Russian successes in Galicia (*q.v.*) during the winter, 1914-15 (*see also* RUSSIAN FRONT IN FIRST WORLD WAR). Hindenburg's two Ger. invasions of Russian Poland, although the second was partially successful, both failed to take Warsaw. Meanwhile on the W. Front a position of stalemate had been reached. The battle of the Marne (*q.v.*) had been succeeded by that of the

1914 THE DECLARATION OF WAR IN GERMANY
A crowd (among whom was Adolf Hitler) in the Odeonsplatz, Munich, Aug. 2, 1914

to force the Narrows proved disastrous, over 2000 men and three first-class battleships of the Anglo-Fr. fleet being sacrificed in vain (*see under* DARDANELES). It was then hoped to succeed by land, but not until the end of April did the expeditionary force arrive (*see* GALLIPOLI CAMPAIGN). Italy, after prolonged diplomatic interchange with Vienna, decided to join the Allies, and concluded the secret Treaty of London, April 26, 1915. Trentino and Cisalpine Tyrol, Trieste, and part of the Dalmatian coast were promised to Italy, among other concessions, and these terms, together with the Allied obligations to Serbia, made it impossible to make a satisfactory offer to Bulgaria and Greece as the price of their intervention. Italy declared war on Austria-Hungary on May 23, 1915, but by this time the Russian advance was being checked by

Aisne (*q.v.*) Battle succeeded battle with no decisive result—Nouve Chapelle in March and Ypres (*q.v.*) in April, when poison gas was first used—but the Gers. were able to hold their positions on the W. Front while concentrating an attack on the E. In May and June 1915, coincident with the It. mobilisation, the Austro-Ger. army under Mackensen retook Lemberg (Lwów) and drove the Russians out of Galicia. Hindenburg met with equal success in Poland, and by Oct. all Poland and part of Courland and Lithuania were in Ger. hands.

Allied prestige was so low in 1915 that Germany was easily able to outbid the Allies in the effort to secure Bulgarian aid (*see* BULGARIA). A secret convention was signed between Bulgaria and the Central Powers on Sept. 6, 1915. On Oct. 14, when Bulgaria was mobilised, war was

declared on Serbia, and the Allies then declared war on Bulgaria. The Allies counted on Greece fulfilling her treaty obligations by aiding Serbia, but the Gk. Premier, Venizelos, whose sympathy was with the Allies, was forced out of office by King Constantine, who was a more cautious patriot, and Greece retained an armed neutrality which became a distinct menace. Serbia was overpowered on all sides and rapidly overcome. A small Allied expeditionary force failed to be of material aid (*see MACEDONIAN FRONT IN THE FIRST WORLD WAR*), and by the end of Dec. the Allied troops abandoned their foothold in Gallipoli in order to reinforce the garrison at Salonika. In Jan. 1916 Montenegro was overrun by an Austrian army, and in Feb. the Its. were forced to evacuate Albania. Simultaneously the Ger. army was attempting a decisive blow on the W. Front, and from Feb. to June terrific and costly assaults were made against the Fr. fortress of Verdun (*q.v.*). On March 27, 1916, the first general war council of the Allied Powers was held in Paris, followed in April by an Allied Inter-parl. conference, and in June by an economic conference. The report of serious food shortages among the pops. of Central Europe decided the Allies to plan simultaneous drives on the Fr., Russian, and It. fronts. A recuperated Russian army under Brusilov (*q.v.*) made successful advances into Galicia during June, July, and Aug., and captured the prov. of Bukovina (*q.v.*). At the same time, Cadorna (*q.v.*), the It. general, was driving back the weakened Austrian army on the Trentino front, while reserving the major effort to be made on the Isonzo front. By Aug. the heights W. of Isonzo (*q.v.*) were carried and the prov. of Gorizia (*q.v.*) was won. These successes decided Rumania to enter the war on the side of the Allies. A treaty between Rumania and the Entente was signed on Aug. 17, 1916. Rumania, assured of support from the Russian army in Bukovina and the Anglo-Fr. army in Salonika, threw the whole of its army into Transylvania (*see RUMANIAN FRONT IN THE FIRST WORLD WAR*). A supreme and unexpected effort by the Ger. General Staff under Hindenburg succeeded in crushing Rumania, with the help of a Bulgarian and Ger. army under Mackensen, who attacked Rumania from the S. and entered Bucharest on Dec. 6. Meanwhile the Allied effort towards forcing a military decision was being made on the W. Front, and the Battles of the Somme (*see SOMME, BATTLE OF THE*) were waged from June to Nov., battles which proved terribly costly and indecisive. On the sea Germany was endeavouring to overcome Brit. supremacy by the use of submarines, but became embroiled with neutral countries. Portugal joined the Allies in March 1916, and the U.S.A., already angered by the sinking of the *Lusitania* (*q.v.*) in May 1915, issued further warnings to Germany to respect merchantmen. The Grand Fleets of England and Germany only encountered each other once during the war, on May 31, 1916 (*see JUTLAND, BATTLE OF*).

German offer of a diplomatic peace—Allied offensive of 1917—Russian Revolution—Treaty of Brest Litovsk.—The year 1916 ended in a position of stalemate, with widespread depression among the Entente Powers. There was a general political reshuffle. In England during Dec. Asquith was succeeded as Premier by Lloyd George, and Grey as foreign secretary by Balfour. Lloyd George formed a coalition War Cabinet, and in France Briand, while remaining Premier, formed a new Fr. War Cabinet on much the same lines. Joffre retired from the command of the Fr. army, and was succeeded by Nivelle, whose counter-attack at Verdun in Oct. and Nov. was the only Allied victory of 1916 which could offset the defeat of Rumania. In Russia the corrupt and ineffective gov. was beginning to meet openly with the opposition it merited. In contrast to the pessimistic criticism of the war govts. prevailing in the Entente, the Central Powers were consolidated in an optimism which proved to be unfounded. The Ger. gov., in which Von Jagow, foreign secretary since 1912, was succeeded in Dec., 1916 by Zimmermann, believed itself in a strong position which would make possible a successful diplomatic peace. The trend towards peace had gathered strength in Austria since the death of Francis Joseph (*q.v.*) and the accession of the emperor Karl on Nov. 21, 1916. Berchtold had been succeeded as foreign minister by Burian early in 1915, but Karl in his efforts to hold the Dual Monarchy together by means of peace, was seconded by Czernin, who had displaced Burian. On Dec. 12, 1916, a proposal to hold peace negotiations was submitted by Bethmann-Hollweg (*q.v.*), the Ger. Chancellor, on behalf of the Central Powers. No terms were stated, and the offer was rejected by the Entente, who also made no terms beyond indicating the necessity for reparations and guarantees. The Allied refusal was represented in Germany as showing an aggressive militarist spirit, and allowed Gen. Ludendorff and the Emperor Wm. once more to stimulate the Ger. armies to resistance. Wilson, the President of the U.S.A., however, encouraged by Bernstorff (*q.v.*), the Ger. ambas., endeavoured on the strength of the Ger. peace proposals, to act as mediator and secure a 'peace without victory.' Both sides submitted their terms privately to President Wilson but they clearly conflicted, e.g. over the possession of Alsace-Lorraine. The Allies, however, on Jan. 10, 1917, assured the President of their adherence to his ideal of a League of Nations. Meanwhile Bethmann-Hollweg was overridden by Ludendorff (*q.v.*), who became in effect a military dictator. The immediate issue was the unrestricted use of submarines. Falkenhayn (*q.v.*), Ludendorff's predecessor, had protested against their restriction in 1915, and the Admiralty now promising to subdue England within five months, Ludendorff launched on Feb. 1, 1917, the unrestricted U-boat campaign. This decision annulled Bernstorff's effort to secure Amor. mediation, and on April 6, 1917,

America declared war on Germany. Ludendorff and Hindenburg calculated on winning the war before the intervention of America became effective, and in the first half of 1917 the submarine warfare was proving a serious menace. Moreover, the Allied offensive on the W. Front during 1917 proved the practical impossibility of piercing the Ger. lines, while Germany was relieved of a powerful enemy by the collapse of the Russian monarchy in the March Revolution (*see RUSSIAN REVOLUTION, THE*). The Tsar Nicholas II. was deposed, and a provisional democratic gov. was organised on March 15, and the U.S.A. were first among the Allied states to accord official recognition. The revolution had been supported by the military leaders, and it seemed that Russia would prosecute the war with renewed vigour. The foreign minister, Millyukov, issued a note to this effect, but Prince Lvov's Provisional gov. was broken up under the opposition of the Soviet Party, which represented the war-weariness of the Russian people. A reconstruction was attempted by Tcheidze and Kerensky (*q.v.*) on May 16, 1917, and a manifesto, disavowing all thought of a separate peace, appealed to the Allied democracies for a revision of war aims in accordance with the ideals of the Russian revolution. Kerensky made a great effort to discipline the army, and, with Brussilov as Chief of Staff, organised a campaign in Galicia in June 1917. This was at first successful, but misfortune developed into complete rout, and the Russians threw down their arms, refusing to fight. Russia was further disrupted by the movement towards autonomy among the Poles and Finns, the Letts of Courland, the Ruthenians in the Ukraine, the Estonians, the Lithuanians, and the Georgians of the Caucasus. The Provisional gov. was also severely attacked by the Bolsheviks (*q.v.*) (majority), the extremist section of the Soviet Democratic party. After the failure of the military offensive, Prince Lvov, head of the Provisional Gov., resigned on July 17, but an attempt by Lenin (*q.v.*) and Trotsky (*q.v.*), the leaders of the Bolsheviks, to seize the power was thwarted by Kerensky, who became head of the Provisional Gov. and virtual dictator. Kerensky, with the aid of Gen. Kornilov (*q.v.*), who had superseded Brussilov, then set up a military dictatorship, but later arrested Kornilov, and vainly tried to save his gov. by sympathising with the extremist faction. The Allied Paris Conference refused to revise war aims, thus disappointing the hopes of the Kerensky Gov., which was finally put out of power by a Bolshevik *coup d'état* on Nov. 7. Lenin estab. a dictatorship of the proletariat, and repudiated political democracy as it is understood in Western E. (*see RUSSIA*). Peace offers were at once made to Germany on a basis of 'no annexations and no indemnities,' and a conference was opened at Brest-Litovsk on Dec. 22, 1917. The Ruthenians (Little Russians) were represented, having formed the Ukrainian People's Republic on Nov. 30, and after the breakdown of negotia-

tions between Germany and the Soviet, Ukraina signed a separate treaty with Germany on Feb. 9, 1918. Meanwhile Finland had become an independent republic on Dec. 4, 1917, and Lithuania on Dec. 11. On Jan. 14, 1918, the conference of Brest-Litovsk came to an end, and in spite of the Russian attitude of 'neither peace nor war,' hostilities were resumed, and a military thrust into Russia during Feb. resulted in the Soviet submitting to the Ger. terms, March 13, 1918 (*see BREST-LITOVSK, TREATY OF*). Rumania, being isolated, had signed a peace treaty with the Central Powers on March 7 (*see BUCHAREST, TREATY OF*). Rumania and Russia being out of the war, Gen. Sarrail, commanding the Allied garrison in Salonika, was unable to take the offensive. Meanwhile the Allied support to the revolt which Venizelos had raised against the king reached the pitch of an armed occupation of Athens, followed by the forced abdication of Constantine, who retired in favour of his second son, Alexander, on June 12, 1917.

International Conference, Stockholm—American troops in France—Armistice of 1918.—The break-up of Russia into its constituent peoples was not without effect in Central Europe, especially in Austria-Hungary. The Emperor Karl had intrigued with the Entente to secure a separate peace during 1917, but in April of the following year Germany compelled him to dismiss Czernin from the post of Foreign Minister and to reinstate Burian, who was more in sympathy with pan-Germanism (*see under AUSTRIA-HUNGARY*). The Russian example stimulated the Socialists of all countries in their efforts towards peace, but there was strong animosity between the Socialists of the Entente and those of Germany and Austria, and the International Conference at Stockholm (1917) proved a failure. In Aug. 1917 the pope put forward a plea for peace, which was welcomed by Austria, but President Wilson replied that the action of the Ger. Gov. rendered a compromise useless. The defeatist movement was strong in the Allied countries, and in France Briand was put out of office; but by Nov. a reactionary Cabinet was formed under Clemenceau, who prosecuted the pacifists. In Oct. and Nov. the Gers. took advantage of pacifist propaganda in Italy, and Ludendorff planned to break through the It. line on the Upper Isonzo at Caporetto, where a crushing defeat was inflicted on the It. army (*see CAPORETTO, BATTLE OF*). It was hoped by putting Italy out of the war to save the integrity of Austria, and at one time, until the arrival of reinforcements, Venice itself was threatened. In this crisis a reorganisation of the It. ministry made Orlando Premier, and the Ita., together with the other Allied peoples, became convinced that a peace by compromise was futile. By Dec. the first drafts of Amer. troops were arriving to stiffen the resistance on the W. Front, where the Third battle of Ypres and the battle of Passchendaele had been waged, sanguinary and indecisive. On Jan. 8, 1918, President Wilson enunciated the

celebrated 'Fourteen Points' (*q.v.*), which were accepted as embodying the Allied war aims, and in one clause advocating the autonomy of the constituent peoples of the Dual Monarchy was spelt the doom of the Hapsburgs. Following on this came the Congress of Oppressed Nationalities, held in Rome in March 1918, and the pact of Rome was concluded between Italy and the Yugoslav peoples.

Germany, all but decisively victorious in Italy, and despite the partial failure of the submarine campaign, was to make one more supreme effort. With commanding strategy, Ludendorff and Hindenburg planned a colossal offensive at an unexpected point on the W. Front where the Brit. and Fr. armies joined. The attack was launched on March 21, 1918, against the central sector of the Allied lines between Arras and the R. Oise. The Brit. armies were rolled back, but the Gers. failed in their purpose of taking Amiens (*q.v.*). An order for conscription was passed by Parliament in London, and the result was further to antagonise the various Irish factions. One important result of the Ger. advance was the decision, at long last, to unify the Allied command under Marshal Foch. This had for long been advised by President Wilson, but beyond a conference at Rapallo on Nov. 9, 1917, between the Prime Ministers and Chiefs of Staff of France, Great Britain, and Italy, the formation of a Supreme War Council and a subsequent Allied Conference at Paris on Nov. 29, little had been done. In May 1918 the Gers. launched a second offensive against the Fr. lines on the Aisne and the Oise. Meanwhile Amer. reinforcements were arriving in numbers, and the Its. were checking the Austrian drive on the Piave R. On July 15, 1918, the Gers. began their third and final offensive in the second battle of the Marne. Foch's counter-attack with Fr. and Amer. troops proved successful, and by Aug. the Ger. armies were in retreat.

In the near East Foch planned a simultaneous offensive in Macedonia under Franchet d'Espèrey (*q.v.*) and in Syria under Allenby (*q.v.*). Bulgaria was put out of the war, an armistice being signed at Salonika on Sept. 30. A month later, following Allenby's successes in Syria, Turkey also signed an armistice. This defection of Germany's allies weakened the strong position Germany had gained among the former Russian dependencies. Its successes against Austria forced an armistice on Nov. 3, and the Dual Monarchy split up into its constituent states. Czechoslovakia emerged as a republic and Yugoslavia as a kingdom, while on Nov. 13 Ger. Austria was proclaimed a republic, and the well-intentioned Emperor Karl (*see* CHARLES) abdicated. Three days later Hungary also became an independent republic. In Germany events moved even more quickly. Ludendorff resigned on Oct. 27, and on the following day a naval mutiny at Kiel was the beginning of a widespread socialist revolution. On Nov. 7 Bavaria became a republic and the king fled, while two days later Wm. II.

also abdicated and a republic was estab. in Berlin. The Provisional gov. under President Ebert hastened to accept the Allied terms, and the Armistice was signed on Nov. 11.

Peace Conference—Treaty of Versailles, Treaty of Saint-Germain, and other peace treaties.—On Jan. 18, 1919, the Peace Conference formally opened at Paris, but the huge plenary sessions came to no decisions not already reached by the Council of Ten, which council was superseded in March by the still smaller Council of Four, consisting of President Wilson, Clemenceau, Lloyd George, and Orlando. On April 30 the Ger. delegation arrived in Paris to receive the terms of the treaty. Ger. criticism and protest led to a partial revision, mainly through fear of throwing Germany into anarchy, and the main concession to Ger. opinion was the grant of a plebiscite in Upper Silesia, which, together with E. Prussia, eventually decided for Germany (March, 1921). After a re-organisation of gov. Germany signed the treaty, together with all the Allied and Associated Powers, at Versailles on June 28, 1919 (*see* VERSAILLES, TREATY OF). In the forefront of the treaty was set the League Covenant (*see* COVENANT OF THE LEAGUE OF NATIONS). Although this was the result of President Wilson's idealistic purpose, he was no longer supported by the Amer. Senate, which refused to ratify the treaty. America accordingly concluded a separate peace with Germany and Austria. The treaty of Versailles was followed by the treaty of Saint-Germain, concluded with Austria on Sept. 10, 1919; of Neuilly with Bulgaria on Nov. 27, 1919; of the Trianon with Hungary on June 4, 1920; and of Sévres with Turkey on Aug. 10, 1920. The treaty with Hungary was delayed owing to the estab. on March 21, 1920, of a Soviet gov. under Bela Kun, who was only overthrown by the advance of Rumanian troops (*see* HUNGARY). He was succeeded by the Archduke Joseph, who formed a Prov. Gov. The treaty of Sévres was never ratified by Turkey, owing to the opposition of the Nationalists under Mustapha Kemal. Turkey resisted the attempts which Greece made to take over the new possessions awarded at the 1919-20 Peace Conference, and a Græco-Turkish war was only terminated by the revision in Turkey's favour of the treaty of Sévres by the terms of the Lausanne Treaty, July 24, 1923. The unratified treaty of Sévres had been designed to reduce the Transcaucasian ter. which Turkey had gained from Russia by the Treaty of Brest-Litovsk, but the newly-created Federal Republic of Transcaucasia could not resist the Turks, and in 1918 became disintegrated into the three Republics of Georgia, Armenia, and Azerbaijan. In 1919 the Caucasus became a sphere of Brit. influence and the Ukraine of Fr. influence. With the withdrawal of the Brit. troops the same year, Soviet Russia took over the country by force, and added the three Transcaucasian Republics to the U.S.S.R., at the same time concluding an agreement with Tur-

key (the Treaty of Kars, Oct. 13, 1921), whereby the boundaries were fixed and the Autonomous S.S.R. of Ajaria was created to include the Free Port of Batum. Turkey on Oct. 29, 1923, became a republic, and the sultan, Mohammed VI., fled from the country. In Greece, Venizelos failed to establish order and retired. On April 23, 1924, a republic was estab. by the Gk. electorate, but the following year Gen. Pangalos set up a dictatorship.

'Succession' States—Rise of Mussolini.

—The prin. results of the peace treaties were in geographical reconstruction. The treaty of Versailles confirmed the creation of the 'succession' states of Poland, Czechoslovakia, and Yugoslavia, and of the Baltic States, Estonia, Latvia, and Lithuania, while Danzig was made a Free City under the League of Nations. Rumania became enlarged by the possession of Bessarabia, Bukovina, and part of the Banat of Temesvar, while the Ukrainian Republic on Dec. 30, 1922, concluded an alliance whereby it became one of the federated states of Soviet Russia. The boundary between Italy and Yugoslavia on the E. coast of the Adriatic presented one of the most difficult problems of post-war E. The It. premier Orlando demanded the cession of Dalmatia and Fiume to Italy, the first-named transference being in accordance with the secret treaties of 1915 and 1917; but he was succeeded in July 1919 by Francesco Nitti. The unauthorised *coup d'état* of D'Annunzio (*q.v.*), who won a plebiscite in Fiume and raided Zara, upset the conciliatory attitude of the Nitti Cabinet; but although in Nov. 1920 Fiume (*q.v.*) was proclaimed a Free City under the League of Nations, it was not until Jan. 1924 that the problem was settled by an agreement made at Rome, whereby Fiume, although governed by Italy, should remain a free port to Yugoslavia. Italy immediately after the war had been upset by internal discord, the Socialists and the Fascists vying with each other in revolutionary ardour. The Fascist Party had come into being in March 1919 and professed an ideal similar to that which had inspired the Bolshevik movement in Russia and elsewhere. The Fascist leader, Benito Mussolini, organised an armed force of irregulars, known as Black Shirts, and these took an active part in furthering the revolutionary strikes of 1919 and 1920. In May 1921 a general election showed the country to be ready to return to constitutional normality, but an unreasoning fear of anti-nationalist Bolshevism still prevailed among the middle classes. Meanwhile the Fascist movement was assuming the proportions of an armed revolt, and his position being strengthened by a succession of parl. crises, Mussolini renounced his republican ideals, and his band of irregulars, armed with cudgels and castor-oil bottles, commenced their march on Rome. On Oct. 21, 1922, Mussolini entered Rome in triumph, and was invited by the king to form a ministry, thus legalising his position (*see FASCISM*).

Civil war in Ireland—First Meeting of the League of Nations—London Conference, Feb. 1920—San Remo Conference.—In the United Kingdom the coalition gov. was attempting to bring civil war in Ireland to an end by a compromise treaty (Dec. 1921) between England and the Republican gov. under President de Valera. The Irish Free State, thus created, was granted dominion status, and in 1922 a gov. was organised under Michael Collins; but the compromise remained unacceptable to the extreme Republicans and also to the Ulster Unionists (*see IRE and IRELAND*). Six cos. of Ulster remained part of the United Kingdom, but with legislative autonomy.

On the Continent of E. a series of international conferences was attempting to adjust the treaty of Versailles. The first meeting of the League of Nations was held at Paris on Jan. 16, 1920, with Léon Bourgeois, Fr. representative, as chairman (*see under LEAGUE OF NATIONS*). European diplomacy, however, was conducted by conferences outside the sphere of the League. On Feb. 12, 1920, a London Conference was held between the Premiers of Great Britain, France, and Belgium, and the foreign minister of Yugoslavia. Millerand had succeeded Clemenceau as Premier of France. The prin. decision of this conference was that Constantinople should remain Turkish. The next Allied Conference, held at San Remo in April 1920, was occasioned by military events in Germany. The militarist party in Germany had had a temporary success over the republic in the 'Kapp Putsch' of March 14-17, and a subsequent Spartacist (Communist) outbreak in the Ruhr was suppressed by the Reichswehr (regular Ger. Army), which, by entering the demilitarised zone on the r. b. of the Rhine, contravened Art. 42 of the treaty of Versailles. Fr. troops therefore occupied Frankfurt and Darmstadt (April 6, 1920). Disarmament was discussed at the San Remo Conference, and Germany was notified of the necessity of fulfilling all treaty obligations, but was invited to a conference at a future date. This conference was to take place at Spa, but previous to it a succession of inter-Allied conferences took place, concerned with economic problems, with the war (1920) between Poland and Soviet Russia, and the Near E. question. On July 5, 1920, the Spa Conference opened, but although the Gers. had great hopes that the hardships of their country would be relieved, the reparations question was aggravated by the hostile attitude of certain Ger. industrial magnates. A compromise was reached over the delivery of coal, and Germany agreed to deliver 2 million tons per month for six months, and the Allies to make Germany a loan dependent on the price of coal. By Dec. 1922, however, deliveries of coal were in arrears, and Germany was declared in default by the Reparations Commission, which had been set up to assess the amount of reparations, an exact figure not having been stated by the Allies at the Peace Conference. A conference between France and England

in Aug. 1920 led to a decision to give military support to the Poles, who accordingly won a victory against the Russians at the battle of the Vistula on Aug. 14.

Inter-Allied Conference on Reparations and Disarmament (1921)—Spa Agreement—Silesian Plebiscite.—The first Inter-Allied Conference of 1921, held at Paris on Jan. 24-30, was concerned with reparations and disarmament (see REPARATIONS). Briand was now Premier of France. The Paris Conference at which figures for monthly deliveries of coal after the Spa Agreement had expired were drawn up, was preparatory to the London Conference, Feb. 21 to March 14. Germany at London made counter-proposals to the Paris terms, but failing the unconditional acceptance of these terms Dusseldorf, Duisburg, and Ruhrort were occupied by Allied military forces on March 7. At a second Conference of London, April 29 to May 5, the Supreme Council of the Allied Powers delivered an ultimatum to Germany, threatening the occupation of the Ruhr unless Germany undertook fulfilment of all treaty obligations. The Ger. Gov. resigned, but a Cabinet was formed by Wirth in time to accept the ultimatum on May 11, a day after the expiry of the time limit. The subject of Ger. disarmament was discussed at a meeting of the Supreme Council at Paris Aug. 8-13, 1921. The chief business of the Paris Conference was the question of the partition of Upper Silesia. The plebiscite of March 20, 1921, had been in Germany's favour, but as France and England could not agree as to the boundary line to be drawn between Germany and Poland, the matter was referred to the League of Nations. The decision of the Council, issued on Oct. 20, 1921, prevented a rupture in the Entente.

Washington Conference, 1921—Reparations—Græco-Turkish War—Treaty of Lausanne.—On Nov. 12, 1921, the Washington Conference opened its first session for the discussion of disarmament and the problems of the Pacific. England was represented by Balfour, and Briand, the Fr. Premier, was present at the opening. The conference continued into 1922, and the prin. achievement was the Five-Power Pact between the U.S.A., the Brit. Empire, France, Italy, and Japan with regard to the limitation of cap. ships and aircraft carriers for a period of fifteen years. In 1929, however, naval disarmament was carried a stage further at the London Conference, opened on Jan. 21, when a Three-Power Pact was concluded between Great Britain, the U.S.A., and Japan with regard to limitation of cruisers, destroyers, and submarines.

To return to the reparations question of 1921, Briand on Dec. 18 conferred with Lloyd George, the immediate occasion being the Ger. admission of inability to pay the reparation instalments due in Jan. and Feb. On Jan. 6 a larger conference of all the Allied Powers, with an Amer. 'observer,' was held at Cannes. Besides reparations, the business of the Conference was to project a European Economic Conference to be held at Genoa. An

Anglo-Fr. treaty guaranteeing Brit. aid in the event of Ger. aggression against France was put forward by Lloyd George, but rejected by Briand as humiliating, there being no mention of a reciprocal obligation of France to support England. Briand was recalled to Paris on Jan. 11, 1922, on the false assumption that he was not protecting Fr. interests, and, being deposed from power, he was succeeded by Poincaré. Poincaré, who also acted as foreign minister, met the foreign ministers of Great Britain and Italy at Paris on March 22 in an attempt to bring the Græco-Turkish war to an end by negotiation. The attempt failed, and the war continued until Aug., when Turkey forced Greece to accept the Armistice of Mudania. The treaty of Lausanne followed in July 1923. The final act took place seven years later, in 1930, when a commercial convention and a pact of conciliation and arbitration were signed by Greece and Turkey.

European Economic Conference (1923)—Reparations—Occupation of the Ruhr—Davies Plan.—The European Economic Conference was opened at Genoa on April 10, 1922, and was attended by representatives of twenty-nine European states, including Russia, but excepting Turkey. The U.S.A. were invited but declined. The main business of the Conference was to explore the possibilities of renewing economic relations between Russia and the other countries of Europe. A draft treaty to this effect was put forward, but was rejected first by France and Belgium, then by the Soviet Gov. itself. The only tangible result of the Genoa Conference was a separate agreement between Germany and Russia, signed at Rapallo on April 18, for the mutual renunciation of reparations and the resumption of diplomatic and economic relations.

With regard to reparations, the issue became clearly defined as a conflict between the Eng. contention that only an economically stable Europe could enable Germany to pay her debts, and the Fr. point of view, which regarded Germany as already able to fulfil her obligations. Anglo-Fr. conferences were held in London on Aug. 7 and Dec. 9, 1922, and again in Paris on Jan. 2, 1923, when Bonar Law put forward a Brit. scheme of payments involving a four years' moratorium, which was rejected. The Reparations Commission had granted a moratorium, which had elapsed on Aug. 31, 1922, and Germany became liable to pay 500 million gold marks on Jan. 15, 1923. On Jan. 11 Fr. and Belgian troops were moved from Dusseldorf (occupied as a 'sanction' since March 1921) to Essen (see FRANCE; RUHR). The M.I.C.U.M. (Mission Inter-alliée de Contrôle des Usines et des Mines) was set up to supervise the production of coal in the Ruhr, but the Ger. Coal Syndicate, which was to take its orders from the M.I.C.U.M., moved its headquarters from Essen to Hamburg. This was the first step in the policy of passive resistance initiated by the gov. of Chancellor Cuno. Ger. officials refused to cooperate with the Fr., and by Jan. 30 a

state of siege was declared by the Fr. commander-in-chief, Gen. Degoutte (q.v.). Great Britain gave no diplomatic support to Poincaré's policy, and indeed Brit. protests only fell short of breaking the Entente relationship. From the Fr. point of view the pressure on the Ruhr was successful, and displayed the superiority of Fr. industrial ability. The Fr. victory remained a moral one, for the economic stability of Europe was much shaken. Germany seemed about to disintegrate, and after the order for passive resistance in the Ruhr was withdrawn by the Ger. gov. on Sept. 26, martial law was proclaimed throughout the country. Stresemann, who had succeeded Cuno as Chancellor on Aug. 12, held Germany together, and by the efforts of Luther, the finance minister, the currency was stabilised on the basis of the *rentenmark*. In Nov. Marx became Chancellor, but Stresemann remained in the gov. as minister of foreign affairs.

On Nov. 30 the Reparations Commission met and inaugurated two Committees of Experts. The first Committee held its inaugural meeting at Paris on Jan. 14, 1924, under the chairmanship of Gen. Dawes (q.v.), U.S. representative. The purpose of the Dawes Committee was to draw up a scheme of reparations and to provide for the economic recovery of Germany. The second Committee, under the chairmanship of McKenna, the Brit. representative, had the subsidiary purpose of inquiring into the value of Ger. cap. placed abroad during the 'flight from the mark.' Both Committees submitted their reports to the Reparations Commission on April 9. The finding of the McKenna Committee was that about 7 milliards of gold marks represented Ger. capital in foreign investment. The Dawes Committee drew up a detailed plan for the stabilisation of Ger. currency and a scheme of reparation payments on the basis of a two years' moratorium, followed by two years' transition, the full payment to begin in the fifth year (see DAWES PLAN). The Ger. Gov. expressed its readiness to co-operate under these conditions, and all the Allied countries with the exception of France accepted the Dawes Plan. M. Poincaré's objection that the evacuation of the Ruhr could not begin until the scheme was in operation was removed by his defeat in the May elections. M. Poincaré's retirement rendered M. Millerand's position of president untenable. On June 11 he resigned, and was succeeded by M. Gaston Doumergue, while on June 14 M. Edouard Herriot became Premier. He found it possible to co-operate closely with Mr. Ramsay MacDonald, who had succeeded Mr. Baldwin as Prime Minister of England in Jan. 1924. At the important Conference of London, which opened on July 18, Mr. MacDonald presided, and the proceedings were marked by the cordial co-operation of the U.S.A. through the Amer. representative, Mr. Frank B. Kellogg. It was agreed that America should also be represented on the Reparations Commission, thus diminishing the domination of specially Fr.

interests, and this made possible the loan to Germany proposed in the Dawes Plan. By Aug. 2 an agreement was reached which satisfied the doubts of Eng. and Amer. bankers as to Germany's security. On Aug. 9 a ministerial crisis was averted in France. M. Herriot gained the consent of the minister of war and of Marshal Foch to a military evacuation of the Ruhr within twelve months. The negotiations at the London Conference were admirably conducted by Mr. MacDonald, and on Aug. 16 the London Protocol recording acceptance of the Dawes Plan without modification was signed by all parties concerned. The plan was immediately put into operation. On Oct. 10 the Loan Agreement between Brit., Fr., Belgian, and Amer. bankers and Ger. financial delegates, providing for a loan to Germany of 800,000,000 gold marks (£40,000,000), was signed at the Bank of England. In the new year a Conference of Allied Finance Ministers was held at Paris, and an agreement was signed on Jan. 14, 1925, with regard to the div. of reparations received from Germany. In May the Reparations Commission replied to the Conference of Ambassadors that Germany was fulfilling her obligations under the Dawes Plan, and by July 31 the evacuation of the Ruhr was completed.

'Little Entente' formed—Anglo-Soviet Trade Agreement—Boundary Problems of East and Central Europe.—While the reparations problem which had been troubling E. for five years was thus for the moment being settled, affairs in Eastern E. centred during the years 1920-23 partly on Hungary and partly on the W. boundaries of Soviet Russia. The fear of Hungary, where until 1921, the possibility of a Hapsburg restoration remained, and also the lesser fear of Bulgaria, were countered by the formation of the Little Entente by treaties signed on April 23 and June 7, 1921, between Czechoslovakia, Yugoslavia, and Rumania. Rumania concluded a further defensive treaty with Poland on March 3, 1921, as Rumania could obtain no recognition from Soviet Russia for her possession of Bessarabia. Three years later, March 1924, a Russo-Rumanian Conference at Vienna failed to settle the Bessarabian question, and a Moldavian Autonomous Republic on the l. b. of the Dniester came into being on Oct. 11, thus increasing Rumanian apprehension. Rumania was one of the fifteen countries which by 1924 had not accorded a *de jure* recognition of the Soviet Gov. Preliminary negotiations between Great Britain and the U.S.S.R. had resulted in a Trade Agreement, concluded on March 16, 1921. Subsequent disputes concerned especially with anti-Brit. propaganda in the E., threatened to break this agreement, but on Feb. 1, 1924, the Brit. Gov. accorded official recognition to the Soviet Gov., and in the same year the govts. of France, the Scandinavian States, Austria, Czechoslovakia, Hungary, and Greece did likewise.

The frontier problems in Eastern E. were settled largely through the Permanent Court of International Justice,

inaugurated in Dec. 1920. There were boundary disputes and local conflicts between Germany and Lithuania over Memel; between Lithuania and Poland over Vilna; between Poland and Czechoslovakia over the Javorzina dist.; between Austria and Hungary over the Burgenland; and between Albania and Yugoslavia over the delimitation of the Albanian frontier. The boundaries of Poland were not fixed at every point until March 15, 1923, when the seizure of the Vilna dist. in 1921 by Zeligowski, an independent Polish gen., was recognised in the demarcation of the frontier by the Conference of Ambassadors. The Javorzina dist. between Czechoslovakia and Poland had been divided by a Delimitation Commission on Sept. 25, 1922, but the frontier line was not finally accepted by the Council of the League of Nations until March 12, 1924.

Although the boundary problems of Central E. and the Baltic were at length settled by negotiation, the delimitation of the Albanian frontier led to a serious political murder. On Aug. 27, 1923, Gen. Tellini, head of an It. commission, was murdered with his companions while investigating the Greco-Albanian frontier near Janina. An It. ultimatum was delivered to Greece and accepted with reservations. On Aug. 31 the It. occupied the is. of Corfu. Greece placed the It. ultimatum before the League of Nations, but at the same time was forced to submit to the Conference of Ambassadors, who demanded an inquiry into the murder of their agents. The It. action however, was condemned by the Assembly of the League, then in its Fourth Session, and the evacuation of Corfu was effected by the payment of a heavy Gk. indemnity to Italy.

Geneva Protocol—Three Power Pact on the Rhineland—Locarno Conference—Locarno Treaties—Kellogg Pact.—At the settlement of the reparations problem by the adoption of the Dawes Plan by the London Conference, the cognate questions of security and disarmament had been advisedly excluded. The problem of security remained for the Fifth Assembly of the League, Sept. 1924. The draft agreement was accepted, entitled the Geneva Protocol (g.v.), for the Pacific Settlement of International Disputes, which had already come up for consideration at the Fourth Assembly. The Geneva Protocol condemned all war save in self-defence or at the instigation of the League. The Fr. and Brit. Govs. of Herriot and MacDonald respectively had been active in sponsoring the Protocol. Great Britain was influenced by the opposition of the Dominions, and when on Oct. 8 the MacDonald Gov. was replaced by the Conservative Gov. of Stanley Baldwin, Great Britain rejected the Protocol.

The Brit. Gov. preferred a regional pact, and it remained with England to suggest an alternative to the rejected Protocol. A Three-Power Pact between Great Britain, France, and Belgium was proposed, its main purpose being to guarantee the 'present territorial status on the

Rhine.' Correspondence between Austen Chamberlain and Briand, the Fr. foreign minister, revealed that France regarded the pact as protecting the frontier from Ger. attack, while England wished to make the frontier inviolate from both Ger. and Fr. invasion. Discussions on extending the pact to include Germany were embittered by the Allied decision, communicated on Jan. 5, 1925, to postpone the evacuation of Cologne in view of the Ger. failure to carry out the disarmament clauses of the Peace Treaty. Negotiations proceeded, however, and it was at length decided to restrict the pact to the Rhineland area. Germany, despite the wishes of France, could not guarantee the permanence of her E. frontier as she had done with regard to her W. France was therefore left free to assist Poland, should there be a breach of the Ger.-Polish Arbitration Treaty. On Oct. 5, 1925, the Conference of European statesmen opened at Locarno in Switzerland. Austen Chamberlain, chairman, and Briand represented Great Britain and France respectively, while Chancellor Luther and Foreign Minister Stresemann represented Germany, and Foreign Minister Scialoja Italy, Belgium, Czechoslovakia, and Poland were also represented. The success of the Conference depended on a resolution of the difficulties which might prevent Germany's eventual admission to the League of Nations. When this was reached, the treaty of Mutual Guarantee went forward, and was hastened to a successful conclusion by Italy's decision to join with France and Great Britain in guaranteeing the Rhineland. Signor Mussolini arrived on Oct. 15. The next day the Locarno Pact was initiated by the delegates, and the date of signature was fixed for Dec. 1, to take place at London. (See LOCARNO CONFERENCE AND TREATIES). In Germany the struggle to secure parl. ratification of the Locarno Pact was successful, Ger. liberal opinion being aided by the evacuation of Cologne by the Allies in Nov. 1925. A Ger.-Rusian Commercial Treaty, designed to placate Russia's mistrust of Germany's foreign policy at Locarno, was signed on Oct. 12.

Art. 16 of the Covenant of the League of Nations, which provided for military co-operation with the League against an aggressor, was modified under the Locarno Treaties and interpreted so as to allow of Germany's entry into the League. The Assembly was convened in March 1926, to discuss the Ger. request, but Germany's admission to a permanent seat on the Council was frustrated by the similar counter-claim made by Spain, Poland, and Brazil. This affront to Germany's prestige was somewhat amended by Germany's formal admission at the Seventh Assembly in Sept. 1926; but although Poland was conciliated, Spain and Brazil threatened to withdraw, and Brazil did indeed withdraw in 1928. The other major problem which confronted the League in 1926 was that of disarmament. The Temporary Mixed Commission on Disarmament had been dissolved in 1924, and from 1926 to 1927 a Preparatory Com-

mission worked at preparing a Draft Convention. At a Preliminary Disarmament Conference held at Geneva in March 1927, the Soviet delegate, Litvinov, proposed universal disarmament, but this the other nations could not accept as limiting their sovereign powers of defence (see ARMAMENTS, LIMITATION OF). The U.S.A. were co-operating with E. over disarmament, and on April 6, 1927, Briand now foreign minister in the Poincaré gov., suggested a bilateral treaty with the U.S.A. for the renunciation of war, and the draft was submitted to America in June. On Dec. 28 Mr. Kellogg, secretary of state for America, suggested a multilateral treaty to which other states should be invited to adhere. This, however, would have annulled France's defensive alliances, and it was decided to limit the pact to aggressive wars, a ban on which had already been passed at the Eighth Assembly of the League on Sept. 24. On April 7, 1928, the Amor. draft treaty was submitted to Great Britain, Germany, Italy, and Japan. After protracted negotiations the Briand-Kellogg Pact for the outlawry of war was signed by fifteen nations at Paris on Aug. 27, 1928 (see KELLOGG PACT). Of the thirty-three states which subsequently adhered to the Pact, sixteen were European. The Kellogg Pact initiated a system of arbitration treaties, of which the first was that between France and the U.S.A., signed on Feb. 6, 1928. A similar treaty was concluded between France and the Netherlands on March 10, and between Greece and Rumania on March 12, while a treaty of Neutrality, Conciliation, and Judicial Settlement was signed between Italy and Turkey on May 30 and between Italy and Greece on Sept. 23.

In Eastern E. the peace was threatened by the dispute between Poland and Lithuania over the possession of Vilna. A technical state of war had existed since Żeligowski's *coup de main* in 1921, and was brought to a technical end in 1927 by the Conference at Geneva to which Piłsudski (*q.v.*), Marshal of Poland, and Waldemaras, Prime Minister of Lithuania, were invited by the League of Nations. No settlement, however, was reached throughout 1928, and it was feared Russia would intervene in favour of Lithuania; but on Dec. 29, 1928, Litvinov, the Soviet Foreign Commissary, proposed an Eastern Peace Pact between Poland, Rumania, Estonia, Latvia, and the U.S.S.R., and this was signed on Feb. 9, 1929. Lithuania, Persia, and Danzig adhered in April, while Finland refused. Soviet relations with Great Britain improved in 1929, when diplomatic negotiations were resumed with the Labour gov. in London. Between the U.S.S.R. and Germany a Treaty of Conciliation was signed on Jan. 24, 1929.

Reparations.—*Young Plan*—*Cancellation of Reparations*—*World Economic Depression*.—A step forward in the policy of liquidating the War, initiated at Geneva in 1928, was the formation of a Committee of Experts to make a definitive settlement of reparations. The Com-

mittee, representing seven Powers, met at Paris on Feb. 11, 1929, under the chairmanship of Owen D. Young, the Amor. representative. The report of the Young Committee was completed by June 7: it was proposed to estab. an International Bank, and reparations were fixed at 38 milliard gold marks, payable between Sept. 1929 and March 1966. The Spa percentages, settled by the Financial Agreement of Jan. 1925, were altered, and this caused some discontent with the Young Plan in England, but at the International Conference which met at The Hague on Aug. 6, 1929, Mr. Philip Snowden, representing Great Britain, secured some modification of the Young Plan in England's favour. Simultaneously, with the reparations discussions, the Political Commission at The Hague Conference, under the chairmanship of Mr. Arthur Henderson, completed and signed an agreement whereby the evacuation of the Brit., Fr., and Belgian forces from the First and Second Zones of the Rhineland should begin from Sept. 1929, and of the Fr. forces from the Third Zone immediately after the ratification of the Young Plan by the Fr. and Ger. govts. Total evacuation was completed by June 1930.

The problem of security which engrossed post-war E. is an economic one as well as military. As nations protect themselves by armics, so do they by economic barriers. Some advance, however, towards economic co-operation in E. was made by the creation of international cartels in industry. In May 1927 a World Economic Conference was held, and efforts were made at securing the removal of trade restrictions and the unification of customs nomenclature. An Economic Consultative Committee came into being in 1928 to supervise the carrying into effect of the recommendations of the Conference. The result of a Tariff Conference, opened at Geneva on Feb. 17, 1930, was a Commercial Convention, but not a tariff truce, which was signed on March 25, whereby eleven nations waived their right to denounce the various commercial treaties then existing. Customs reform in E. could be effected only by an economic reorganisation of the kind advocated by Briand on Sept. 5, 1929. His speech to the Tenth Assembly of the League of Nations endeavoured to bring the long-held pan-European ideal into the sphere of practical politics, and his proposition of a United States of E., later embodied in a memorandum to the various govts. of E., was under active discussion.

In E. in 1930-31 most other events were overshadowed by the world economic depression in general and the default of Germany in particular. Germany was practically bankrupt by 1931 and unable to continue the payment of reparations. Her efforts to conclude a customs union with Austria were frustrated through the strong opposition of France. Meanwhile in Germany the sittings of the Reichstag were suspended and a dictatorship formed under the able Dr. Heinrich Brüning as Chancellor, aided by Dr.

Luther, the banker, in an effort to restore Ger. credit and at the same time resist the progress of the National Socialists (Nazis) under Adolf Hitler (*q.v.*). The Hoover 'holiday' or respite of one year from all international debts and reparations did not save Germany from impending financial collapse and, at length, following the closing of the Reichsbank, credits were granted to Germany by the former Allied Powers. Similarly, in Austria an almost equally grave financial crisis was only partially averted by a Bank of England credit for £4,000,000.

year. Hitler, at first coming into power in coalition with Von Papen, was by the elections of March 5 made sole dictator. The Nazification of Germany then proceeded, involving persecution of the Jews, conflict with Rom. Catholicism, the withdrawal of Germany from the League of Nations and the Disarmament Conference (Oct.), and opposition to Soviet Russia which resulted in a rapprochement between that country and France. Meanwhile Mussolini launched the Four-Power Pact which, however, by the time it was initiated at Rome (June, 1933) asserted

E.N.A.

THE ALPS AND THE SOUTH: ITALY

Stresa, scene of International Conferences in 1932 and 1935, and Lake Maggiore

Finally at Lausanne, in July 1932, the whole question of reparations was settled, by the cancellation of reparations, Germany to make an eventual payment by way of bonds to the total amount of £150,000,000 at par. Elsewhere in E. the outstanding event was the fall of the Bourbon monarchy in Spain and the setting up of a republic. (See ALFONSO XIII; CATALONIA; SPAIN.) In Russia the launching of the so-called 'Five Years' Plan' to flood European markets with raw materials under cost price, contributed further to the prevailing economic depression.

Rise of Nazi Party—Mussolini's Four-Power Pact—Murder of Dollfus—Saur Rebelle.—The following year (1933) the tension continued. Economic nationalism became stronger, and the rise of Hitler's Nazi Party in Germany ruined any chance of success for the Disarmament Conference which had been sitting since the previous

no newer principle than that of co-operation within the League. In June and July in London the World Economic Conference met but ended in failure. In England the National Gov. with Ramsay MacDonald as Prime Minister, continued in office, and a departure from party gov. was noticeable throughout E. Following the Feb. riots in Paris in 1934 the veteran statesman, Gaston Doumergue, was called to office to stabilise the gov. through a national appeal, but the end of the year saw him resign; Fr. political life having been seriously impaired by disclosures of corruption and by the assassination in that year of the Foreign Minister, Barthou, together with King Alexander I. of Yugoslavia at Marseille. Barthou had previously been on a tour to strengthen Fr. relations with the Balkan states and the little Entente. Poland which, hitherto, had looked to France, was in 1934 seeking a rapprochement with Nazi Germany.

The Nazi regime had continued in Germany, although, in Austria, Nazis of German persuasion failed in their revolt which they heralded by the murder of the Austrian Chancellor, Dr. Dollfuss (July 25, 1934). Dollfuss had in February suppressed by force an armed revolt against his power from the Social Democratic Party. After his death the leadership of his Patriotic Front, into which the Right Wing parties had been merged, passed to Prince Starheimberg. Politically Austria and Italy were in agreement, and in July 1934 Hitler also paid a ceremonial visit to Mussolini in Venice. Hitler had disavowed any idea of a coalition with Austria, but he himself was confirmed in absolute power in Germany by nominating himself President of the Reich for life upon the death of President Hindenburg (Aug. 6, 1934). At the close of 1934 central European politics were centred on the forthcoming plebiscite in the Saar which was to decide the future status of that dist., and in the following year as a result of the plebiscite the dist. was returned to Germany. The forcing of a plebiscite on the people marks the first stage in the aggressive tactics of Hitler, which subsequently were to be developed into a completely matured plan for securing Ger. hegemony throughout E. The international tension in E. increased in 1935. The 'collective peace system,' goal of the ill-fated League of Nations, was proving illusory in the eyes of realists. Great Britain had tried to set an example to the world in reducing armaments, but in doing so had allowed its own armament to become inadequate, and in March the Brit. Gov. drew up a statement of its policy in the matter of imperial defence (issued as a White Paper, March 4). The increase in armaments was justified if only to enable Britain to speak with more weight in international conferences on disarmament and the rearmament of Germany, along with the spirit in which the Ger. people were being organised, was emphasised as the main cause of the feeling of insecurity in E. Hitler's reaction to the Brit. White Paper was, on March 16, without any warning, to decree the reintroduction of conscription in Germany. If from that date Britain had introduced conscription and expanded her Air Force to the utmost, there would have been no world war four and a half years later. But none in England dreamed of the rate of Ger. rearmament or the predatory character of Nazi policy—with the exception of Mr. Winston Churchill, whose voice was more or less unheeded in a world which was still war-weary from the exertions of the First World War. Instead, efforts were made to pursue the futile policy of trying to bring Germany back to the councils and comity of E. on terms which would be just to her and fair and secure for all. Sir John Simon, foreign secretary, went to Berlin only to find confirmation of the worst suspicions which were held in England with regard to Germany. Hitler would have nothing to do with a proposed E. Pact of mutual guarantees, had no interest in the 'col-

lective system' of peace and security, refused to withdraw the conscription decree, would give no guarantees with regard to Austria, and vaunted his achievement of parity with Great Britain in the air.

Stresa Conference.—In April a conference was held at Stresa between Brit., Fr., and It. representatives to consider the relations of their three countries to Germany. Prior to the conference the 'isolationist' group in the Brit. cabinet made it clear that Great Britain would on no account undertake any new international commitment. In spite of continued Ger. provocation, the three govts. represented at Stresa recorded their anxiety to join in every practicable effort to promote international agreement on limitation of armaments, Germany being invited to be a partner to negotiations. Mr. Ramsay MacDonald, Brit. Prime Minister and representative at Stresa, subsequently charged Germany with having acted so as to destroy the feeling of mutual confidence in E. and with 'breaking up the road to peace and besetting it with terrors' (article in the *News Letter*). Later in the year Mr. Eden, foreign secretary, defined Britain's attitude to Germany as one of 'practical and comprehending realism,' but he still emphasised the need for a system of collective security to be built up through the League. It was, however, beginning to be clear—especially since the conclusion of an Anglo-German naval agreement allowing Germany to build a navy up to 35 per cent of the Brit. strength—that few Brit. ministers and still fewer Fr., desired to go very far in defence of the shadowy principle of collective security. This principle received a rude shock in the course of the strenuous efforts made by the Brit. and Fr. govts. to prevent Italy from invading Abyssinia, and it may be said that the collapse of the policy of applying economic sanctions to Italy, after the opening of the It. invasion, sealed the doom of the League as a force in the sphere of power politics. There can be but little doubt that Brit. policy towards Italy—although modified by the eleventh-hour effort of the Hoare-Laval Pact—embittered relations between Britain and Italy to a degree which was to have serious reactions in the World War of 1939-45 (see also *ABYSSINIA*).

Italian Invasion of Abyssinia—Spanish Civil War.—The succeeding year was dominated, as to the earlier months, by European reactions to the Italo-Abyssinian campaign and, as to the later months, by the outbreak of civil war in Spain. In both cases France took the lead in the effort to resolve the issue through the League machinery of collective action. Both events were of immediate and obvious significance to France and a source of eventual anxiety to Britain by reason of the manifest interest of Italy in the Mediterranean and the possibility that Mussolini and Hitler would exploit the situation in Spain to poison Anglo-Sp. relations. There can be no doubt that Italy felt the sting of the economic sanc-

tions which, however, were powerless to stop their rapid conquest of Abyssinia soon after Gen. Badoglio (*q.v.*) took control of operations and exploited the technique of combined air and motorised-artillery tactics. Yet the sanctions were not lifted until July 15 or over two months after the It. forces had seized Addis Ababa. In the Sp. Civil war (*q.v.*) Britain and France—which two nations all through these troubled years prior to the Second World War acted in close co-operation from the identity of their outlook and national interests—followed a policy of what was called 'non-intervention.' This policy was, naturally, condemned by Communist sympathisers with the Sp. Republican Gov. as tantamount to 'keeping the ring' clear for Gen. Franco's rebels, who were further helped to victory by material assistance in men, planes, and guns by both Mussolini and Hitler. This assistance was to seal the doom of the Republican forces which, however, inflicted a resounding defeat on the It. forces on the Guadalupe. The ostensible interest of Mussolini and Hitler in Spain was the fulfilment of their common anti-communistic ideology as expressed in the anti-Comintern Pact (*q.v.*). Actually their aims were essentially imperialist and indicative of an unceasing joint policy of exploiting every disturbed situation in E. which might serve the purpose of enhancing their power as against Britain and France. Mussolini, however, was in the invidious position of being in effect the satellite of Hitler; for while his Mediterranean ambitions received at least sympathetic consideration by Britain, they were luring him along the path which was calculated to drift his country into a general European conflagration against the Western Democracies with no kind of guarantee that Germany would respect It. aspirations any longer than suited Germany's goal of *Weltmacht*. Elsewhere in E., a notable event of this year was a visit by King Edward VIII. to Istanbul. This visit was the sequel to the successful application by Turkey to regularise the Dardanelles; and the grant of this and other Turkish demands cemented the good relations between Turkey and Britain, which were destined to have some effect on the war three years later. At the opening of the year 1937 the situation in Spain was still fraught with the potentialities of a European conflict, despite all the efforts of France and Britain to support the policy of non-intervention. The answers of Germany and Italy to the Franco-Brit. proposals for banning volunteers to Spain was still not forthcoming nor was satisfaction ever given on that count throughout the Civil war. There was a definite improvement, however, in the international situation through the Italo-Brit. negotiations for regulating the position in the Mediterranean where, for some time, there had been serious possibilities of friction between the two countries. In March King Leopold of Belgium visited England to discuss the more effective safeguarding of Belgian

neutrality. Later, a Franco-Brit. declaration was issued relieving Belgium from her obligations under the Locarno Treaties (*q.v.*), while continuing in force the Franco-Brit. guarantees of her integrity. Events three years later were to show that it would have been far wiser had all three countries restored as far as possible the famous 'scrap of paper' or Treaty of 1939, and then promoted staff talks for their mutual defence; for in the development of Hitler's plans, the neutrality of no nation was respected and one after another was fated to be but the stepping stone to the destruction of the Brit. Empire. In the Sp. Civil war there were always incidents to point the moral of Ger. methods of warfare and diplomacy, yet such was the faith in 'collective action' and the lure of 'appeasement' that these things passed without more than indignant comment. On May 30, the Sp. Gov. aeroplanes dropped bombs on the Ger. battleship *Deutschland* in the harbour of Isvizia. Ger. warships immediately bombarded the open port of Almorá, and the Ger. Gov. then announced its withdrawal from the work of the non-intervention committee. It should have been apparent to any European statesman that the Ger. Gov. had no intention of observing any international obligations whatsoever but only to make a show of respecting such obligations for so long as it might suit the purposes of her dictator and his entourage. The destruction, too, of the Basque tn. of Guernica by Ger. bombs from the air towards the end of April aroused intense horror throughout the world; but the Brit. Gov. seemed less concerned to express its undoubted moral indignation than to keep alive the futile activities of the non-intervention committee. All this year Germany was putting forward insistent demands for colonial possessions. This question was discussed by the Fr. and Brit. Govs. towards the close of the year, but it was recognised that it was not a question that could be considered in isolation or without consulting other colonial powers. (See COLONIAL QUESTION, THE). The Sp. Civil war dragged on throughout 1938.

British Foreign Policy of 'Appeasement'—Hitler seizes Austria.—The Brit. Gov. was united in its determination to keep the non-intervention committee in being; but while Mr. Eden, foreign secretary, took the view that the immediate task of the committee was to secure the withdrawal of It. and Ger. forces from Spain and that only by success in that effort could its continued existence be justified, the Prime Minister's (Mr. Chamberlain) chief anxiety was to keep on good terms with Mussolini, and to ensure that one had no objection to the It. and Ger. troops remaining in Spain until their activities should bring about Franco's victory. This difference in outlook between the two ministers led to inconsistencies in Brit. foreign policy and was soon to lead to an open breach between them fraught with startling consequences not merely for the political situation in Britain itself but in E. as a

whole. In the midst of these pre-occupations over Spain, Hitler summoned the Austrian Chancellor, Dr. Schuschnigg, to Berchtesgaden and ordered him to remodel the Austrian Gov. in conformity with Nazi ideas. Mr. Eden's suspicions of the Ger. and It. dictators now brought him into complete disagreement with Mr. Chamberlain over the question of opening negotiations with Italy on all outstanding issues, Mr. Eden insisting that Italy's tone was menacing and that before negotiations were begun Italy should fulfil her pledge to withdraw her troops from Spain. In this attitude the foreign secretary had the sympathy of the opposition members of the Brit. House of Commons, but his partisans were won over to the majority and he resigned. He explained his resignation on the broad ground that the dictators had repeatedly violated international agreements and constantly attempted to secure political decisions by forcible means. That his attitude was justified found confirmation in the fact that when the European War broke out in 1939 he was re-appointed to the gov. by Mr. Chamberlain, along with Mr. Winston Churchill and later with Mr. Duff Cooper—all these statesmen being outspoken and fearless critics of dictatorial policy in Europe and opposed to Mr. Chamberlain's policy of 'appeasement,' a policy which, in the light of future developments, was to be fraught with the gravest possible danger to the peace of E. and the liberties of all nations. Germany was now disregarding her pledged word in regard to Austria in the same way that Italy ignored hers in the matter of Spain. Germany was proposing to hold a 'plebiscite' in Austria on the question of that country's absorption in the Reich. Lord Halifax, now Brit. foreign secretary, protested to the Ger. Gov. on this virtual ultimatum to Austria, but Baron von Neurath, Ger. foreign minister, retorted in very plain language that Austria was no concern of Britain's. Hitler now brought off his second coup—the seizure of Austria by an unresisted invasion and the conversion of that republic into a prov. of the Reich. (See AUSTRIA.) By the late summer, however, Mr. Chamberlain was expressing the view that the prospects of peace being maintained in E. were somewhat improved. His optimism was founded on a scheme evolved by the non-intervention committee for removing foreign troops from Spain and in the mission of Lord Runciman to Prague to mediate between Czechoslovakia and the Sudeten Gers.

The Munich Pact—German seizure of Czechoslovakia—German invasion of Poland.—Hitler had long planned to be ready for war in Aug.-Sept. 1938 and by way of *casus belli* he incited the Ger. minority in the Sudetenland of Czechoslovakia to demand incorporation in the Reich. It was obvious that the loss of the Sudetenland would leave Czechoslovakia defenceless. Both France and Russia were bound by treaty to defend the Czechs, and Britain, though not a guarantor of the integrity of Czecho-

slovakia, could be expected to follow France. But when the crisis came, neither France nor Britain was adequately equipped for war, both having allowed Germany to mass produce armaments without attempting to stop her or to take countermeasures, and even when Britain began in 1937 to make preparations for mass production of munitions they were half-hearted; and France was in worse case, for in the years of Germany's rearmament her attention was largely occupied with internal economic dissensions, particularly with the 40-hour week suddenly imposed by statute on industries accustomed to a 52-hour week (or even more)—Germany's was then a 60-hour week. It was in these circumstances that Great Britain and France yielded to Hitler and concluded the notorious Munich Pact (q.v.) on Sept. 29, 1938, which has been described as 'one of the great capitulations of history.' During the negotiations Hitler brazenly raised his terms and the two humiliated Powers accepted them all—at the expense of Czechoslovakia. The Pact gave no protection against further seizure of territory save a worthless promise from the signatories (Germany, Great Britain, France, and Italy). Russia, though the ally of France, had not been invited to the Munich Conference and five months later the Soviet Gov. announced that Russia considered herself released from any obligation to Britain or France. Hitler had gained enormously on balance—the elaborate fortifications of the Bohemian frontier and the well-equipped Czech army, the great factories of Pilsen and Brno all fell to him in the sequel without his firing a shot. Britain and France had gained nothing, for even the twelve months' grace for rearming was but illusory and at the end of the time Germany's superiority in armament was even greater than before Munich. At Munich Hitler had averred that he wished for nothing more than the German-speaking areas of Czechoslovakia but very soon his armies overran the Czech areas as well. Britain and France, despite Munich promises, protested but did not attempt to resist Hitler (for full details of the diplomatic events leading to the German invasion of Czechoslovakia and the circumstances of the invasion, see under CZECHOSLOVAKIA). Hitler, thus encouraged, proceeded to seize Memel (q.v.) while Ger. troops were sent into Slovakia, which had been declared independent (see SLOVAKIA) in order to outflank Poland. It was in these circumstances that Great Britain on March 24, 1939, gave a unilateral guarantee to Poland which already (like Czechoslovakia) was in alliance with France. Hitler then made demands on Poland for the incorporation of Danzig in the Reich and other demands which if granted would have disrupted Poland much as the annexation of the Sudetenland had disrupted Czechoslovakia. The Polish Gov. refused the demands and Hitler on April 28 annulled the German-Polish pact of Non-Aggression. By July his troops were entering

Danzig. As the political horizon darkened the Brit. Gov. became more active at home and abroad. A ministry of supply was formed (April 1939) and unilateral guarantees given to Rumania and Greece and a treaty for mutual assistance signed with Turkey. These guarantees, however, were of small practical value without the support of Russia. Britain sought Russian co-operation but could obtain it only at the price of acquiescence in Stalin's occupation of the three Baltic states. Hence Stalin conducted parallel negotiations with Hitler and on Aug. 23, 1939, the world was amazed by the news of a Ger.-Russian pact (*see below* *Hitler's 'Volte-face'* with Stalin). The pub. text of this Pact recorded a close agreement between the two Powers, adding that if either were attacked by a third, the other would give no help to the attacking Power. No-one could doubt, however, that more specific bargains were covered by secret clauses, and events soon showed that these concerned the betrayal of the Baltic states, the partition of Poland and forced concessions from Finland. All was now in train for Hitler to launch his thunderbolts of war and after a farce of ultimatums, which Poland was given no opportunity to answer, the Ger. armies invaded Poland (for full details of the causes of the Second World War and of all immediately antecedent events, *see* *WORLD WAR, SECOND, Causes*).

HISTORY OF EUROPE DURING THE SECOND WORLD WAR (1939-45).—*German Conquest of Poland—Position of Neutral Countries.*—The hist. of E. in the first two years of the war was the record of the rapid and shattering Ger. conquest of one European country after another, until Britain remained the sole defender of the liberties of mankind against a triumphant Germany holding down most of the Continent, including her fascist partner, Italy, whose unhappy people had been dragged into the war by Mussolini in the expectation of cheap and easy rewards. For the greater part of this period Stalin played the rôle of European Janus, always apparently ready to enter into formal agreements with Hitler, yet never losing an opportunity of strengthening his frontiers against him.

Poland, with her somewhat medieval army, proved unable to stem the tide of invasion even for the short period which many military experts thought probable. The attack proceeded at immense speed, with a devastating avalanche of mechanised troops supported by an overwhelming force of dive-bombers and fighter planes. Civilians were mercilessly bombarded from the air. To paralysed traffic the Ger. bombers flew alternately up and down the backs of streets knocking the houses down towards each other. By the middle of Sept. Warsaw was surrounded and the Polish armies fell back on their last line of defence to the east. (*See* *POLISH CAMPAIGN IN SECOND WORLD WAR*.) At this point the Soviet army crossed the frontier in their rear and Polish resistance collapsed (Sept. 24). Once again in its chequered story Poland was partitioned,

with provision for a small puppet state under Ger. domination. It seems evident that the assignment of a part of the country to Russia was part of a bargain made between Germany and the Soviet immediately before the invasion began and with the object, on Germany's part, of avoiding the contingency of a war on two fronts. In the West of E. the Allied declaration of war was followed by a long lull—excepting at sea (*see* *NAVAL OPERATIONS IN SECOND WORLD WAR*). On land the Maginot and Siegfried Lines were promptly manned, but both were either too strong for a major attack with the advance of winter or, more probably, the Fr. armies preferred to remain strictly on the defensive, while the Ger. High Command had, from the first, the strategy of the Schlieffen plan (*q.v.*) in mind—to outflank the W. Front by an attack through the Low Countries at such time as they were ready. On Sept. 11 a Brit. Expeditionary Force of eight divs. under Gen. Lord Gort had crossed the Channel and taken its place beside the Fr. armies, under the supreme command of Gen. Gamelin (*q.v.*). Not long afterwards there was more than a hint that the area of conflict would be extended. Even at this early time, a Ger. invasion of the Low Countries in order to turn the flank of the Allied position and establish bases for air attack against Britain seemed to be seriously threatened; but the Ger. staff evidently thought better of the plan for the time being. Russia took the opportunity to reduce the three small Baltic republics to vassalage, this being presumably part of the price paid by the Reich for the Russian 'entente.' Soon afterwards Russia invaded Finland—the obvious purpose of this unprovoked onslaught being to secure her Baltic position against Ger. encroachments. (*See* *FINLAND—History*.)

Up to the end of the spring of 1940 there were no major military developments on the W. Front. The belligerents were mainly engaged in manoeuvring for position. The diplomatic omens for the Allies were dark. The devastating completeness of the success of Germany's Polish campaign not only freed Germany of the nightmare of a war on two fronts, but it demonstrated, even more obviously than the fate of Czechoslovakia (*q.v.*), the reprisals small states, however 'guaranteed,' might expect at Germany's hands if they were spirited enough to offer resistance to her plans of European conquest. In the first six months of the war, the struggle between Germany and the Allies had been to secure the support of the neutrals, and especially of the N. neutrals. The Allies had espoused Finland's cause, but, since Finland had been defeated, their prestige had suffered a heavy blow. However exorbitant might be Ger. demands on neutrals, they were not unlikely to be conceded, owing to the prestige of terror excited by Germany's victories; but Ger. demands were not always so evidently exorbitant as to drive neutrals in desperation to seek aid elsewhere. Often they took the form of

pressure to secure advantageous trade agreements ensuring the supply of essential raw materials. The neutrals, however, were a far greater problem to the Allies, for, by remaining neutral and trading with Germany—even under compulsion—they considerably diminished the efficacy of the Allied blockade. It was, therefore, the cardinal problem of the Allies to try to convince the neutral world that they were fighting the battle of every small state and that they were sufficiently powerful and determined to achieve ultimate victory. With the defeat of Poland and Finland, the policy of the smaller European neutrals was that, at whatever sacrifice of economic and political independence, they must not become involved in the war. Yet, in reality, had Norway and Sweden consented to the passage of a large Anglo-French force through their ter., Finland might have been saved from Russia's invasion, though, as events were to show, it was to the Allies' advantage not to thwart or weaken Russia but to make her as strong as possible in relation to Germany. Since, too, the Allies were negotiating a full alliance with Russia in August, 1939, their failure to achieve it was a severe diplomatic setback, however forcibly events in Poland and Finland were to illustrate the price they would have had to pay. Germany was able to make use of her general advantage *vis-à-vis* any neutral state in E. The Allies had to ask Russia to fight and to ask in vain; Germany only that she should remain neutral. After Poland's partitioning, Germany and Russia appeared to be collaborating in harmony. Their govs. by Dec. 1939, had begun the transfer of Gers. from the Polish provs. annexed by Russia and of Ukrainians and White Russians on the Ger. side of the partition line, the numbers involved being respectively 100,000 and 1,000,000.

German designs on 'the Low Countries and Scandinavia.—In Nov., Ger. troop concentrations on the border caused alarm in Holland. King Leopold, who on Oct. 27 had announced that Belgium would fight if attacked, suddenly visited Queen Wilhelmina (Nov. 7), and the two rulers broadcast a joint offer of mediation to the belligerents, which was of course rejected. The development of the Polish crisis found the Iberian peninsula divided. But despite Ger. propaganda, Portugal remained pro-Ally and stood by her ancient alliance with Britain. In Spain, the Franco Gov., in recognition of aid in the Civil war, inclined to the Ger. side, while the conquered republicans held aloof in resentment of the failure of Britain and France to assist them in that struggle. But undoubtedly Gen. Franco was apprehensive of the abrupt change of front by the Gers. towards hapless Poland, though little sympathy was expressed in Spain for Catholic Poland. On Oct. 19 was signed an Anglo-Fr. treaty of assistance with Turkey, which contained a proviso absolving Turkey from compulsion to take action which would involve her in war with Russia. Italy declared her 'non-

belligerency' at the outset of the war. Signs of Russian interest in the Balkans aroused alarm in Italy, and the relations of that country with Turkey and Greece improved on that account. But as time wore on it became evident that a common Balkan pact was as far off as ever, and, as will be seen later, Turkey ultimately found herself isolated when the whole of the rest of the Balkans had surrendered to the Ger. forces in 1941.

In the early months of the war it was seen that Germany was evading the Brit. blockade by transporting iron-ore from the Kiruna mines in N. Sweden through the territorial waters of Norway and these waters were accordingly mined by the Royal Navy. But Germany had much wider designs on Scandinavia, and was planning to seize Norway so as to be able to threaten the Brit. coasts from Norwegian ports. Suddenly, in April 1940, Ger. forces seized a number of key points in Denmark and Norway, including both Copenhagen and Oslo. Denmark was powerless to resist, but its only outlying dependency, Iceland, was saved by being taken under the immediate protection of Gt. Britain. The Norwegians offered a heroic resistance under King Haakon and a Brit. expedition was hurriedly landed in Norway. But the Ger. surprise invasion was complete and their forces, landed by parachute and in troop-carrying planes, soon put them in possession of the few existing airfields. Norwegian resistance soon became hopeless, the more so as their capital had been betrayed by one Maj. Quisling (*q.v.*), whose name became a synonym for this kind of treachery (*see also FIFTH COLUMN*); the King went to England and the Brit. force was re-embarked for Britain (*see NORWAY AND DENMARK, GERMAN INVASION OF (1940)*). This Allied defeat produced immediate repercussions in Britain and France, Mr. Churchill replacing Mr. Neville Chamberlain as Prime Minister of Britain, and Paul Reynaud replacing Daladier, both being pledged to the more vigorous prosecution of the war, while some impetus was given to the movement for a closer understanding between the Brit. and Fr. govs. through the Supreme War Council.

German Conquest of Belgium and Holland—Collapse of France—Franco-German Armistice—Vichy France breaks off relations with Britain—Italy declares war.—Hitherto the Low Countries had absolutely declined any consultation with the W. Allies, on whose help they would necessarily have to rely for their defence. Their neutrality, however, was soon destined to suffer a shattering disillusionment. Without notice or declaration of war, the full fury of the Ger. war-machine was unleashed against both Holland and Belgium, with the object of forcing a way through their ters. and turning the left flank of the Maginot Line (May 10). Holland was crushed in a few days, and King Leopold surrendered on May 28. The Dutch royal family escaped to England. The greatest rearguard action that military hist. has ever recorded culminated in the evacuation from Dunkirk, when

335,000 men of the R.E.F. were brought home. Gamelin's whole strategic plan collapsed. The Gers. entered Paris on June 14. (For the immediate effect on Britain of the collapse of the Western Front and the preparations made for the defence of Great Britain against a Ger. invasion, see GREAT BRITAIN: *History*.) Reynaud, who seemed prepared to carry on the fight in Fr. ter. overseas, found himself in a minority of one in his own Cabinet, and a new cabinet was formed under Pétain, which in 1941 had become

tection of her Mediterranean interests, was now in danger of being handed over to Germany. But this menacing situation was generally changed for the better by Mr. Churchill's prompt exercise of Brit. sea-power against the Fr. fleets in Oran and Mers-el-Kebir, a number of ships being sunk or put out of action (see NAVAL OPERATIONS IN SECOND WORLD WAR). The immediate result of this move was that the Fr. Gov., now at Vichy, broke off diplomatic relations with Britain. It has sometimes been supposed

Imperial War Museum: Crown copyright
1940: THE DUNKIRK EVACUATION

so permeated by Ger. sympathisers that the two countries thenceforth openly collaborated against Britain. France signed an armistice with Germany on June 22 and with Italy, which country had entered the war on June 11 in the hope of securing the spoils of victory at the least cost to herself in blood and treasure, on June 24. (For the campaign on the W. Front, see WESTERN FRONT IN SECOND WORLD WAR and for the immediate and underlying causes of the collapse of France, see below and FRANCE: *History*.) The collapse of France in conjunction with the entry of Italy into the war created a situation of grave peril for Britain and not least in the Mediterranean where the Brit. forces were now heavily outnumbered by land and by sea. The Fr. Fleet, on which much reliance had been placed by Britain for the pro-

tection of her Mediterranean interests, was now in danger of being handed over to Germany. But this menacing situation was generally changed for the better by Mr. Churchill's prompt exercise of Brit. sea-power against the Fr. fleets in Oran and Mers-el-Kebir, a number of ships being sunk or put out of action (see NAVAL OPERATIONS IN SECOND WORLD WAR). The immediate result of this move was that the Fr. Gov., now at Vichy, broke off diplomatic relations with Britain. It has sometimes been supposed that Mr. Churchill was too precipitate in his action towards the Fr. fleet; but nothing in the hist. of the men, like Laval, Adm. Darlan, and Bonnet, who were now controlling Fr. destinies under the aegis of the helpless and aged, if honourable, Marshal Pétain, would lead the dispassionate historian to suppose that any other course would have been prudent. France was defeated, crushed and humiliated and not least by her own wealthy bourgeoisie and fifth columnists (see FIFTH COLUMN). Resistance from Algiers, with the aid of the Fleet, might have been practicable, but such resistance would have been rendered abortive by political machinations and by Ger. pressure on the families of the Fr. naval officers and men.

German infiltration in the Balkans and Hungary—Tripartite Pact.—In the E.

Mediterranean a large It. army under Marshal Graziani, based on Libya, was preparing to invade Egypt, whose protecting forces were embarrassed by the situation in Syria in its rear. But instead of advancing rapidly across the W. Desert, Graziani proceeded in leisurely manner to organize powerful defences in Cyrenaica, while new armies suddenly advanced on Albania to invade Greece. Whether this adventure was embarked on with the knowledge or connivance of Hitler seems doubtful. It is more probable that Italy was suspicious of Ger. infiltration through Rumania into the Balkans generally and sought herself to acquire control of the E. Mediterranean by antipating the Gers. But by the end of the year the entire It. Colonial Empire was in jeopardy through the military and naval successes of Brit. and Gk. arms (see AFRICA, NORTH, SECOND WORLD WAR CAMPAIGNS IN; GREECE, SECOND WORLD WAR CAMPAIGNS IN (1941); and ITALIAN EAST AFRICA, SECOND WORLD WAR CAMPAIGN IN (1941)).

For the time being, Greece, aided by Brit. naval, military, and air forces, was still heroically resisting the invader, and indeed, had Germany not taken a hand, would have driven the Its. out of Albania. But meanwhile, the Ger. war machine, gradually and remorselessly, was shaping European economy to its own exclusive needs, and among its next victims were the S.E. states of Hungary and Rumania. Hungary was admitted to the Axis (*q.v.*) but only when her superiors decided that her interests were involved. Rumania, by a succession of gradual encroachments on her sovereignty, soon found her entire system of gov. subverted. The Soviet was won over to these Nazi absorptions, by the cession of Rumanian ter., but Turkey, though dangerously situated between the Ger. hammer and the Russian anvil, reiterated its continued friendship with Great Britain and its determination to defend its independence. At the other end of the Mediterranean, Gen. Franco pursued an opportunist policy, which, when France fell, seemed not unlikely to bring him into the war as a partner in the Axis; but he became cautious when it was seen, in the autumn (1940), that the destruction of Brit. power was still far off. Meanwhile, despite Ger. military successes, the hope of the oppressed nations of E. was reposed in Britain, who was in the way of obtaining material aid from the U.S.A., whose President, earlier in the year, had sent Mr. Sumner Welles to tour the belligerent countries of E. in order to acquire information on the general position (see Sumner Welles, *The Time for Decision*, 1944). The menace of 'Hitlerism' to the New World, made obvious by the Tripartite Pact between Germany, Italy, and Japan, drew closer the bonds of sympathy between the U.S.A. and Great Britain. (See EARLIS, PACT OF.)

During the first five months of 1940, the Balkan States, including Turkey, were the scene of much diplomatic competition between the W. Allies, the Axis, and Russia. The Allies sought economic

advantages and the denial of Balkan raw materials, especially Rumanian oil, to Germany, through purchases of local supplies and their support of Balkan unity—both of which means proved abortive. Stalin, seizing his advantage from the Fr. collapse, delivered an ultimatum to Rumania, which, being unable to resist except through the doubtful medium of Hitler, ceded Bessarabia and N. Bukovina to Russia whose confines now reach the Lower Danube. A pro-German puppet gov. in Rumania repudiated the Anglo-Fr. guarantee and withdrew Rumania's membership of the League of Nations. Thus the Balkan Entente was at an end. Now, both Bulgaria and Hungary, undermined by Nazi sympathisers, pressed territorial demands on Rumania. With Ger. aid, Bulgaria obtained the S. Dobrudja. Britain acquiesced in the vain hope of buying off Bulgarian sympathy for the Axis. Hungary and Rumania could not agree and, on Aug. 30, lt. ministers at a conference in Vienna, dictated a settlement which cost Rumania over half of Transylvania. This betrayal resulted in the abdication of King Carol (Sept. 6) and the entry of Ger. troops. Rumania, for all practical purposes, was now a Ger. protectorate.

Nazi persecutions in occupied countries.—Under Ger. occupation, Poland, Czechoslovakia, Belgium, Holland, and France suffered privations and hardships in varying degree. Throughout 1940–41 there was no respite from Ger. terrorism in Poland. Every day brought new examples of inhuman cruelties and shootings on the slightest pretext. The unmasked plot of the Gestapo (*q.v.*), the Ger. terrorists, was nothing less than the extermination of the Polish pop. in the eastern areas of E. The Ger. 'Youth Organisation' was reviving in all its horrors the traditions of the anct. Teutonic knights, who, under the pretext of converting the heathens to Christianity, conducted in the Middle Ages in E. Prussia, Pomerania and Lithuania the most ruthless extermination policy. In Holland, economic life was subordinated exclusively to Germany's interest. The Dutch had to bear the costs of the occupation and also those of all Ger. preparations for an attack on Great Britain from Dutch shores, where one million Ger. soldiers were concentrated. A special branch of the Ger. Chamber of Commerce for the Netherlands was estab. to provide for raw materials to Dutch industries so as to ease the pressure on Ger. industries. Similar conditions prevailed in Czechoslovakia and in Belgium, where economic life was ordered exclusively in the interests of the Ger. war-machine. In the first months of the occupation the Gers., mindful of the influence in the last war of Cardinal Mercier, were careful not to do anything that might offend the Church. The two prin. obstacles they encountered in Belgium were, as before, the spiritual and the communal power. These still represented the soul of Belgium. Hence, in 1941, the Ger. propaganda machine began to make

unfounded attacks on the Belgian clergy. Germany did not hesitate to plunder Belgium of its reserves of food, though the country has never produced enough food for domestic consumption. In exchange the Gers. paid in marks of the Reichskreditkassa, which were worthless outside the occupied territories and therefore could not be used to replenish supplies. From the start rationing was very severe and was indeed a prin. cause of the moral resistance which began to assert itself in Belgium soon after the occupation began. The situation was even worse in Holland, where the Gers. tried to prevent the smuggling of Dutch foodstuffs across the frontier. Elsewhere in E., the burden of oppression lay heavily on the nations. Bohemia was in the grip of famine. In large Czech areas the distribution of meat was negligible. Famine conditions were created by wholesale Ger. requisitioning, by congestion of communications with military material and by heavy Ger. immigration into Czechoslovakia. In Norway, after the Lofoten raid (see NAVAL OPERATIONS IN SECOND WORLD WAR) and the destruction of the machinery for extracting glycerine oil, a large quantity of fish was thrown upon the market and fish suddenly became plentiful again in N. Norway. But the people were then presented by Germany with a bill for 200 million kroner on account of the Ger. occupation and this was only an instalment.

In the summer of 1940 the Gov.-General of Ger. occupied Poland was incorporated in the Reich as a puppet state, Hitler having realised that he could no longer use an 'independent' puppet Poland as a bribe to Britain to make peace. The immediate result of this change was a lull in persecution, especially as the Gers. were fully occupied elsewhere in E. Exiled Poles were even induced to return, but those who did were set to work in slave-gangs to work on fortifications, roads and quarries, and never saw their homes. There had been a scheme to force all Jews into Lublin, but the first deportations caused so serious a threat of general starvation that in June 1940 the Ger. governor himself was driven to protest. There were widespread deportations of Poles from Poznan, Pomerania, and Silesia into the Gov.-General so that good agric. land should be put at the disposal of the Ger. 'ruling people' (Herrenvolk). In Russian-occupied Poland there was little terrorism until the end of 1940, but thereafter began deportations into Central Russia, Turkestan, and Siberia. But with the single exception of the Poles, no nation in modern times has endured so devastating a persecution as was inflicted by Germany on the Czechs during the two years since their 'bloodless conquest' of March, 1939 (the facts may be studied in *Two Years of German Oppression in Czechoslovakia*, pub. in 1941 by the Czech Ministry of Foreign Affairs). Tens of thousands of prisoners passed through the Gestapo centre in Prague to be robbed of their possessions, humiliated and killed or half killed either at the centre or in

concentration camps. Particular objects of Ger. vengeance were officers who had served with distinction in the Czech army. Their treatment throws much light on Ger. conceptions of 'chivalry' towards the vanquished. Czech culture in all forms was an especial object of Ger. animosity and persecution. All univs. and colleges were soon closed. The churches fared no better; their property was confiscated and many priests were sent to concentration camps (q.v.).

German occupation of Bulgaria—Abovite Serbian revolt.—We have seen above how the Balkan Entente came to an end. After the Ger. absorption, King Boris (q.v.) still hoped at least to keep his country neutral. Pro-Brit. himself, and his people pro-Russian, his belief that he could keep Bulgaria out of the struggle probably rested on his faith in the influence of Russia as the traditional protector of the Balkans and on an equal measure of confidence in Britain's growing strength. But his army was pro-Ger. and it had the backing of many politicians. Thus it came about that the infiltration of German 'tourists' and a disguised occupation of key-points by Ger. technicians were permitted right from the beginning of the war, while Russia, though jealous of this Ger. penetration in her sphere of racial influence, was impotent against it.

Throughout these months diplomatic battles raged between the small states in the Balkans and Germany's vast and menacing power—the bloodless prelude to the imminent war which was to be fought. In the hope of forestalling the Ger. invasion of Greece, Mr. Eden, Brit. foreign secretary, visited the Balkans in an endeavour to organise a Balkan bloc of resistance. To counteract this visit and the effect of the American Lend-Lease Bill, the Ger. Gov. hastily occupied Bulgaria, 'invited' Yugoslavia to join the Axis and gave 'friendly' advice to Greece to conclude peace with Italy. From the previous year Turkey was one of the most active advocates of a Balkan union. Its diplomacy made continuous efforts to consolidate the community of the Balkans as well as the rule, theoretically accepted but not applied everywhere, 'the Balkans for the Balkan people.' But Turkish policy followed three other main lines, which were rendered difficult by the proximity of Ger. forces: not to fight against Great Britain; not to help Germany; and to do nothing of which Russia would disapprove. For Russia gave no assurance that, if there were war in Thrace or in Asia Minor, she would not seek some strategic gain in Iran or elsewhere and, as experience had shown in Poland, Scandinavia, and Rumania, Russia had always taken compensation for her acquiescence in Ger. aggression. Yugoslavia embarked on a temporising policy. Ever since the murder of King Alexander the country had been under a regency. There were jealousies within the young kingdom which seriously impeded its political and economic development. When the Prime Minister, M.

Tsvetkovitch and his associates went to Vienna at Hitler's request to sign away their country's independence, the Serbs rose in revolt. Prince Paul, the regent, fled and the country prepared for war. But the Serb coup d'état and the people's traditional bravery were of no avail, and the country was overrun by Ger. troops in a few days (see p. 487, *Surrender of the Greek Army and under GREECE, SECOND WORLD WAR CAMPAIGN (1941)*).

Franco-German Collaboration—The German 'New Order.'—It has been indicated above that, after the Brit. fleet attacked the Fr. ships at Oran and Mers-el-Kebir, diplomatic relations between France and Britain were broken off. This rupture of diplomatic relations that could have had little more than a conventional basis, was hardly more than a gesture in self-defence. France had been crushed and humiliated in the field, and any overt sympathy for her former ally, Britain, might well have resulted in the termination of the Armistice and a Ger. occupation of that part of France which remained, at least nominally, under the control of the Vichy Gov. The transition from an uneasy passivity towards Britain to open hostility was only gradual. The Brit. Gov. for months was weak and complaisant towards Vichy and hesitant in its support of the Free Fr. followers of Gen. de Gaulle (*q.v.*). It long retained an implicit trust in the aged Marshal Pétain (*q.v.*) himself a vacillating and impotent force in Fr. public life. This attitude sprang from Britain's inability to believe that any Fr. leader could see in the Ger. invader anything but a traditionally hated enemy, and that, at heart, all France merely awaited the day of resurrection. And, truly, after the triumph of the Brit. defence in the Battle of Britain (*see* **BRITAIN, BATTLE OF**) from Aug.-Oct., 1940, many Frenchmen entertained this hope—a natural hope inherent in the normal and honourable interpretation of Fr. interests and security which associated the fate of France with the free civilization of the W. But a true understanding of some of the fundamental causes of the defeat of France pointed inevitably to a diametrically opposed conception of the interests and security of France—an acceptance by fearful and miserly men of the position that E. must inevitably be unified by Germany and that the hope of France lay in conciliating the old enemy and in fitting her economy into the needs of the Reich. The men of property, the bureaucrats, and the colonial officials were encouraged in this passive acquiescence by years of skilful Ger. propaganda, in which the 'dangers' of liberal democracy to property were linked with the 'menace' to France of the world leadership of a liberal and bellicose Britain. The struggle for France's freedom against Germany was distorted into Britain's attempt to fight a war with the man-power of France and to keep the continent of E. weak by perpetuating, at the cost of war, the enmity between those two 'natural allies' France and Germany. Fantastic as it may sound, this interpretation was believed in Vichy. It is the

less fantastic when it is realised that the rival ideologies of fascism and communism or republicanism had already resulted in the triumph of fascism in Italy, Germany, and Spain. In France political life had been unstable for several years. The communists had split the ranks of the working-class at the crisis of the anti-fascist struggle. The covert friends of fascism in the critical days of 'non-intervention' in Spain proved too strong for the wealthy socialist, Blum, and the leaders of the 'Popular Front,' who therefore lost the support of the Fr. Social Democrats. The weakness and corruption of the rulers of France created an unique opportunity for the party of progress; but it was missed. Since the last war France had been ruled by men who were incapable of meeting the challenge of their epoch. They sought their allies in a Mussolini, a Franco, in Arab landlords and in any and every group except those who were, by necessity, anti-fascist. The 'principles of 1789' were no longer popular with the Fr. bourgeoisie, for they were now identified with bolshevism. Hence the united front which was presented to the Ger. invader in 1914 had long been undermined by 1939, and in the hour of defeat the conservative elements looked for leadership to men like Laval, Flandin, and Bonnet. After the Fr. collapse, the Gers. were in a specially favourable position to play upon Fr. feelings of resentment against Britain—the blockade, air bombardment, industrial and business dislocation—all these could be laid to the door of the Brit. people under the 'war-mongering' leader Winston Churchill, and to their obtuse determination to carry on the war against a 'united' E., which was only waiting for the end of Britain's insane onslaught to organise prosperity under Ger. leadership—the 'New Order' (*q.v.*).

Admiral Darlan's Attack on Britain.—By the middle of 1941 the phase of 'collaboration' between France and Germany had advanced far. The final step of military collaboration was inherent in the position adopted earlier at Montebello, when a kind of economic *modus vivendi* was reached. For in total war the distinction between economic and military collaboration is impossible to maintain. Through their control of raw materials, the Ger. officials in Paris were able, soon after the Fr. defeat, to control industry throughout the country, and they found willing collaborators among the leading industrialists. With a show of independence Marshal Pétain stated that in collaboration with Germany 'France would preserve her continental and colonial status' (May, 1941); but the Brit. Gov. had no choice but to interpret the statement as one that paved the way to joint action in N. Africa—which indeed had been threatened by Adm. Darlan—by the Fr. and Ger. navies. By this time, indeed, Pétain's name and authority served only to cloak and excuse surrenders to Germany. The most important man in France now was Adm. François Darlan, who had never forgiven the

damage inflicted on his ships by the Brit. navy at Mers-el-Kebir nor the implication that his word was not to be trusted. He had, moreover, convinced himself that England, in spite of Amer. support, was doomed to defeat. But though probably at first he did not intend to betray his country but simply to obtain, through collaboration, the best possible terms from Germany, he had, under constant pressure from an unscrupulous enemy, who alternately flattered and threatened, ended by selling himself body and soul to France's conquerors, knowing well that Hitler intended to annex all the N. and N.E. of France up to the R. Somme, in addition to Alsace-Lorraine. The previous Dec. Laval (*q.v.*) had been ignominiously dismissed for having tried to foist on France a policy similar to his own, and at that time there were many patriotic ministers who would not have allowed themselves to be committed to a dishonourable policy, however immediately profitable. But Darlan had no such scruples and, on assuming power as minister of foreign affairs and of the interior, which gave him the key posts of the country, he at once secured the dismissal of these ministers. He tried to convince his countrymen, most of whom were passionately opposed to this policy, that he was adhering to the terms of the armistice; but under increasing Ger. pressure and under the haunting fear of reprisals exercised on the 2,000,000 Fr. prisoners of war in Germany, he finally abandoned subtleties, violently attacked Britain, whom he accused of wanting to starve France and cut her off from her empire, and threw in his lot deliberately with Germany.

*The Brenner Conference.—*Hitler's preoccupation with Russia.—In the mid-summer of 1941 Germany's political efforts were concentrated on promoting the 'New Order.' Hitler convened a conference with Mussolini at the Brenner in order to give weight to his diplomatic manoeuvring, especially in the W. Inspired reports of the conference spoke of the stabilisation of peace in Europe and the organisation of a unified economy. Mussolini himself by this time had no more significance than a Pétain or an Antonescu, and, indeed, so anxious was Hitler to secure the complete collaboration of the Vichy Gov., that nothing more was heard of the former It. 'claim' to Tunis, Corsica, and Nice. Not even Croatia was given to Italy, for shortly afterwards it was announced that that country had become a member of the Axis Tripartite Pact. But as a political sop Greece, now conquered by Ger. troops, was assigned to Italy. This vicarious generosity on the part of Germany was really dictated by Germany's preoccupation with Russia. Both Germany and Russia were now aligning their common frontier with vast armies. If garrisons for Greece would operate to release seasoned Ger. divs. for that frontier, especially as a move against Russia might easily bring Turkey into the war, and the divs. which had reduced

Greece could be used to encircle Turkey and advance through Asia Minor on Iran. These were the prospects at this time, but no manoeuvrings in the S.E. or east of E. could in any way lull Britain into a sense of false security. The previous year it had been to Hitler's advantage to grant France an armistice and to reserve the discussion of peace terms till the war was over. Thus by a process of blackmail he had succeeded in forcing the Vichy Gov. to surrender and so secured considerable advantages in waging war on Britain. But he had to recognise the force of hostile opinion in the U.S.A., and so now wished by all means at his disposal to confront the Americans with a set of facts that would strengthen the argument against taking part in the war. He wished that his 'new order' might seem to have pacified and organised Europe, so that Brit. resistance was hopeless and so that all that the U.S.A. could hope to achieve by entering the war would be to prolong it. For that purpose it would be useful to make peace with France—a peace that could be trumpeted to the world as the close of the long story of deadly rivalry that had produced such widespread disasters. His accomplice in this plan was Adm. Darlan, who in Dec. 1939, had spoken of his 'close collaboration with the brave British Navy' and of the 'inviolability of moral force,' and who now told France to throw in her lot with Germany so as to find her place in the 'New Order' and 'hold up her head again.' There was, however, one fatal flaw in this dispensation: if it suited Hitler to tear up the peace treaty he gave France when the war was over, what could restrain him from so doing and what was there in his political record to suggest that he would not? For the time being, however, Hitler's immediate objective was the fullest Fr. collaboration whether in Syria, in N. Africa, or elsewhere, so as to strengthen his hand against Britain and at the same time to bring pressure to bear on Russia so as to rob her gigantic reservoir of raw materials, particularly oil and wheat.

*Russian Expansion in defence.—*Russo-German relations.—For the curtain was now about to be raised on a new and startling tragedy—the German invasion of Russia. Nothing could have proved more clearly than this attack that power was the ultimate goal of Nazi policy. Yet none should have been taken by surprise: for the invasion was but the sequel to the irresistible logic of events. But, superficially, the relations between Germany and Russia had been so equivocal that European statesmen might well have believed that Germany had abandoned her traditional ideal, the *Drang nach Osten* (*q.v.*), so far as the ideal applied to the wheat of the Ukraine and the oil of the Caucasus, and was well content to purchase Russian neutrality at almost any price. Half Poland and a free hand on the "Russian fringe" were offered to Stalin by the infamous non-aggression pact of September 1939, so as to ensure Russian neutrality when Germany

launched the Polish invasion. Britain, however, refused to betray the Baltic states, and in fact was asking Russia to join in a common front against Germany in return for no immediate benefits. Yet it had been better for Stalin if he had not assumed that Russia's security was to be assured by years of exhausting trench-warfare in the west of E. But from the signing of the Ger.-Soviet Pact of 1939 until the end of the Battle of Britain (q.v.) the Soviet Gov. took advantage of Germany's preoccupations on the W. front to reinforce their own frontiers and in fact to provide ter. for a 'defence in depth' in the event of a war. The partition of Poland in 1939 was followed by the 'protection,' and, finally, the absorption, of the Baltic States—Lithuania, Estonia, and Latvia: by the war on Finland (see FINLAND—History) from which a new Russian defensive frontier was gained, if at heavy cost; and by the annexation of Bessarabia. This process of Russian expansion was resented in Berlin; but, while the rest of E. remained undefeated, Hitler was ostensibly even prepared to assist Stalin in his policy of expansion. Thus the Ger. Balts were transmigrated; pressure was put on Sweden to prevent the passage of allied troops to help Finland; and Rumania was advised to submit to Stalin's claim to Bessarabia. Nothing could better exemplify the essentially provisional character of the Ger.-Soviet Pact from Hitler's standpoint than his readiness to allow Russia to expand into the Ger. sphere of influence in the Baltic and Balkans. None knew the mind of the Kremlin. Secrecy has always been the dominant trait of Russia's relations with the world. That Teuton and Muscovite hated each other was always accepted as axiomatic. Equally nothing definite was known of the true strength of the armed forces and equipment of the Soviet or whether the many 'purges' spelt corruption or a progressive efficiency. Had the revolution imbued the Russian peasant and workman with an enthusiasm for his Communist political institutions which, under the Czarist regime, he could never have felt? Had the successive five-years' plans placed Russia on an industrial footing almost of equality with any other great nation? Was the Soviet Gov. gradually and subtly abjuring its peculiar Utopianism for a neo-imperialism? None knew precisely the answers to these and other questions, but optimistic political cartoonists in the newspapers of democratic countries never tired of representing Stalin as a mighty Gulliver holding the ill-fated Hitler in the palm of his hand and as Hitler made one 'desperate' gamble after another, the emphasis on the cunning and willingness of Stalin as the ultimate arbiter of Russo-German destinies never palled in the comments of W. publicists, and in the ultimate issue they were justified in their outlook.

It would seem to be erroneous to suppose that, when he launched his attack against Russia, Hitler was merely returning crudely to the policy of *Mein Kampf*

(q.v.); for this would be to ignore the development of Nazi technique since the previous decade or more. It was commonly accepted in Ger. foreign office circles that Germany, with her technical skill and organising ability, must somehow gain control of the resources and manpower of Russia. Some Ger. politicians, believing that the Soviet régime was moving steadily away from the tenets of the world-revolution and towards a form of 'national' socialism, thought that that régime might be prevailed on to accept a position as the Reich's junior partner. Others held that Russia must be attacked in order to effect the overthrow of the Bolshevik régime and its replacement by another more prepared to do Germany's will. Hitler, in his approach to the Russian problem, kept in being the treaty of Rapallo, whose provisions went beyond those of a mere treaty of non-aggression; for he gave large commercial credits to the Soviet Union and fostered Ger.-Russian trade; and at the same time, he mobilised Ger. opinion for the anti-Communist crusade. The isolation of Russia was a necessary preliminary, whether she was to be conquered or made into Germany's ally. That isolation was achieved at the Munich Conference, 1938. The Reich undoubtedly hoped that the pact of Aug. 23, 1939, would eventually lead to the adoption by Russia of a policy of unlimited co-operation. The 'neutralisation' of Russia, dictated by the military requirements of the moment, could be only a temporary solution. Russia, for her part, was pursuing an exactly analogous policy. Under the thin cloak of preparations against the 'Anglo-French war-incendiaries,' Stalin was seizing strategic vantage-points from Finland to Bessarabia. He seemed anxious to persuade Hitler of the value of Soviet friendship, whilst at the same time taking steps to improve the security of Russia. The Gers., just before their invasion of Russia, were looking forward to the day when a Russian gov., both anti-democratic and anti-communist, would perform for the Reich in the east of E. services, diplomatic and military as well as economic, comparable to those which the Vichy Gov. was rendering in the west of E., in the Near E., and in Africa. And just as the subservience of Vichy France did not avert the annexation by Germany of Alsace-Lorraine, so the subservience of a pro-Ger. gov. in Moscow would not, in Ger. eyes, preclude the severance from Russia of a semi-circle of 'Independent' States from Armenia and Georgia in the S. by way of the Ukraine in the W., to Lithuania, Latvia, and Estonia in the N.

It may be doubted whether Stalin ever cherished any illusions on the true nature of his relations with the Reich. Ten years before the war some elements of the Ger. staff were favourably inclined towards concluding an alliance with Russia; and Hitler, in order to win over the Ger. militarists so as to ensure his political success, had to supply convincing reasons against such alliance. These reasons may be found in his *Mein Kampf*. Here he

avers that 'one concludes no treaty with a partner whose sole interest is the destruction of the other' (25th ed., 1933, p. 750). In a speech in Berlin on May 21, 1935, he said that both 'we National Socialists and the Bolsheviks are convinced that there is a gulf between us which can never be bridged. . . . So far as this Bolshevism draws Germany into its clutches we are the deadliest and most fanatical enemies'; and in Nov. of the following year he concluded with Japan the notorious anti-Comintern Pact (*q.v.*), which confirmed his previous declarations that Germany was the bulwark of the W. against Bolshevism—a most astute move and one calculated to make its appeal to considerable numbers of people in the wealthy democracies of the world. The year 1938 saw no abatement of Hitler's anti-Russian fulminations, and this was one of the factors which induced in Mr. Neville Chamberlain and M. Daladier and their advisers the belief, in spite of the then still existing Franco-Soviet Pact, that it would be useless to try to associate Russia with the Munich conversations. The Russians were thus left in doubt on the resolution of the W. democracies as well as irritated by their own exclusion from the Munich Pact, short-lived as was this historic gesture of appeasement. But after this, Hitler's diatribes against the Soviet progressively lessened and, in the sequel, it is obvious that, as he contemplated attacking in the W., it would be to his advantage to try to lull Russia into a sense of false security. Indeed, he did not even conceal from his intimates his opinion that it would be good policy to make a temporary pact with Stalin, which he could tear up whenever he chose. Hence the next chapter in Nazi-Bolshevist relations opened with the Russo-Ger. Pact of Aug. 23, 1939 (*see above*). Whatever his personal assurances to his political and military colleagues may have been, Hitler and they hailed the pact as a triumph of Ger. reason. Jibes at the failure of the Brit. and Fr. to forestall Germany were now mingled with emphasis on the great political and economic advantages which would accrue to both signatories. Hitler now eschewed the 'assumptions' of Germany's designs on the Ukraine, Transilvania and Rumania as 'an abortion of morbid imaginations' (*Reichstag*, Oct. 6, 1939) and some two months later he sent warm birthday greetings to Stalin. His last public utterance on Russo-Ger. relations was in Berlin (July 19, 1940) when he said that those relations had been finally settled and that neither Germany nor Russia had overstepped its sphere of interests.

Hitler's 'Volte face' with Stalin—Molotov's visit to Berlin.—But the defeat of the Luftwaffe over Britain; the aid increasingly sent by America to Britain under the Lend-Lease Act; the economic difficulties of the Reich; and the realisation that Stalin was taking no military risks led to a *volte face*. Lies had served their purpose, but now deception was no longer of any political or military value. After the conquest of the Balkans, Hitler

returned to his 1936 position to prove by deeds that 'any treaty links between Germany and Bolshevik Russia . . . have no value whatsoever.' Without the slightest scruple he now reverted to his anti-Communist ideology in the belief that, by attacking Russia, he would split opinion in America which, like the rest of the free world, was bitterly opposed to Communism. But the conquest of Russia was obviously not an end in itself but a means, an incident in the struggle with Britain and America for the domination of the world, and these stark realities loomed abruptly as rocks through the fog of ideology.

Stalin, for his part, had not been guiltless of deception. His immediate fears sprang from the fact that the wealth of the Ukraine had bulked largely in the early programme as set out in *Mein Kampf*. Between 1933 and 1937 he had made strenuous efforts to ensure that if Hitler struck eastward, France and Britain would enter the war. And in these efforts he dropped dogmatic orthodox Communism and took up, instead, the line of anti-Fascism and the Popular Front; so that, in the result, both Hitler and Stalin abandoned ideology for naked power politics or Imperial aggrandisement. Yet with the boldest cynicism Hitler at this time was able to exploit the anti-Communist tendencies of the W. democracies—with entire success so far as France ultimately was concerned (*see FRANCE—History; Causes of the French collapse*) and to forge his anti-Comintern weapon for the prevention of any real rapprochement between East and West. It was his weapon against 'encirclement'; and before ever he made war, he was already using his propagandist machine to avoid a war on two fronts and, as we have seen, at Munich he secured the isolation of the Soviet. In looking back on the winter 1940–41 it is, however, easy to discern a progressive deterioration in Germano-Russian relations. Molotov's visit to Berlin left all the major problems unresolved—the Balkans, where it proved impossible to establish spheres of influence; Finland, whither Germany was already sending troops; and the Straits, where Germany refused to countenance any Russian infiltration. Soviet diplomacy was trying to stiffen the resistance of Bulgaria to Ger. pressure by the offer of a military pact—an offer which would seem to have been made also to Yugoslavia. But, as yet, there was no spectacular rupture. For the campaigning season did not open until April 1941 and the strategic conditions of a successful campaign against Russia were not yet fulfilled. As yet Bulgaria and Yugoslavia might still look to Russia as the great traditional Slav protector, and the Brit. forces were already in Greece. This dangerous flank must first be cleared before the major campaign began and the ensuing drive through Greece and into Crete (*see GREECE, BATTLE OF*), believed by some allied strategists to be the first stage of an attack on Suez, was really first and foremost an act of consolidation and

defence—the first phase of the Russian campaign. With the fall of Crete, the Dardanelles and the Black Sea were closed and Turkey was neutralised and indeed soon jockeyed by Germany into a pact of non-aggression. The attack on Russia could now be launched without fear of direct allied intervention. Ger. reinforcements arrived in Finland; units were sent N. from Greece, and on June 22, the Gers. began their offensive along the whole Russian frontier. Once again Mr. Churchill, the Brit. Prime Minister, was proved a true prophet. For months he had publicly forecast this attack on Soviet Russia and had warned Stalin. In a most statesmanlike message to the world Mr. Churchill, while bating nothing of his hostility to communism, pledged Brit. aid to Russia—as indeed to all govts. prepared to destroy 'Hitlerism.'

German Invasion of Russia—Anglo-Russian Alliance.—The Gers. launched three major attacks: in Lithuania so as to menace Leningrad; in Poland from Brest-Litovsk against Grodno and Vilna, so as to menace Moscow; and in Bessarabia, by combined Germano-Rumanian forces, across the Pruth, aimed against the Ukraine. Soon afterwards, further attacks developed in White Russia, particularly around Minsk, in Finland and around Murmansk (for this great campaign, see EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR). Russia at once accepted the Brit. offer of assistance, and a Brit. mission went to Moscow. The Baltic states were soon largely overrun, and in E. Poland the Gers. advanced a considerable distance. But from the beginning they met with unexpectedly strong resistance from the Red Army, and gradually it seemed evident that the Russians would hold their own, especially as they were soon launching heavy counter-attacks and offering a united defence even to the point of literal obedience to Stalin's order to devastate the country in the wake of their withdrawal. On July 12 the Brit. and Soviet govts. signed a formal agreement undertaking to render each other all assistance in the war 'against Hitlerite Germany,' and to negotiate no armistice or treaty of peace except by mutual consent. The precedents of this and the previous war, when similar declarations were regularly exchanged between allies, made the agreement tantamount to an alliance, and it was so described by Mr. Churchill. It embodied the undertakings which had already been given by the Brit. Gov. to support Russia to the utmost in the conduct of the war; but it also went further; for it implied the necessity of agreement on the terms on which arms should be laid down and therefore of a common elaboration of peace aims. Since the experience of the previous twenty years had plainly demonstrated that a stable settlement of the affairs of Eastern and South-Eastern E. could not be achieved without Russian participation, this conclusion was warmly welcomed by public opinion in Great Britain.

Russo-Polish Agreement (July 1941)—

Allied guarantee to Turkey.—The over-running of E. Poland by the Gers. necessarily brought into sharp relief the political relations between the Poles and the Soviet Gov. The natural solution was for the Soviet to forgo her 'conquest' and pledge her word to the cause of Polish independence. Hence on July 30 the Soviet Gov. and Gen. Sikorski, Polish Prime Minister, concluded an agreement by which the Soviet-German Treaty of 1939 regarding territorial changes was declared void. The two govts. agreed to render each other mutual aid of all kinds in the war against Hitlerite Germany, and it was arranged to raise a Polish army of some 300,000 troops on Russian soil. Thus the common factors of hostility to Hitlerism and alliance with Great Britain apparently overrode the differences of a century and a half, and even if both govts. had to make some political sacrifice, both realised that the need of unity among the states defending civilisation rose superior to the individual need of any one of them. The delimitation of the new frontiers was, however, left over until the end of the war. Shortly after this agreement, the Brit. and Soviet Govts. made a joint declaration in Ankara guaranteeing help to Turkey if she were attacked by a European power and renewing pledges to respect the territorial integrity of Turkey and the Montreux Convention of 1936 regarding the Straits. This joint disclaimer of aggressive intentions or claims upon the Straits went far to dispel much of the suspicion which had clouded Russo-Turkish relations in the years recently passed. These relations had been increasingly friendly since the Soviet Gov. had supported Turkey in the struggle for political and economic independence which ended in the treaty of Lausanne, 1923 (q.v.). They deteriorated after the signing of the Russo-German Pact of 1939 because the Turkish Gov. suspected that by way of set-off to that pact the Brit. Gov. might make pacts with other nations at the expense of Turkey, or that they were prepared to conclude a secret agreement with the Soviet giving that gov. complete control of the Straits.

The Atlantic Charter.—Germany's diplomatic situation had deteriorated since the heyday of her military successes in Greece and Crete. Held up in her giant thrusts at Leningrad, Moscow and Kiev, Germany was more than ever anxious to create a diversion which should prevent Britain from fully concerting her strategy with Russia. The prospect of a long campaign in the east of E. meant time for the Allies to make joint military plans, as well as to apportion between them the munitions, planes and guns the U.S. Gov. was so willing to give. It also spelt increased pressure by Germany on Vichy France, Spain, and Japan. It meant extending the war while there was yet time to make a good case on paper for the ultimate triumph of the new dictatorial spirit and the 'New Order,' if only those who hoped to profit by it would come quickly to the aid of the chief protagonist. Germany therefore now endeavoured to divide her

opponents, so that they might be conquered in detail, by occupying the Brit. in the Middle East with or without the compliance of Turkey. She undertook so to manipulate or coerce the Vichy Gov. as to restore the situation of the Axis in the Mediterranean and afford it a new sphere of mischief in W. Africa. In this way Germany hoped to be in a position to promise Spain a greater measure of security in return for help at least in Africa, if not in E. Meanwhile, by virtue of the menace she hoped to offer to Iran and Iraq, and later to India, Germany counted on reassuring the doubts of Japan, which country had now, in spite of warnings from the U.S. and Great Britain, landed a force in Fr. Indo-China (q.v.). Above all, Hitler needed Japan to engage not only Britain in the Far E., but also the Americans, lest the latter should successfully carry out her projects for arming Britain and Russia with an ever accumulating weight of material. Towards the middle of Aug. 1941 it was generally believed that Germany intended to put forward 'peace' proposals, designed to perpetuate Hitler's 'New Order' and, above all, to accentuate the split in America between the pro-Ally public and the isolationists. But this move was forestalled by an historic meeting at sea on Mr. Roosevelt's invitation between the President and Mr. Churchill, the outcome of which was a joint statement of principles on the national policies of their respective countries on which they based their hopes for a better future for the world—a remarkable manifesto and entirely without precedent or parallel, for it was in effect a pact between a belligerent and a non-belligerent. (See ATLANTIC CHARTER.) The two statesmen were accompanied by officers of their military, naval, and air services, and the whole problem of munitions supply as provided by the Lease-Lend Act for the armed forces of the U.S.A. and for those countries actively engaged in resisting aggression was examined anew. Lord Beaverbrook, Brit. minister of supply, also took part in the conferences and later went to Washington to discuss also the supply problems of Russia.

Surrender of Greek Army—Battle of Crete—Moscow threatened—Britain declares war on German satellites—America enters the war.—The year 1941 will stand out in the hist. of E. as the time of building up a greater alliance for the defence of civilisation. The Brit. blockade of Ger. E., reinforced by the arming of Amer. merchant ships, the amendment of the Neutrality Act (q.v.), and the landing of Amer. naval forces in Iceland, was now the key to the whole strategic situation; for the Ger. blockade of Britain, if dangerous, was never more than a diversion. The weakest link in the Brit. chain of encirclement was the Mediterranean where the struggle for control greatly fluctuated. When Gen. Wavell shattered Graziani's army in Libya (Jan.—Feb. 1941) the balance swung in Britain's favour just as it had in the previous year after the devastating attack on the It. fleet in

Taranto. But the advantage was now lost when troops from Wavell's army had to be withdrawn to meet the Ger. invasion of Greece. The main force of the It. navy now ventured out to sea (March) in the hope of cutting Brit. communications between Alexandria and Crete or Salonika; but it was detected and routed by Adm. Sir Andrew Cunningham at the battle of Cape Matapan (q.v.). The surrender of Prince Paul of Yugoslavia, however, led to the defeat of the Yugoslav people who had risen gallantly in repudiation of Prince Paul's policy, and the Ger. army penetrated the Monastir gap and seized Salonika (April 9). Brit. and Imperial forces came into action at the side of the Gks. but the odds were too great and the Gk. forces in Epirus and Macedonia surrendered (April 23). The last of the Imperial forces, evacuated on May 2, prepared to resist in Crete, but within a few days of the first Ger. onslaught the Brit. troops were driven out of the is. Thus by midsummer the area under Ger. control had been expanded S.E. to include the whole of the Balkans with the Aegean Sea. These advances had been watched with foreboding by the Soviet Union and the renewal of the Russo-German Pact of 1939 did nothing to allay Stalin's suspicions. Stalin realised that Hitler had come to the conclusion that he could never proceed with the long-projected invasion of Britain without first getting control of Russia's great resources nor while the vast military forces of the Soviet remained undefeated on Germany's E. flank. These forces had been augmented all along the frontier as suspicions of Hitler's intentions hardened into certainty, and very soon the alleged menace of these defensive preparations were made the pretext for launching the Ger. invasion. This was so successful that by autumn the advancing Ger. armies had enveloped Leningrad and threatened to surround Moscow, while the rich industrial and agric. region of the Ukraine passed almost entirely into their hands.

The outbreak of war on the E. front changed the whole aspect of European and world affairs. On the Axis side troops from the subject countries of Hungary, Rumania, and even Italy were soon thrown into the struggle. Finland, resenting its defeat in 1939-40, was soon induced to co-operate in the invasion of Russia. Later, in response to Russian requests, Britain declared war on these Ger. satellite countries. But for geographical reasons the help which Britain might render Russia could only be in the form of munitions of war and even then delivery involved hazardous convoy operations in the Arctic. The joint determination, by means of munitions deliveries, to buttress Russian resistance drew Great Britain and the U.S.A. closer together. The next step was to formulate concrete plans for assistance to Russia. An Amer. representative, Mr. Harry Hopkins, was sent to E., and he and Lord Beaverbrook went to Moscow where Marshal Stalin presented a formidable list of his requirements in machinery, weapons

and munitions. All these demands the Brit. and Amer. representatives, despite the strain on their countries' resources, guaranteed to supply. The entry of Russia into the war brought new hope to the defeated nations. The spirit of revolt in France expressed itself in sporadic acts of violence, followed by ferocious reprisals by the occupying Gers. Meanwhile the tide had turned in Russia. The Russian winter fell with devastating effect on the ill-protected rank and file of the invading armies. The misery of the Ger. soldiers in the intense cold could not be concealed from the Ger. people, and the situation became so aggravated that Hitler tried to restore confidence by assuming personal command of the Ger. armies. Greater help than the much-doubted 'intuitive' guidance of the Führer was, however, forthcoming for the Axis from the Far E. when the treacherous Jap. attack on Pearl Harbour brought America into the war overnight. Though the year ended with heavy territorial losses for the Allies in the Far E. theatre of war, in Europe and N. Africa, on the other hand, the legend of Nazi invincibility had been shattered for ever. The new alliance, disposing ultimately of resources far transcending those of the Axis, had been firmly estab., though a long period of effort, more intense than any yet undertaken, had to be faced before the decisive strength of the grand alliance could be made effective.

German Spring Campaign of 1942—Russian Counter-thrust against Kharkov—Defence of Stalingrad.—The Russian counter-offensive, which had relieved the gloom of Dec. 1941, was brought to an end by the Jan. frosts, and left the Gers. to resume preparations for the spring campaign. Heavy disasters befell the Allies in the Far E. and further threats there were fast developing. These would be multiplied when spring came to E. With a huge army poised in Britain, and now augmented by thousands of Amer. troops, there was growing popular clamour for some more obvious expression of Brit. power in the main theatre of war. This took the form of a demand for the invasion of N. Europe, an agitation founded on a chivalrous eagerness to share the heavy burden borne by Russia. Yet the real key to the situation was the control of Africa and the Mediterranean, in which sea the garrison of Malta alone kept the Brit. flag flying in what had become almost an Axis-controlled *mare clausum*.

By the time the snows had melted on the Russian front the Ger. armies were massed for a great onslaught. By a bold counterstroke, however, the Russians forestalled the attack and themselves delivered a powerful thrust against Kharkov (May 1942). This counter-attack did not win Kharkov, but by disorganising the Ger. plan hampered their summer campaign, and therefore had a far-reaching influence on the ultimate issue of the war. Meanwhile M. Molotov (q.v.), Russian foreign commissar, visited London for conferences on allied strategy, and an

alliance was then concluded between Great Britain and Russia to last for twenty years and to associate the two nations in the post-war settlement of E. When the expected Ger. offensive came, it proved not to be, as in 1941, a general advance on the whole front, but to be concentrated on the S. sectors, beginning with the Crimea. Fierce protracted battles were fought but the great fortress of Sevastopol held out with heroic tenacity, and only capitulated on July 1, having gained time of incalculable value. Nonetheless the Ger. offensive was surging ahead with alarming momentum towards the Don, on the upper reaches of which riv. the Gers. were contained by a determined Russian defence, pivoting upon a solid bridgehead at Voronezh; but below that tn. it proved impossible to stem the ferocity of the attack. The Gers. having reached the lower riv. at a point above Rostov, that city surrendered on Aug. 28. The Russians therefore decided to withdraw from the whole huge area comprised within the loop of the Don, and continue the defence from outside it. This retreat involved the abandonment of one of the richest industrial regions of Russia, but it enabled a more tenable line of defence to be formed. The Gers. having captured Rostov, hastened to exploit their success in two directions: one great army wheeled right to invade the Caucasian passes through which they hoped to march before winter and so reach the Caspian Sea and the oilfields of Baku; another army advanced straight forward to cut the chief remaining life-line of the Soviet, the Volga. But at this critical juncture the Russian resistance buttressed itself upon the steel city of Stalingrad, at the point of the Volga nearest to the Don; and by the heroic endurance of the garrison and people of that fortress, continued over several weeks, gradually fought the invaders to a standstill.

This remarkable defence entailed the defeat of the Gers. main strategical intentions for the year and the autumn of 1942 may be regarded as the dividing line in the calendar of the war. Both sides knew that the initiative of the Axis in grand strategy was spent at last and that with their increasing resources the United Nations would soon be in a position to attack. The Ger. leaders indeed tacitly acknowledged this governing fact in their public utterances, and their purpose now was to convert E. into an impregnable Ger. fortress, capable of resisting an indefinite siege until war-weariness or internal dissension should cause the allies to give up their efforts to reduce it. To this end the Gers. ruthlessly exploited the occupied lands, as sources of supply of man-power, food, and munitions. Rumanians, Hungarians and others were sent in thousands to the Russian front; and by a campaign of cold-blooded murder and cruelty unmatched in recorded annals, an attempt was made to wipe out the whole Jewish race. It was at this time (Oct. 23) that Gen. Alexander (q.v.) launched the Eighth Army (q.v.) to the attack on the Axis positions at El Alamein. The entire

success of these operations was of good augury for the Allies, for in the result the Ger. and It. armies were driven out of N. Africa or captured and the way opened for the invasion of Italy in the following year. This was achieved partly through the victory of El Alamein and partly by the surprise landing of an army of Brit. and Amer. troops at key points of Algiers and Morocco. With but a token resistance the Fr. garrisons surrendered and the two colonies threw in their lot with the

situation reflected the closer inter-allied planning though, at the opening of 1943, it could not be said that completely unified counsels had prevailed. Russia was pursuing her triumphant campaign according to a plan separately evolved, whereas the Anglo-Amer. war effort had been co-ordinated from the start. Hence in Jan. 1943 President Roosevelt and Mr. Churchill, with their military advisers, met at Casablanca to plan the conduct of the war by a more closely integrated

Allies or United Nations as they were now styled. The response of the Axis to these events was to man the battlements of the threatened fortress of E. The Ger. army marched into the unoccupied zone of France, the Fr. navy scuttling their ships rather than surrender them to the enemy; and the Its. were permitted to occupy parts of S.E. France. The spirit of victory seemed to influence the Russian front too; for on November 20 a severe check was administered to the Wehrmacht in the Caucasus; while two days later an impressive counter-offensive began in front of the bloody but unbowed city of Stalingrad, and so powerful were the Russian blows that ere long a Ger. army of 300,000 men was completely encircled. *Casablanca Conference—German Sixth Army annihilated by the Red Army—Kharkov retaken by the Russians.*—The increasing allied control of the general

effort. Stalin was invited but was unable to leave Russia. Russian needs were discussed at the conference, whose primary object was to 'draw as much of the weight as possible off the Russian armies.' For the time being precedence was given to the destruction of the Axis system in Africa and Europe. The Russian armies could be relied upon to engage the main strength of the enemy throughout the year, while the Anglo-American armies battered the outer defences of the so-called 'fortress of Europe.' At the same time every effort was to be made to overcome the submarine menace and, by air power, to destroy Ger. war industry. Meanwhile the Anglo-Amer. expeditionary forces were to clear the S. shore of the Mediterranean and effect landings on the N. The immediate objective for 1943 was to eliminate Italy from the war. This programme was duly executed, and indeed

allied successes came more quickly than was foreseen at Casablanca, the chief factor being the remarkable Russian victories. On the first day of the year the Russians captured Veliki Luki, broke the Ger. lines of investment before Leningrad, and brought about the surrender of the remnants of the Ger. Sixth Army, which cut off before Stalingrad, sustained a defeat on a scale unprecedented in modern hist. The Ger. army in the Caucasus, no less baffled in its strategy, had succeeded in keeping its line of retreat open. But throughout Jan. it was falling back towards the lower Don. The recapture of Rostov on Feb. 14 marked the liberation of the main Caucasian area, and throughout Jan.-Feb. many cities in the Donetz Basin and the Ukraine were successively delivered. Khar'kov was retaken (Feb. 16) but here the Russians had outrun their communications and the Gers. struck back and recaptured the city (March 15).

Allied Invasion of Sicily—French Fleet joins the Allies—Collapse of Italian resistance—German retreat from Donetz Basin.—By May 13 the Axis had lost its last foothold in N. Africa with the surrender of their forces in Tunisia and the Allies at once prepared to cross the Mediterranean and complete the overthrow of Italy. The summer campaign of 1943 was marked by two significant political preludes: on May 22 the Soviet announced the dissolution of the Comintern, the revolutionary organ which had for many years proved an obstacle to harmonious relations between Russia and the W.; and on July 3 the rival leaders of pro-Ally France, Gens. de Gaulle and Giraud, reached agreement, and a Committee of National Liberation was formed to direct the Fr. share in the campaigns of reconquest. On May 31 the Fr. Fleet at Alexandria, which had been neutralised since 1940, joined the Allied navies.

The fact that in the Far E. the Jap. were everywhere held meant that the largest possible forces could be committed in E. for the reduction of Axis forces and resources. In the Mediterranean the Allies, after feints which achieved no small measure of strategic surprise, launched their invasion on the S. corner of Sicily by an amphibious operation on an unprecedented scale. While the Amers. cleared the W. part of the Is., encountering no serious resistance, the Brit. Eighth Army advanced irresistibly on Syracuse and Catania against a dour defence which was mainly in the hands of a strong Ger. garrison—for the spirit of the Is., after their experiences in N. and N.E. Africa, was broken. Meanwhile the evident collapse of It. resistance had caused revolt on the It. mainland and dismay in the Palazzo Venezia. In this conjuncture Mussolini importuned Hitler at Verona (July 24) for succour, but by this time the Ger. army in Russia was too hard-pressed for such aid to be practicable. The following day the Fascist Grand Council met and deposed Mussolini, and an emergency gov. under Badoglio dissolved the Fascist Party and sent over-

tures of peace to the Brit. Gov. While the It. emissaries, who had been referred to the joint authorities of the United Nations, were passing backwards and forwards between Rome and Lisbon, the invasion of the It. mainland had begun, and on the day (Sept. 3) that the Brit. Eighth Army entered Calabria, Badoglio's envoys had secretly given in their 'unconditional surrender'—as required by the Casablanca declaration. This heavy blow to the Gers., who thenceforth had to garrison with their own resources, not only the It. mainland but the great Balkan regions hitherto garrisoned by It. troops, came in the midst of a disastrous campaign on the E. Front. In previous years the summer fighting had always favoured the Ger. arms; this time the tables were turned when the Gers., striking against the great Russian salient at Kursk, were held and then hurled back with great losses by a powerful Russian counter-offensive. Throughout Aug. and Sept. numerous Russian cities were delivered, including Orel, Kharkov, Bryansk, Smolensk, Taman, and Taganrog. The early autumn found the Gers. in headlong retreat out of the Donetz basin and with difficulty taking up prepared positions on the lower Dnieper. By the end of the year, however, the Ger. grip on the riv. itself was almost everywhere broken, though they still clung to a large area in the S. bend of the riv. On Nov. 6 the Russians retook the historic city of Kiev and speedily developed a vast salient, in the process cutting the most important lines of lateral communication left to the Gers. on Russian soil. When the frosts descended on the N. half of the front the Russians opened their winter campaign with a deep penetration near Nevel. By Christmas the Ger. counter-offensive, for which they had concentrated the greater part of their armoured strength, was exhausted, and the Russian forces under Gen. Vatutin (*q.v.*) struck back from the S. of the salient in a powerful counter-thrust.

The surrender of Italy was made public on Sept. 8 simultaneously with fresh Allied landings near Salerno. This operation met with somewhat chequered fortune, but by Oct. 1 Naples had fallen, though the road to Rome remained barred till the summer of the following year. In Corsica and Sardinia native co-operation was instrumental in driving out the Gers. but an allied expedition to take the Dodecanese Is., frustrated in expectation of help from the It. garrison, was overwhelmed by a swift Ger. counterstroke. In the Balkans, however, the It. surrender gave greater scope to the partisan forces of the enslaved countries, though in both Yugoslavia and Greece their exploits were to some extent discounted by dissensions amongst themselves or with their exiled govts.

United Nations Relief and Rehabilitation Administration—Moscow Conference of Foreign Ministers.—With so many signs of ultimate victory and its concomitant anxieties and responsibilities, there was a growing concentration of

thought upon the problems of future reconstruction. For shorter term problems of liberated E. there was set up the United Nations Relief and Rehabilitation Administration (U.N.R.R.A.); and a corps of administrators (Civil Affairs) was formed, under military responsibility, to provide for the military gov. of enemy ter. and initial civil gov. of liberated ter. A conference of the foreign secretaries of America, Britain, Russia, and France met in Moscow (Oct. 19) and dealt with questions concerning the treatment of Hitlerite Germany and her satellites, economic co-operation and assurance of general peace. It was also decided to set up in London a European advisory council for 'the examination of European questions as the war developed.' As to permanent machinery to replace the League of Nations Covenant, the four Powers recognised 'the necessity of establishing at the earliest practicable date a general international organisation, based on the principle of the sovereign equality of all peace-loving States, large or small, for the maintenance of international peace and security' (see further under UNITED NATIONS, CHARTER OF THE). Two other declarations dealt directly with Germany: one announced plans for the trial of Ger. war criminals, while the other favoured the re-establishment of an independent Austria (see CRIMES, WAR; NUREMBERG TRIAL). Other conferences followed including a meeting at Teheran between Roosevelt, Churchill, and Stalin who issued a manifesto declaring that the Ger. forces would be destroyed by operations of agreed scope and timing from E., W., and S., and accepting responsibility for a peace that would 'banish the scourge and terror of war for many generations.' On his return to Moscow Stalin was visited by President Benes, who signed a treaty of alliance between Russia and Czechoslovakia similar in general terms to the Anglo-Russian treaty.

Red Army clears the Crimea—Rome taken by the Allies.—The year 1944 found the Allies at last deployed in their full military might. The usurper power, which at the beginning of the year still held most of E., was reduced to the defence of its own frontiers. The assumption in Jan. by Gen. Eisenhower (q.v.) of the supreme command of the allied forces concentrated for the invasion of western E. heralded the outstanding military enterprise of the year. But meanwhile the main offensive power remained with the Red Army, while to the Eighth and Fifth Allied Armies in Italy was assigned the duty of checking the powerful Ger. force of Kesselring (q.v.) S. of Rome. The Red Army, having in the last days of 1943 stopped the Ger. thrust against the Kiev salient, now burst out from its S. flank towards the Bug and at the same time conducted a still larger campaign in the N., where Leningrad was completely liberated and Finland isolated. In March the Russian armies in the Ukraine swept over the riv. barriers in the S. half of the front and crossed into Rumania, threatening the Danube basin. On the

left flank of this advance Odessa was liberated (April 10), the Crimea was cleared in May, and Sevastopol recovered. In the N. a new offensive against Finland pierced the Mannerheim line (June), by which time the focus of strategic interest had shifted to France. Meanwhile the deadlock in Italy was resolved by sea-power which covered a new landing at the Anzio-Nettuno beaches. Like the Salerno landing this new venture made but slow and precarious progress; but by dour resistance against repeated attacks the invading troops held firm on the beaches while the forces on the main front broke through the Gustav Line and effected a junction with them. Thus the Ger. flank was turned and the road opened to Rome, which fell on June 4.

Allied Invasion of Normandy—Political reactions in Germany.—After being at least once deferred owing to adverse weather, the immense and hazardous amphibious operation of landing on the coast of Normandy was begun on the morning of June 6, the culmination of months of intensive but hidden activity in Britain and America and on the Atlantic seaways, directed to the marshalling and equipment of the greatest army of invasion ever launched overseas against a hostile shore. The hub of the great battle of Normandy was a tactically defensive position covering Caen, which was taken on July 9, and thereafter for sev. weeks the most dangerous hostile striking force was pinned down to an almost static battle. But after Cherbourg fell (June 26) and the Amer. armies turned S. again to break through the Ger. lines at St. Lô and sweep out into Brittany, there followed a rapid and dramatic transformation of the whole aspect of the campaign. Brittany was rapidly overrun and its Ger. garrison took refuge behind the fortifications of Brest, Lorient, St. Nazaire, and St. Malo. While the Brit. and Canadians held the enemy before Caen, the Amers. turned eastward again and advanced through Anjou and Maine and so threatened to take the enemy's great panzer army in the flank. The Ger. commander, Rommel (q.v.) now tried to evade the trap by a bold counter-offensive aimed at the hinge of the Amer. wheel at Avranches. His failure led to the headlong retreat of the entire Ger. army, and a substantial part of it was destroyed at the Falaise gap (see WESTERN FRONT IN SECOND WORLD WAR), the remainder retreating to the Seine and across the riv. after destroying most of the bridges. In the vain effort to sustain the defence of Normandy S. France was denuded of first-line Ger. troops and a landing, based on Italy, was easily effected by a new Allied army which quickly captured Toulon and Marseilles and advanced up the Rhone valley. Its progress was effectively assisted by men of the Fr. *maquis* (or partisans) and many great cities, including Bordeaux, were liberated by their own countrymen; while a well-prepared insurrection had almost completed the expulsion of the enemy from Paris when the Fr. and Amers.

entered the city on Aug. 25. A provisional gov. was at once set up under Gen. de Gaulle. On the left of the line the continued pursuit of the retreating Gers. soon brought the Brit. and Canadians into Brussels, and most of Belgium and part of Holland were freed by the early autumn.

The political reactions of these heavy defeats in Germany were profound. An important section of the military caste apparently attempted to overthrow the leaders whose policy and strategy had led to these disasters, while an abortive attempt on Hitler's life on July 20 was followed by a ruthless purge in the course of which many officers of the highest rank were hanged. The morale of the Ger. people at this critical time seems to have been sustained mainly by the vain hope of destroying their foe in England by the aid of 'secret weapons' such as flying bombs (q.v.) and rockets (q.v.) which caused considerable destruction of civil life and property in S.E. England and Belgium, but had only the most negligible effect on the war effort.

Red Army's Summer Offensive of 1944—Russians Conquer Rumania—German retreat up the Danube—Red Army invests Budapest.—At the end of June the Red Army opened their summer offensive. In the centre of the front they quickly overran all E. Poland and approached the Vistula, at which moment the underground forces in Warsaw, vainly anticipating the relief of the city by the Russians, rose prematurely against the Gers. The Gers., however, by a formidable concentration of armoured reserves, threw back the relieving forces and then turned on the Polish patriots in Warsaw, subjecting them to merciless reprisals. The incident embittered the already strained relations between Russia and Poland, arising out of the Russian claim to retain the provs. seized from Poland in 1939. Further N. the Russian armies forced their way through Lithuania to the mouth of the Niemen, and Riga fell to them on Oct. 13. Their attempt at this time to cross the frontier of East Prussia, however, met with such determined resistance that it was not resumed until the next year. Meanwhile a series of minor operations had begun the process of eliminating the satellites of Germany in eastern E. Finland gave up the unequal struggle and signed an armistice at the end of Sept. whereby she agreed to co-operate with the Allies in driving the Gers. out of her ter.

On the S. half of the E. front the Russian advance was now resumed, both over the Carpathian passes and up the Danube valley. Constantza, Ploesti and Bucharest fell on successive days at the end of Aug. and Rumania then sued for peace and re-entered the war on the side of the Allies. Bulgaria, thus isolated, also submitted to the Allies' terms. These defections not only forced the Gers. to a hasty retreat up the Danube, but imperilled their armies of occupation in Yugoslavia and Greece, which now began a hazardous withdrawal, continually harassed by Marshal Tito's partisans who

had now grown into a formidable army. Mainly by the efforts of the Gk. guerrilla bands, Greece was completely liberated by the autumn. The position in the Balkan peninsula being now adjusted, the Red Army pushed on into central E., converging upon Hungary by way of the Danube and over the Transylvanian Mts. The Ger. nominee Hungarian Gov. fled from Budapest, which was completely invested on Christmas Day, while the civil pop. of Austria was forced by their Ger. masters to the labour of preparing fortifications on the approaches to Vienna. The Red Army's thrust towards the S. provs. of Germany thus tended to become concerted with the campaign of the Allied armies in Italy, which during the autumn had conquered Tuscany and, turning the Apennine barrier, debouched on the basin of the Po. The Russian pressure towards Austria was becoming a threat, if still a remote one, to the communications maintaining the Ger. resistance on this front.

The campaign on the W. Front now seemed stationary relatively to the mobile conditions of the summer, but the methodical massing of force opposite the Siegfried Line (q.v.) still involved hard fighting. The main battles were brought about by operations to extend the Allied grip on the classic gateways to Germany—the gaps of Belfort, the Saar, and Aachen. The last-named city, the first major city of Germany to fall to the Allies (Oct. 21), thus became the seat of the first experiment in the civil administration of hostile ter.

Post-war problems of liberated countries of Europe—Internecine strife in Greece.—From the time of the landing in France an over sanguine sense of the imminence of complete victory in E., pervaded the public mind, which naturally became ever more interested in post-war problems, and in some of the countries suddenly liberated from Ger. tyranny the difficulties of transition were only too evident. In Belgium Brit. arms had to be invoked for a short time to prevent violence between rival parties. In Greece actual civil war broke out and raged till the end of the year. The Brit. troops in Athens, endeavouring to disarm the contestants, became involved in the controversy and even the personal intervention of Mr. Churchill, who flew to Athens on Christmas Day, did not bring the internecine strife to an end, though one good result was that the archbishop of Athens assumed the regency.

Failure of von Rundstedt's Counter-offensive in the Ardennes—Red Army on the Oder—Yalta Conference—Allied Advance across the Rhine—Conquest of East Prussia—Fall of Berlin.—In Dec. von Rundstedt (q.v.), the Ger. commander-in-chief, made bold attempts to restore Ger. fortunes by a powerful thrust through the Ardennes (see WESTERN FRONT IN SECOND WORLD WAR); but at the turn of the year the Allies launched a counter-attack which threw the Gers. back on the defensive. The failure of this ambitious offensive proved strategically disastrous to the Ger. commander, for his enterprise had necessi-

tated fighting the decisive battle of the campaign W. of the Rhine and made it certain that he would not have the strength for a protracted defence after the riv. was crossed. In the E., by the middle of Jan. 1945, the main Russian line was sweeping irresistibly over the frozen plain of Poland and up to the Oder opposite Berlin by the beginning of Feb. Here there was a pause; but meanwhile other Russian forces occupied Budapest (Feb. 13) and pressed on into Austria. A thrust towards the mouth of the Oder cut off E. Prussia, which was now gradually reduced in bitter fighting. The resumption of the advance from the middle Oder brought the Russian armies into the

suburbs of Berlin in mid-April, and S. of the capital mobile detachments broke through the enfeebled resistance to the banks of the Elbe. While this last great surge of the Red Army was in its initial stages, Mr. Churchill, Mr. Roosevelt and M. Stalin held a conference at Yalta (q.v.) in the Crimea to co-ordinate allied policy and administration after the subjugation of Germany which all might see to be imminent. The Conference had not ended when on Feb. 8 the Battle for the Rhine opened with a strong Brit. offensive in Holland, which towards the end of the month developed into a general attack all along the line. As soon as the exploitation of the bridgeheads won on the Rhine began it was obvious that Germany's

doom was at hand. Field-Marshal Montgomery (q.v.) swung northward to complete the liberation of Holland and to drive the confused mass of the Ger. right towards Schleswig-Holstein. At the same time the Amer. armies in a masterly operation encircled the Ruhr area and then penetrated far into Central Germany beyond that great industrial region. The Amer. Third Army drove on irresistibly under its meteoric commander, Gen. Patton (q.v.), into Bavaria and to the Austrian frontier, while the Fr. army advanced to the Swiss border from the N. In E. Prussia the Russian avalanche engulfed in its train numerous cities and strongholds. With the surrender of Königsberg (April 9) the whole of E. Prussia (q.v.) was overrun. Vienna was taken on April 13 and, on May 2, after a devastating bombardment, which completed the destruction previously wrought by Allied bombers, the surviving Nazi leaders in the city surrendered the blazing ruins of the Reich. The final disruption of the Nazi and Fascist hierarchies of E. was precipitated in Italy by Field-Marshal Alexander's forces, which, in three weeks, broke Kesselring's formidable position on the Bologna line.

Final Offensive in Italy—Germany's Unconditional Surrender.—The final offensive in Italy was launched on April 9 and within a few days the Allies crossed the Po at a number of points and a Ger. collapse followed. On April 29 all the Ger. forces here and in Austria surrendered. The previous day the fugitive ex-dictator, Mussolini, was caught and lynched by It. partisans near Milan. Hitler probably perished in the ruins of his chancellery, though the precise circumstances of his end cannot be established with absolute certainty. Himmler (q.v.) came forward as nominal dictator in N.W. Germany and proposed, through neutrals, to negotiate surrender to the W. allies, while continuing the fight against the Red Army. This transparent manoeuvre, in harmony with Goebbels's (q.v.) frenzied propaganda to separate the Western Allies from Communist Russia, was ignored. Dönitz (q.v.), the naval commander-in-chief, now arrogated to himself *pro tem.* the supreme power and was allowed by the Allies to sign in that capacity the act of unconditional surrender to the United Nations generally (April 29), the final submission being made at Rheims on May 7. Dönitz's signature in fact meant but little, for the Gers. were giving themselves up by whole armies in the hope of escaping the Russians; and while the guilty chiefs of the Nazi clique elected variously to take their own lives or to await their trial as war criminals, the allied armies moved into the Reich from all sides to assume the responsibility for its administration.

Atrocities of hitherto incredible horror had been revealed as the Allied forces overran the concentration camps (q.v. and see AUSCHWITZ, BELSEN, BUCHENWALD, etc.) of Germany and a beginning was made with the trial and punishment of those immediately responsible. A

more solemn act of high justice was inaugurated at Nuremberg, previously the headquarters of National Socialism (*q.v.*), where the apprehended chiefs of the party were arraigned before an international tribunal on an indictment charging them with war crimes (*q.v.* and see also NUREMBERG TRIAL).

Reconstruction Measures—Problem of Displaced Persons—Political reconstruction.—The material and spiritual ravage in E. was only too conspicuous, and a joint responsibility for the reconstruction of the continent rested primarily on Great Britain, Russia, and America; but the prospect of the continuous application of a concerted policy was prejudiced by the fact that the reconstruction proceeded in two zones dominated respectively by Anglo-American and Russian influence. Germany and Austria were partitioned for administration between the two groups of Powers, the frontier being defined by the Elbe and a continuation southward, and the Western half being subdivided between Brit., Amer., and Fr. zones. Central Control Commissions in Berlin and Vienna were appointed to co-ordinate these sev. administrations. A problem of grave dimensions confronted all by the swollen flux and reflux of millions of displaced persons—slaves of the Nazi war-machine seeking the homes in occupied countries whence they had been deported, or native Gers. for whom there was no shelter in the bomb-shattered tns. Against the background of nation-wide destitution the Allies proceeded with an attempt to reconstitute indigenous political life from the lowest local level upward, among a people whose ideas of self-government had clearly been eradicated by a decade or more of National-Socialist 'education.' The aim of some of the Powers of ultimately restoring a unified Ger. gov. or a single economic unit, was naturally opposed in the interest of her own security by France. Meanwhile the Allies proceeded to dismantle so much of the Ruhr as had not been destroyed by bombs and gun-fire, and other centres of the heavy armament industry, and convert its equipment, by way of reparations, to their own peaceful uses. On the E. side of Germany, Russian influence remained strong in the ters. that had been occupied by Russian troops in the course of the war. A part of former E. Poland was annexed by the Soviet Union, compensation being given by extending the Polish frontier at the expense of Germany, to the Oder. For this new Poland the Russians had nominated a gov. which they set up in Warsaw when they captured the city (Jan.) and this gov., slightly reconstructed, was recognised by Great Britain and America in place of the exiled gov. which had maintained its continuous existence in London. Bulgaria and Rumania were settled under coalition govs. friendly to Moscow; in Yugoslavia the victorious Tito (*q.v.*) was acclaimed by an overwhelming majority of electors, the exiled young king being deposed and a republic inaugurated. In Hungary a

general election gave the smallholders a large majority over the Communists, which seemed to show that no undue influence had been exercised by the Russian occupying authorities, whatever may have been the measure of Soviet influence in the restored republic of Czechoslovakia. Spared the worst ravages of war and restored under her former President, Dr. Benes (*q.v.*), Czechoslovakia settled down under a gov. of advanced views to a programme of reconstruction which included the nationalisation of about one thousand large industrial concerns. In Austria, as in Germany, the country was divided into four zones of occupation. Dr. Renner, a social democrat, was elected President of the republic, after having headed a gov. sponsored by the Russians. Elections in Nov. saw the virtual eclipse of the Communists, the Catholic Agrarians making large gains. In Western E. the transition from war and foreign occupation to peace and freedom was less difficult than elsewhere. Political equilibrium was secured in France under the firm but temperate leadership of Gen. de Gaulle, though economic recovery was hampered by a gravely damaged transport system and lack of supplies. In Belgium a relatively high degree of political and economic stability was attained notwithstanding many difficulties. An issue which threatened to split the country was the return of King Leopold. On his liberation by the Allies he wished to resume his functions, but the gov. declined to assume the responsibility for his return in view of the hostility towards him on account of his conduct during the war, and ultimately the regency was continued while he remained abroad. By contrast the queen of the Netherlands and the king of Norway, both of whom had resolutely sustained the long struggle, were welcomed back by their subjects with popular acclaim. Denmark, where also the monarchy emerged with new credit, returned fruitfully to the works of peace. In Russia the losses in life and treasure during the war were on a scale so vast as to subject the national resources, both material and moral, to the heaviest strain. On the fields of battle lay no fewer than seven million Russian dead. A new and characteristic five-year plan was promptly announced. The loss of six million destroyed houses had to be made good and twenty-five million displaced persons had to be settled and cared for. Russia was to be the chief beneficiary of the reparations to be demanded of Germany. Under the Potsdam agreement of Aug. 1945 Russia and Poland were to draw their reparations in kind from the Russian zone of occupation in Germany and, in addition, Russia was entitled to receive twenty-five per cent of the reparations to be contributed by the three W. zones, the allocation of the remaining seventy-five per cent being the subject of an agreement reached by an inter-allied conference in Paris. Under the Potsdam Agreement the Allies were bound to restore local self-government in Germany and to introduce

elective representative principles into the administration. The Agreement in fact provided that the administration of affairs of Germany should be directed to the decentralization of the political structure and the development of local responsibility. It was not intended to prevent progress towards a central gov. with powers necessary to deal with matters which might properly be dealt with on a nation-wide basis; but it was intended to prevent the estab. for the time being of a strong central gov. dominating the Ger. people instead of being responsible to their democratic will. These explicit agreements, signed by M. Stalin among others, were not honoured when the time came to implement them, and, in particular, the execution of the agreement that Germany should be treated as an economic unit was met on the Russian side by a blank refusal (see further under POTSDAM AGREEMENT).

Conflicting ideologies in resettlement of Europe and discussion of Peace treaties.—The W. Powers being in control of half E. and Russia of the other half, the resettlement of the whole was organised on unrelated lines. Across the line of demarcation there was little economic intercourse and from the E. side little communication of intelligence. All Governments beyond the so-called 'iron-curtain' were either members of the Soviet Union or subject to its influence. In Greece a Brit. military force ensured a régime that was liberal in form if authoritarian in practice. Following substantially free and fair elections by a Brit. and Amer. election mission, a Royalist ministry was formed on April 18, 1946, and on Sept. 1 a plebiscite resulted in a decisive vote in favour of the return of King George, who arrived in Athens soon afterwards. But the country was yet far from settled either internally or on the Albanian or Yugoslav frontiers. In all the Balkan countries, excepting Albania and Yugoslavia, stabilisation of political régimes was marked by the holding of elections. The year passed in Poland without the gov. holding the free elections to which it had pledged itself, and relations with the Brit. and United States Govs. therefore continued to be uneasy and controversial. Meanwhile the allied countries in the west of E. restored and reconstructed their political systems upon lines of parliamentary self-government. Of all the allied countries France had most difficulty in finding a political *modus vivendi* for the post-war period. The Third Republic, having been fatally discredited by the circumstances of its fall, the country was occupied throughout 1946 in the search for a new constitution. The draft produced by the first constituent assembly was rejected on a referendum in May. A second constituent assembly was elected and its revised proposals for new republican organs of gov. were accepted at a referendum in October. The provisional legislature elected at the beginning of 1946 and also that which was set up under the final constitution showed an even division of strength between three parties, Socialist,

Communist, and the Mouvement Republicain Populaire or Liberal-Catholic group, and successive administrations, before the formation of the stop-gap Socialist cabinet under the veteran statesman, Leon Blum (q.v.), were constructed upon a balance of their opinions. For nearly half of 1946 Italy was waiting for the decisions of the Allied Foreign Ministers on the peace treaty and of her own people on her future form of gov. Elections—the first for twenty-five years—were held on June 2. The Christian Democratic party emerged in great strength and were only slightly outnumbered by the Socialists and Communists combined. A referendum on the 'institutional' question showed a ten per cent majority for the Republic. King Victor, who had abdicated a month previously, was then in Egypt: his son, a king for one month, withdrew to Portugal and a former president of the Chamber was elected to the presidency of the republic.

E. being thus divided, the settlement of terms of peace seemed to resolve itself largely into a diplomatic trial of strength for the adjustment of frontiers between the rival systems. After more than twenty weeks of discussion, first in Paris and then in New York, the Council of Foreign Ministers completed (December) the five treaties with Germany's former satellite States in E.—Italy, Bulgaria, Finland, Rumania, and Hungary. A few days later the Council decided to meet in Moscow on March 10, 1947, to try to devise a common policy in Germany and Austria. Throughout the year Mr. Bevin (q.v.) and Mr. Byrnes (U.S.A.) made strenuous efforts to establish four-Power agreement on Germany, but the discussion within the Council of Foreign Ministers only served to emphasise the differences. M. Molotov (q.v.) could not agree to bring the E. zone into a common plan for treating Germany as a whole; and he alarmed his colleagues on the Council by demanding reparations from Germany to the value of one billion dollars. Among many problems the most intractable, perhaps, was that of the disposal of Trieste, which lay in the debatable area where the two rival Power systems met and served the economic traffic routes of both. A compromise, however, was reached, on the basis of the creation of a city-state internationally guaranteed and in part internationally administered.

In Germany and Austria administration and disarmament had been based by the Potsdam Agreement upon the close co-operation between the four Powers—Britain, Russia, United States, and France. This agreement of Aug. 1945 remained throughout 1946 the charter of Allied control, and though much of it was increasingly less observed and applied no attempt was made to revise it. As one consequence of it there arrived in the W. zones of Germany during 1946 nearly 4,000,000 Gers. expelled from Poland, Hungary, and Czechoslovakia. Over 2,000,000 were scheduled to enter the

Russian zone. But in one great matter co-operation was real. The state trial of the principal Ger. leaders for high crimes and misdemeanours against humanity and international law was carried to a conclusion and a number of the accused put to death by judgment of a tribunal representative of the four Powers. In administration, however, there was no such measure of agreement. No Ger. agency able to act in Germany as a whole came into being. Greater unity began to develop between the Brit. and Amer. zones, but throughout 1946 E. and W. Germany drifted further apart. The division of E. between opposed political and social systems was responsible for cutting Germany in two. Its consequent economic bisection proved most damaging; for its normal organisation of production and exchange between the industrial W. and agric. E. was wholly frustrated. The Russians devoted the food surplus from the regions which they administered to the feeding of the countries within the Communist sphere of influence, at the same time claiming industrial reparations from the W. and charging Great Britain and America with tardiness in carrying out the Potsdam Agreement for the reduction of Germany's industrial potential. In the W. zone of Germany the people were reduced to extreme scarcity of food, shelter, and fuel and were only saved from starvation by the imposition of a charge for their sustenance which, equally apportioned between the two administering Powers, involved the Brit. taxpayer in an annual subvention of £125,000,000 for at least three years. The Brit. and Amer. Govs. made an agreement to administer their combined zones as an economic unity, which the Fr. and Russian zones would be free to join at any time. Russia abstained, and so did France, whose overriding concern for security gave Ger. disarmament and resistance to the estab. of any central institutions of gov. in Germany precedence over all considerations of economic relief.

Russian Intransigence—The 'Iron Curtain'.—Hopes at the end of 1946 that the ravages of war might speedily be made good were not fulfilled in 1947. On the contrary, the disastrous consequences of six years of physical devastation and disruption in western E. and in the principal food and timber-producing zones of eastern E., together with the dislocation of the European transport system, seemed to strike the world with delayed impact. The effect of this was, however, a clearer understanding of the universal damage that had been done and a more realistic appreciation of the magnitude and quality of the efforts necessary to arrest still further deterioration and lay the foundations of a new world order. Meanwhile, in the political sphere, it was essential to conclude the peace treaties and stabilise international relations. Although the League of Nations was formally dissolved (July 31) nothing in the events of 1947 suggested that its successor, the United Nations, had any substantial prospect of realising the dreams of promoting univer-

sal peace on which the League had been founded after the First World War. A common policy of the Great Powers, which was its condition precedent, grew steadily more improbable, and consequently the proceedings of the Security Council and the Assembly (see UNITED NATIONS, CHARTER OF THE) were generally felt to be far less significant for the dominant issues than the meetings, albeit inconclusive, between the representatives of the United States, and those of Great Britain, Russia, and France. Unhappily, as the year wore on, Russia became progressively more and more flagrantly ranged in opposition to the other three. This intransigence of Russia was, in fact, the decisive feature of European hist. after the war. The signing of peace treaties with Italy, and the lesser European satellites of Ger., did little to solve the deadlock. The Soviet Union concentrated on consolidating its relations with and influence over all nations—except Greece and Turkey—E. of the line of div. estab. at the time of the Ger. surrender. Under Russian influence all these countries were now ruled by single-party totalitarian régimes, and the leaders of opposition were exiled or, in some cases, judicially murdered—e.g. M. Petkov, leader of the opposition in Bulgaria, was sentenced to death on Sept. 16 and, despite urgent representations by the W. allies, hanged on Sept. 23. In fact, all opposition to Russian-inspired policy (see RUSSIA—History) was inexorably crushed. Rigid control of communications prevented Western E. from learning very much of what was happening behind the so-called 'Iron curtain', while those within the Soviet Union were yet more ignorant of the conditions of the W. This system was consolidated by the estab. of a 'Communist Information Bureau' in Belgrade, which was doubtless merely the revival of the former 'Comintern' (see under ANTI-COMINTERN PACT), dissolved during the war, under a new name ('Cominform'). In Western E. a fierce struggle for power raged between the Communist parties, largely following the direction of Russian policy, and other political groups. The background to the conflict was the economic misery and chaos of a continent threatened with starvation and bankruptcy.

Marshall Plan—Russian Counter-moves.—It was evident that nothing could avert these evils from befalling in the not very distant future, and, at the same time, offer a prospect of ultimate recovery to European autarchy except the importation of vast supplies from the New World. Accordingly Mr. George Marshall (h.c.), the secretary of state, in a speech at Harvard (June 5) outlined his plan to come to the rescue of E. with financial help on a gigantic scale. The condition of assistance was that the European nations should meet and submit a combined statement of their needs and that the aid would be granted only for recovery and as part of a system of mutual aid; but when a conference with this object assembled in Paris, the Soviet Union per-

sued their satellite states not to participate. They declared that the purpose of the United States was to subject E. to Amer. imperialism. The Western peoples (16 nations) submitted their proposals in a general report giving details of a four-year programme of reconstruction and at the end of the year the United States Gov. recommended to Congress the provision of credits reaching the enormous figure of 17,000 million dollars. But even before this historic recommendation the Amer. Gov. had given help to E. For the Truman doctrine of granting aid to countries threatened by aggression was formulated when the need to reduce Brit. commitments abroad left Greece and Turkey exposed to acts of aggression by Russia and her satellites. President Truman's request for 400 million dollars of relief and military supplies for those Balkan countries was granted after protracted debate and only following Senator Vandenberg's (*q.v.*) amendment pledging Amer. withdrawal if the United Nations should request it. Also at a special session of Congress a Bill was passed for W. aid to France, Italy, and Austria (as well as to China). Hostility to communism induced Congress to pass the bill without much difficulty. Yet the same antipathy did not provide a much stiffer struggle when Congress came to consider the totals and credits of long-term aid to E.

In every aspect the political and still more the economic instability of E. was intimately related to the uncertainty over the place that Germany was eventually to take in the Continental system. The foreign ministers of the prin. Allies met in Moscow in the spring to discuss in broad outline the terms of an agreement on which a peace treaty might be founded; but six weeks of argument only served to widen the difference of outlook between the W. Powers and Russia. Agreement was prevented not so much by the inherent difficulties of the German (and Austrian) problems themselves as by the overshadowing ideological forces implicit in Russian foreign policy generally, and the political trials in Eastern E. and the emergence of the 'Cominform', together with the intensified Soviet propaganda, only served to harden W. democratic opinion and to predispose their govts. against making concessions. In Germany little now remained of the Potsdam provisions after the Brit. and Amer. govts. forced to counteract the exclusive policy in the Soviet zone, formed their own economic State out of their combined zones. In answer to the Marshall plan, the Soviet Union made it evident that it would do all in its power to make it ineffective and, by necessary inference, would press for four-Power control of the Ruhr. France, in the meantime, put forward schemes for detaching the Ruhr, Rhineland, and Saar from Germany; Britain and the United States supported that plan for the Saar, but were opposed to the separation of the Ruhr and Rhineland. In reply to Russia's demand for international control over the Ruhr industries, Mr. Bevin (Britain) bluntly re-

fused to agree to any Four-Power interference in the Ruhr while the E. zone of Germany remained in effect a 'closed shop.' It was under these unpromising auspices and in an atmosphere of mutual suspicion that the London conference met in Nov. to renew discussions of a Treaty basis. It was not surprising, therefore, that no agreement could be reached upon the reconstitution of a Ger. gov. with which a treaty might be concluded, for the sufficient reason that the Soviet conceived such a gov. in terms of totalitarian communism and the W. Powers in terms of compromise between parties representative of the various shades of Ger. opinion. The Russians persisted in their claim (see RUSSIA.—*History*) to take large amounts from current Ger. production as 'reparations'; the W. allies, who were heavily subsidising the economy of their zones in order to ward off starvation, held that such 'reparations' were in effect being paid by them; and on that issue the London conference broke down without any arrangement to meet again, thereby leaving the world uneasily conscious that forces were being arrayed on either side of a gulf which, unless bridged in the immediate future, might well contain the seeds of a third world war.

The 'Cold War' between the Western Powers and Russia—The 'Western Union.'

—The hist. of E. in 1948 is the hist. of the struggle between Russia and the W. world, when the div. between E. and W. became more sharply defined, with both sides in the 'cold war' endeavouring to consolidate the forces under their control. The failure of the Four-Power conference on Germany at the end of 1947 had made the div. of E. inevitable and from that moment the W. Powers had no option but to carry out their own plans for the recovery of Germany in their zones and to organise a W. bloc as an answer to the E. bloc which had already been formed under the leadership of Russia. In the House of Commons (Jan. 22) Mr. Ernest Bevin, Brit. foreign minister, put forward the idea of a 'Western Union' or voluntary association of the govts. of Britain, France, and the three 'Benelux' (*q.v.*) countries to deal with practical economic and military problems. His declaration that talks on the a lines had already begun roused interest and support in Canada and the United States, as well as in western E. It also provoked Russia to consolidate the countries of eastern E. in a solid Communist bloc.

Russian Coup d'Etat in Prague—Treaty of Brussels.—The Czech communist party, openly supported by Russia, carried out a *coup d'etat* in Prague as the result of which a Communist-dominated gov. took office and civil liberties were destroyed. This, however, was only one of a series of moves designed to impose greater discipline on Russia's satellite states, in each of which the dissolution of the former democratic parties was expedited and new orders issued for the socialisation of industry and the land. In only two of these states, Yugoslavia and Poland, were serious difficulties encoun-

tered. But while, later, the Polish communist party bowed to the 'loyal' or 'Russian' faction of the party, Marshal Tito refused to submit and boldly maintained his position, Yugoslavia being expelled from the Cominform (q.v.). The *coup d'état* in Prague was widely condemned in the W. world as an act of aggression as brutal as that of Hitler in 1938, and, on March 4, the Brit., Fr., and Benelux Govs. representatives met in Brussels to form a W. Union and, on March 17, the treaty of Brussels (q.v.) was signed, pledging the signatories to close co-operation in economic matters and to give immediate military assistance if any of them should be the object of armed attack in E. The five govts. also agreed to set up a permanent consultative Council to meet in London. The treaty was welcomed by the Canadian Gov. and by President Truman and, in June, the Amer. Senate adopted a resolution presented by Senator Vandenberg (q.v.) urging the association of the U.S. with regional defence agreements, though this resolution was in no sense a treaty. No such constitutional difficulties, however, handicapped the steady progress of the European recovery programme, which had been made possible by Mr. Marshall's offer of aid the previous year, and on April 3 President Truman signed the Foreign Assistance Act authorising aid to E. for one year. When this Act was signed the sixteen European nations which had accepted the Marshall offer met again in Paris to set up a joint Organisation for European Economic Co-operation (O.E.E.C.) which was intended to outlive the European Recovery Programme.

Control of the Ruhr—Currency Reform in Germany—Blockade of Berlin.—Meanwhile the problem of Germany—and to a lesser extent of Austria—became more urgent and menacing. In Feb. the Brit., Fr. and U.S. Govs. began discussions in London about the future of the three W. zones of Germany. These discussions, in which the Benelux countries later joined, finally resulted in a Six-Power Agreement which was pub. on June 7 providing for international control of the Ruhr, Germany's representation in the European Recovery Programme and the association of the Benelux countries in policy relating to Germany. It also provided for the election of a provisional Ger. Gov. in the W. zones 'until the eventual estab. of German unity.' Russia immediately countered with a conference of Eastern European states at Warsaw, which condemned the agreement as a plan to divide Germany and proposed instead Four-Power control of the Ruhr, the creation of a 'democratic' gov. for all Germany and the withdrawal of all occupation forces within a year of the conclusion of a peace treaty. Before the Warsaw conference met the three W. Powers had announced (June 18) a drastic currency reform to apply to their zones of Germany, but not to Berlin, and the Reichsmark was superseded by a new Deutsche Mark. The Russian authorities then issued an order banning passenger

trains, motor and pedestrian traffic between their zone and the W. and, on June 19, the blockade of Berlin began—the W. Powers imposing restrictions on trade as a countermove. The real objection of the Russians was not so much to the currency reform as to the whole plan for economic recovery in the W. zones and, above all, to the proposal to form a provisional gov. in W. Germany. The blockade of Berlin was a deliberate attempt to force the W. Powers either to abandon their plan for W. Germany or to leave Berlin. From the beginning of the dispute the W. Powers were prepared to accept the currency in the Russian zone as the currency for Berlin provided that its issue was made under the control of the Four-Power Kommandatura of the city. The Russians rejected this offer and announced that they would introduce a new currency to cover the whole of Berlin independently. On June 23, therefore, the W. Powers introduced the new Deutsche Mark into the W. sectors of Berlin. The Russian blockade was at once intensified and a critical position arose. Unable to supply the pop. of their sectors with food and other supplies by road or rail the W. Powers arranged to supply them by air. The success of this 'air lift,' which surprised the Russians as much as it seized the imagination of the Ger. people, made it possible for the W. Powers to consider the situation more calmly. They presented Notes to the Russian Gov. protesting against the blockade, but offering to discuss outstanding questions once the blockade was lifted. On Aug. 30 agreement with Russia was reached in principle and a joint directive sent to the military commanders in Berlin laying down that all restrictions on trade would be lifted and the Soviet mark would be introduced as the sole currency for Berlin as soon as the military commanders agreed on the details of currency control. The commanders, however, failed to agree and further conversations in Moscow proving abortive, the W. Powers informed (Sept. 26) the Russian Gov. that they were obliged to refer the matter to the Security Council of the United Nations. But the debates in the Security Council, which met in Paris, had no better result and the blockade continued.

Berlin City Council elections.—In the summer the Russian military authorities began to show their determination to make Berlin a part of the Russian zone by organising riots in the streets, which forced the democratic assembly to seek refuge in the Brit. sector. These tactics were stimulated by the knowledge that elections for a new city assembly were due to be held on Dec. 5—elections which were certain to confirm the preference of a great majority of the Berliners for democracy and the W. to Communism and Russia. The Russians, therefore, forbade elections in their sector, but, being unable to prevent them in the W. sectors, announced beforehand that they would not recognise the result and urged their Communist followers to set up a new *magistrat* or city council in the Russian sector. In this

manner the final div. of the city, long threatened, was accomplished (Nov. 30). While the blockade continued, the W. Powers were forced to concentrate on restoring the W. zones to a state of political and economic health and in this they were helped by the success of their currency reform which so stimulated Ger. production that by the end of 1948 the output of coal, steel and consumer goods was approaching the 1936 level. At the same time events in Berlin demonstrated to the Ger. political parties that their best course was to accept the div. of Germany and co-operate with the W. Powers in forming a provisional gov. A constituent assembly met at Bonn on Sept. 1 to adopt a constitution or basic law. The W. Powers then turned their attention to the question of the future of the Ruhr and, on the eve of a conference in London in Nov., called to set up an international authority for the Ruhr, the Brit. and Amer. military commanders in Germany announced that the coal and steel industries would be handed back to Ger. trustees under allied supervision until a Ger. gov., elected by the people, could decide their future ownership. France, to whom Germany's recovery and the prospect of a Ger. gov. in the spring of 1949 were not altogether agreeable, forcibly protested at this proposal. The result of the Berlin magistrat elections in the W. sectors was announced on Dec. 6 as follows: Social Democrats, 858,100 votes or 64.4 per cent; Christian Democrats, 258,496 or 19.4 per cent; Liberal Democrats, 214,224 or 16.1 per cent. (comparable figures for 1946 for the whole city were: 909,170 votes or 48.7 per cent, 454,202 or 22.1 per cent, 192,527 or 9.4 per cent respectively; and 405,992 votes or 19.8 per cent for the Social Unity party, who were not represented in the 1948 elections). In view of the installation of a new Soviet-sponsored Magistrat at the Neues Stadthaus, the W. liaison officers were withdrawn from that building on Dec. 1 when it was also announced that the legally-elected city assembly and the legitimate Magistrat would be accommodated in the W. sectors. The city assembly repudiated the Soviet-sponsored magistrat, proclaimed a 'state of political emergency' in Berlin and passed a unanimous vote of confidence in the W. magistrat.

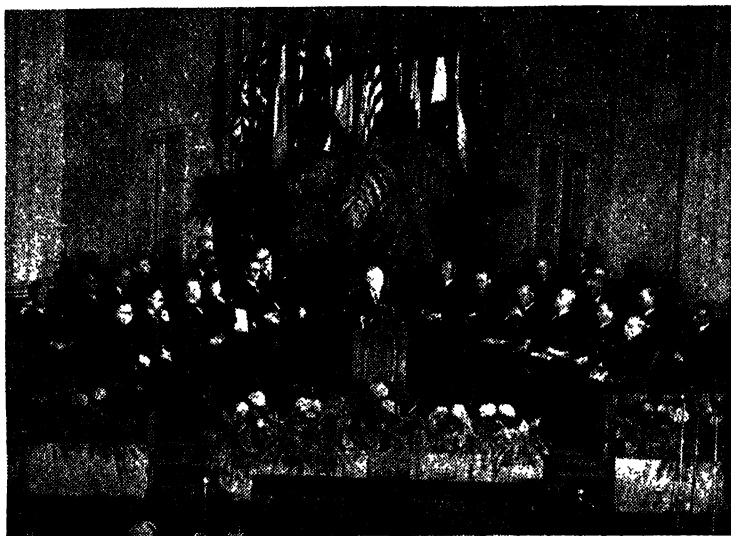

Statute of the Ruhr.—Arising out of a Six-Power conference of the W. Gov. concluded on Dec. 28, the agreed draft text of the Statute of the Ruhr Authority was pub. on that date. The Statute provided for an international authority for the Ruhr, the members of the authority being the signatory govts. and Germany. The authority consists of a council composed of representatives of the signatory govts., assisted by a secretariat headed by an executive secretary appointed by the council. When a Ger. gov. is estab. it may appoint a delegate to the authority with the right to attend meetings of the council. The chief function of the authority is to make a div. of coal, coke and steel from the Ruhr as between Ger. consumption and export.

European Recovery Programme—On July 25, 1948, Mr. Paul Hoffman, administrator of the European Recovery Programme at a meeting of the O.E.E.C. and of delegates of the W. zones of Germany at Paris called for 'a master plan of action' by which nations could achieve full economic recovery by June 30, 1952, when aid by the U.S.A. was due to end. On Sept. 11 the council of the O.E.E.C. reached provisional agreement on both the distribution of Amer. aid contributions and drawing rights in the intra-European payments scheme for the year July 1, 1948–June 30, 1949. Under the terms of the European Economic Co-operation Act (U.S.A.) the agreement was subject to approval by Mr. Paul Hoffman. The distribution of the total aid for 1948–49 of \$4,875 m. among the participating countries was as follows: Austria \$217 m. (£54,250,000); Belgium Luxembourg \$250 m. (£62,500,000); Denmark \$110 m. (£27,500,000); France \$989 m. (£247,250,000); Greece \$146 m. (£36,500,000); Ireland (Eire) \$79 m. (£19,750,000); Iceland \$11 m. (£2,750,000); Italy \$601 m. (£150,250,000); Netherlands \$496 m. (£120,000,000), including \$21 m. for Indonesia); Norway \$84 m. (£21,000,000); United Kingdom \$1263 m. (£315,750,000); Sweden \$47 m. (£11,750,000); Trieste \$18 m. (£4,500,000); Turkey \$50 m. (£12,500,000); Bizone (Western Germany excluding Fr. zone), \$114 m. (£103,500,000); Fr. zone (Germany) \$100 m. (£25,000,000). (Switzerland and Portugal did not apply for aid and are therefore not included.) On Oct. 17 a European recovery plan for the year July 1, 1948–June 30, 1949) to be carried out with the estimated Marshall aid of \$4,875 m. (£1219 m.) was handed over to Mr. Averell Harriman, special representative in E. of the Amer. Economic Co-operation Administration, on behalf of the O.E.E.C. There was also signed on that date an agreement on intra-European payments under which the drawing rights of debtor on creditor countries totalled \$810,400,000. The main features of this twelve months' programme were: a marked increase in the production of agric. and industrial goods; a considerable increase in trade between member countries, making it possible for them to meet a much larger part of their essential requirements from their own resources; an improvement in the supply of basic consumer goods to the pops. of member countries, with a consequent improvement in the standard of living; the limitation, with a few exceptions, of imports paid for in dollars to those goods which are essential for the recovery programme; and an increased production of machinery which in subsequent periods will lead to higher all-round output in member countries. The report of the O.E.E.C. on the economic programmes of its member nations for the year beginning June 30, 1948, showed that the estimated dollar aid required was \$4,317 m. Imports from the dollar area for that period were reckoned at \$6,326 m., as against \$6340 m. for 1948–49, exports from the nineteen

Marshall aid countries to the dollar area were expected to show an increase of 25 per cent and total exports from those countries; an increase of 18 per cent.

Council of Europe.—The Consultative Council of the W. Union, consisting of the foreign ministers of the five W. Powers met in London on Jan. 27-28 when they agreed on the creation of a Council of E. consisting of a ministerial committee meeting in private and a consultative body

North Atlantic Pact. Meanwhile negotiations had been in progress for the conclusion of a N. Atlantic Pact in which the United States of America should be associated with Western E. in security arrangements. The draft pact or treaty was completed in March 1949. Its principal Article (V.) recognised that any aggression against one of the signatories would be considered as an aggression against all. In these circumstances immediate action

THE SIGNING OF THE NORTH ATLANTIC TREATY, APRIL 4, 1949

President Truman addresses the group before the signing of the pact. Seated in the inner semi-circle, left to right, are the representatives of the twelve signatories: Ernest Bevin, United Kingdom; Halvard Lange, Norway; Joseph Bech, Luxembourg; Bjarni Benediktsson, Iceland; Gustav Rasmussen, Denmark; Paul Henri Spaak, Belgium; Dean Acheson, United States; Lester B. Pearson, Canada; Robert Schumann, France; Count Carlo Sforza, Italy; Dirk U. Stikker, Netherlands; Jose Caeiro Da Matta, Portugal. Behind the foreign secretaries of the signatory nations are their ambassadors to the U.S.A.

meeting in public. The Council decided to invite other European countries to take part in negotiations for the estab. of the Council of E. This proposal was a compromise between the Brit. and the Fr. Benelux views and an acceptance of the general principle that each gov. would adopt a system suited to its own constitutional practices, which meant that the Brit. delegation would be appointed by the gov. and the other delegations would be elected by their parliaments. The defence organisation of the W. Union countries took shape when the Defence Ministers of the five powers met in Paris (Sept. 1948). The nucleus of a command was set up with Field-Marshal Lord Montgomery as the permanent chairman.

against aggression, either individually or collectively, and by armed forces, is contemplated by the pact. Aggression is defined (Article VI.) as any attack against the ter. of the contracting parties, against their occupation forces outside their ter., against their ships or aircraft in flight in the region bounded to the S. by the Tropic of Cancer (the three Metropolitan depts. of Fr. N. Africa are included in this security area). Article VII. recognises the supreme authority of the Security Council of the United Nations for the maintenance or re-estab. of peace and security or, in other words, the pact is to be considered as a defensive measure, whose existence in no way crosses the authority of the United Nations. Simi-

larly, Article VIII. recognises the validity of previous engagements entered into by the signatories, such as the Franco-Soviet treaty or Anglo-Soviet treaty. The Pact was signed on April 4, 1949, by the United States, Canada, Great Britain, France, Belgium, Holland and Luxembourg. Norway, Italy and Denmark were invited to adhere later, and, in a still later stage, Portugal and Iceland.

Falls, *The Second World War: a Short History*, 1948; D. D. Eisenhower, *Crusade in Europe*, 1949.

European Corn Borer (*Pyrausta nubilalis*), moth, comparatively harmless to crops in Europe, where it has long been known, but regarded as a serious menace in the U.S.A. It made its first appearance on the E. coast of America in 1917, having been carried in presumably on Eng. vessels, and since then has penetrated further W. It has chiefly attacked Indian corn, where its ravages have threatened the future of the whole crop. The alarm of agriculturists during 1926 led to the sum of ten million dollars being granted by Congress to fight the invader, and two lines of defence have since been adopted with some promise of success. One of these is the importation of parasites that prey upon the moth, and the other consists in thoroughly cleaning up the fields after an Indian corn harvest, and destroying all stalks and vegetable refuse with fire, in order to prevent further breeding of the moths.

Europium, chemical element discovered by Demarcay in 1896. It belongs to the group of rare earths. Its symbol is Eu,

its atomic weight 152, and its atomic number 63. Eurcptom oxide is a pale powder.

Eurotas, one of the chief rivs. of the auct. Peloponnesus, in Greece, now named Morea. Its course is not more than 50 m., flowing through Laconia to the gulf of Gythion.

Euryale ferox, species and genus of Nymphaeaceae, is an elegant aquatic plant which inhabits the lakes of the E. Indies and China.

Eurydice: (1) In Gk. legend, wife of Orpheus. She was bitten by a serpent while fleeing from Aristaeus. Orpheus descended to Hades after her, and by his exquisite music persuaded Pluto to allow her to return with him to the upper world. The condition that Orpheus should not once look behind him being broken, his 'half-regained Eurydice' was snatched from him again. This legend has been the subject of many pictures, including one by Watts. Copies of a Gk. relief (end of fifth century B.C.) are at Rome, Naples, and Paris. See Virgil, *Georgics*, iv.; Ovid, *Metam.* x. 1. (2) Illyrian princess, wife of Amyntas II. of Macedonia, mother of Philip II. of Macedonia (339-336 B.C.) and Perdiccas III. See Justin, vii. 4, 5. (3) Relative of Philip, in whom numerous political intrigues centred over the succession on the death of Alexander the Great (323 B.C.).

Eurymedon, in auct. geography, riv. of Pamphylia, Asia Minor. At its mouth the Athenian commander Cimon signally defeated the Persians in 466 B.C. Its modern name is Kopru-Su.

Eurynome, genus of decapod brachyurous crustaceans, which belongs to the family Midae, the species are known as spider-crabs. *E. aspera* inhabits the Mediterranean.

Eurypharynx, see PELICAN FISH.

Eurytheus, see HERCULES.

Eusebius of Emesa (c. 295-c. 360 A.D.), Gk. ecclesiastic, b. at Emesa. He refused the offer of the see of Alexandria, being averse from all theological disputes; but he accepted the small bishopric of Emesa, in Phoenicia, instead. He was, however, driven from this, as his powers as mathematician and philosopher resulted in his flock accusing him of sorcery. Only a few fragments of his works are extant.

Eusebius of Nicomedia (d. c. 312), Gk. bishop and theologian, related on the maternal side to the Emperor Julian, whose early tutor he was. Like Eusebius of Caesarea, he was a defender of Arius, and placed himself at the head of the Arian party after the Council of Nicea. The Emperor Constantine was baptised by him in 337, and two years later he was promoted to the see of Constantinople.

Eusebius Pamphili of Caesarea (c. 284-c. 349 A.D.), the 'father' of eccles. hist., probably b. in Palestine. His name, Pamphili, was assumed after the martyrdom of his instructor, Saint Pamphilus. About 313 he became Bishop of Caesarea and took a prominent part in the Council of Nicea, where he was the leader of the temporising or semi-Arian party, which, opposed to discussing the nature of the

Trinity, would have preferred the language of Scripture to that of the theology in referring to the Godhead. He has the reputation of being the most learned father of the church, after Origen and Jerome; and Constantine, who appreciated his moderation and other good qualities, said that he was fit to be the bishop of practically all the world. He wrote two treatises which have come down to us, the *Preparation* (*Preparatio Evangelica*) and the *Demonstration* (*Demonstratio Evangelica*) of the Gospel, two apologetic works, and many other writings of the highest value, the chief of which are: *The History of the Church, from the Time of its Founder to the Year 323*, and the *Chronicon*, a hist. of the world down to 328, valuable as containing extracts from many auct. writers whose works are no longer extant. Some of the most informative passages in his *History* are those on the written liturgy and primitive ritual; on the Ignatian Epistles; on the persecutions of Diocletian and Trajan, and on the Thundering Legion. Writings of less importance are: *The Martyrs of Palestine*, treatises against Hierocles and Marcellus, the *Theophania* (discovered in 1839), and a panegyric *Life of Constantine*. The first ed. of all E's works was pub. in 1512 at Basle; the best modern one is that of E. Schwartz and T. Mommsen (1903-09). Among the many eds. of the *Church History* are those by Heinichen, 3 vols. (1865-70), containing also the *Life of Constantine* and the *Oration in Praise of Constantine*; and that by E. Burton (1838). Accounts of Eusebius and his opinions will be found in J. Herzog's *Encyclopaedia*, 1954; I. Dorner's *History of the Person of Christ*, (ii) 1839; P. Schaaf's *Church History* (ii) 1867; Introduction to Lee's trans. of the *Theophania*; and in various chapters of J. J. Blunt's *The Christian Church during the first three centuries* (1888). See also trans. by Kirsopp Lake and J. E. Oulton, 1926-1932, and by H. Lawlor and J. E. Oulton, 1927-28.

Euskera, see under BASQUES.

Euskirchen, Ger. tn. in the Rhineland, Germany, at the junction of railways running S. from Cologne and W. from Bonn. Its pre-1939 industries included cloth, metalware factories, and iron foundries. The church of St. Martin dates from the thirteenth and the tn. hall, partly destroyed in the Second World War, from the fourteenth century. E. figured in the Anglo-Amer. advance to the Rhine in Feb. 1915 as a vital road-centre. Its capture, with that of Prüm, led to breaching the Siegfried Line in this region and eventually to the seizure of the bridgehead at Remagen. Pop. 15,000.

Euspongia, see SPONGE.

Eustachian Tube (after Bartolomaeo Eustachio), cylindrical tube lined with mucous membrane, dilated at both ends and connecting the cavity of the middle ear with the pharynx, to which it passes downwards, forwards, and inwards, for a distance of about 1½ in. It is partly osseous, but chiefly cartilaginous. Sound vibrations acting on the *tymppanic mem-*

brane and the *fenestra ovalis* cause constant changes of pressure in the middle ear, which changes are equalised by means of this tube. It is open during rest, but closed during deglutition. Permanent occlusion of this tube is one of the most common forms of deafness. See EAR.

Eustachian Valve, after Eustachio, the attachment which in the fetus directs the blood from the inferior vena cava through the foramen ovale into the left auricle. Its remains will be found attached to the right and lower margins of the opening of the inferior vena cava.

Eustachio, Bartolommeo (c. 1500-74), It. physician and anatomist, b. at Severino. He is celebrated for his discovery of the Eustachian tube (*q.v.*). Anatomical science was greatly enriched by his researches. He also discovered the rudimentary valve of the heart. E. was physician-in-ordinary to the popes and prof. of medicine in Rome, where he died. His chief works are the *Opuscula Anatomica* (1564) and *Tabulae Anatomice*, pub. in 1714.

Eustathius (d. c. 1193), celebrated Gk. scholar, b. at Constantinople. He first became a monk and afterwards a deacon and teacher of rhetoric in his native city. In 1160 he became archbishop of Thessalonica and subsequently of Myra. E. was a man of great learning, and was deeply versed in the anc. classic authors. His commentary on Homer (1st ed. Rome, 1542-50) is his prin. work. Some letters and theological and historical treatises were first pub. by Tafel in 1832.

Eutaw Springs, near Eutawville, in S. Carolina, U.S.A. The springs originate at the foot of a hill, and spread into a large stream which disappears underground to appear again further on. The last battle of the War of Independence was fought here 1781.

Eutectic, name which was given by Frederick Guthrie, a scientific writer, to those mixtures in which the components are in such proportions as to solidify on cooling, after melting, at one temp. like a pure substance. This temp. which is called the E. point, is the lowest freezing temp. of any mixture of the components. E. mixtures play an important part in the constitution of alloys, the heterogeneous structure of which may be demonstrated by the uneven action of etching agents.

Euterpe, genus of tropical spineless palm is found largely in the forests of S. America. There are sev. species; *E. edulis*, the Assai or cabbage palm, produces a bud which is eaten as food, a fruit from which oil is obtained, and wood used for building purposes.

Euterpe, in anc. Gk. mythology, is one of the nine goddesses who presided over the different departments of literature. E. was the muse of lyrical poetry, and is represented with the double flute.

Euthanasia, administration of pain-relieving mediums or, in certain circumstances, narcotics to those who are dying. The term is also applied to the painless killing of human beings who are suffering from mental or physical disease that is thought to be incurable. It is not legal, but is practised, and the pros and cons

have been the subject of much controversy. The Rom. Catholic Church has specially been against it as an unwarrantable interference with the processes of life and death of the individual.

Eutheria (Gk. *εὐ*, well, and *θηρίον*, an animal), term given to a sub-order of mammals (*q.v.*) comprising all but the marsupials and monotremes, first applied by Gill in 1872. It is a synonym of Monodelphia and Placentalia.

Eutocius (c. A.D. 550), Gk. mathematician and geometer of Ascalon, in Palestine, and pupil of the architect Isidorus. He is noted for his *Commentaries on Apollonius of Perga* and *Archimedes*, four of which are extant, including comments on Archimedes' *Treatise on the Sphere and Cylinder*. E. discusses the problem of the duplication of the cube and gives sev. solutions.

Eutropius, Flavius (d. c. A.D. 370), Rom. historian of the fourth century. He was secretary to the emperors Constantine and Julian, accompanying the latter on his Parthian expedition. He probably rose to high office in the state, possibly that of senator or consul. He wrote *Breriarum Itorum Romanorum ab urbe condita*, a concise hist. down to the death of Jovian, A.D. 364. The best eds. are those of Grosse, 1813; W. Hartel, 1872; and H. Droysen, 1879. See Suidas, *Eutropius*; Moller, *Dissertatio de Eutropio*, 1685; Duncker, *De Paganis Eutropii Interpretis*, 1880; Germadius, *De Viris Illustribus*; D. Pastorino, *Eutropius*, 1926.

Eutyches, founder of the Eutychian heresy, which said that after the incarnation Christ had but one nature, the human nature being absorbed in the divine nature. The cause of E., however, was somewhat favoured at Alexandria, where Cyril had taught a less-developed form of the same doctrine, and owing to the influence of Dioscurus of Alexandria, a fresh council was held at Ephesus. To this period belongs Pope Leo's famous treatise on the two natures of Christ in the Incarnation. E. was restored by the 'Robber Council' of Ephesus (449), but this decree was reversed at Chalcedon (451). After this, the heretic disappears from hist., and the sect was put under penal laws.

Euxine, see BLACK SEA.

Evagoras, King of Salamis in Cyprus from c. 410-374 B.C., a descendant of Teucer, Telamon's son. The Athenians and Egyptians aided him in his long wars with the Persians, ending with a peace in 376 (see Xen., *Hell.* ii. 1). He was assassinated, and succeeded by his son, Nicoteles. An oration of Isocrates praising E. is still extant. Evagoras II. succeeded Nicoteles, and was dethroned by Protagoras.

Evagrius (c. 536-594), surnamed 'Scholasticus,' of Antioch, Syrian church historian, who wrote a *Church History* (from A.D. 431-594), a continuation of the work of Kueobius (see ed. of J. Bidez and L. Parmentier, 1898). He also trans. *Athanasius' Life of St. Anthony* into Lat.

Ewald, Johannes, see KWALD, JOHANNYS.

Evander, in classic legend, Gk. hero, son of Hermes. About sixty years before

the Trojan War he led an Arcadian colony to Latium, founding Pallantium (later the Palatine Hill). He was supposed to have taught the inhabs. various arts and the worship of sev. Arcadian gods, particularly of Pan (Faunus). He was worshipped among the heroes of Rome on the Aventine. E. was father of Pallas, and ally of Æneas against Turnus in Virgil's story (see *Æneid*, viii., x., xi.). Consult H. Nettleship, *Lectures and Essays*, 1895.

Evangelical (εὐαγγελικός, of good tidings, for the Gospel). This term was originally claimed as a right by all Protestants, in that their beliefs were derived entirely from the evangel or Bible. In the course of time, however, its use and meaning have varied greatly. The term has been especially applied to the school which insists on the utter depravity of unregenerate human nature, necessity for conversion, justification of sinners by faith, free offer of the Gospel to all mankind, and the divine inspiration, authority, and sufficiency of Holy Scripture (reserving the right of individual believers to interpret scriptural passages according to their judgment). In the Anglican communion, holders of such beliefs are usually known as 'Low Church.' In Germany the word applies to the United Church as opposed to the Lutheran and Reformed churches, but it is also sometimes assumed by the pietistic party within the Protestant Church. See CHURCH HISTORY.

Evangelical Alliance, voluntary association of Christians of various countries and denominations, first formed in London, 1846, at a conference of 921 clergymen and laymen, representing some fifty sections of the Protestant Church. The idea started in Scotland, as a protest against Popery and Puseyism. Nine points were agreed upon as a basis of the alliance formed by members holding 'the views commonly called evangelical.' Its aims include maintaining religious liberty throughout the world and succouring the persecuted. It held many international meetings. Its chief pub. is a monthly journal, *Evangelical Christendom*. See A. Bonnet, *Lettres sur l'alliance évangélique*, 1847; A. J. Arnold, *History of the Evangelical Alliance*, 1897.

Evangelical Church. This religious body of N. America was founded in E. Pennsylvania by Jacob Albright (Albrecht) in 1800. The rules of gov. and beliefs adopted were very similar to those of the Methodists. Albright was leader of the association till his death in 1808. In 1816 the first ann. conference was called, and in 1818 the present title was first adopted. Internal controversy in 1891 caused a div. and the branch which met at Philadelphia took the name of 'United Evangelical Church.' But by an Enabling Act the two churches were reunited, the new organisation being officially estab. at Detroit in 1902. The church now has a total membership of over a quarter of a million. See Plitt, *Die Albrechtaleute*, 1877.

Evangelical Synod of North America. Religious communion estab. in 1840 at

Gravois Settlement, Missouri. It is strictly evangelical in principle, and its members accept the Reformed and Lutheran doctrinal statements so far as they are in agreement. When not in agreement, the Synod follows the Scriptures and assumes the liberty of conscience prevailing in the Evangelical Church (q.v.). A new constitution was adopted at a great conference in 1927. The organisation has over 1200 pastors, over 350,000 communicants, and over 1200 Sunday schools. In 1932 it owned property of the value of nearly 40 million dollars. Publications: *The Evangelical Herald*; *The Light Bearer*.

Evangelical Union, religious body (also called Morisonians) formed in Scotland, 1843, by the Rev. J. Morison of Kilmarnock and other ministers who had left the United Secession Church. They were joined by ministers from the Congregational Union who held similar views. The chief article of their faith was belief in the universality of the Saviour's atonement. They also believed in the freedom of the human will. By 1896 the Congregational Union absorbed nearly all the churches. See the *Doctrinal Declaration* of the union, 1856; F. Ferguson, *The History of the Evangelical Union*, 1876, and *The Worthies of the Evangelical Union*, 1883.

Evangelist (the bringer of good tidings, preacher of the Gospel), term used in the N.T., signifying an official of the Christian Church, whose chief duties seem to have been those of a missionary and pioneer, carrying the Gospel message to new places and preparing the way for organising work which was to follow. The E. is not permanently connected with any local field of work, nor is he devoted to the usual service of the pastorate, his work is of an itinerant rather than a local nature. Thus Philip of Caesarea and Timothy of Ephesus are called Es. The term was also used in post-apostolic times for those who read and explained the written Gospels in public worship: but though this has continued to be its distinctive meaning, the official name is more often used to-day in its earlier sense and has been transferred to the writers of the four Gospels.

Evans, Sir Arthur John (1851-1941), Eng. archaeologist, b. at Nash Mills, Hertfordshire, eldest son of Sir John E., a wealthy paper-maker and distinguished antiquary. Educated at Harrow, Oxford, and Göttingen. Married the daughter of Freeman, the historian. He made archaeological explorations in Finland, Lapland, Balkans, and Crete. In 1884 he was appointed keeper of the Ashmolean Museum, which he entirely reorganised, leaving it in 1896 without a rival in England outside national collections. His Cretan enterprise, where he discovered the pre-Phœnician script, made him famous and won him academic honours all over Europe. By his discoveries, through excavations at Knossos, where he built himself a villa, he carried further the work of Schliemann, proving, in his *Cretan Pictographs* (1896) and *Further Discoveries of Cretan Script* (1898), that the Mycæan

or Aegean culture did in fact possess a system of writing. His chronological scheme of Aegean archaeology, as set out in his *Essay on the Classification of Minoan Civilization* (1906), has been accepted almost universally. He issued the first part of his *Scripta Minoa* in 1909. But his greatest work is his *The Palace of Minos*—which did not begin to appear till 1921 (completed 1936). It deals with the earlier Minoan periods and is the definitive pub. of his Cretan discoveries. Other works include *Mycenaean Tree and Pillar-Cult* (1901), *Through Liosnia* (1875), ed. and supplemented E. Freeman's *History of Sicily*, vol. iv. (1891). In 1917 he was elected to the Chair of the Soc. of Antiquaries. Extraordinary Prof. of Prehistoric Archaeology, Oxford Univ. President of the British Association, 1916-19.

Evans, Edith Mary (b. 1888), Eng. actress. b. in London. She made her first appearance at King's Hall, Covent Garden (1912), in *Troilus and Cressida*. She has appeared in the plays of Shakespeare and Shaw and in revived Restoration drama—particularly Congreve's *The Way of the World*. Also appeared in Brieux's *Trois Filles de Monsieur Dupont* (1926); *The Lady of the Lamp* (1929); and *The Humours of the Court* (1929). Among her chief successes were *Misses Page*, *Helena* and *Nerissa* in Shakespeare's plays; *Millamant* in Congreve's play; and *Lady Utterwood* in Shaw's *Heartbreak House*, and the She-Ancient in *Back to Methuselah* (1929).

Evans, Sir Edward Radcliffe Garth Russell, first Baron Mountevans (b. 1881), Eng. admiral and explorer. Popularly known as 'Evans of the Broke.' E. was in the S.Y. *Morning*, relief ship in search of Capt. Scott's ship the *Discovery* (1902-1904); was second in command of Scott's expedition to the South Pole and succeeded Scott on his death. In the First World War 1914-18 he commanded a destroyer patrol guarding the Straits of Dover and won fame in 1917 when his destroyer *Broke*, with *Swift*, defeated six Ger. destroyers which had crept through the fog to raid Dover. Commander of H.M.S. *Carlisle*, 1926-27; of the battle-cruiser *Repulse*, 1926-27; rear-admiral in command of the Australian Navy, 1929-1931; commander-in-chief, Africa station, 1933-35; of the Nile, 1935-39. Awarded King Edward VII. and King George V. medals for Antarctic exploration and a score of times decorated for bravery. London Regional Commissioner for Civil Defence, 1939-45. Created 1st Baron Mountevans, 1945. Publications: *Keeping the Seas* (1920), *South with Scott* (1921), and *Adventurous Life* (1946).

Evans, George Essex (1863-1909), Australian poet; b. in London; youngest son of John Evans, Q.C. Educated at Haverfordwest Grammar School and in Guernsey; emigrated in 1881. Edited the *Antipodean annual*, 1892, 1893, and 1897, with assistance from K. L. Stevenson. Poetry: *The Repentance of Magdalené Despar*, and other verses (1891); *Lorraine*, and other verses (1898); the fifty-guinea-prize poem on inauguration

of the Commonwealth (1901); *The Sword of Pain* (1905); *The Secret Key* (1908).

Evans, Sir George de Lacy (1787-1870), Brit. general, b. in Ireland. In 1815 he fought at Waterloo. He also distinguished himself at the siege of Sebastopol and the battle of Inkerman in the Crimean war, for which services he received the thanks of the House of Commons in 1855 and was created G.C.B.

Evans, Marian, see ELIOT, GEORGE.

Evans, Oliver (1755-1819), Amer. mechanist and inventor, b. at Newport, Delaware. He invented a machine for making wire card teeth (1777) used in carding cotton and wool, and is also noted for his improved machinery for flour-mills. E. is said to have invented the first steam engine constructed on the high-pressure system, sending his drawings and specifications to England, 1795. He also made the first steam dredging machine of U.S.A. His project of a railway between New York and Philadelphia failed through lack of funds. E. has been called the 'Watt of America.' He wrote *The Young Millwright's and Miller's Guide* (1795). See R. Thurston, *Growth of the Steam Engine*, 1878.

Evans, Robley Dunglison (1846-1912), Amer. naval officer; appointed to the Naval Academy from Utah in 1860. He was in command of the *Iowa* at the naval battle of Santiago in the Sp.-Amer. War, and was commander of the *Yorktown* at Valparaíso in 1891, where he earned the name of 'Fighting Bob Evans.' In 1901 he was made rear-admiral, and in 1902 commander of the Asiatic fleet. He became commander of the Atlantic fleet in 1905, and in 1907 commander-in-chief of that fleet on tour of the world. *A Sailor's Log*, pub. in 1891, is his work. He retired from public life in 1908.

Evans, William (1811-58), Eng. landscape painter in water-colours, is usually known as 'Evans of Bristol.' A painter of Welsh scenery, one of his finest works is 'Treh Mawr.'

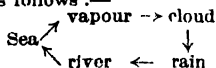

Evansville, beautiful residential city of Cook co., Illinois, U.S.A., 12 m. N.W. of Chicago. It is the seat of the North-Western Univ. of the Methodist Episcopal Church, of the Dearborn Observatory, and of three theological colleges, and the headquarters of the Women's Christian Temperance Union. Pop. 65,300.

Evansville, city in Indiana, U.S.A., a manuf. and commercial city, on the Ohio R. with fine parks and drives. There are many coal mines near and a trade in coal, hardwood lumber, and agric. products; flour, furniture and cigars are manuf. Pop. 97,000. Water power is supplied by a dam in the Ohio R.

Evaporation, or **Vaporisation**, is the process by which a substance changes into the state of vapour. Some solids, such as snow, camphor, iodine, etc., readily disappear in the state of vapour at temps. well below their melting points. The E. of a liquid may go on at all temps., but the rate of change is greater the higher the temp., until the boiling-point (g.e.) is reached, when free E. occurs. The rate at which E. takes place depends (1) on the

area of the surface exposed; (2) on the freedom from vapour of the space above the liquid; and (3) on the nearness of the vapour pressure to the external pressure. Thus, taking a quantity of liquid, it will evaporate most rapidly if placed (1) in a shallow vessel; (2) in a draught, so as to remove the vapour as soon as formed; and (3) if heated, or placed under an exhausted receiver, the vapour pressure being increased in the former case, and in the latter the external pressure reduced. If a quantity of liquid is placed in an evacuated vessel, some of it will evaporate until the space above the liquid is 'saturated' with the vapour; equilibrium is then maintained, or in other words, E. and condensation take place at equal rates. For every temp. there is a maximum vapour pressure, which becomes equal to atmospheric pressure at the boiling-point of the liquid. The presence of another gas or vapour, such as air, has no effect upon the magnitude of the vapour pressure, but merely increases the time taken to arrive at the state of equilibrium. A large amount of heat is absorbed in the process of E., the remaining liquid and its surroundings being cooled, sometimes to a considerable extent. Thus, by placing a dish of water under the receiver of an air-pump, together with some sulphuric acid to absorb the vapour, the water may be frozen by rapidly exhausting the receiver. Again, by directing a spray of ether upon animal or vegetable tissue, the latter is soon frozen by the cold produced by the rapid E. of the former, use being made of this for producing local anaesthesia in the case of small operations.

Evaporation in nature.—E. is constantly taking place all over the surface of the globe, but is most rapid in tropical regions, where the hot air is able to take up a large amount of moisture from the sea, lakes, and rivers. This water-laden atmosphere, when it condenses with a cooler climate, is chilled and gives up some of its moisture in the form of rain, snow, or hail, according to the surrounding temp. Thus the water on the earth is undergoing a constant cycle of E. and condensation which may be represented as follows:—

Taking the West of Europe, E. is rapid in spring and still more so in summer, and on the other hand, from Nov. to Feb. it is almost at a standstill, due to the falling temp. and consequent moisture-laden state of the atmosphere. Measurements of the annual E. have been made at various places, the following being a selection. Interior basin of the United States in lat. 36° N., 150 in.; Cumana, S. America, 136 in.; Madras, 91 in.; Co. Cavan, Ireland, 13 in.; and over a very large area in Europe less than 20 in. It has been found that in general the ann. E. and rainfall are approximately proportional.

Commercial applications of evaporation.—E. plays an important part in most

manufacturing processes, and various means have been devised to facilitate the removal of moisture from solutions and substances. Thus brine is concentrated by being made to trickle down piles of brushwood, placed in a current of air, a large surface being thereby exposed for E. The same principle is applied to the coolers used in breweries and elsewhere, a stream of water being made to trickle over the pipes containing the warm liquid. Liquids like sugar, syrups, and various extracts are evaporated in vacuum pans, in which the external pressure is reduced as far as possible by suction pumps, so that E. will proceed fairly rapidly, even at a low temp. The same principle is made use of in the multiple effect evaporator, which consists of a series of vacuum pans in which the vapour produced by the E. of the liquid in the first pan is used to heat the liquid in the second pan, and so on. In freezing machines of the liquid ammonia type, the low temp. is produced by the rapid E. of the liquefied ammonia under reduced pressure. See E. RAUSBRAND, *Evaporating, Condensing, and Cooling Apparatus*, 1933.

Eve, see ADAM.

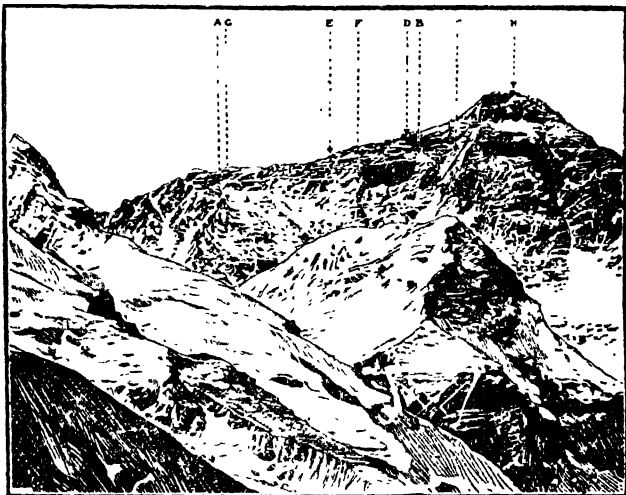

Evection (Lat. *evectio*, carrying upward, forth), in astronomy, a lunar perturbation or inequality, first discovered by Ptolemy. This inequality or eccentricity of the moon's orbit (alternately increasing and decreasing) is produced by the sun's action. E. may alter the moon's place by a maximum amount of 1° 15' in either direction, and the time of occurrence of an eclipse by six hours. These variations take place almost semi-annually, and depend partly on the position of the perigee. See LUNAR THEORY; MOON.

Eveleth, city of St. Louis co., Minnesota, U.S.A., lying in the midst of the great red and brown hematite iron ore deposits of the Mesabi Range. Mining and shipping are the prin. industries. Pop. 6800.

Evelyn, John (1620–1706), Eng. diarist, b. at Wotton House, near Dorking, Surrey, was educated at Southover free school, and went, in 1637, to Balliol, but came down in two years without a degree. He had some time before been admitted as a law student, and in 1640 he took up his residence in the Temple, though he never, apparently, thought of practising as a barrister. He was interested in horticulture, and improved the grounds of his father's estate of Wotton. From 1641 he travelled much on the Continent, but settled in England in 1652 at Sayes Court, Deptford, where he devoted much of his time to the gardens, which he brought to a state of high perfection. He was author of a celebrated work on arboriculture, entitled *Sylva*, or *A Discourse of Forest-Trees* (1664), etc. He did, indeed, do much to improve horticulture and introduce exotics into this country. He also wrote on a wide variety of subjects, including hist., religion, architecture, law, sculpture, navigation and commerce, medals, and sallets and pub. sov. tracts, of GK., Lat., and Fr. authors. The *Diary* was edited in later eds. by J. Forster (1850–52); H. B. Wheatley (1879 and 1906); C. Newnes

(1906); A. Dobson (1906); also in Everyman's Library (1907). See Helen Evelyn, *The History of the Evelyn Family*, 1915; Lord Ponsonby, *John Evelyn*, 1933; and the bibliography by G. Keynes, 1937. After the Restoration he held many minor offices and sat on various commissions. For a while he was secretary of the Royal Society, but twice declined the presidency. A friend of many notable people, including Pepys, he was *au courant* with most of the events of the day, which were duly recorded in his famous *Diary* which was

founded in 1880. The *St. James's Gazette* was from the first distinguished for its strongly literary character, and belonged rather to the category of reviews, like the *Spectator*. There were three other penny Conservative evening papers in the field against it, with the result that the 'news' element was increased, and it fell into line with particular movements by becoming an ardent supporter of Imperialism (q.v.). In 1903 it became the property of C. Arthur Pearson, who, in 1905, amalgamated it with the *Evening Standard*,

The Alpine Journal

MOUNT EVEREST

A, Camp. VI.: 26,700 ft. B, Point reached by Somervell in 1924. C, Point reached by Norton in 1924. D, 'The Second Step,' where Mallory and Irvine were last seen alive. E, 'The First Step.' F, Point reached by Finch and Bruce in 1922. G, Point reached by Mallory, Norton, and Somervell in 1922. H, The Summit.

discovered in 1817 in an old clothes basket and first pub. in 1818 ed. by Wm. Brac. It is a mine of information about England and the Continent in his day.

Evelyn, John, the Younger (c. 1655-98), Eng. translator and scholar, son of the diarist (d. 1706). E. trans. Plutarch's *Life of Alexander the Great* (1683-86), Rapin's poem, *Of Gardens* (1673), and Chassagnol's *History of the Grand Visiers* (1677). He contributed some Gl. hexameters to his father's *Sylva* (3rd ed.), 1678. Examples of his verse are in Dryden's *Miscellanies*, and Nicols' *Collection of Poems*.

Evening Primrose, see ORNOTHERA.

Evening Standard, a penny London evening paper formed, by an amalgamation in 1905, of two evening papers, the *Evening Standard*, founded in 1827 as the *Standard*, and the *St. James's Gazette*,

which had also become his property. It is now controlled by Lord Beaverbrook (q.v.) and makes a prominent feature of politics. With much the smallest circulation of the Beaverbrook trio of newspapers (the others being the *Daily Express* and the *Sunday Express*), the E. S. has always exercised in the past the most political influence. Among its editors in recent years were Frank Owen, Michael Foot, and Sydney Elliot, all independent minded. The paper is notable for its political and social cartoons by David Low, who came to the paper from the *London Star*.

Everdingen, Aldert (Allart) van (1621-1675), Dutch landscape painter and engraver; studied under R. Savery and P. Molyn, surpassing both. He excelled in sketches of rugged scenery, marine views, and storms. Among his best pictures are:

'Landscape with River,' c. 1648 (Louvre); 'Landscape with Waterfall,' 1650 (Munich); 'Wooded Slope,' 'Castle by River,' and 'Norwegian Waterfall' (Berlin Museum); 'Norwegian Landscapes' (National Museum, Amsterdam); 'Storm at Sea' (Munich). His most famous etchings are the series illustrating 'Reineke Fuchs.' Some of his original drawings are in the Brit. Museum.

Everest, Mount, or Chomolungma, summit of the Himalayas. It is situated on the frontier between Nepal and Tibet. The height has been ascertained as over 29,000 ft., and it is the highest mt. in the world. Its name is derived from Sir George Everest, a surveyor-general of India. Recent attempts to reach the highest peak have formed an epic story of Brit. pluck and endurance. In 1921 a reconnaissance party was sent out by the joint enterprise of the Royal Geographical Society and the Alpine Club, and this made an important survey of the mt. In the following year a climbing party approached the mt. by the Rongbuk Glacier on the Tibetan side, and in this attempt Norton, Somervell, and Mallory reached the height of 26,800 ft. without making use of oxygen; while Bruce and Finch, with a Gurkha who accompanied them, reached 27,200 ft. with oxygen. In 1924 a carefully organised expedition under Gen. Bruce set out from Darjeeling in the last week of March, forming themselves into two parties as they crossed Tibet in order not to overcrowd the rest-houses. In April the command was taken over by Col. Norton, owing to the ill-health of Gen. Bruce. Camps were estab. at different heights on the mt.; terrible snowstorms and blizzards were encountered, and at one time the temperature recorded 56° of frost. On May 15 a visit was paid to the Holy Lama in the Rongbuk Monastery, and his blessing was bestowed upon the native carriers. Early in June came the final stages. From a high camp Norton and Somervell climbed to 28,000 ft. without oxygen and Somervell alone to 28,130 ft. Later, with five porters to carry provisions and reserve oxygen cylinders, Mallory and Irvine estab. a still higher camp. It is unknown whether they actually reached the summit, for when last seen they had achieved the height of 28,230 ft., but the attempt cost them their lives, and their bodies have not been recovered. An illustrated account of this expedition, with a contribution by each of the survivors, is in the *Geographical Journal* for Dec. 1924. Aircraft flights were made over the summit by the Marquess of Clydesdale and Fl. Lt. McIntyre, members of the Houston expedition, in 1933. There were further climbing expeditions in 1933, when Wyn Harris and Wager found Mallory's ice-axe at about 28,000 ft., 1936, and 1938, but none has yet succeeded in reaching the summit, though some lives have been lost and a point within a thousand feet of the top has been reached. See C. K. H. Bury, *Mount Everest, the Reconnaissance*, 1921; C. G. Bruce, *The Assault on Mount Everest*, 1922; E. F. Norton, *The Fight for Everest*, 1924; Sir F. Younghusband,

The Epic of Mount Everest, 1928; H. Rutledge, *Everest* 1933, 1934, and *Everest—the Unfinished Adventure*, 1937; F. S. Smythe, *Camp Sir*, 1937; Douglas and Clydesdale (Marquess of) and D. F. McIntyre, *The Pilot's Book of Everest* 1936; H. W. Tilman, *Mount Everest* 1938-1948.

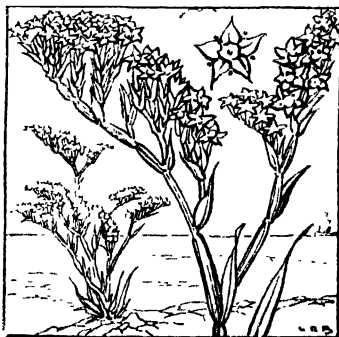

Everett, (1) until 1870 part of Malden, 3 m. N. of Boston, U.S.A., now a city with a pop. of 46,700 with important manufs., including coke, chemicals, leather goods, tools, trunks, etc. (2) A city of Washington, U.S.A., 28 m. N. of Seattle on Puget Sound, with a fine harbour and beautiful mountain scenery, many lumber mills, iron works, and factories and salmon canneries. Pop. 30,200.

Evergem, small tn. of E. Flanders, Belgium, situated 4 m. N. of Ghent. Makes lace, linen and cotton goods, starch and soap. Pop. 8700.

Everglades, lake in S. Florida, U.S.A. It is large but shallow, and contains a great number of small is. which are covered with dense overgrowth and are frequented by numerous alligators. Florida is sometimes called 'Everglade State,' after this swampy dist.

'**Evergreen State**,' see WASHINGTON.

Evergreens, are those plants, shrubs and trees which keep their leaves and do not shed them annually. The leaves sometimes live as long as four or five years on E. trees, but they are constantly shedding and making new ones, so that the trees are never left bare. In tropical climates certain trees that are deciduous when grown in temperate regions are E.; as an example of this the *Robinia pseud-acacia*, popularly known as acacia, may be quoted. All conifers except the larch are E., and many shrubs and creepers, e.g. box, laurel, ivy, are cultivated because they do not shed their leaves in autumn.

EVERLASTING FLOWERS: STATICE

Everlasting Flowers or Immortelles, are flowers which retain their form and colour for a long time after they have been picked and dried. A few genera of the order Compositae are among the best known, and sev. are cultivated in gardens for

decorative purposes; they are often dyed bright colours, and some are bleached white. *Antennaria dioica*, mountain everlasting, or cat's foot, is the only Brit. species growing wild, but *Anaphalis margaritacea* is naturalised in S. Wales, Scotland, and the Channel Is. Species of *Helichrysum* are the ones best suited for cultivation in gardens. They should be gathered on a dry day before the flowers are fully opened. Statice, or sea lavender, is a graceful species used both for greenhouse and for garden cultivation. (The genus is sometimes referred to as *Lunonium* by botanists.) It has purplish flowers in summer, and is about 18 ins. in height.

Eversley, vil. of N.E. Hampsh-ire, England. There is in the neighbourhood a fine old Jacobean residence, Braunschill House, which was built for the son of James I. Pop. 900.

Evertsen, Dutch naval family which produced sev. distinguished officers, of whom five were brothers. Two of them were killed in action, viz. Vice-Adm. Cornelius in 1666 in the second battle off the N. Foreland; and Adm. Jan. in the same year in 'St. James's Fight.' Cornelius, the son of Jan., attained the rank of vice-admiral and died in 1679. No fewer than nine members of the E. family fell in action at sea.

Everyman, title of a morality play of the fifteenth century. The characters are Everyman, God, Death, Good Deeds, Knowledge, Beauty, Strength, etc. Everyman is summoned by Death, and all his friends forsake him, except Good Deeds. See E. Rhys (ed.) *Everyman and other Interludes* (Everyman's Library).

Everyman's Library. The title of a comprehensive library of the representative works of all time, initiated in 1906 and pub. at a popular price by Joseph Malaby Dent (q.v.) of the firm of J. M. Dent & Sons, Ltd., London, and imported into the U.S.A. and pub. there by E. P. Dutton & Co., Inc., New York. The name was suggested by Ernest Rhys, the general editor (q.v.), whose cue was the line in the old morality play of *Everyman*, 'I will go with thee, and be thy guide.' It now comprises (1919) 987 vols., and new vols. are issued every year. There existed in Eng. previously to its inauguration a number of inexpensive series of classics, but nothing on a large enough scale to ensure the universality essential to complete success. Among its fore-runners were Henry Morley's *Universal Library*; the *Camelot Series*; Grant Richards's *The World's Classics*, now continued by the Oxford Univ. Press; and J. M. Dent's own ed. of the *Temple Classics*. There were also two very notable continental exemplars, the *Reclame* library of Germany and the *Bibliothèque Nationale* of France. The democratisation of knowledge was the fundamental purpose of E. L., and this was in no small measure a spur to the enthusiastic co-operation of editors, printers, paper-makers, binders and other collaborators of the publisher. The essentials of inexpensive production, coupled with good

quality of materials and workmanship and an attractive format, having been settled, some 10,000 copies of nearly every book in the first one hundred and fifty of the series were printed and issued in three batches within a couple of years; and the price of each vol. was fixed at one shilling (unavoidably increased after the 1914-18 war and still further during and after the Second World War, the price in 1919 being four shillings and six pence).

The success of E. L. necessitated the estab. of Dent's factory, The Temple Press, Letchworth, Hertfordshire, the firm's City binding works not being large enough to cope with the immense binding requirements of E. L. vols. Binding at Letchworth commenced at the end of 1906, and two years later the factory was enlarged by the installation of a printing plant. To-day almost all the vols. are bound at Letchworth; most of them are also printed there, but some are still printed by the outside firms who played a generous part in the inauguration of the library, among whom H. Clay & Sons, Ltd., of Bungay, Suffolk, are outstanding. The size of the vols. is 64 by 4½ in., pocketable but large enough for the bookshelf; the number of pages in the vols. ranges from 250 to 1000. In 1931 the typographical lay-out and binding style were brought into line with modern practice. E. L. consists of thirteen sections: Biography; Classics (Gk. and Rom.); Essays and Belles Lettres; Fiction (which with over 250 vols., is naturally the largest section, including often the complete range of novels by renowned authors, e.g. Dickens, Scott, Jane Austen); History; Oratory; Poetry and Drama; Reference (in which section *Everyman's Encyclopedia* was originally issued); Romance; Science; Theology and Philosophy; Travel and Topography; and books for Young People. There are in fact very few works of out-standing importance in Eng. literature which are not to be found in E. L.; and included in every section is a good number of trans. from famous foreign works. Although most of the vols. have a wide appeal, the publishers have included many less-known works of great importance to students, and such classics as Grote's *History of Greece*, in 12 vols.; Gibbon's *Decline and Fall of the Roman Empire*, in 6 vols.; Mommsen's *History of Rome*, in 4 vols.; and Hakluyt's *Voyages*, in 8 vols., besides many others which, in the ordinary way, are not accessible to the general public.

It is estimated that there are nearly 200 vols. in E. L. containing works not available in any other ed. and about another 50 vols. of works only available in eds. at a considerably higher price. A consistent feature of the library is the use of unabridged texts; only with a relatively few works is an abridged text used, this fact being then plainly stated. Critical and biographical introductions are included wherever desirable, and many of the older works have been specially edited for the series; bibliographies are always given. To keep the library abreast of current scholarship works issued in the

series from twenty to forty years ago are, where necessary, re-edited and completely re-set, recent examples being Plato's *Republic*, in the trans. of Lord Lindsay, the poems of Keats, Matthew Arnold, Byron and Tennyson, the four vols. of *The Spectator* essays, *Lamb's Letters*, in the E. V. Lucas edition, Thucydides' *Peloponnesian War* with a new index, the trans. of Balzac's novels, Boswell's *Johnson*, newly introduced and indexed, and White's *Selborne*, newly annotated. Since 1934 the editors have aimed at including more works in all classifications by modern writers, among such being Samuel Butler, G. K. Chesterton, Joseph Conrad, Havelock Ellis, E. M. Forster, Dr. Charles Gore, W. H. Hudson, Aldous Huxley, Henry James, D. H. Lawrence, Walter de la Mare, Somerset Maugham, H. G. Wells, Virginia Woolf. The Second World War interfered with the production of the Library owing to the shortage of materials and labour, which coincided with an increased demand for the classics of literature, and even four years after the war a considerable number of the 987 vols. were still out of stock, but it is the publishers' intention to restore all the vols., with very few exceptions, to circulation within the shortest possible time. The total sales of the Library during its forty-two years of existence are over 37,000,000. The Library has from its earliest days circulated throughout the world, not only in the Brit. Commonwealth, the U.S.A., and all Eng. speaking countries, but on the continent of Europe, in S. America, Japan, and China, and indeed in the most remote places.

Eves, Reginald (1876-1941), Eng. painter, b. in London: From Univ. College he passed with the Trevelyan Goodall scholarship to the Slade School, where he studied under Legros, Frederick Brown, and Henry Tonks and won the Slade Scholarship. In 1899 his picture 'Waiting' was accepted for the Royal Academy: E. became a regular exhibitor at the Royal Academy, Royal School of Portrait Painters, the Salon and elsewhere, specialising in portraiture. His first portrait to be acquired by the National Portrait Gallery was that of Thomas Hardy, bought in 1931. Other portraits in the same gallery are those of Shackleton and Jelliffe and, in the Tate Gallery, are portraits of Sir Frank Benson and Sir Max Beerbohm. Among his portraits of women are those of the Queen of Spain and Miss Julia Neilson. If he lacked charm of colour, he had a fine feeling for character. Future generations will rely for their knowledge of what the men of his age were like very largely on E.'s portraits. He also excelled in water-colour landscapes.

Evesham, municipal bor. and markt. tn. of Worcestershire, England. It is situated on the r. b. of the Avon, 15 m. S.E. of Worcester. The extreme fertility of the soil renders the neighbourhood most suitable for mrkt. gardening, which is the chief industry. There is a fine bridge over the riv., here navigable, also a library, technical college, hospital, etc. By a

battle fought here in 1265, by which Henry III. regained the throne and the barons were crushed for a time: the Prince of Wales defeated Simon de Montfort, Earl of Leicester. E. is noted for its abbey founded in 701, a magnificent detached tower, rebuilt in the fifteenth century, 110 ft. high, and containing a clock with chimes and ten bells, which still remain, also a mutilated gateway of the twelfth century, a fine arch and the abbot's stables. Pop. 8800.

Eviction, in law, means the ejection of a person from possession of lands or tenements. E. may be total or partial, an instance of the latter being where some other person sets up a claim to a right of way or other easement over the land. Entry by a landlord to view the state of repair, or to effect alterations, is not E. or trespass if the tenant agreed to allow the landlord to enter for such purposes. To maintain an action for damages for E. physical expulsion need not be proved, any act tending to prejudice the quiet enjoyment or comfort of the tenant being an E. or *constructive E.* The remedy for E. is generally by an action of damages for breach of a covenant (*q.v.*), for quiet enjoyment, and an action of ejectment to recover the land (*see ENTRY*); but, when there is no contractual relationship between the tenant and the person evicting him, an action of damages for trespass would be the appropriate remedy, and if the evictor acted without colour of right, the tenant would recover heavy damages. In the case of a house protected under the Rent Restriction Acts, the Courts require satisfaction on sev. essential points before they will grant an E. order. *See also RECOVERY OF LAND.*

Evidence. Legal E. denotes the means by which facts are ascertained for judicial purposes. It is a branch of the law of procedure, but there exists no general or codifying Act, and indeed it is probably undesirable that judicial discretion in the matter of reception of E. should be so fettered. Sir James Fitzjames Stephen was employed in 1872 to draw a code for England, but the code drawn never passed into law, although its model, drafted by the same judge, subsequently became the Indian Evidence Act of 1872. The whole of our law of E. as it exists now, is a system of restriction upon the admission of testimony, and based as it is upon the formal rules of inductive logic, reveals a strong tendency to narrow the freedom which formerly characterised, especially in state trials, the conduct of judicial proceedings. The bulk of the rules of E. is negative in character. That part of the law of E. which relates to *relevancy of facts* as distinct from *mode of proof of a fact* deemed to be relevant is dominated by four primary rules of exclusion or rules which, (subject to certain important exceptions), exclude the admission as E. of facts which outside legal circles might well be regarded as affording excellent testimony. These rules include the following four classes of facts: (1) Facts similar to, but not specially connected with, each other, *e.g.* if the issue is whether A forged B's signature

to a cheque, the fact that he forged C's signature on some former occasion is irrelevant. But if there is a question whether an act was done intentionally or accidentally by A, the fact, if so, that such act formed part of a systematic course of conduct would be relevant, e.g. if A is suing on a policy of fire insurance, the fact that he had sustained fires in other houses insured by him would be relevant to the issue whether the fire was accidental or not. (2) The fact that a person not called as a witness has asserted the existence of any fact. This is the fundamental principle which is more popularly expressed in the maxim that hearsay is no E. The most striking exceptions to this rule are afforded by the various rules of convenience which allow of the admission of statements by deceased persons (as to which see DECLARATIONS OF DECEASED PERSONS), and statements which amount to admissions. Admissions may be E. against a party to an action when made in his behalf by any person who has a substantial interest in the event of the proceedings, or who is an agent expressly or impliedly authorised by that party to make such admissions. But admissions made 'without prejudice' can under no circumstances be adduced in E. The rule against hearsay renders irrelevant statements in books or documents not made by parties to the proceedings or their authorised agents. Exceptions to this rule, excluding documentary E., include, *inter alia*, entries in public records, official books, or registers; recitals of public facts in statutes and proclamations, and statements in works of hist. Final judgments, orders or decrees of any court are always E. as against all persons of all facts stated or decided by such judgments, etc., or upon which they are based, but not of facts which may only be inferred as probable from their existence. (3) The fact that any person is of opinion that a fact exists. Fact not opinion is what a witness is in general required to state. But the opinions of experts on points of science or art are admissible in E., subject to the judge's decision on their competence as experts. As a matter of law judges have full power on all technical matters to call in the aid of judicial assessors, but except in Admiralty cases they seldom avail themselves of their statutory powers. (4) The fact that any person's character is such as to render conduct imputed to him probable or improbable. E. of character, may, however, be given in criminal trials in certain circumstances stated in the Criminal Evidence Act, 1898. That Act allows the prosecution to give E. of a prisoner's bad character if the prisoner has himself or by his counsel given E. to establish his own good character, or has at the trial cast imputation on that of the prosecutor or the witnesses for the prosecutor or the witnesses for the prosecution. E. of previous convictions may be given before the verdict (a) if proof of such former offences is admissible on other grounds, e.g. as showing a systematic course of conduct (see above); (b) to rebut E. of good character.

E. is said to be either oral or documentary. Documentary or written E. consists of records, documents under seal, such as charters and deeds, and writings not under seal. Bentham used the term real E. to denote such E. as was neither oral nor documentary in the above special sense; but E. which is not oral is generally classified, even if unscientifically, as documentary. Acts of Parliament are records of the highest nature, from their quality as the memorials of the legislation; but a distinction is made with respect to E. between public and private statutes. A public statute requires no proof in courts of justice; but private Acts must be proved by copies compared with the original roll of Parliament. Records of the proceedings of courts of justice are proved by exemplifications, sworn copies and office copies. Exemplifications are transcripts of the records of different courts, accredited by having the seals of such courts attached to them. Sworn copies are transcripts made by individuals who authenticate them upon oath when they are produced in E. Office copies are copies certified to be true and accurate by an officer expressly entrusted with that business. The reception of various certificates, official and public documents, is regulated by various statutes, especially the 8 and 9 Vict. c. 113. Charters and deeds are proved by the production of the instrument and proof of the execution by the party to be charged with it; but where the document is more than thirty years old the execution need not be proved. The general rule is that the original deed must be produced. Deeds attested must, in general, be proved by one at least of the attesting witnesses; but if the witnesses be dead, or cannot be found, the execution may be proved by proof of the handwriting of the party. The method adopted to prove handwriting in general is to secure the testimony of some person acquainted with the handwriting of the individual in question, or who has seen him write, or who has had written correspondence with him; but otherwise the testimony of persons skilled in calligraphy as 'experts' is wholly excluded.

Practically all persons are competent to give E. at the present day. Formerly plaintiffs and defendants were not allowed to give E. on the ground that they were interested parties, the result being that probably the best possible E. was excluded. Where the judge decides that any witness is too young or mentally infirm to testify, the witness is incompetent to give E. In certain cases witnesses may claim a privilege (see CONFIDENTIALITY IN LAW). Since the passing of the Criminal Evidence Act, 1898, both the accused and the husband or the wife of the accused are competent witnesses; but the principle that the accused is not compelled to incriminate himself is preserved by the provision that such witnesses are not compelled to give E. except that the wife or husband of accused may be called either for the prosecution or the defence, and without the consent of the accused, if he

(or she) is charged with any offence under the Vagrancy Act, 1824 (neglect to maintain wife and family), offences against the Person Act, 1861 (relating to rape, indecent assault, and the like offences), the Married Women's Property Act, 1882 (offences by a married man or woman against the other spouse's property), and the Criminal Law Amendment Act, 1885 (sexual offences). E. must be given on oath unless the witness objects to being sworn, upon the ground that he has no religious beliefs, when he may instead solemnly affirm in the Scottish fashion. Children of tender years who do not understand the nature of an oath may give E. without being sworn if the judge thinks the child sufficiently intelligent to give E. and to understand the moral obligation of speaking the truth.

The only change for many years in the principles of the law of E. is that introduced by the Evidence Act, 1938, which admits documentary E. in civil proceedings in order to establish facts on which direct oral E. would be admissible. But such E. is only admitted where the maker of the documentary statement *either* had personal knowledge of the matters therein dealt with, *or*, if he had not, the document is part of a continuous record and he made the statement in the performance of a duty to record information supplied to him by a person who might reasonably be supposed to have personal knowledge of the matters recorded. But in either case the maker of the statement must be called as a witness. The court may, in order to avoid undue expense or delay, admit such a statement in E. notwithstanding that the maker of it is available but is not called, and in these circumstances the court may accept a certified copy of the original document. But nothing in the Act will render admissible as E. any statement made by a person interested at a time when the proceedings were pending or anticipated. It is for the court to decide what weight is to be attached to such statement, regard being had to the question whether the statement was or was not made contemporaneously with the occurrence or existence of the facts stated, and to the question whether or not the maker had any incentive to conceal or misrepresent the facts. See Stephen, *Digest of the Law of Evidence*, 1876; Taylor, *The Law of Evidence*, 1920; Roscoe, *Digest of the Law of Evidence*, 1928; Phipson, *Law of Evidence*, 1942.

Evil has no positive existence. It is the privation of good, rather than the mere absence of it, *e.g.*, it is a physical evil for a man to be blind, since it is natural for him to see, and it is a spiritual evil for a man to refuse to do what he knows to be good. The existence of E. is one of the everlasting problems both of theology and philosophy—how to account for it, and what to infer from it; and in accordance with the significance attached to it, philosophy inclines to an optimistic or pessimistic view of the world, or, further, an attempt to compromise between the two. The last theory would explain E. as warring against the triumph of good,

and is thus of a dualistic character. J. S. Mill, in his *Essays on Religion*, regards this as a plausible explanation of the mixture of good and E. in the world. The difficulty of explaining E. is theological rather than scientific, it being often stated that for science there is no E. in the universe. The teachings of Freud and the psychoanalysts on the origin of the 'sense of guilt' are of interest in this connection, but the recent tendency of scientific thought is to recognise its limitations, and to leave moral questions to the theologians.

Evil Eye. From the earliest times there has existed the superstition that certain people possess the power of injuring, bewitching, and even killing by a glance from the eye; hence the expression Evil Eye. Children and young people were supposed to be particularly susceptible, and in the East any unexpected calamity befalling a child was accounted for by its having been 'overlooked.' The glance of a person suffering from any physical calamity, such as a cast in the eye or a squint, is regarded as particularly dangerous. The power was supposed to be involuntary in many cases and not cultivated with evil intent. Few of the old classic writers fail to refer to it, and the wearing of amulets or charms against it was universal. Envy was supposed by many to be the impulse of the E. E., and it was therefore looked upon as unfortunate to have one's possessions praised unduly, the prosperous in particular having reason to fear it. The power of the E. E. over animals as well as children was dreaded, and in the Scottish Highlands as late as the eighteenth century the belief as affecting cattle was universal. It is still feared for horses in India and China.

Evil-Merodach, Avel, or Amel-Marduk ('man of Marduk'), king of Babylon (c. 561-559 B.C.), son and successor of Nebuchadnezzar. He released Jehoiachin, King of Judah, from prison in the thirty-seventh year of his captivity (see 2 Kings xxv, 27). He was killed in a rebellion led by his brother-in-law, Neriglissar (Nergalsharezer), who seized the crown in his stead. Berosus (third century B.C.) speaks of him as an arbitrary and unwise ruler.

Evoli, see ENOLI.

Evolute, see CURVE.

Evolution (Lat. *evolutio*, an unrolling), literally, the process of opening out or unfolding what is wrapped up. In biology it is applied to the unfolding of successive phases of development in the growth of animal and vegetable organisms. Herbert Spencer's definition is as follows: 'E. is an integration of matter and concomitant dissipation of motion; during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity, and during which the retained motion undergoes a parallel transformation.' (*First Principles*, pt. II, chap. xvii.). The theory of E., first started by C. Bonnet in 1762, is the hypothesis that the germ (instead of being brought into existence by the process of fecundation) is developed from a

pre-existing form which contains the rudiments of all parts of the future organism. This theory (also called the theory of Proliferation) is directly opposed to that of 'epigenesis.' This latter view, which originated with Aristotle, was supported in the eighteenth century by C. F. Wolff, who believed that development came about through a series of new formations and transformations, and 'epigenesis' entirely superseded the old evolutionist theories of Bonnet, until they were revived in a more refined form in the 'germ-plasm' theory of Weismann. It is shown that the ovum cannot be entirely undifferentiated, as parts of the adult organism may be traced back to corresponding parts in the embryo. E., however, in this sense is only a branch of embryology (*q.v.*). The word is more generally applied to the development of matter from its simple unorganised condition—or even from the electron-systems called atoms from which matter itself evolved—to the present structure of the physical universe. This is called Inorganic E. and its main direction is towards the 'degradation' of energy, for in every transformation of inorganic matter some energy is wasted. Living matter is a more complex form of inorganic matter and the living may be said to have originated from the non-living. Setting aside the possibility of spontaneous generation, matter gradually assumed the properties of living matter through the medium of colloidal compounds of carbon which form the proteid, common only to plant and animal life. Organic E. traces the development of simple unicellular forms of protoplasm, called protista by Haeckel (*q.v.*), to more complex multicellular forms, from aquatic forms to terrestrial, from invertebrates to vertebrates, and from mammals to man (*see BIOLOGY*).

The theory of E. is especially associated with the name of Charles Darwin (*see DARWINISM*), but it had been foreshadowed by Aristotle among the Gks., and by Linnaeus and Buffon, Erasmus Darwin and Lamarck in the eighteenth and nineteenth centuries. A group of Catholic Darwinists also appeal to St. Augustine's teaching of 'rationes seminales.' The evidence for organic E. lies in the study of fossils (paleontology), the similarities in development and in structure of certain animals (and plants), and in the facts of their geographical distribution; there is also direct evidence of blood relationships in higher animals.

In the sphere of idealist-philosophy Hegel developed the moral and abstract element of his philosophy of spirit in correlation with the idea of E. Apart from the fact of E., various theories as to its method have been propounded—the theory of inheritance of acquired characters by Lamarck and that of natural selection by Darwin and Russel Wallace. In addition, there is the theory of orthogenesis that evolutionary change follows definite and predetermined directions, and also Cope's theory of kinetogenesis or 'mechanical genesis.' In so far as orthogenetic E. tends towards the development

of the 'highest' type, it has not been a straight ladderlike process, but one of slow experiment and frustration, as is shown by the study of paleontology. In fact, E. does not show any tendency to produce a high type, only a number of types, and it is only to the E. of Mind that orthogenesis in the sense of evolving 'upwards' can be applied strictly. We must assume, however, that something of the same nature as Mind is inherent in all living organisms, but in the course of E. new properties arise. Such E. Bergson calls 'creative' and Lloyd-Morgan 'emergent.' It must be borne in mind that E. as a theory cannot adequately explain the cause of such emergencies; it only professes to show their relation to preceding and succeeding emergencies. Before the emergence of Mind in man E. was operated by the blind purpose of adapting types to their environment and of insuring the survival of those best adapted, but with the beginning of what is called the 'psychozoic period' Mind became dominant, and, with Mind, values, and subsequently ethical values, came into being. Man is the agent of a self-conscious E., which, as Thomas Huxley points out in *Evolution and Ethics*, is at variance with the non-moral cosmic process from which he himself has evolved. We may hold, however, that a self-conscious ethical E. will be the central fact of future development. Whereas before Mind the direction of E. was decided by environment, Mind enables man to control this and, in the words of L. T. Hobhouse, 'to grasp the conditions of its development that it may master and make use of them in its further growth.' In connection with purpose in E. we may recall Huxley's definition of a species: 'In most cases a species can be regarded as a geographically definable group, whose members actually interbreed or are potentially capable of interbreeding in nature, which in nature does not interbreed freely or with full fertility with related groups, and is distinguished from them by constant morphological differences.' Huxley, therefore, gets rid of the idea of purpose from the universe but believes in 'biological progress.' He detects no purpose in past E.: 'The purpose manifested in evolution, whether in adaptation, specialisation, or biological progress, is only an apparent purpose. It is just as much a product of blind forces as is the falling of a stone to earth or the ebb and flow of tides. It is we who have read purpose into evolution, as earlier men projected will and emotion into inorganic phenomena like a storm or earthquake. If we wish to work towards a purpose for the future of man, we must formulate that purpose ourselves. Purposes in life are made, not found.' Commenting on these statements, Julian Huxley says: 'But then if it be admitted that, through the mechanism of natural selection, there is purpose in the universe, can we resolve the difficulty offered by apparent examples of fiendish purpose, by the thought that we, with our high level of consciousness, may be reading into the lower levels feelings which do not there exist? Or

must we appeal, with the theologians, to a fundamental falling-away of the universe from its destined purpose—in short, to Original Sin? (See Julian Huxley, *The Modern Synthesis*. See also ANTHROPOLOGY; BIOLOGY; DARWINISM; MAN. The method of E. has long ago superseded the *a priori* in the writing of hist.; one of the most brilliant expositions of the method in this sphere was the work *Ancient Law* by H. S. Maine (1861).

Evora (Ebora, or Liberalitas Julias): (1) Dist. of Portugal, extending W. from R. Guadiana and the Sp. frontier. Pop. 207,900. (2) Tn. and archiepiscopal see, cap. of above, Alentejo prov., 70 m. from Lisbon. It has ramparts and a citadel, a fine Gothic cathedral (1186), narrow, picturesque streets and places, a theatre, library, and an archaeological museum, in the building of the former Jesuit univ. There are also the lyceum, archiepiscopal seminary, and orphanage. It manufs. textiles and leather and has a trade in wine. The aqueduct and ruined temple of Diana are attributed to Sertorius, who captured E. about 80 B.C. E. is bounded by the Serra d'Ossa on N. and E. Pop. 16,000.

Evremond, Saint-, Charles Marguetel de Saint-Denis (1613-1703), b. at St. Denis in Normandy, and educated at Clermont, Oen, and later at the Collège d'Harcourt in Paris. He afterwards entered the army, and fought with distinction in the Thirty Years' War, seeing much service in the Netherlands. He had to flee, however, in 1661, first to Holland and thence to Eng. where he received a cordial welcome from Charles II. and became the chief figure of the salon of the Duchess of Mazarin in London. His fame as a Fr. writer and wit is notably illustrated in his *Conversation avec le Père Canaye*, and *Lettre sur la Paix des Pyrénées*, and his writings include

various essays and comedies and the charming letters to Ninon de l'Enclos. For good vols. of selections, see C. Giraud (1865) and Lescoure (1881). Although he lived for the best part of forty years in Eng., E. never learned Eng., and was unacquainted with Shakespeare. He was buried in Westminster Abbey. E. figures in Dickens's *Tale of Two Cities* under the assumed name of Charles Darnay.

Evreux, tn. in France, cap. of the dept. of Eure. The cathedral (eleventh century) is its most interesting building. The church of St. Taurin is noted for its belfry, 144 ft. high. It manufs. hosiery and textiles, and has iron and copper works. In the Second World War much damage was done to the tn., including the cathedral. In the advance of the Allies to the Seine E. fell to the British forces on Aug. 23, 1944, soon after the elimination of the Falaise 'pocket.' Pop. tn. 20,400, arron. 136,000.

Evseyevich, Grigory, see ZINOVIEV, GEORGY.

Ewald, Heinrich Georg August (1803-1875), famous Ger. Orientalist and biblical critic b. at Göttingen. He was prof. of philosophy and Oriental languages at Göttingen, 1827-37; prof. of theology at Tübingen, 1838-48; and again at Göttingen, 1848-67. He lost his position for a time for political reasons, both in 1837 and 1867. His first book on *Genesis* appeared in 1823. E.'s greatest work was *Geschichte des Volkes Israel bis Christus*, 1843-59, trans. into Eng., 1867-86. Other works are *Kritische Grammatik der hebräischen Sprache* (1827); *Die Poetischen Bücher des alten Bundes* (1835-39), *Die Propheten des alten Bundes* (1840), *Die Altertümer des Volkes Israel* (1848), *Die Lehre der Bibel von Gott* (1871-76). Many of his works have been trans. into Eng. See T. W. Davies, *Heinrich Ewald*, 1903.

Ewald, Johannes (1743-81), Dan. poet, b. at Copenhagen, son of a pastor. In 1764 he wrote an allegorical poem entitled *Lykkens Tempel*, which was well received, but his lyrical power is best shown in the biblical drama, *Adam og Eva* (1769), and in the lyrics *Til Sjaelen* and *Til min Moltke*. His most beautiful work, the opera *Fiskerne*, was written in 1778, containing a song called 'Kong Christian stod ved højen Mast,' which has become the national song of Denmark.

Ewart, James Cossar (1851-1934), Scottish zoologist, educated at Penicuik and Edinburgh. Became prof. of natural hist. at Aberdeen in 1878, and regius prof. of natural hist. at Edinburgh Univ., 1882. Started the marine biology station near Aberdeen in 1879, and became a member of the Fishery Board for Scotland in 1882. His works include: *The Locomotor System of the Echinoderms* (with Romanes) (1881), *On the Preservation of Fish* (1887), *Guide to Zebras, Hybrids, etc.* (1900), *On a Pre-hyaline Hybrid* (1907), *The Development of the Horse* (1915), *Moulting of the King Penguin* (1917), *The Nesting Feathers of the Mallard* (1921).

Ewe, group of Negro people in W. Africa, living off the Slave Coast, in a country to which they give the name of

'Eweme' (Land of the Ewe). Their family consists of five groups: the Anlo, the Kpeli, the Jeji, the Dahomeyans, and the Mahi, all speaking different dialects of E. E. are a pagan tribe, noted for their human sacrifices in honour of the dead.

Ewell, Richard Stoddert (Stoddard) (1817-72), Amer. soldier on the Confederate side in the Civil war. He graduated at West Point in 1840. In the Mexican war (1847) he was present at Contreras (q.v.) and Churubusco (q.v.). He helped to suppress the outbreak of the Apache Indians in 1857, and resigning his commission on the outbreak of the Civil war, 1861, served under 'Stonewall' Jackson. E. commanded a div. near Richmond (1862) and a corps of Lee's army at Gettysburg (1863). He was badly wounded at the battle of Bull Run (1861), and at Warrenton Turnpike. He was also present at Winchester, the Wilderness, and Spottsylvania Court-house (1864). Captured by Sheridan at Sailor's Creek, near Appomattox R. in 1865, he lived in retirement after the war.

Ewing, Sir James Alfred (1855-1935), Scottish civil engineer, b. at Dundee; in 1881 he pointed out the phenomenon of *hysteresis*, or the lagging of magnetic effects behind their causes. He was prof. of mechanical engineering at the Imperial Univ., Tokyo, Japan, 1878-83; at Univ. College, Dundee, 1883-90; at Cambridge Univ., 1890-1903 (Rede lecturer there, 1904). He was director of naval education, 1903-16; a member of the Ordnance Research Board, 1906-08. During the First World War he was in charge of the cipher department of the Admiralty. He was awarded the Albert medal, 1929. His publs. include: *Treatise on Earthquake Measurement* (1883), *Magnetic Induction in Iron and other Metals* (1891), *The Steam Engine and other Heat Engines* (1894), *The Strength of Materials* (1899), *The Mechanical Production of Cold* (1908), *Thermodynamics for Engineers* (1920), *The Physicist in Engineering Practice* (1923).

Ewing, Juliana Horatia Orr (1841-85), Eng. writer for young people, b. in Yorkshire, daughter of Margaret Gatty, author of *Parables of Nature*, to whose pub., *Aunt Judy's Magazine*, she largely contributed. She married Major E. in 1867, and to this may be attributed her interest in soldiers, as exemplified in many of her tales. Amongst her delightful stories of child-life may be mentioned: *Mrs. Overthway* (1869), *The Brownies and Other Tales* (1870), *Jan of the Windmill* (1876), *Old Fashioned Fairy Tales* (1882), *Jackanapes* (1883), *Snapdragon and Old Father Christmas* (1888), *Purses for Children* (1888). See *Everyman's Library* eds. of *Jackanapes* and *Mrs. Overthway's Remembrances* (1916); life by H. K. F. Eden (her sister) (1885), also Christabel Maxwell, *Mrs. Gatty and Mrs. Ewing* (1949).

Examination, in evidence, denotes the interrogation upon oath of witnesses. E.-in-chief means the interrogation of one's own witnesses; cross-examination, that of the opposing witnesses; and re-examination, that of one's own witnesses after they

have been cross-examined. In E.-in-chief counsel is not entitled to put leading questions, that is to say, questions which suggest the answer expected. In cross-examination there is no such limitation, or, indeed, any other limitation than that imposed by the discretion of counsel himself or the presiding judge. Questions in re-examinations can only be put upon matters arising out of the cross-examination; the object of re-examination is to rehabilitate a witness whose testimony has been shaken in cross-examination, but leading questions may not be put any more than in E.-in-chief. On application to a judge in chambers, leave may be obtained to examine witnesses abroad, by the process called taking evidence on commission. See also EVIDENCE.

Examinations. Educational Es. as now held have evolved from those of the medieval univs. Since the function of the univs. then was only to teach, their tests were directed towards ascertaining fitness to lecture—successful candidates obtaining the Doctor's or Master's degree. Among the earliest univ. tests of which we know details were those held at Bologna in the thirteenth and fourteenth centuries, which consisted of a private *visa voce* examination and a public 'conventus' or delivery of a speech and maintenance of a thesis against opponents. The same principle obtained in the rather more complicated system in vogue at Paris. In both cases the questions included both 'set books' and 'unseens', and heavy fees were required of the candidates, who were placed in order of merit. The Bachelor's degree, which of course preceded the Doctor's, was sometimes awarded without E. on the completion of a course of study, and what test was prescribed in other cases was usually more or less formal. Written answers to set questions, and practical, i.e. other than oral tests, in subjects such as medicine, were later innovations, while the competitive element and the number of subjects required for E. have also largely increased in the course of years. But on the whole the present system of univ. education is a recognisable development of the medieval system, with the difference that the Bachelor's degree has become more important. Thus at Oxford the stages are Responsions or 'Smalls,' Moderations, and Finals (Pass and Honours) for B.A., three years, after which M.A. is awarded on payment of a fee without E. At Cambridge they are the Previous E. of 'Little-Go,' and the Tripos E., in two parts. London has a Matriculation, an Intermediate, and a Final E. for the Bachelor's degree, and it and other modern univs. have largely increased the number of 'faculties' in which degrees are awarded. Numerous other classes of educational E. are now in vogue (for school Es. see under EDUCATION). Open competition is usually adopted for civil service (q.v.) (other than specialist appointments, appointments to the Colonial Service, which are made by nomination after interviewing the applicant, appointments to the diplomatic service and various other appointments), and

other public appointments, while numerous tests are held by various professional and technical bodies in different branches of knowledge. The question of the actual value of E., especially those conducted on a competitive basis, for getting the best man for the position or honour, is a vexed one, involving as it does the fact that the nervous strain of such tests has an adverse influence upon many people. The standard of marking to be adopted is also a point of considerable difficulty, since it is obviously unfair to expect the same percentage on a memory as on a capacity test. See J. Crofts and D. Jones, *Secondary School Examination Statistics*, 1928; C. Valentine, *The Reliability of Examinations*, 1932; P. Hartog and E. Rhodes, *Examination of Exams*, 1935; *The Construction and use of Examinations*, ed. by H. Hawkes, 1936; Ministry of Education Circular 168, April 1948.

Examinations (U.S.A.). Excepting as a means of entry to the higher professions, Es. are regarded rather differently in America from what they are in Great Britain. Entry into most of the univs. has depended more on evidence of reasonably sound preparation in a good grounding school than upon any set tests. But in some cases this method has been modified. The Amer. mind attaches importance to graduation, for which an examination is a usual condition, but in many cases the diploma gained is rather evidence that the student has been an attentive and satisfactory scholar than that a severe test has been passed. In America, Es. of a semi-psychological nature are becoming increasingly popular, especially for entry into business houses and for selecting men and women for promotion. While many of these tests are exceedingly clever and very ably conceived, they often appeal rather to the swift superficial mind than to the slower and more profound. It is probable, however, that for certain commercial purposes such tests may be useful in eliciting information about a candidate that a set examination would miss.

Examiner of Stage Plays, see CENSORSHIP OF THE DRAMA.

Exanthema (a blossoming out), fever accompanied by an eruption. The commonest are Measles, German Measles, Smallpox, Chickenpox, Typhus, Typhoid, Scarletina, and Erysipelas. In most countries these are compulsory notifiable diseases.

Exarch, word of Gk. derivation, signifying chief person, or leader. In the Rom. empire the viceroy of the Byzantine emperor in Italy bore this title, and it has been conferred at different times on governors and chief officers, both in secular and eccles. matters. In the Christian Church E. was originally a title of the bishops, but afterwards came to be applied to a primate only. The spiritual head of the modern Bulgarian church bears the title of E.

Excalibur, the mystic sword of the legendary King Arthur, which, according to the promise of Merlin, he received from the Lady of the Lake. At his death it was hurled into the lake by Sir Bedivere, where

it was received by a hand which rose from the waters.

Excambion, in Scots law, the term applied to the exchange of heritable subjects. Writing is not essential to the legality of an E., word of mouth, supported by subsequent possession, being accepted in a Scots court of law.

Ex cathedra, the pope speaks *ex cathedra* when in virtue of his office he defines a doctrine concerning faith and morals. Hence the phrase has come to be used for any authoritative and official announcement.

Excavation, in an engineering sense, is an open cutting of greater or less dimensions, as opposed to a tunnel, which is roofed in. The various types of machines that have been invented to accelerate and facilitate E. are known as excavators. These machines which are sometimes known as 'steam navvies,' combine the properties of a digger and a crane, and are very useful in dock works and for cutting canals. The kind that generally comes into operation first has the appearance of an ordinary steam crane, save that it is mounted on wheels and rails. It is fitted with an iron bucket or scoop with a heavy handle to which a second chain is fastened. The machine that is used to widen the cutting made by the other class is stationed on a temporary line of rails a few feet from the edge of the cutting. The jib of the machine is lowered until the row of buckets cut into the earth; they then scrape up the side of the bank and passing over the excavator empty themselves into waggon beyond. The machine and the waggons which receive the excavated material are moved along together. Another class of excavator is known as the 'ladder excavator'; this comprises a ladder pivoted at the upper end which can be raised or dropped at the lower end to any required angle. The ladder is constructed of two channel irons braced together, a trolley running in the middle and forming the back of the bucket. The resistance of the excavated material is met directly by a chain which is attached to the bucket. A small independent engine controls the movements of the ladder. The operation of filling, emptying, and lowering a bucket of half a cubic yard capacity takes about forty seconds. Generally speaking, the first type of excavator is capable of more varieties of work, but the second is more powerful. The most economic method of working is for double track roads for waggons to be cut on the flank, a central gullet having first been cut for the machine's own passage. These machines are a modification of the dredgers which are used so extensively for dock works, etc.; in America they are called 'dredgers,' as are the other variety, a practice which is confusing. 'Grabs' are sometimes called 'excavators,' but this use is deceptive as grabs can work in both water and on land, and the term 'excavator' is properly applied only to land machines. See W. Barnes, *Excavating Machinery*, 1928; K. Park, *Principles of Modern Excavation Equipment*, 1942.

Excellency, title of honour, once borne in Great Britain by the viceroy of India and the lord-lieutenant of Ireland and now by the governors of colonies, and ambas.

Excelsior Springs, city of Clay co., Missouri, U.S.A., 939 ft. above sea-level, the most popular spa in the Middle West. Pop. 4600.

Excentric, see **ECCENTRIC**.

Excess Profits Duty or Tax, a tax varying from 40 to 80 per cent imposed in 1915, during the First World War, on profits in excess by £200 or more of those made prior to 1914, the standard by which the excess profits were measured being the average of profits of any two of the three years preceding the war. Exemption was allowed to farmers and to persons engaged in certain specified professions and employments. Though successful in producing revenue, the tax was not economic, as it encouraged wasteful expenditure by the taxpaying firm or company. It was abolished in 1921. In 1937 a new tax, called the National Defence Contribution, was introduced by Mr. Neville Chamberlain to finance rearmament, and bore some resemblance to the old E. P. D. It was levied on the increase of profits in industry over £2000 in any accounting year, and was not applicable to incomes from employment or professions. In the war budget of Oct. 1939, the armaments profits duty was replaced by an E. P. D. 60 per cent. In May 1940, when Mr. Churchill formed a gov. consisting of many labour members, the duty was increased to 100 per cent. The National Defence Contribution was an alternative, and the tax-payer paid whichever ever was the higher. From Jan. 1, 1946, E. P. T. reverted to 60 per cent. The following amounts were realised from E. P. T. in the financial year indicated: 1939-40, £81,000; 1940-41, £72,780,000; 1941-42, £247,803,000; 1942-43, £347,074,000; 1943-44, £467,712,000; 1944-45, £174,699,000. (The yield of the Defence Contribution was, relatively, negligible, averaging for the six financial years 1939-40 to 1944-45, £28,430,000.)

Exchange (Fr. *changer*; It. *cangiare*, *cambiare*, *cambire*, to barter or exchange). term applied to many transactions and to the circumstances connected with them, all of which have, however, the basal idea of the giving of one thing—material, labour, or rights—for another. The *Exchange of Lands*, in law, is a mutual or reciprocal grant of equal interests in land, the one in consideration of the other, as a grant of a fee simple in return for a fee simple. Facilities for E. by parties under disability or tenants for life are now provided under the Inclosure Acts and the Settled Land Acts. In eccles. procedure, the *Exchange of Livings* is conditioned by the consent of the bishops and patrons of both the benefices concerned. It is effected by resignation, and no monetary compensation for inequality in the value of the livings may be offered or accepted. *Exchange in Commerce* is used in various senses of the giving or receiving of money or of one currency in return for an

equivalent sum in another currency (see **EXCHANGES**, **FOREIGN**); the giving or receiving of money in one place for a bill providing the payment of an equivalent sum in another place; the rate at which this documentary transfer of money may be made, etc. The *Exchange* is applied to the assemblage of merchants, bankers, and brokers for the transaction of business in commodities, stocks, bonds, bills, etc., and also to the place in which they meet for such purpose, e.g. the Royal E. in London, the Bourse in Paris, and the Stock E. in New York. A *Deed of Exchange* is a legal document recording the transfer of lands, etc., and is provided for by the Real Property Act of 1845.

Exchange, Bill of, see **BILL OF EXCHANGE**.

Exchanges, Foreign, term applied to the settlement of the balance of indebtedness arising out of the carrying on of trade between different countries. This settlement involves much complicated business, since the balances are continually changing both in amount and direction, and, in order to effect the remittance of money in the most economical manner, it is necessary to ascertain the relative values of the currencies of many different countries. The basic theory of exchange is that only the balance into which the financial transactions resolve themselves shall be liquidated, this being done when possible by a transfer of credit, or, failing that, of gold. The subject of F. E. has an important bearing upon the choice of a monetary system, since if, in a given case, this is based upon an enforced depreciated currency, the exchange operations of that country with others are bound to be prejudicially affected. F. E. is at its simplest when 'at par,' i.e. when a sum of currency in one country is able to buy a bill for a sum of currency in another country, the two sums being equivalent to the same amount of bullion of a given standard. The discharge of international liabilities may be performed in three ways: (1) By means of the actual remittance of bullion or cash in coin. This method is little used owing to its costliness, since the expense of conveyance and the premium for insurance materially increase the amount of the remittance. (2) By means of the remittance of international securities, i.e. certain well-known gov. bonds and other securities or stocks and shares, the certificates of which are accepted in payment of international debts. This method is also expensive since brokerage charges have to be added to the cost, and the margin between the buying and selling price is also a loss. (3) By the remittance of bills of exchange. This is the cheapest and easiest method of F. E. and consequently the most common. Those bills, which may be of various currencies, need not be drawn upon the country to which they are remitted, e.g. it may be most profitable to effect a remittance from London to Paris by means of an Amsterdam bill drawn upon Paris. The principle upon which this business is transacted may be roughly illustrated thus: A, a merchant in London, has to

make a remittance to Paris to a merchant, B, in that city. B, in order to save A the risk and expense of transmitting cash, draws a bill for the amount due upon him. B sells this bill to C, another Paris merchant, who sends it in place of cash to settle his account with D, in England. At the expiry of the time the bill has to run, D takes it to A, and receives cash in exchange for it, while the possession of the bill marks A's discharge from B's debt. The bills, which are any first-class ones on the market, are commonly drawn at three months' date.

F. E. and the market price of bills of exchange are affected by two main causes, viz., the relative indebtedness of the two countries involved, and the rate of discount ruling in each. The first cause is dependent upon the law of supply and demand, since if one country is considerably in debt to the other, the price of bills upon the creditor rises in the debtor's market owing to the competition of merchants who are trying to buy bills to remit, while in the creditor's market the absence of demand for bills upon the debtor tends to lower their price. The second factor is really the value or price of money in the two countries, since a high rate of interest in one country will tend to make foreign merchants buy bills upon it, and the increasing demand again leads to an increase in price. When the price of bills upon a country goes beyond a certain height, known as the specie, or gold point, i.e. the point at which the buyer pays to the seller a premium equal to the amount of the cost of transport, gold begins to flow in, as the debtor then prefers to make payments in cash. The turning of F. E. in favour of a country is marked by the approach of this point. The inverse position is produced by the fall of the price below par. So far as F. E. in England are concerned, where the rates of exchange are quoted in foreign money, high rates are favourable to England; but when the rates are quoted in Eng. money, low rates are in England's favour.

The First World War played havoc with the ratio of F. E. This was only natural when it is realised that the trade and commerce of the whole world were affected, and that the greatest commercial nations in the globe were active belligerents. The natural flow of trade and consequently of bills of exchange between the nations was severely impeded, and in the case of the enemy countries stopped altogether. The inflation of the currencies of Germany and Austria by means of the free use of the printing press contributed to the fact that the currencies of these countries had for some time not even an external nominal value. With regard to internal value, it is worthy of record that when the new Reichsbank was formed in Germany, it called in all its previous circulation and converted it into Reichsmarks at the rate of one trillion Marks for one Reichsmark.

F. Es. were also much disturbed in the decades following the First World War by the abnormal influence of huge

indemnity and war debt payments and by attempts to secure transitory commercial advantages through deliberate currency depreciation. In Britain the machinery of the Exchange Equalisation Fund, which was estab. in 1932, contributed to the removal of difficulties caused by rapid fluctuations of Es. But towards the end of 1938 the Fund, having sustained heavy losses of gold in defence of the currency, had to be strengthened by increasing the Bank of England's fiduciary issue to a record issue, a sum of £200,000,000 of gold, valued at the old parity price of 85s. per fine oz. (equivalent to £350,000,000 at the then current price), being transferred to the Fund from the issue department of the Bank.

On the outbreak of the Second World War, in Sept. 1939, the gold reserve of the Bank of England was transferred to the Exchange Equalisation Fund or Account as part of the general plan for strengthening the country's financial resources abroad. Under Defence (Finance) Regulations issued in that month, United Kingdom residents holding U.S.A. dollar securities were required to register their holdings with the Bank of England and thereafter the Brit. Gov. gradually acquired all Brit. holdings of U.S.A. railroad and industrial dollar securities at fixed sterling prices, the purpose being to conserve all the dollar exchange possible for financing war purchases in the U.S.A.

The Exchange Control Act, 1947, purports to put in legislative form the obligation which rested on Britain, as a result of the series of agreements with the U.S.A. associated with Bretton Woods (q.v.) and the Amer. loan to Britain of 1946, to free current exchange business from control while at the same time, in view of the likely course of the Brit. balance of payments, maintaining a necessary restraint upon movements of cap. There was no dispute in the debate on the Bill about the necessity for the gov. to seek the powers conferred by the Bill; the argument in the House of Commons concerned rather their duration. The Bill was represented by the chancellor of the exchequer as an indispensable weapon for safeguarding our balance of payments by husbanding our exchange resources for a long time. 'Sterling,' he said, 'was a great international currency, and the Government sought to make it greater. They aimed to maintain its stability, and the Bill was an essential weapon to extend its uses. The goals to which we were moving were a more assured stability in our balance of payments and our rate of foreign exchange, and greater expansion of our trade.' (In the House of Commons, Nov. 28, 1946.)

Exchequer (Norman-Fr. *eschequer*). The name of the king's court of revenue is taken from the fact that in early times the accounts were reckoned upon a chequered cloth, resembling a large chess-board, round which the officers sat. The Eng. and Fr. words are allied to the Lat. root *scac*, which appears in *scaccum*, a chess-board, and *scaccarium*, the Court of E., and also the chequered cloth used

there. It appears that the sums of money received by the treasurer were scored upon the squares of this cloth with counters, the process being suggestive of a game of chess. The name only began to be used about the time of Henry I., and previous to the use of the chequered cloth as an aid to calculation business was transacted by means of 'tallies,' or notched sticks.

Exchequer Bills, *see* BILL of EX-CHEQUER.

Exchequer Bonds, *see* PUBLIC DEBT.

Exchequer, Chancellor of the, head of the Treasury Department, being one of the most important members of the cabinet in the Brit. Gov. He must be a member of the House of Commons, and acts as the first finance minister of the crown, having the duty of preparing the annual budget, *i.e.* the estimates of revenue and expenditure, and the imposition or removal of taxes in order to meet deficit or surplus, and the management of all matters relating to public money. With the exception of certain times, when his place is taken by the lord chief justice of the King's Bench, the chancellor acts as one of the lords of the treasury. The office of C. of the E. may be held by the Prime Minister, if the latter is a member of the House of Commons, and the combined office has been held by Wm. Pitt (1804-6), George Canning (1827), Sir Robert Peel (1834-35), and William Ewart Gladstone (1873-74 and 1880-82). The chancellor was originally an under-treasurer, who checked the proceedings of the lord high treasurer. He also had important judicial functions, sitting on the 'equity side' of the Court of Exchequer. These disappeared in the eighteenth century, the last C. of the E. who sat as a judge being Sir Robert Walpole, who gave a decision in this capacity in 1735.

Exchequer Court, one of the three great courts of the realm, having the functions of a court of revenue and a court of common law. In its latter capacity it is now merged in the King's Bench Div., but in its former it deals with all matters relating to the revenue of the kingdom. It is connected with the Treasury, and its operations are supervised by the Audit Office.

Excise Duty, duty imposed on home-produced articles, usually on articles of stable consumption, such as beer and spirits, so that the estimated revenue can be relied upon. It is sometimes levied on certain commodities as a countervailing tax to a customs duty on imported goods of the same nature, when the latter tax is not imposed, in order to protect the home product. If an article is manuf. both at home and abroad, a customs duty tends to exclude the foreign article from the home mkt.; an E. D., by taxing the home product as well, makes that particular article as full a source of revenue as possible. All licences come under the heading of excise, excepting those for motor vehicles. E. Ds. were first imposed by the Long Parliament in 1643 to raise funds for the Civil war against Charles I. and it was levied on wine, beer,

tobacco, and other articles. In 1936-37 E. D. yielded £104,000,000, in 1938-1939 £114,200,000. The yields for the years ended March 31, 1943, 1944, and 1945 were respectively: £412,529,000, £469,878,000, and £484,990,000. The average receipts under individual heads for those three financial years were: beer, £253,877,000; spirits, £53,078,000; liquor licences, £4,073,000; other licences (auctioneers, hawkers, etc.), £360,000; saccharin, £2,407,000; entertainments, £40,196,000; matches, £4,822,000 and purchase tax £100,318,000.

Excitants, *see* STIMULANTS.

Exclusion Bill (1679-80), measure brought forward by Shaftesbury to prevent the duke of York (afterwards James II.) from coming to the throne, owing to his adherence to the Rom. Catholic faith. It was three times passed by the Commons, but on each occasion Charles II. dissolved Parliament.

Excommunication (Lat. *ex*, out of, from; *communio*, communion), exclusion by formal sentence of offenders from the rights and privileges of the religious community to which they belong. The hist. of the practice of E. may be traced through pagan analogies. Heb. customs, primitive Christian practice, medieval and monastic usage, and modern survivals in existing Christian Churches. That the Christian Church has always laid claim to the powers of E. is shown by such early writers as Irenæus, Cyprian, Basil, Ambrose, etc., who give proof of the existence of two degrees of E.; the first involving exclusion from the participation in eucharistic service, and the second involving 'exclusion from all church privileges.' The former was the usual punishment for light offences, the latter the penalty for graver scandals. The necessity for church discipline did not cease to be recognised at the Reformation, though its administration would seem to have passed through a period of some confusion. In some cases, the old episcopal power passed into the hands of the civil magistrate, in others it was conceded to the presbyterial courts. In the Anglican Church the right of excommunication is in the hands of the bishops, though it is never exercised. The reformers claimed the power of E., and Luther insisted on the right as inherent in the ministers of the Church. Calvin, too, asserted that it was of the very essence of the ministry. At first civil disabilities followed E., but later this ceased to be the practice. In England, until 1813, persons excommunicated were debarred from bringing or maintaining actions, from serving as jurymen, or from practising as attorneys in the courts of the realm; but all these disabilities were finally removed by statute. E. renares a culprit and punishes his conduct, and by thus warning, endeavours to recall him to salvation. Whether the power of E. rests in the Church or the clergy has been an important question in the hist. of Eng. and Amer. Churches. Archbishops, while exercising visitatorial jurisdiction, bishops within their sees, and heads of religious orders within their own

communities possess the power to issue E. (subject to appeal to the sovereign), but the power can never be delegated to laymen. In contemporary Eng. Free Churches the purity of the Church is commonly secured by the removal of persons unavailing for membership by a vote of the responsible authority. In the Rom. Church E. is either *ferenda sententia*, when the intervention of judicial process is required to attach it to a given person; or *latæ sententia*, when a crime carries E. with it automatically. An excommunicated person may be *tolerandus*, who is cut off from the spiritual benefits of the Church only; or *non-tolerandus*, against whom the faithful are warned. These may not participate in any Church functions or exercise any juridical or teaching office. E. in certain cases is reserved in varying degrees of stricture to the pope. See Schilling, *Der Kirchenbann nach canonischen Recht*, and Von Kober *Der Kirchenbann*; T. Erasmus, *Nullity of Church Censures*, 1659; H. Thorndike, *The Church's Power*, 1856.

Excretions, eliminatory products of such organs as the skin (*q.v.*), kidneys (*q.v.*), intestines (*q.v.*), etc., viz. sweat, urine, feces, etc. See also RESPIRATION.

Exe, riv. of England, which rises in Exmoor. It flows through the cos. of Somerset and Devonshire in a southerly direction, its chief tribs. being the Barle, Loman, Batham, Culm and Creedy. Its course of 54 m. is through beautifully wooded and picturesque country. The tns. on its course are Dulverton, Topsham, Exeter, etc. Its estuary is navigable for 8 m., and as it is a mile in width vessels of large size can enter. A canal connects it with Exeter.

Execution means the enforcement of judgments and other proceedings analogous to judgments of courts of law in civil actions. The term denotes the process by which a party is put into possession of that to which the judgment declares him to be entitled. It is generally effected by a writ directed to the sheriff or other proper officer, commanding him to seize goods or take other compulsory proceedings to carry out the judgment. In the simplest form of judgment the defendant is ordered to pay the judgment creditor *forthwith*, and the latter may at once proceed to E. Under a writ of *fi. fa.*, which is the most ordinary form of E., the sheriff is directed to 'cause to be made' (*fieri factas*) out of the goods and chattels of the debtor the sum recovered by the judgment, together with interest at 4 per cent and to bring the sum into court for payment to the judgment creditor. Armed with this writ the sheriff may enter the premises of the debtor and seize what property of the debtor he can find, with the exception of wearing apparel and bedding, tools and implements of trade to the maximum value of £5. He may then sell the goods seized, including leases of land, but not freehold estates of inheritance, for these latter go to the heir of the debtor. Where goods seized are claimed by a third person the sheriff must take

out an interpleader summons upon which an issue to try the title to the goods will be directed. (For the application of a writ of *elegit* to enforce E. against the debtor's lands, see ELEGIT.) In many cases the ordinary processes of the common law will not avail to enforce a judgment, e.g. against a share of the proceeds of land to be, but not yet sold, or against rents. In such cases the court may in its discretion appoint a receiver by way of what is called equitable E. Another mode of equitable E. is to obtain a charging order against a partnership interest. E. against debts owing to the judgment debtor is enforced by process of attachment of the debts (see GARNISHMENT). Other writs of E. are of *attachment (q.v.)*, of *possession*, or to put the plaintiff into possession of land recovered in an action, and of *delivery* to enable the plaintiff to get possession of property other than land or money. E. is also used to denote the giving effect to the sentence of a court of criminal jurisdiction, and in this sense usually means the E. of sentence of death (see CAPITAL PUNISHMENT). For the meaning of E. in relation to deeds and wills, see DEED; WILL.

Executive. In every sovereign political society, or state, there must exist some person, group of persons, or body independent of all external control, with power to maintain the independence of the state against aggression from without and to preserve order within. Such person or body is known as the E. Non-sovereign political societies may also possess an E., but in all such cases, as e.g. in the case of colonies and protectorates, that E. acts under the active or latent control of the E. of some other state or suzerain power. E. powers are to be distinguished from legislative, although both may be vested in one person or group of persons. The function of a legislature is to make laws, but the functions of the E. are (1) to give those laws legal effect, and to enforce them where necessary, and (2) to determine the policy of the state in its foreign relations. In the case of an absolute and despotic monarchy, all the executive powers reside in one person who may or may not be assisted by a council of chosen advisers. In a limited constitutional monarchy, the E. power resides collectively in the crown and its responsible ministers or cabinet (see CABINET and CROWN). In federal states the E. powers reside in some central body composed of representatives of the various federated bodies. In the Eng. Crown (colonies a nominated governor or governor and council wield the E. powers (see COLONIAL LAW; CROWN COLONIES).

It is to be observed that the interdependence of the legislature and E. of those representative govs. of the present day which possess what may be termed a 'parliamentary E.' is such that the E., far from being distinct from the legislature, is, in reality, chosen from among the members of the latter, and not only appointed but dismissed by the elective portion of the legislature. In the case of those representative govs. where the E.

power is in an emperor and his ministers, or a president and his cabinet, the E. is appointed by the legislature, and is therefore a 'non-parliamentary E.'. Under the constitutions of England, Belgium, Italy, and the Fr. republic there exist parl. Es., while examples of non-parl. Es. are to be found in the United States and the pre-1939 Ger. empire. For an exposition of the various prerogatives of the E. in England, see CROWN; and for the relationship between the E. and Parliament, see CABINET. See also CONSTITUTION.

Executor. The person or persons to whom another person commits by his last will the carrying out of his testamentary wishes or are his E. or Es. An E. can only be appointed by will or by codicil. But he need not be termed an E. in the will if it can be inferred from the powers and duties vested in him by the testator that he was to be E. It is usual to appoint two Es., although one is sufficient; any number up to and including four may be appointed. An E. may be a legatee: thus a child or wife to whom the whole or a portion of the estate is left may be appointed sole E., or one of two Es. If an E. has not been appointed in the will, or if the E. be dead, or does not wish to act, the residuary legatee nearest of kin to the deceased, or a legatee, is entitled to act and administer the will. A person appointed E. may accept or refuse office, but he will be taken to have accepted if he performs acts of authority over the estate or property from which it may reasonably be implied that he meant to accept, and similarly his refusal may be implied from his abstaining from intermeddling in the administration. The authority of an E. dates from the moment of the testator's death. The will is the only source of his title to act, but probate of the will is the only evidence of that title. Before probate an E. may validly perform any of his executorial functions, such as receiving debts or paying legacies, but he can maintain no action at law until he takes out probate. Where there are sev. Es. they are not bound to act jointly, and most executorial acts are valid even if done by one E. separately. The duties of an E. are to bury the deceased in a fitting manner, but without incurring unreasonable expense: then he should prove the will and take out administration. The other duties are, within a convenient time after the testator's death, to collect the goods comprised in the estate, make an inventory of the personality, advertise for creditors and debtors, and deal with the personal effects as directed by the will. He has a year in which to pay or transfer the legacies: but if the solvency of the estate is beyond question, he should pay or transfer them before the end of the year, and may be sued if he does not do so. At the end of his year he must submit an account of his dealings to the proper authorities. These dealings will, in general, be the payment of debts and legacies in the order laid down by the rules of equity.

Since the Land Transfer Act, 1897, real

property also vests, in the first instance, in the E. or other personal representatives of the deceased, whether the deceased died intestate or not: and an E. may sell the real estate if necessary for the purpose of paying debts, but where not required for debts the E. must transfer the real estate to the devisee, or, if not devised, to the next of kin. An E. should be careful not to mix the moneys belonging to the estate with his own, as he may be charged interest on it. Interest is charged on all moneys received by an E. and not properly applied, or which have been allowed by him to lie idle. If a stranger, i.e. one not constituted E. by the will, assumes the functions of an E. by intermeddling in the administration, he is called in law an E. *de son tort*, i.e. an E. of his own wrong. Such acts of intermeddling do not include the burial of the deceased, or the preservation of the goods, or payment of funeral expenses, or other acts which may appropriately be termed acts of salvage or charity. An E. *de son tort* is liable for such assets as come into his hands, and may be sued as if he were the rightful E. There is no remuneration allowed to an E. save as expressly provided by the will; but in Canada the E. is allowed 5 per cent commission on the money passing through his hands.

Executory. In the Eng. law of real property an E. interest is a future estate or title to land, which is said to arise of its own strength when the contingency on which it rests is fulfilled, and to put an end to prior estates or interest. *e.g.* in an ordinary marriage settlement of land, the settlor, a day or two before the marriage, conveys land to trustees to hold for him until the marriage takes place, and after that to such other uses or trusts as may have been agreed upon between the spouses or their parents. In the law of contract, an E. consideration (*q.v.*) means a future as opposed to a present consideration, or a promise as opposed to an act.

Exedra, in architecture, term applied to an open recess, such as a niche containing a seat, the space within an oriel window, or the spaces between the buttresses of a cathedral.

Exegesis, term meaning exposition or explanation applied by the Gks. to the interpretation of the Holy Scriptures. Hermeneutics is the term frequently used as applying to the discovery of the meaning of the Bible, but E. is distinguished from it as more properly covering the exposition and application of Holy Scripture to faith and conduct.

In a general sense, however, the term has now come to be applied to the science and art of the elucidation of Scripture. E. includes both the study of the text and the doctrinal bearing of same, with the conclusions that may be deduced from it. Thus, it may be seen that E. requires a wide and accurate learning as well as a certain amount of intuition of an intellectual and spiritual nature. Amongst the great exegeses may be mentioned Origen, Augustine, Calvin, and Meyer, and all of these have been distinguished for

their scholarly attributes and spiritual insight. The materials for the critical study of the O.T. are scanty as compared with the New, and the difficulty of attaining definite conclusions is therefore greater. MSS., versions and quotations are the different kinds of critical materials ready to the hand, and here again the student of O.T. hist. is very slenderly equipped.

The two main currents discovered in the hist. of E. are the literal and allegorical. The tendency to seek an underlying sense in writings of venerable age come to be looked upon as authentic and weighty, if not inspired, gave rise to the allegorical method, of which the attractiveness is very great, as it gives full scope for the penetrating of original minds, and is thus more popular than the literal method. Nevertheless, the old theory of verbal inspiration is no longer held by the intelligent scholar, and the nineteenth-century exegetes were the first to establish a satisfactory critical *modus vivendi* by insisting on the human as well as the divine element in the Scriptures. The Jewish E. of the O.T. is seen in the Talmudical writings, and the Hellenic Jews were responsible for seeking to make a reconciliation by means of allegorical interpretation, between the traditions of Hebraism and the results of Gk. philosophical thought. Philo was the greatest master of this art, and he formulated the twofold teaching in the Pentateuch—the verbal and the figurative. The Alexandrian school also adopted this system, and the same influences show themselves, though to a lesser extent, in the writings of Hippolytus and Augustine. As opposed to these, the Antiochene school, represented by Theodorus, Lucian, Diodorus, and Chrysostom, shows a marked contrast. These writers aimed at a grammatical and historical criticism, which at times, however, degenerated into an unspiritual and bare interpretation. Exegetical work was practically at a standstill during the Middle Ages, except for some collections and views of the fathers: but Nicholas of Lyra made a transition to the modern period in his *Postille*, emphasising the literal sense; and the humanists, as personified in Erasmus, began to make serious and systematic philological investigations. The names of contemporary exegetes are too numerous to mention, since a continuous chain has laboured at the elucidation of the Scriptures on sound scientific lines. Alford, Lightfoot, De Wette, Perowne, Hitzig, Oehler, Keil, Lagrange, etc., are among the number. For E., see E. Hatch, *Libbert Lectures*, 1888; and A. Cave, *Introduction to Theology*, 1896. For fullest and latest information, also see *The Cambridge Bible for Schools and Colleges*, and the *International Critical Commentary*.

Exelmans, Remy Joseph Isidore, Comte (1775–1852), marshal of France, who fought under Murat in the Sp. campaign, during which he was taken prisoner and sent to England. He escaped in 1811 and joined Napoleon's army in Russia in 1812, being made a general of div. for his bravery. He was exiled from France at

the fall of Napoleon, but allowed to return in 1823.

Exempla, or Exemplar, short story with a moral, a kind of fable (q.v.).

Exequatur, in international law, the term applied to the document issued by the state to which a consul is accredited, confirming his appointment. This appointment has, of course, previously been made by commission or patent issued by the consul's own state. The foreign state is at liberty to decline an E., or to withdraw it when issued.

Exeter, situated in lat. 50° 43' N., long. 3° 31' W., at the head of the estuary of the R. Exe, 9 m. from the S. coast of Devon, and 172 m. from London, besides being a city and co. of itself, is the administrative cap. of Devonshire, an episcopal see, and the seat of the Univ. College of the S.W. of England. As a mercantile and residential centre, holiday resort and minor port at the conjunction of many roads and of the W. and S. Regions of Brit. Railways, it retains much of its anct. dignity as the metropolis of the S.W. peninsula, formerly the Brit. kingdom of Dumnonia. Its origin has not been established. Inconclusive evidence suggested that a tn. may have existed here in the third century B.C. That 'Isca of the Dumnonii' was well estab. by A.D. 55 has been proved by excavation. Sixty years later it was known to Ptolemy the geographer in distant Alexandria and continuous habitation from his day to ours is a dominant feature of the city's story. St. Boniface, the apostle of Germany and a native of Crediton, received his early education in an Exeter monastery about A.D. 690, by which time the Saxon incursions had extended to this dist. For two centuries the Britons and Saxons shared the city, jointly defending it against the Danes in 877 and 894. In 928 Athelstan met the Witan here and expelled the remaining Britons. In 1003 the place was sacked by Sweyn. At the Norman Conquest, E. was already an anct. city with prescriptive privileges, among which Domesday notices an exemption from geld save when London, Winchester, and York, the other regional caps. of the country, might be taxed. The tn. of those days, enclosed by a wall of mixed Roman, Saxon, and medieval workmanship (now attenuated, but still continuous save where the four main gates have been demolished within the last 150 years), covered a polygonal area of one half by one third mile, upon a 170-ft. hill E. of the riv. In 1067, with Harold's kin as its guests, E. defied the Conqueror, but submitted after a siege of 18 days. Within the highest N.E. angle of the tn. wall, Wm. then raised the strong motte-and-bailey castle of Rougemont, so named from its red masonry and earth, noticed by Shakespeare in Richard III., act iv., scene ii. The earliest allusions to municipal gov. here recall Rom. and Saxon administration: it is not until about 1200 that a mayor is noticed. The extant city charters commence with a confirmation by Henry II. of customary rights enjoyed under his grandfather,

Henry I., together with the privileges of the Londoners. Other grants were received from twenty-two sovereigns or princes between Richard I. and George III. Henry VII., in token of his gratitude for firm resistance to Perkin Warbeck, gave the State Sword and Cap of Maintenance which are still borne before the Mayor. Henry VIII. in 1537 made E. a County incorporate, independent of Devonshire, with liberty to elect its own Sheriff. In 1549 it withstood the Prayer-Book Rebels. In 1643 it was occupied by Prince Maurice for King Charles. In 1646 it surrendered to Fairfax. Wm. III. spent eleven days here after his landing at Brixham in 1688.

John H. Stock

THE GUILDHALL, EXETER

The Guildhall, home of the anct. City Court, is documented from 1160 and believed to be the oldest municipal building in the country. Rebuilt in 1330 and 1488-70, the date of the fine timber roof, it has a famous Elizabethan portico with upper chamber athwart the pavement and contains much good woodwork, portraits including two by Lely of Princess Henrietta ('Madame'), born here in 1644, and of George Monk, duke of Albemarle, whose maternal grandfather was thrice mayor; the city regalia and silver ware. At a little distance the handsome fifteenth-century Hall of the Tuckers commemorates Exeter's woollen trade and her many corporate guilds. The Cathedral church of St. Peter, around whose foundations exist remains of the Rom. baths and Saxon conventual buildings, springs from

a monastic church estab. by Athelstan in 932 and rebuilt by Canute in 1017. The see was removed hither from Crediton in 1050, when Edward the Confessor and his Queen personally enthroned Loofric as first bishop of Exeter. As now seen, the noble structure is most remarkable for its massive transeptal towers of 1112-33, which leave unbroken the lofty vault over nave, choir and sanctuary, 100 yds. long from E. to W.; for its unique fourteenth-century organ-screen, fine minstrels' gallery, episcopal throne, tombs of the medieval bishops, and sculptured W. screen. In 1942 a Ger. bomb destroyed the Chapel of St. James in the S. choir aisle, besides doing other grave damage to the Cathedral and adjacent Palace. The Benedictine Priory of St. Nicholas, in the Mint, contains good thirteenth-century work.

Intensive bombing on May 4, 1942, destroyed 9 and damaged 22 churches; destroyed 1800 and damaged 17,000 other buildings. Three devastated areas deface the city centre, with other damage dispersed over a wide area. The Probate Registry perished with all its contents, as did Bampfylde House, Norman House, Chevalier House and the medieval Hall of the Vicars Choral. The City Library was gutted by fire. Much damage was done to Southernhay, Queen's Crescent and York Road and also to St. Sidwell's Church, most of the Banks, St. Luke's College and the Heavitree Hill Hospital. Nevertheless, E. retains a remarkable wealth and variety of good buildings belonging to all periods from the Middle Ages to the Regency. Her most famous accumulations of historical manuscripts also survived: the *Exeter Book* of A.-S. poetry, *Exeter Domesday Book*, the episcopal and chapter archives in the Cathedral Library, the copious city archives, with other collections belonging to the city library, and the co. Records in the Castle. In the bombed area adjoining South Street, in ground that probably comprised one of the central *insule* of the Rom. city of Isca, excavations in 1946 uncovered two interesting wooden houses of the first Rom. occupation. Finds of Samian and coarse pottery of pre-Flavian character enable the period of occupation to be fixed at about A.D. 55-75. Beneath the remains of St. George's Church the walls and flooring of a colonnaded stone building were found of the same period extending up to and below South Street. The discoveries give a good indication of the alignment of the Rom. city. Fragments of walls found seem to establish that the one-time Saxon Church was a building some 35-40 ft. long and about 15 ft. broad. It is of interest as the sole example of the period known technically as Devon.

The Univ. College of the S.W. arose from an educational enterprise founded jointly by Exeter and the co. of Devon as a Royal Albert Memorial. It was incorporated under its present title in 1922 and then obtained its first Treasury grant. Besides premises in the city, it has acquired a park of 120 ac. on the N.

outskirts and erected therein halls of residence, laboratories and a library. It prepares men and women for the examinations for the external degrees of the Univ. of London. St. Luke's College, founded in 1838 as a Church of England Training College, the oldest foundation of its kind in the country, was partially destroyed in 1942. It was reopened in 1945 and prepares about 200 students, chiefly for the Ministry of Education Certificate. The Royal Albert Memorial Museum and Art Gallery in Queen Street contains good collections illustrating zoology and local archaeology.

The Port of E. extends down-river to the sea, and coastwise eastward to the Axe and westward to the Teign. In the 5½-mile canal stretching from the tn. quays to Topsham, E. has the earliest lock canal in the country, though much deepened and widened since its construction in Elizabethan days. The prin. industries are paper-making, brewing, flour-milling, tanning, iron and brass founding and light engineering. The parl. bor. of 1705 ac. returns one Member. Pop. (1947) 75,290.

Exeter, tn. of New Hampshire, U.S.A., cap. of Rockingham co., 12 m. from Portsmouth, at which many eminent men were educated, there are some fine colonial homes. It was at Exeter that the first independent state gov. was formed. It contains the Phillips Exeter Academy. Pop. 5300.

Exeter, Peerage of. The titles earl, marquess, and duke of E. have been borne by members of the families of Holland (Holland), Beaufort, Courtenay, and Cecil. The first duke of E. was John Holland, son of Thomas (d. 1360). He was created duke by Richard II. in 1397, and as the king's half-brother held a high position at court, but was degraded from his rank by the Parliament of Henry IV. After plotting against Henry's life, he was beheaded in 1400. The second duke, Thomas Beaufort, was created in 1416. He was the youngest son of John of Gaunt by Katharine Swynford. The title expired on his death (c. 1426). In 1413 John Holland, son of the first duke, was created duke of E. under Henry VI. His son, Henry, also held the title, but died without sons (c. 1473). He supported Henry VI. in the Wars of the Roses, and was attainted (1461). In 1525 the earl of Devon, Henry Courtenay, was created Marquess of E., the title becoming extinct on his execution (c. 1538), though sometimes given to his son Edward. The earldom of E. was bestowed on Thomas Cecil, second Lord Burleigh, 1605, son of Wm. (d. 1598), by James I. His direct descendants carried on the title. Henry, the tenth earl, becoming Marquess of E. in 1801. (Tennyson's *Lord Burleigh* is founded on an incident in the life of Henry, 1754-1804.) The present (fifth) marquess (William Thomas Brownlow Cecil), is a lineal descendant.

Exeter Book, or Codex Exoniensis, a unique manuscript of A.-S. poetry, in the possession of the dean and chapter of Exeter Cathedral. It was presented to

the library of the cathedral by Leofric, who was bishop of Exeter, 1050-71, and probably dates from the first half of the eleventh century. It contains 246 pages of vellum, upon which, besides some legal documents, are the original of the following poems: 'Crist' and 'Guthlac,' probably both by Cynewulf; 'Azarias,' an independent text of the Song of Azarias in the Julian Calendar; 'Daniel'; 'Phoenix,' probably by Cynewulf; Cynewulf's 'Juliana'; 'The Wanderer,' a beautiful dramatic lyric; 'The Gifts of Men'; 'The Father's Teaching'; 'The Seafarer,' a haunting description of the painful and yet voluntary exile of the seaman; 'The Spirit of Men'; 'Widsith,' probably the oldest poem in the book; 'The Fates of Men'; 'Gnomic Verses,' containing rather trite philosophy; 'Wonders of Creation'; 'The Rime Song'; 'The Panther'; 'The Whale,' and 'The Partridge,' all three fragments of an old Eng. Bestiary; 'Address of the Soul to the Body'; 'Deor'; 'Riddles,' fifty in number, of which many are probably by Cynewulf; 'The Wife's Complaint'; 'The Last Judgment'; 'A Prayer'; 'The Descent into Hell'; 'Alms'; 'Pharaoh,' an incomplete 'Paternoster'; a didactic fragment and some different forms of two 'Riddles'; 'The Husband's Message'; 'Ruin,' and about forty more 'Riddles.' The MS. has been described by Humphrey Wanley in his *Catalogue* (1705), and by J. J. Conybeare in 'Account of a Saxon MS., read 1812 and printed in *Archaeologia*, 1811. It was transcribed by Robert Chambers in 1831 (Brit. Mus. Addit. MS. 9067), and first printed by Benjamin Thorpe in 1842. The poems are now printed in Grein's *Bibliothek* (vol. iii.); Pfeiffer's *Germania* (vol. xix.); and Israel Gollancz's ed., for the Early English Text Society.

Exeter College, Oxford, founded in 1314 by Walter de Stapledon, bishop of Exeter. Twelve scholars studying philosophy were supported at Oxford by the income of the rectory of Gwinear, Cornwall, which he had conveyed for this purpose to the dean and chapter of Exeter. Stapledon housed them in Hart Hall and Arthur Hall, in the par. of St. Peter in the E., but in 1315 removed them to buildings on the present site, known as Stapledon Hall. In 1404 Edmund Stafford, bishop of Exeter, added two fellowships and gave the college its present name, and the endowment was further increased by Sir Wm. Petre in 1565, and Mrs. Shiers in 1770.

Exeter, or Exon Domesday, part of the great survey of England ordered by Wm. the Conqueror. The *Exeter Domesday*, which is preserved at Exeter, contains the original returns made by the twelve local jurors sent from each hundred in the cos. of Wiltshire, Dorset, Somerset, Devon, and Cornwall. It includes the details, omitted from the great *Domesday Book*, of the tally of live stock. It was pub. in 'record type' in 1816, in a supplementary vol. to the gov. reprint of *Domesday Book*. See DOMESDAY BOOK.

Exeter Hall, large building which formerly stood on the N. side of the

Strand, London, originally built in 1831 as a proprietary estab. to be used for the meetings of religious and charitable societies. It was purchased by the Young Men's Christian Association in 1880.

Exhibit. In law a document shown to a witness while giving evidence and sworn to by him, or shown to a deponent while being sworn previous to making an affidavit in which it is referred to.

Exhibition. This term has come to be applied to the display of goods to the public for promoting trade, and denotes in a general sense a public show. The first E. of any national importance was that credited to the Marquis d'Avèze at Paris in 1798, consisting of a collective display of the art factories of France, including those of Sévres and the Gobelins. In 1801, a second E. of the same kind was held, and a third of a greatly improved kind in 1803. A fourth was held in 1806 and attracted 1422 exhibitors. This concluded the number of Es. held in France till after the fall of the empire; but a fifth was held in Louis XVIII's reign, and others at various intervals. The impetus given by the Paris display was felt all over Europe, and E. began to be held in all the chief cities between 1820 and 1840, including the United Kingdom and Ireland. These E., however, were all of a smaller nature—more or less confined to the products of the particular country in which they took place; and the first great International E., promoted by the Society of Arts, was held in London in Hyde Park, where a site was obtained for the erection of the Crystal Palace, designed by Sir Joseph Paxton, at a cost of £193,168, under the presidency of Prince Albert. This E. was opened by Queen Victoria in 1851. The building was composed entirely of glass and iron, and was afterwards removed to Sydenham, where it stood until destroyed by fire in 1936. It remained open for over five months, and attracted 6,170,000 people, the money drawn amounting to £505,000, of which sum £150,000 was profit, and was invested in the purchase of an estate at S. Kensington on which numerous institutions have been placed. In 1862 the second great International E. was held in London, in a building at S. Kensington, but the outlay of this one was so great that the receipts did not cover it, and it resulted in a deficit of about £10,000.

Vienne held an international E. in 1863, but was surpassed by the Paris E. of 1878, which made an advance in magnificence and size upon all previous displays. Paris again excelled all its predecessors from this point of view in 1889 with its Universal E., the Eiffel Tower being one of its chief attractions, and again in 1905 the Paris E. was on a scale vast enough to mark worthily the completion of the century, nearly every civilised nation in the world being represented.

In later years, important Es. were held in Glasgow, New York, and St. Louis, and the Franco-Brit. E. held at Shepherd's Bush in London in 1903 was a great success. In the artistic taste and magnificence

of the buildings and the interest of their exhibits, this E. may be said to have vied with, if not gone beyond, the great Paris E. The Jap.-Brit. E. was held in the same place in 1910, and also proved a success. An E. was also held at Brussels in the same year; but the success of this was unfortunately marred by a serious fire, in which the Brit. section especially suffered.

Practically the whole year round there, is held somewhere in London an E. of a specialised nature, e.g. there are Rose, Chrysanthemum, and other Shows at the Horticultural Hall; Cattle, Horse and Dog Shows at the Agricultural Hall—where also may be seen the ann. Drapers' E., in addition to bakery, confectionery, brewery and other trade Es. Olympia is the setting for many interesting Es. organised by the great London newspapers, as well as for motor shows, advertising Es., international horse shows, and the magnificent spectacle of the Royal Tournament. During the Christmas holidays a Schoolboys' E. is held in London. But the greatest E. Great Britain ever undertook was the British Empire Exhibition held at Wembley, under the presidency of the Prince of Wales, and opened by the King on April 23, 1921. It covered a vast area of 216 acs., and the various buildings housed treasures amounting in value to many millions of pounds. Among the royal visitors were the king of Denmark, the kings and queens of Italy and Rumania. There was an average attendance of over 3,000,000 people during each of the summer months, and the closing of the E. was postponed until 1925. The most notable buildings were the Palaces of Art, Industry, and Engineering, the last-named being six times the size of Trafalgar Square. In this was a display of electrical, marine, transport, motor, and other engineering appliances, with rolling-stock from the great railways; here a power station generated and supplied all the electric light and power used throughout the E. Vast and beautiful pavilions represented the dominions and colonies—Australia, Burma, Canada, Ceylon, India, East, West, and S. Africa—as well as the Home Gov. Many visitors were attracted by the model coal-mine, cigarette factory, printing works, and other displays, while the Amusement Park and the Tattoo were immensely popular; in the first six months the Queen's Doll's House gained £20,000 for charity. In 1929 Spain, considered a backward country, had two Es., one at Barcelona and the other at Seville. The Barcelona E. was notable for the most beautiful electrically illuminated fountains the world ever saw.

The Brit. Empire E. held in Buenos Aires in 1931 showed a very modern tendency in its display of films, featuring many phases of industry. In 1931, from May to Nov., the Fr. held an exceedingly beautiful colonial Exposition at Paris to show the progress of the Fr. colonial empire. One of the many notable buildings was a reproduction of the famous temple of Angkor.

The most recent Brit. Empire E. was that held in Glasgow at Bellahouston Park from May to Oct. 1938. During that period no fewer than 12½ million persons visited the E., which, contrary to the usual experience, involved the promoters in no financial loss. The Brit. Industries Fair, held annually in London and Birmingham, is an E. for trade buyers from all over the world.

United States.—There have been many notable Es. in U.S.A. commercial hist. In 1876 was held at Fairmount Park, Philadelphia, the Centennial E. to celebrate the 100th anniversary of Amer. independence. The visitors numbered nearly 10,000,000, and the total receipts amounted to about £800,000. The most remarkable feature was the display of U.S. machinery. A World's Industrial Fair was held at New Orleans in 1881-85, but it did not meet with the same degree of success as the Centennial E. Then followed the great Chicago E. of 1893, held at Jackson Park, Lake Michigan, to celebrate the 400th anniversary of the discovery of America. A company with a cap. of £2,000,000 undertook the financial arrangements, and the central gov. at Washington allotted large sums for the purposes of foreign exhibits. The total receipts from admissions were £3,000,000, while the expenses were over £5,000,000, the difference, however, being made up by subscriptions and gov. grants. There have also been important international Es. at New York, Buffalo, Jamestown, San Francisco, and St. Louis in recent years, that at St. Louis being held to commemorate the Louisiana purchase. In 1933 Chicago opened a great world's fair to celebrate a centenary of progress. *See also BRITISH INDUSTRIES FAIR.*

The term E. is also used for an allowance or bounty to students in a univ.

Exhumation. Under the Eng. law it is a misdemeanour as well as sacrilege to disinter or interfere with a human body in any way without lawful authority for so doing, when the corpse is buried in consecrated ground. The eccles. courts have power to grant faculties for removing interred remains, but only that they may be re-interred in other consecrated grounds. In cases of suspected foul play, the coroner may order disinterment for medical inspection and E. may also be ordered by the Home Office, but otherwise no body may be disinterred without licence.

Exile, banishment from one's country by authority, either permanently or for a limited period. Outlawry and transportation involved exile. Magna Charta abolished outlawry of freemen otherwise than by the law of the land. Transportation of convicts was finally abolished in 1864. *See also BANISHMENT.*

Existentialism, post-war philosophy which became the vogue in France after the liberation (1944) especially among intellectuals of the Lat. Quarter. The chief apostle of E. is Jean-Paul Sartre (b. 1905) who gave the world his creed in a series of successful plays, books and essays. Briefly, E. may be defined as a

school of thought based on a conception of the absolute inanity of existence, absurdity of the universe, negation of all creation and, therefore of all morale or, as Sartre has put it, 'all human activities are equivalent, all are destined by principle to defeat.' One of the basic principles of E. is that man can shape his own destinies by the exercise of his will in the face of the given set of potentialities which is his life. The main premise and point of departure is the concrete fact that man *exists*. Predetermination is denied. Man has freedom of choice and of action; and each man's actions, while subjectively inspired, influence other people, so every individual is responsible to humanity as a whole. No dogmatic solutions of the eternal questions of ultimate origins or endings are offered. A man can choose his faith. An existentialist, says Sartre, can be Christian or atheist. Sartre is an atheist, though his disciples included even Catholics until the condemnation of E. by Rome, 1948. Sartre supports his philosophy with the theory of complete atheism and the blind following of one's instincts and primitive impulses, in contradiction to that of Man Alone on Earth with God as his Judge. E. refutes the sublime in man and chooses to portray only his misery. Hence Sartre's play *Morts sans Sepulture* which tells of the extreme mental and physical suffering of a group of French men in the resistance movement who have been captured by Fr. traitors and thugs employed by the Ger. police during the occupation. His *Huit Clos* is a quasi-philosophical drama of frustration staged in an existentialist conception of hell, which was produced in London as *Vicious Circle* and in N. York as *No Exit* with considerable success. Sustained criticism of E. has come both from Communists, who consider it incompatible with Marxist dialectical materialism, and from Catholics.

The familiar contrast between 'existence' and 'essence' suggests that the existentialist philosophy is not entirely novel; for, in the hist. of philosophy, it is implicit that we cannot derive the particular existent from its supposititious abstract properties or from those of which it is said to be an 'instance.' The existentialists of to-day are insistent that we must disregard the abstractions, generalisations, and inquiries into 'essential' qualities, and concentrate on existence in and for itself. To the existentialists, it is the particular experiences in which we make choices that are significant; for it is *choosing* rather than *thinking* that is explanatory of the existentialist attitude, because it is just those experiences which enable us to feel and exhibit our individual distinctiveness. These experiences are, therefore, revelatory of our true nature; they are moments when we truly *exist*, they are experiences of *Existence* (Kierkegaard). E. is, therefore, a philosophy which claims it is concerned with actual life as it is lived, and not with abstractions, and that it is especially concerned with the implications of those moments when life is lived in some revealing way, which is

somehow different from mere living. But the difficulty in this logical analysis comes when the existentialist selects as revealing, experiences such as are in no way universal and upon them founds repellent systems as if they were revelatory of the predicament of 'mankind' in general. This was essentially the attitude of Kierkegaard from whom, really, the existentialist movement borrows its distinctive features. Karl Jaspers, whose thought more resembles that of Kierkegaard, than does that of the other existentialists, discusses in his *Philosophie* (1938) the study of *Existenz* as a mode of philosophy, and in his work too we come again upon the contrast between mere existence and significant existing; but Jaspers introduces other persons and the interplay of mutual communication and stresses the experience of another person as a separate other person, whereas Martin Heidegger, whom Sartre follows, eschews an Other and argues, with consistent existentialist logic, that there is nothing there and that existence is somehow born from Nothing. See J. P. Sartre, *L'Être et le néant*, 1943, and *Existentialism and Humanism*, 1948; G. de Ruggiero, *Existentialism*, 1946; E. Mounier, *Introduction to Existentialist Philosophies*, 1949; N. Bobbo, *The Philosophy of Decadentism: A Study of Existentialism*, 1949; R. Friedmann, *Kierkegaard and other Existential Studies*, 1949.

Ex Libris, see BOOKPLATES.

Exmoor, dist. on the border of Somerset and Devon, England, near the Bristol Channel, mainly moorland and marsh, the hills rising to 1100-1700 ft. The chief heights are Dunkery Beacon and Exe Head. Sheep and ponies are largely raised, and the Exmoor breed is famous, while the red deer is still found, carefully preserved, and hunted. The R. Exe rises among the uplands. There are many prehistoric barrows. It is the scene of Blackmore's romance of *Lorna Doone*.

Exmouth, Sir Edward Pellew, first Viscount (1757-1833), Brit. admiral, entered the navy at the age of thirteen, and very early in his career proved himself capable and gallant. He rose rapidly in the service and in 1816 he won world-wide recognition by his bombardment of Algiers when the Bey refused to abolish Christian slavery. For this service he was made viscount. There is a biography by Edward Osler (1835).

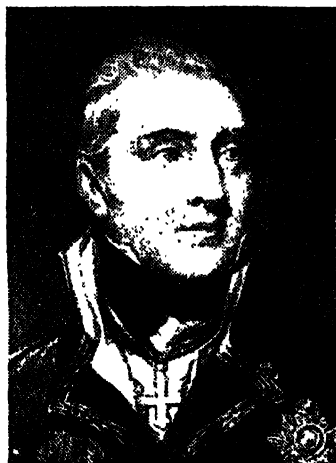

Exmouth, seaport of Devonshire, England, at mouth of R. Exe, on the Enk. Channel, 9 m. S.E. of Exeter. It is a noted watering-place, having beautiful surroundings and a sheltered climate. There are good docks, which are 530 ft. long and were opened in 1869. E. is worth visiting for its matchless sunsets. A fifteenth-century mill-wheel called Marpool Mill is still in motion. There is a wealth of pleasure grounds and shaded walks and a spacious esplanade 2 m. long. Pop. 15,000.

Exocarpus, native cherries of Australia, of the family Santalaceae. *E. latifolius* or broad-leaved cherry yields a tough hard close-grained wood weighing five stone a cubic foot. It is pale brown wood, re-

sembling satinwood. *E. cypressiformis* yields a reddish coloured hard straight-grained wood, also very heavy. The woods of E. are used for golf-clubs, marquetry, tool-handles and cabinet-work.

Exocetus, see FLYING-FISH.

Exodus, The Book of, the second book of the Pentateuch, was generally attributed by tradition to the authorship of Moses, to whom, indeed, the Jews attribute the authorship of all these five books. It continues the hist. of the family of Israel after the death of Joseph, though now it is less the record of a family than that of a nation. It tells of the birth and training of Moses, the departure from Egypt, and the events in the wilderness. It is a composite narrative, the various sources being

VISCOUNT EXMOUTH

much the same as those of Genesis. The book ends with the account of the construction of the tabernacle and its fittings, according to the divinely-ordained pattern, and with the entry of the glory of Yahweh into his dwelling-place. See J. Estlin Carpenter and G. Harford-Battersby, *Hexateuch* (1900); B. W. Bacon, *The Triple Tradition of the Exodus*, 1894; J. Jack, *The Date of the Exodus*, 1926; J. Harford, *Survey of Pentateuchal Criticism*, 1926; Raffalowitz, *The Pentateuch: our Inheritance*, 1932; D. Davidson, *The Exodus of Israel*, 1933.

Exogamy, term applied to tribal custom compelling marriage outside the tribe, clan, or 'totem,' thus the converse of endogamy (q.v.). E. holds good among the aborigines of Australia; the Somalis and Bakalaharis of E. Africa; the tribes of W. and Equatorial Africa; the Khasias, Iuangs, Warais, Cracons, and Hos of India; the Kalmucks, Circassians, Samoyeds, Ostiaks, and Yakuts, and the N. Amer. Indians.

Exogens, see DICOTYLEDONS.

Exon Domesday, see EXETER.

Exophthalmio Goitre, see GOITRE.

Exorcism (from a Gk. word meaning 'to conjure out'), the act of conjuring evil spirits to depart out of the person possessed, the term being specially applied to the freeing of an individual from a possessing spirit. There are numerous examples of the exercise of E. in the early church, Tertullian and Origen speaking of it as an ordinary occurrence. The professional exorcist was known among the Jews, and the art was practised by women in Greece. The anct. rite of E. in connection with baptism is still retained in the Rom. ritual, which contains also a form of special service for the E. of possessed persons. See G. Mylius, *De Abrogatione Exorcismi in Baptismo*, 1591; R. Woolley, *Exorcism and the Healing of the Sick*, 1932.

Exoteric, see ESOTERIC.

Exotic Plants are those introduced from a foreign country, as opposed to indigenous or native ones. Popularly speaking E. P. are those which have come from tropical or sub-tropical climates, and so have to be grown with heat under glass. For the harder ones a greenhouse is sufficient which keeps out frost and cold winds, but to which air is daily admitted: the more tender require much more heat, no direct outside air, and much moisture.

Expansion. An E. or increase of bulk due to the action of forces from within is a notable effect produced by heat on matter. It has been found by experiment that in general all bodies expand by heat or rise of temp. The length of a metallic bar varies with every change of temp., and is always the same at the same temp. This more increase of length is more correctly called 'elongation' or 'dilatation.' The tire of a cartwheel is thus fixed by enlarging the wheel hoop by heat. When cold it subsequently contracts, and clings closely to the wooden framework. In structures such as bridges and arches E. and contraction likely to ensue from changes of temp. must be taken into account. Watches and clocks are liable to go faster in cold weather, and slower in hot, as a result of the E. or contraction of their balance-wheels and pendulums. Exceptions to the ordinary rule of E. under heat are vulcanised rubber, oxide of copper, and the diamond at low temp., iodide of silver and iron beyond red-heat. Water begins to expand when lowered to 40° F.; otherwise most bodies begin to contract when the temp. is lowered. Among solids metals are the most expandable by heat. The observed E. of a liquid or gas within a containing vessel is called its 'apparent E.' the 'true E.' being found by correcting for the changed E. of the vessel. When homogeneous bodies are uniformly heated E. takes place equally in all directions, resulting in change of volume but not of form. In all bodies or systems that are not homogeneous, E. is not equal in all directions, and change of form results from the changes of temp. See also BAROMETER, HEAT, THERMOMETER.

Expansion, in mathematics, the detailed working out of a contracted expression contained in a short statement: the writing out in full of its meaning, or the result thus obtained. Thus the E. of $(a + b)^2$ is $a^2 + 2ab + b^2$. Among theorems for E. may be mentioned Taylor's and Fourier's. See I. Todhunter, *Algebra*, xxxvi., Fonnior series.

Expectation of Life is the technical term used to indicate the number of years which any one from any group of persons (males, females, sailors, plumbers, etc.) may live, the attendant circumstances being normal. In other words, it is the mean time which a number of persons at any moment of age will live after that moment. The same idea is expressed by the Fr. *vie moyenne*, average life—or by the Eng. expression *after life-time*, meaning the duration of life after any particular moment of life. Tables showing E. of L. have been compiled and issued at intervals from 1843, when A. W. Farr, the Deputy Registrar-General pub. Eng. Life Table No. 1. This was followed in 1853 by Eng. Life Table No. 2, and in 1861 by Eng. Life Table No. 3. These pub. are also known as Farr's Life Tables, and comprise a large number of tables of annuities and anniversary tables for the estimation of different kinds of life contingencies. Tables showing the E. of L. are used by Insurance Companies in fixing their premium terms for policies payable at death or at a stipulated age and also their terms for annuities.

Expectorant, drug which aids expectoration and facilitates the removal of secretions from the air passages. The simplest ways of aiding expectoration are: The local application of heat, by means of inhaling steam, medicated sprays containing ammonia, creosote, iodine, carbolic acid, eucalyptus, etc. The drugs taken internally are: Ipecacuanha, iodides, and chlorides of potassium, sodium, and ammonium. Es. are used for colds, bronchitis, and other affections of the air passages.

Expeditionary Force, British, see BRITISH EXPEDITIONARY FORCE.

Expenditure, National. The gross expenditure of Great Britain in recent years (each ending March 31) is:—

Year.	Expenditure. £
1904-5	151,769,000
1913-14	197,493,000
1914-15 (F. World War)	560,474,000
1915-16	1,559,158,000
1916-17	2,198,113,000
1917-18	2,696,221,000
1918-19	2,579,301,000
1919-20	1,665,773,000
1920-21	1,195,428,000
1921-22	1,079,187,000
1922-23	812,197,000
1923-24	788,840,000
1924-25	795,777,000
1925-26	826,100,000
1926-27	842,395,000
1927-28	838,585,000
1928-29	818,141,000
1929-30	748,712,000

Year.	Expenditure.
1930-31	799,170,946
1931-32 Two Budgets	770,599,000
1932-33	777,070,000
1933-34	693,419,000
1934-35	688,879,000
1935-36	749,979,000
1936-37	802,886,000
1937-38 Nat. Defence	847,024,000
1938-39	943,649,000
1939-40 S. World War	1,325,122,000
1940-41	3,884,288,000
1941-42	4,775,694,000
1942-43	5,637,367,000
1943-44	5,798,421,000
1944-45	6,062,004,000
1945-46 Two Budgets	5,565,231,000
1946-47	5,484,333,000
1947-48 Two Budgets	3,187,104,000
1948-49	2,975,673,000
1949-50 (Estimated)	3,308,368,000

Experience, really a philosophical term, but a very ambiguous word, and often used in an historical sense referring to the process in the past by means of which we have gained present knowledge. It is a continuous process, widening and extending the knowledge of an individual, and embraces both present and future. Pain, sorrow, pleasure, good and evil, and any change of sentiments and views all come under the heading of E. It is employed in a religious sense also; thus people talk of 'experiencing' religion, that is, becoming converted. The work of the mind, by means of which knowledge grows, is a work of discovery; and actual E., whether it be wide or narrow, is not mere data only, but concrete, definite knowledge. The widest conception of the term is when the whole race is substituted for the individual. Then we obtain a collective E., embracing life as a whole and the knowledge gained by living it. From this all-comprehensive meaning, all other meanings in which the term is used are more or less legitimate abstractions. Primary E. may be reduced to the barest minimum of sensation and feeling, that is to say, a distinction is drawn between what is directly perceived and what is only inferred, and E. can be explained as manufactured out of these immediate or primary data of sense. When regarded in this way, controversy arises between false empiricism and its counterpart, rationalism.

Experiment (from Lat. *experiri*, to try), literally the action of trying anything, putting it to the proof or test. It is a great method of scientific inquiry, as opposed to observation. An operation, in science, undertaken either to discover something unknown, or to test an hypothesis and illustrate truths already proved and known. It consists in the arrangement of the elements or essential features of some process, so as to allow observation at will. Laboratory Es. serve to distinguish purely accidental circumstances from the really essential conditions of any phenomenon. In meteorology, biology, and even astronomy, Es. play an important part. Newton's law of gravitation was founded on experiment.

Experimental Embryology is that branch of Embryology concerned with the conditions necessary for the development of ova into new individuals, the mode of development, the functions of the various cells formed by the div. of the ovum, and the relative importance of the nucleus and the cytoplasm, both in development and heredity.

Although fertilisation is generally essential for the formation of embryos, there are sev. animals and plants in which the unfertilised ovum develops (parthenogenesis). Fertilised ova of the honey-bee produce females (workers and queens); unfertilised ova develop into males (drones). Aphids produce two kinds of ova, one parthenogenetic (*see* EMBRYOLOGY) the other requiring fertilisation, and many other Invertebrata are frequently reproduced by parthenogenetic ova. Experimentally the unfertilised eggs of sea-urchins have been activated by chemical methods. Starfish eggs exposed for a time to a comparatively high temp. develop without fertilisation, and a frog's egg pricked with a needle, will develop parthenogenetically. Such experiments have led to the conclusion that the egg in itself contains all that is necessary for actual development, and sperms, or physical or chemical stimuli, merely enable the reactions to begin. An additional rôle of the sperm is to carry hereditary factors (*see* CELL and HEREDITY) and hence the inheritance of the embryo formed by a fertilised ovum is biparental.

The relative parts played by ova and spermatozoa in heredity have been investigated mainly by experimental hybridisation and by inducing sperms to enter enucleated eggs. The general results of such experiments, carried out mainly with various Echinodermata, show that some characters are transmitted through the nucleus, and therefore inherited from both parents. Characters distinctive of the group to which the animal belongs may be transmitted through the cytoplasm of the ovum, but experiments on the development of enucleated ova activated by the sperm are not yet conclusive, especially since such ova do not usually develop beyond the larval stage. The small amount of cytoplasm provided by the sperm is negligible as an agent in inheritance.

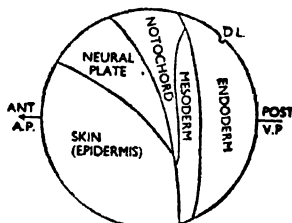

The cortex, i.e. the cytoplasm at the periphery of the egg, secretes a substance, 'fertilisin,' that enables spermatozoa of the same species to enter, while it inactivates those of other species. Removal of the cortex renders the egg incapable of fertilisation. Immediately the sperm enters, a membrane is formed, excluding other sperms, but in large yolk eggs the membrane forms slowly, and sev. sperms may enter; only one fuses with the nucleus of the ovum.

By centrifrifuging eggs it has been shown that some, e.g. *Ascaris*, are of the 'mosaic' type, having their materials arranged in a definite pattern which is destroyed by the experiment, and consequently the egg develops abnormally. Eggs of frogs and sea-urchins are not damaged by centrifrifuging, and in such eggs differentiation of the

cells may not take place until after the fifth div. of the ovum.

The stage at which cells become differentiated has been determined by interchanging cells from various parts of the embryo at different stages of development. Undifferentiated cells produce tissues normally formed in the region to which they are transplanted, but differentiated cells, even though the differentiation be invisible, will develop into the kind of tissue they would have produced before transplantation. Since some parts of the embryo induce in the area to which they are transplanted the development of structures which do not normally arise there, they are regarded as 'organisers.' These grafting experiments, and the discovery of organisers, is associated particularly with Spemann and his collaborators.

Prof. C. M. Child has shown the existence of definite metabolic axes generally approximately coincident with the axes of symmetry in the egg and the embryo. An axial gradient, i.e. a fall in metabolic rate, extends from the anterior to the posterior pole, and from this primary gradient secondary gradients extend laterally, particularly in limb-forming regions. The existence of metabolic gradients has an important bearing on development.

Blastula of the amphibian from the side, showing the presumptive areas (after Vogt).

Ant., A.P., the animal pole and future anterior end of the embryo; Post., V.P., the vegetative pole and future posterior end; D.L., dorsal lip of blastopore.

The action of external environment upon the growth of embryonic cells is studied by growing them in culture media. Tissue culture also serves to determine the degree of self-differentiation reached by the cells. Cantl and Fell, for instance, have shown that the rudiment of a fowl's leg is capable of development into the various bones, joints and other parts even when completely isolated in a nutrient solution.

Experimental E. shows that stages of development are conditioned each by the preceding one. The functions are not irrevocably fixed from the initiation of the cells, but are determined mainly by the relations between the cells themselves and by other environmental factors.

Recently a new technique of *intra-vital staining* has been developed by Prof. Vogt of Zurich, and has cleared up pre-

vious obscurities in the process of gastrulation in the heavily yolked egg of Amphibia. Patches of cells on the outside of the segmenting egg (blastula) are coloured by harmless dyes, so that it is possible to observe the subsequent fates of these regions. Thus the egg has been mapped out into *presumptive areas* of ectoderm (sub-divided into skin and neural plate), notochord, mesoderm and endoderm. The presumptive skin remains on the outside; the remaining areas flow to the blastopore where, in process of being tucked inside the embryo, they come under the influence of the primary organiser, and their fates are then no longer presumptive but are finally sealed. Once the main parts of the embryo have been blocked out, secondary organisers come into play, imparting the detailed structure to the individual organs; the best-known example is the production by the optic cup (rudimentary eye) of a substance which stimulates the overlying ectoderm to sink down and become the lens. See C. H. Waddington, *How Animals Develop*, 1935; G. R. de Beer, *Introduction to Experimental Embryology*, 1926 (2nd ed. 1934).

Experimental Psychology is virtually a new science, since much that was studied as such up to a few years ago is now regarded as physiology. It has not been found possible to submit all the questions of psychology to the test of laboratory experiment, but the method may nevertheless be applied to a considerable number. Experimental studies of the processes of remembering and forgetting have been carried out, whilst hearing, seeing, feeling, tasting, and smelling have been investigated experimentally.

In the last few years attention has been concentrated upon experimental studies of abilities of various kinds. Typically, these studies have proceeded from the devising of tests of various kinds, which have then been applied to large groups of individuals. The wide applications of the tests, and the study of the individuals tested, have enabled the experimenter to know something of the implications of the various scores given for success with the tests. He may then apply them to new individuals, and, from the scores they make in connection with the tests, predict with some confidence the extent to which the individual will show the ability which the test is designed to discover. The application of statistical methods to the interpretation and standardisation of the tests has resulted on the one hand in the formulation of the tests of proven reliability; and, on the other, in the development of new views regarding ability.

The formulation of tests has had important results in the educational field, since the 'intelligence tests' of Binet, Terman and Burt appear to be tests of educability. In the industrial field, certain tests have been devised which show whether the person tested possesses the necessary ability to follow callings which demand proficiency in certain operations. In industry, not only have tasks been analysed and shown to consist of combina-

tions of simple operations, but the ability for performing such operations has been experimentally investigated, and the conditions under which such operations may be best carried out by persons with the ability to perform them have also been studied. As a result the industrial psychologist is finding himself increasingly in possession of reliable information which enables him to advise employers as to whom to engage or reject, and further to inform them as to the conditions in which their output may be raised to an optimum and their work maintained at a constant standard of maximum efficiency. Interesting studies have been made of the effect of temp., ventilation, noise, lighting and other factors on the general behaviour and output of workers, and others are still being made. Not least is the introduction of bright colours into the decoration of industrial premises, and to the machines in them; in particular to the colouring distinctively of handles and emergency points, which reduces the strain on the worker in repetitive operations. The increasing importance of this dept. of psychology led to the foundation by Sir Charles S. Myers, M.D., Sc.D., F.R.S., of the National Institute of Industrial Psychology. See C. Spearman, *The Nature of Intelligence*, 1923, and *The Abilities of Man*, 1927; Mary Collins and J. Drever, *Experimental Psychology*, 1926; C. Murchison (ed.), *The Foundations of Experimental Psychology*, 1929; S. Freud, *Civilisation and Its Discontents*, 1930; W. McDougall, *Psycho-analysis and Social Psychology*, 1936.

Expert Witness, see *under EVIDENCE*.

Exploration, see *GEOGRAPHY*.

Explosion, the sudden and forcible expansion of certain substances through the action of heat or other cause. This expansion may either take the form of the conversion of solids or liquids into gases, or the increase in bulk of gases themselves through chemical changes.

Explosives, compounds or mixtures of an unstable character which can readily undergo chemical changes of an explosive nature.

According to the official Brit. list of authorised explosives, the classes recognised are: gunpowder, nitrate mixture, nitro-compound, chlorate mixture, fulminate, ammunition, firework.

Gunpowder is an intimate mixture of potassium nitrate, charcoal and sulphur in the proportions 75 : 15 : 10, mainly used for blasting. **Gun-cotton**, or trinitrocellulose, is a typical high E. discovered by Schönbein (1845), by the action of a mixture of nitric and sulphuric acids on cotton. Other forms of cellulose besides cotton, when nitrated, give nitro-celluloses. **Nitroglycerin**, discovered by Sobrero (1846), made by the action of nitric and sulphuric acids on glycerin. **Kieselguhr**, a siliceous earth, absorbs it (see *DYNAMITE*). Chemically it is glycerin trinitrate. **Cordite** is made by making a paste of nitroglycerin, gun-cotton, and vaseline (30 : 65 : 5) with acetone, and after forcing through dies, allowing the excess of acetone to evaporate. The re-

sult is a horny brown substance. **Cordite** is used largely for sporting rifles. **Blasting gelatin** is a mixture of nitrocellulose and nitroglycerin. **Picric acid** (trinitrophenol), is used largely for high explosive shells. **Trinitrotoluene** is safer to handle than picric acid. It is a high E. and gives rise to clouds of undecomposed carbon. **Amatol** is composed of trinitrotoluene (20) and ammonium nitrate (80). **Ammonal** is like amatol, but with powdered aluminium. **Cheddite** contains potassium chlorate, castor oil, and a nitro-body. **Sprengel** mixtures contain an oxidising agent such as nitric acid or potassium chlorate, together with a combustible substance like nitrobenzene, petroleum, etc. **Schultz** smokeless powders are made from nitrated wood and potassium and barium nitrates. **Oxyliquit** is liquid oxygen in a suitable absorbent such as kieselguhr. **Fulminates** of silver, mercury, etc., suitable for use in percussion caps. See also *BLASTING, BULLET, CARTRIDGE, DYNAMITE, FIREARMS, and INFERNAL MACHINES*.

Explosives Committee, body under the organisation of the War Office for the purpose of advising on subjects connected with explosives.

Exponent, or Index. In algebra, the E. or index is a symbol placed just above and to the right of another (termed the base) in order to indicate the power to which that base is to be raised. Indices may be positive, negative, or fractional. Thus a positive index a^1 indicates $a \times a$, i.e. a raised to the second power; a negative index a^{-1} indicates $\frac{1}{a^1}$, or the reciprocal of

a to the second power; while a fractional index $a^{\frac{1}{2}}$ indicates \sqrt{a} , or the square root of a . More generally $a^m \times a^n = a^{m+n}$. This is one of the fundamental laws of algebra, and is the principle behind the logarithm (*q.v.*) which transform the practical process of multiplication into addition. A logarithm is merely an E. Similarly $a^m - a^n = a^m - a^n$, $(a^m)^n = a^{mn}$ and $a^0 = 1$.

The **Exponential Series** depends on the transcendental number e which is derived from the consideration that if $y = \log_e x$, and $\frac{dy}{dx} = \frac{1}{x}$, then the number $e = 1 + \frac{1}{1} + \frac{1}{2!} + \frac{1}{3!} + \dots = 2.718 \dots$, and is the natural logarithmic base for theoretical purposes.

Exports, see *IMPORTS AND EXPORTS*.

Express. The word E. in the Brit. Post Office signifies immediate delivery of letters or packets by a special messenger at a higher prepaid rate, on the system introduced in 1891. **Express train** was the name given in 1845 to one running 'expressly' to take passengers to one particular place and not stopping elsewhere (what would now rather be a 'special'). To-day it means a train travelling at a high speed stopping only at a few important intermediate stations. In the United States the express system is an institution for the rapid and safe delivery of light goods and parcels, the idea having first originated in 1839 with W. F. Harnden.

The present Adams Express Co. was formed (1849) as 'Adams and Co.'s California Express,' and the Wells Fargo Co. started 1852. The American-European Co. was the first trans-Atlantic E., founded in 1855. A feature of the Amer. system is the 'Collect on Delivery' business, goods being marked C.O.D. The companies aim at saving their clients all trouble, taking entire responsibility from the time of collection to that of delivery. The parcel post (1883), Post Office, and railways undertake most of such duties in the United Kingdom. See F. J. Stimson, *History of the Express Business*, 1883.

Expressionism, form of art which endeavour to express the inner life of the artist, in which process the objective content is but a means to that end, wherein the subjectivity of the artist engrosses the interest so much that the external object may not dispute its supremacy, and either disappears or becomes unrecognisable. In brief, subjective presentation accompanied by total or almost total distortion of nature to the point of unrecognisability, or by suppression of all external reality. According to Max Raphael 'Art should merely reproduce the artist.' For a proper appreciation, or perhaps interpretation, of a picture, the critic will require to translate the detail of the picture as symbolic of some experience, whether physical, intellectual or spiritual, of the artist, much as psycho-analysts interpret the recollected incidents of dreams. The movement towards E. arose in the first quarter of the twentieth century as a reaction against Impressionism (*q.v.*) chiefly in Germany, Russia, and the Scandinavian countries. Among prominent expressionist painters are Severini, Nolde, Boccioni, Schaefer, Casper, Munch, Chagall, Compendonok, and Max Raphael; among sculptors, the Russian Archipenko. Variations of E. are Cubism, Futurism, Constructivism, and Surrealism.

The term E. properly belongs to painting, but can be loosely applied in music to composers who aim at the interpretation of moods and states of mind, not by the accepted symbols of romanticism, but by apparently unrelated abstractions, and in literature to writers like Kafka and James Joyce and many modern poets who express their inner truth in the raw symbols that spring from the unconscious. See C. Marriott, *Modern Movements in Painting*, 1921; A. Pope, *The Painter's Mode of Expression*, 1929-31; R. Samuel and R. H. Thomas, *Expressionism in German Life, Literature, and Theatre*, 1910-21, 1939.

Extension, in logic, a term used of any given term to describe the total number of objects to which it may be applied, being practically synonymous with 'Denotation,' and opposed to 'Intension' or 'Connotation,' which are used of the attributes essential to the conception of the term.

Extortion, in Eng. law, the term applied to the improper, premature, or excessive exaction of money or money's worth by public officers; also to such exaction by means of threats of personal violence or

blackmail. E. is regarded as a misdemeanour by the common law. See **THREATS**.

Extracts are solutions or syrups containing one or more substances that have been removed from admixture with others by means of a solvent. The methods of extraction depend on the particular case, but as a rule, the solvent, which may be water, alcohol, ether, acetic acid, etc., is poured over the crushed or powdered substance, and, after standing, is strained off. The substance is said to be macerated if the solvent is cold and digested if warm. When the substance is boiled with the solvent, a decoction results. Many forms of apparatus for performing extractions have been devised, with a view to minimising the amount of solvent used, and thus rendering the subsequent concentration of the E. a less tedious process.

Extradition (Lat. *ex*, out, and *traditio*, handing over), the giving up of a person accused of crime to the gov. in whose ter. the offence was committed by the gov. In whose ter. he has taken refuge. Great Britain has entered into E. treaties with practically all civilised nations; the offences for which E. is permissible are naturally all of a serious nature, including arson, murder, piracy, embezzlement, etc. In most states offences of a political nature do not allow of E.; such offences are not those with a political motive, but those which 'are incidental to and form part of political disturbances.' Criminals are not given up unless some specific treaty is in existence with the gov. requiring them, and in Eng. law the gov. has no power to surrender a fugitive criminal without express statutory authority. It is necessary to show the offence enumerated and the specific treaty, and also that the acts with which the fugitive is charged amount to the alleged offence according to the laws of both the govts. concerned. The authority in Great Britain is contained in the Extradition Acts of 1870-73. The fugitive can be tried only on the specific charge for which he was given up. Whether a state is called upon to give up its own subjects varies with different nations; the procedure in relation to Great Britain and other nations is briefly as follows. With France and Germany neither gov. surrenders its own subjects; with Spain and Switzerland Great Britain only surrenders them; with Russia, Belgium, and the Netherlands it is optional. If a Sp. subject committed a crime in Switzerland and took refuge in England, the Brit. Gov. would surrender him to Switzerland only after the consent of Spain had been obtained. A fugitive is committed on the same evidence as for an ordinary crime, but is not surrendered until a diplomatic representation of the gov. demanding him has been addressed to the secretary of state. In the U.S.A. foreign E. is not regulated by the individual states but by the Federal Gov. When a demand is made for E., the accused is handed over if his probable guilt is estab. at a preliminary examination before a commissioner or judge. An E. treaty embraces all previous crimes committed by the same person. Inter-

state E. is provided for by Act of Congress under the Constitution. The fact that an act may be no crime in one state does not debar another where such act is a crime from demanding surrender. Release by writ of *Habeas Corpus* is the procedure on an improper surrender. See also FUGITIVE OFFENDERS ACT, 1881.

Extra-Territoriality, or Exterritoriality, term of international law, which denotes the exclusion of certain individuals from the rule that everybody within the boundaries of a state is subject to the laws of that state. It is also used to describe the quasi-exterritoriality of the dwelling-place of an accredited diplomatic agent, and of public ships of one state when cruising in other waters than their own. Generally speaking, all cases where a state refrains from enforcing its laws within its own ter. are cases of the operation of the principle of extra-territoriality. The persons who come under this rule are those of foreign sovereigns, whether travelling under an incognito or not, ambass., ministers, plenipotentiary and other accredited diplomatic agents. Not only are the persons of these included, but their suites also, and their belongings. Public ships in foreign waters also enjoy the rights of exterritoriality. Consuls are not as a rule included, are in some non-Christian countries. In certain non-Christian states also extra-territoriality has been granted by treaty to the subjects of contracting Christian states who are resident therein (see CAPITULATIONS). Eng. settlements in the Far E. were subject to the conditions of the treaties by which they came into being. In the period 1928-37 the Nationalist Gov. of China had two main lines of policy: to achieve uniformity of political structure and administrative control within China, and to strengthen and modernise the country. The gov. showed a high average of skill in dealing with foreign interests. Here the primary problem was the old yearning of the foreign interests for a 'strong man' to run China on their behalf. These interests were then still conservative in their attitude and disposed to resent any attempt of the Chinese Gov. to make foreign enterprise respect the national interests of China. They obstinately clung to the theory that the foreign concessions and the system of E. were essential safeguards of 'law and order'—although disorder and corrupt politics were still fostered by the ability of all Chinese war lords and others who got rich in unpatriotic ways to put their money in foreign banks in the foreign concessions, safe from taxation or any form of Chinese control. These foreign interests would have liked nothing better than to make Chiang Kai-shek their strong man. But Chiang Kai-shek built up the strength of the gov. and its international credit without allowing foreign control to increase either politically or financially. Gradually he succeeded in committing America and Britain, among the great powers, not only to the support of the Chinese Gov. but to progressive relinquishment of their privileges and res-

toration of the sovereignty of China, so that Japan stood more and more isolated both as the advocate of territorial and political imperialism in China and as a rival threatening Amer. and Brit. interests. As early as 1931 the Chinese National Gov. announced the abolition, as from 1932, of extra-territorial rights of foreigners resident in China. This announcement followed China's refusal to accept the Powers' demands that foreign jurisdiction should continue at Shanghai, Canton, Tientsin, Peking, and Hankow. It was further announced that courts for the trial of criminal and civil cases involving foreigners were to be estab. in special areas, including Shanghai, Tientsin, Mukden, and Canton; but these decisions could not then be implemented owing to the capture of all these cities by the Jap. invaders. In 1942, however, the Brit. and U.S. Govs. relinquished extra-territorial rights in China. Gen. Chiang Kai-shek in Oct. of that year sending messages of appreciation to Mr. Churchill and Mr. Roosevelt for their gesture of friendship and goodwill manifested in their determination to abrogate E. in China and thereby to allow China to assume the full stature of an independent democratic nation. There were formerly similar agreements or capitulations with Turkey for securing immunity to foreigners in that country or in its dependencies, including Egypt. In the case of Egypt, the question of capitulations was settled by the Anglo-Egyptian Treaty of 1936 (see EGYPT). An exceptional case of exterritoriality was that granted to the residence of the pope by an It. law. When armies are allowed by another gov. to cross the borders of their own state, they thereby come into possession of exterritorial rights. It was laid down in the arbitration of the *Alabama* case that the extension of exterritoriality to ships was not the law of nations or an absolute right, but simply an act of courtesy; such a view is not in accord with the universal practice. The extension of immunity to vessels owned by states and engaged in trade was an issue before the Eng. courts in *The Porto Alexandre* (1920), in which case the Court of Appeal in spite of the commercial difficulties that might arise, felt bound in view of the prevailing fashion of internationalisation to follow the decision in *The Parlement Belge* (1878) where the fact that a ship had been declared by a foreign sovereign to be in his possession as sovereign was held to be conclusive and to confer immunity from the local jurisdiction.

Extravasation, passage of fluid from a vessel. The term is also applied to the passage of fluid into an unusual position by bursting or perforation. E. of blood is the most commonly seen, as in a bruise, the size of which depends upon the amount of blood that leaves the damaged vessels, and the chances that a bruise goes through are caused by the alteration in the blood. The extravasated blood is either absorbed or remains fluid, and has to be removed, or else gangrene of the skin or damage of deeper parts results. The

treatment of a bruise consists in applying cold to check the bleeding, and when the bleeding has been arrested and there is no longer an increase of swelling, heat is applied to dilate the neighbouring vessels and enable them to drain off the extravasated blood.

Extreme and Mean Ratio, in geometry, a phrase used of the proportional div. of straight lines. Thus if AB is a straight line, and the point of div. is at C, the line will be divided in extreme and mean ratio, or medial section, if the ratio $AB : AC = AC : CB$. The term is used by Euclid, who states the problem in Book II. prop. 2.

Extreme Unction, sacrament of the Rom. Catholic Church, reserved to those at the point of death. It is believed to give spiritual aid to the person receiving it and also, when God so wills, to restore bodily health. The custom of anointing the sick with oil doubtless had its origin in the counsel of St. James (James v. 14), but it is noteworthy that this passage makes the cure of the sick person the object of the act. There are still traces of this primitive view in the Rom. rite of unction. In the Gk. Church the ceremony is known as 'The Holy Oil,' or 'The Oil of Prayer,' and the primitive view has remained more fully. In the 1549 Book of Common Prayer, a form of unction was given, but this has since been omitted. The practice of unction of the sick with the primitive intention has lately been revived in the Eng. Church with episcopal consent.

Exuma, Great and Little, two of the Bahama Is. These two, together with the smaller Exuma Keys, are about 150 sq. m. in area, and support a pop. of 2300. The chief tn. is Georgetown.

Eyalet (Arabic *wāli*, a governor; *wilāyat*, a prov.), originally the term applied to a pashalic, or one of the largest administrative divs. of the Turkish empire; now to a prov. under the administration of a governor-general. 'Vilayet' is an analogous term.

Eyam, vil. of W. Derbyshire, England, 10½ m. N.E. of Buxton. It stands in a romantic vale in a dist. noted for its beauty, geological interest, and anct. Brit. and Saxon remains. Barytes mining is carried on. In E. churchyard is a fine ninth or tenth century Runic cross, restored by John Howard in 1738. The vil. was ravaged by plague in 1665-66. Pop. 1200.

Eyasses, see under FALCONRY.

Eyck, Hubert Van (c. 1370-1426), early Flemish painter, probably b. at Maaseyk on the R. Maas, who lived at Bruges and later at Ghent. He usually worked in conjunction with his brother Jan, being appointed together with him by Philip of Charolais as court painter at The Hague in 1422. They are said to have invented painting in oils, and certainly perfected the art of colour mixing, their work being famous for transparency and brilliance of colouring. To Hubert is attributed the major part of 'The Adoration of the Lamb,' of which four panels, up to the First World War, still in the church of St. Bavo at Ghent, and the other six in

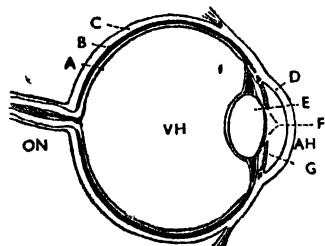

the Berlin Museum, were, under the Treaty of Versailles, returned from Berlin. Two lesser works by van E. are at Madrid and Naples. He had great intellectual power, and represented scriptural scenes and characters through the medium of such life as he himself had observed.

Eyck, Jan Van (c. 1390-1410), an early Flemish painter, brother and pupil of Hubert (*q.v.*), and like him b. at Maaseyk. During Hubert's lifetime he worked with him, and after his death completed 'The Adoration of the Lamb.' He also became court painter to the duke of Burgundy in Lille. He died at Bruges. His work, while lacking the power of conception of Hubert's, shows more attention to detail and delicate finish. His works, mainly portraits, historical subjects, and landscapes, include: 'The Consecration of Thomas à Becket'; 'St. Francis receiving the Stigmata'; 'The Virgin and Child'; the 'Madonna di Lucca,' the 'Portrait of Himself and Wife' (in the National Gallery, London); 'Portrait of Jan de Leeuw'; 'Head of Christ as Salvador Mundl.'

Eyck, Margaret Van, a painter, sister of Hubert and Jan. She lived a retired life as a member of the order of Our Lady of Ghent, and died before 1431, being buried in the cathedral of Ghent. She is believed to have executed some miniatures in the missal of the duke of Bedford.

Eye. The E. is one of the higher sense organs, and like those of hearing and smell, it consists of an essential part and an accessory part. The organ of vision, strictly speaking, consists only of the eyeball, but it is also necessary to discuss its many important appendages. The eyelids, fringed by the eyelashes (*cilia*) consist of integument with a thin layer of dense fibrous tissue strengthening their margins. They are closed by the *orbicularis muscles*, and the upper is raised by the *levator*. The *meibomian glands*, which secrete sebum, open on the free margin of the eyelids. A layer of mucous membrane (*conjunctiva*) lines their inner surface and is continued over the front of the eyeball. The upper lid is the larger and more movable, and joins the lower at the inner and outer canthi. Near the inner *canthus*, on each lid, will be seen the slight elevation (*papilla lachrymalis*) pierced by the *lachrymal canal*, which is the drainage channel for the fluid from the conjunctiva; this fluid is continuously secreted by the *lachrymal gland*, which is lodged in the orbit on the outer side of the ball. The reflex action of winking the lids about once in every two minutes distributes the fluid over the ball and thereby washes it. The lachrymal canals from above and below converge and open into the *lachrymal sac*, the upper slightly dilated end of a duct about ½ in. in length descending to the fore-part of the lower meatus of the nose. Stimulus of the lachrymal gland by pungent vapours or the stress of strong emotions may result in an excessive secretion of the fluid exceeding the capacity of the *lachrymal duct* and tears result. The conjunctival mucous mem-

brane becomes continuous with the nasal mucous membrane by means of this system of canals. The globe of the E. is not perfectly spherical, its antero-posterior diameter being about $\frac{1}{2}$ of an in., as also is its vertical, but the transverse diameter is usually a little longer, about 1 in. The eyeball consists of three concentric coats and of certain fluid and solid parts enclosed by them, viz. (a) the tough, firm, fibrous external coat, the *sclerotic* and *cornea*; (b) a middle vascular pigmented and in part muscular membrane, the *choroid* and *iris*; (c) an internal nervous and epithelial layer, the *retina*. The corneo-sclerotic case is kept in shape by (i.) the *aqueous humour* which distends

DIAGRAMMATIC SECTION OF THE EYE

ON, optic nerve; A, retina; B, choroid; C, sclerotic; D, cornea; E, crystalline lens; F, pupil; G, Iris; VH, vitreous humour; AH, aqueous humour.

the cornea; (ii.) the *vitreous humour* which fills the less convex sclerotic chamber; these two humours are separated by the *crystalline lens*. The whole may be represented as a 'water-camera' of the highest degree of perfection and adaptability.

A brief description of each of the above parts follows. The sclerotic coat is a strong, opaque, fibrous structure extending over about five-sixths of the eyeball. Its outer surface is pearly white; its inner is of a light brown colour. The remaining sixth, although not changed essentially in character, is transparent, and is termed the *cornea*. The cornea is normally from $\frac{1}{2}$ to $\frac{3}{4}$ in. in thickness. The choroid coat is a thin membrane, and supports in its outer layers the larger arteries and veins of the E. Its inner stratum is covered by hexagonal pigmented cells; these, which were formally considered as part of the choroid, belong in reality to the retina. Near the corneo-sclerotic junction the choroid becomes raised up into a number of longitudinal ridges or puckers (*ciliary processes*) arranged meridionally and forming a circle. The *iris* at its circumferential border is continuous with the choroid. It is a curtain with a round hole (pupil), and is provided with circular and radiating unstriped muscular fibres which adjust the size of the pupil. (Though unstriped, these fibres contract with extreme rapidity.) The pigment cells of the iris vary in different individuals, and the

different colours of Es. are partly dependent on the amount and distribution of the contained pigment. The retina is the delicate membrane containing the expanded termination of the *optic nerve*. It varies in thickness from $\frac{1}{16}$ to $\frac{1}{8}$ of an in., and forms the lining between the choroid and the vitreous humour extending nearly to the outer edge of the ciliary processes; its indented border is termed the *ora serrata*. It, for the most part, is of even texture and smooth surface, but almost exactly opposite the middle of the posterior wall is a slight circular depression (*yellow spot*), and not far from this, towards the nasal side of the eyeball, is a radiating appearance produced by the spreading of the optic nerve at its point of entrance.

It is impossible within the limits of this account to deal with the microscopic structure of this wonderful membrane. No less than eight distinct strata build it up, of which only four are here mentioned. The innermost layer is one of nerve fibres, and lying next to this is the layer of nerve cells; the outermost layer consists of the pigment cells previously mentioned, and immediately within is the layer of *rods* and *cones*, the former far exceeding the latter, except in the yellow spot. These bodies are closely packed, and it is suggested that each rod or cone conveys but one impression, so that any image, even microscopic in size, must be the result of combined impressions from a number of rods and cones. The *aqueous humour* is a watery solution of saline and organic material, while the *vitreous humour* is of a soft gelatinous consistency, and serves as a support for the delicate retina from which, in most parts, it may be readily separated. The crystalline lens, about $\frac{1}{2}$ in. across and $\frac{1}{4}$ in. thick, is a transparent solid body, double convex in shape and enclosed by an elastic capsule with attached suspensory ligaments subject to varying tensions. Its posterior convexity is the greater. It is composed of a number of concentric laminae, resembling the coats of an onion, and each lamina is composed of ribbon-shaped fibres built together in a peculiarly curved manner. The lens, which is practically spherical in the fetus, becomes more and more flattened with advancing age.

The action of the E. is roughly as follows: Diverging beams of light from any one point in an object strike all over the surface of the cornea, this gathers them slightly together, refraction follows in the aqueous humour, and the lens brings them to a focus, in normal vision, on the retina. The rods and cones are affected by the image, and in consequence cause disturbances and stimuli in the nerve fibres and an impulse is transmitted via the optic nerve to the brain. There are special adjustments for the varying distances of objects. This *accommodation* is brought about by (1) a compression of the ball of the E. by its muscles which cause a change in the form of the cornea; (2) a shifting of the lens bodily; (3) a pressure of the iris upon the front of the lens. The muscles which move the eyeballs are six in

number, four *recti* and two *obliqui*; and by means of the contractions of these sev. muscles the eyeballs may be moved in any desired direction.

Double vision, or *diplopia*, is the name given to an optical abnormality in which two images of the same object are seen. If the diplopia concerns one eye only it may be the result of some abnormality of refraction in the eye concerned, but if it disappears when either eye is closed, thus showing that both eyes are concerned in its production, it is true diplopia, and may be due to a transient weakness of the ocular muscles which will pass off. It may be the first warning of the disorder called disseminated sclerosis, or of the rare condition known as myasthenia gravis. A case of diplopia should therefore receive expert attention. The so-called double vision found after alcoholic excesses, in attacks of migraine, after the taking of drugs, etc., is really only blurred and muddled vision. *Nystagmus*, a condition in which the eyes are continually moving in a rhythmical fashion, from side to side, or up and down, or with a circular motion, is present in disease of the labyrinth or semi-circular canals which control the balance of the body. Sometimes it is due to disease of the eyes or of the parts of the nervous system which are connected with them. The *Argyll Robertson pupil*, called after the Edinburgh physician who first described it, is the name given to the condition in which the pupils do not react to light.

Wounds and foreign bodies.—As was said in the description of the structure of the eye, any irritation to the eye causes such intense pain to the individual that he usually seeks to remove the cause at once. This is one of Nature's ways of safeguarding sight, which is among man's most precious possessions. Every injury to the eye should receive immediate attention. Careful treatment of injury or inflammation in the early stages may avoid loss of sight in the damaged eye, and it must never be forgotten that undue strain thrown on the other eye may lead to blindness in it as well. The most frequent accident to the eye is undoubtedly the entrance of a foreign body; and the smallest particle of dust, splintered wood or metal, or coal, or road grit may be sufficient to cause grave damage. When a particle falls on it, the eye will water and thus the article may be washed to the corner of the eye, where it can be removed. Never rub the eye which has grit in it, but blow the nose and the particle may be dislodged so that it can be removed with the corner of a clean rag or handkerchief. If the foreign body be wedged under the upper lid, a few drops of a bland oil, such as castor oil, may be dropped into the eye in the hope that the particle will float out. If this is unsuccessful, gently grasp the rim of the lid and pull it out and downwards, pushing up the lower lid under it. Drop the upper lid, and as the lids slide apart again, the particle is very often carried out on the lashes of the lower lid. If these first-aid measures are unsuccessful, no further attempt should be made,

but the patient should be taken at once to the doctor. In the case of larger particles which are apt to enter the eyes of workers in such places as steel works, expert advice should be obtained at once. The cornea is subject to ulceration of various kinds. Even such a small wound as a tiny scratch may lead to inflammation and ulceration. Children from poor and dirty homes often develop these ulcers, sometimes in conjunction with tuberculous glands in the neck. Older people in poor health are prone to corneal ulcerations. When inflammation is present in the cornea without actual ulceration, the condition is called keratitis. All corneal inflammations require expert advice and treatment.

Wounds of the Eye.—Any sort of wound may happen to the eye, and accidents in which rods of metal or wood, such as prongs of pitch-forks, tools of all sorts, projecting parts of cars or furniture, stones, golf-balls, elbows and fingers at football, etc., enter the eye and lacerate it are fairly frequent. First-aid treatment only should be attempted, and the patient should as soon as possible be taken to the doctor, or the doctor be sent for if there is collapse from the shock and pain, which is often severe. The eye may be covered with a pad of wet boracic lint, and bound up with a bandage. Hot tea or coffee or other stimulant may be given to restore the patient. The worst aspect of an eye accident is the frequency with which the other, sound, eye becomes involved, and loses its sight, even though the damaged eye may recover.

Black eyes, in which the tissues round the eye become suffused with blood and discoloured, are common. The usual cause is a bruise in the region of the eye caused by a blow or knock, but sometimes black eyes occur after such happenings as operations on the nose. In a few days the blood which has collected in the tissues will be absorbed, and the dark colour will fade through shades of yellow to a normal colour again. Immediately after a blow has been struck on the eye, cold wet cloths should be applied, or the part should be covered with pads of cotton wool soaked in weak lead lotion. This treatment, if applied soon enough, may prevent a black eye from forming, and is cheaper and more efficacious than the slab of raw beef-steak of popular tradition. If a black eye develops in spite of these precautions, hot compresses may be used to relieve any pain, and grease-paint during the day will conceal some of the disfigurement without doing any harm.

Other conditions and diseases of the eye and eyelids are described under: **ASTHENOPIC**; **ASTIGMATISM**; **CATARACT**; **CONJUNCTIVA AND CONJUNCTIVITIS**; **EYE-LIDS**; **SORE**; **GLAUCOMA**; **MYOPIA**; **OPHTHALMIA**; **PINK EYE**; **SQUINTING**; **STYE**; **TRACHOMA**. See also **BLIND**; **COLOUR-BLINDNESS**; **OPTICS**; **SPECTACLES**; **VISION**, **DEFECTS OF**.

Eye, *tn.* of Suffolk, England, on a trib. of the R. Waveney, 20 m. N. of Ipswich. Formerly a centre of the pillow-lace industry. Pop. 2000.

Eyebright, see EUPHRASIA.

Eyemouth, tn. of Berwickshire, Scotland, at the mouth of the R. Eye, 8 m. N.W. of Berwick. It has large fishing industry. Pop. 2400.

Eyes, **Propagation** by, in plant culture, consists in carefully cutting out the eye, as it is called, and planting it afresh; this soon shoots out and becomes a new plant. The best known example of this form of propagation is the potato.

Eyelids, **Sore**, or **Blepharitis**. Sore eyelids are very common. They occur in persons, of any age, who are run down, but are most common in delicate children. Catarrhal conditions of the nose, eye, or ear, chronic skin diseases, anæmia, rickets, malnutrition, and infective and debilitated states of health generally may cause the eyelids to become sore and inflamed. Uncorrected errors of sight, and exposure to dust, glaring lights, etc., are also frequent causes. The condition is apt to become very chronic, and treatment may have to be carried out for months before a cure is achieved. Even then a return of the original debility may cause the lids to redden again. Any cause of ill-health must be attended to, and the general tone of the body raised as much as possible, by good food, rest, fresh air, and correct hygiene. Tonics such as those containing iron, arsenic, and strychnine are very useful, and a course of cod-liver oil often helps. The local treatment is to bathe the eyes sev. times a day in a warm mild antiseptic, such as a weak solution of boric acid or bicarbonate of soda. At night, yellow oxide of mercury ointment may be rubbed into the edges of the lids, and in severe cases the doctor may paint the eyelids with a silver preparation, such as argyrol or protargol. Chronic inflammation of the eyelids can be very disfiguring, and may lead to damaging of the eyelids and falling out of the eyelashes. At one time the lashes used to be removed, but this blemishing operation is fortunately no longer carried out.

Twitching or **fluttering** of the eyelids (**blepharospasm**) is another common accompaniment of weak eyesight, especially if supplemented by physical or mental debility. The treatment aims at toning up the general condition, and correcting any errors of sight. See also STYE.

Eylau, **Preussisch**, see PREUSSIAN EYLAU.

Eyra, native S. Amer. name for a species of wild cat, *Felis eyra*, which ranges through the W. hemisphere from Mexico to Paraguay. It is reddish-yellow, with white spots on the face, and is about the size of the domestic cat.

Eyre, **Edward John** (1815-1901), a Brit. colonial governor and Australian explorer, son of a Yorkshire vicar. He emigrated to Australia, becoming a squatter on the Lower Murray R., a stipendiary magistrate and protector of the aborigines. He undertook difficult journeys to prove the possibility of an overland route between S. and W. Australia. Starting in 1841, he reached Albany in about five weeks, publishing an account of his journey in England, as *Discoveries in Central*

Australia (1845). In 1846 Grey appointed him lieutenant-governor of New Zealand. He was transferred to the W. Indies in 1854, governing St. Vincent and Antigua, and finally became governor of Jamaica in 1862. E. took stern measures to suppress the negro rising there (1865). For this he was superseded by Grant, and prosecuted by a committee of which J. S. Mill was president. Carlyle and Kingsley were on the committee for his defence. He was acquitted in 1867, and retired with a pension. See W. L. Mathieson, *The Sugar Colonies and Governor Eyre*, 1849-1856, 1936; Lord Olivier, *The Myth of Governor Eyre*, 1933.

Eyre, **Sir Vincent** (1811-81), Eng. gen., who served in Afghanistan (1841-42). His *Military Operations at Cabul... with a Journal of Imprisonment in Afghanistan*, pub. in 1843, gave an account of his eight months of captivity with Akbar Khan. He fought in the Indian Mutiny, being with Havelock and Outram at the relief of Lucknow. See memoir by Malletson (*Recreations of an Indian Official*, 1872).

Eyre, **Lake**, lake in S. Australia. It is 4000 sq. m. in area, but in the dry season it becomes a mere salt marsh. Lakes Gairdner and Torrens are similar in character—i.e. when the supply of water is least the evaporation is greatest, whereas in the case of most lakes both supply and evaporation are more or less constant at all seasons.

Eyres Peninsula, triangular piece of land on the S. coast of S. Australia, lying between Spencer Gulf and Anxious Bay, its base being formed by the Gawler range.

Eyre-Todd, **George** (1862-1937) Scottish author, b. at Glasgow; son of Henry Todd. Educated at Glasgow, one time lecturer on Eng. literature and Scottish hist. at Glasgow Athenæum. Later, editor of *The Scottish Field*. His works include: *Ossian* (1888), *Byways of the Scottish Border* (1892), *Abbotsford Series of Scottish Poets* (1891-96); *Ancient Scots Ballads, with their Traditional Airs* (1894), *The Glasgow Poets* (1902), a trans. of Barbour's *Bruce* (1907), *Works of Macrae* (1909), *The Angel of Robert Burns* (1917), *The Legend of Langmuir* (1922), *The Highland Clans of Scotland* (1923), *L. M. & S. Rly.* (1925); *History of Glasgow*, Vol. II. (1929), Vol. III. (1934) (written for the Glasgow Corporation).

Eyston, **George Edward Thomas** (b. 1897) Brit. racing motorist and consulting engineer; educated at Cambridge Univ., where he was a rowing blue. After service in the 1914-18 war he took up motor racing and in Nov. 1937 he broke the world's land speed record with an average speed of 312.20 m.p.h., and, again in Sept. 1938 at Bonneville Salt Flats, Utah, U.S.A., in his 'Thunderbolt' with an average speed of 357.5 m.p.h.

Ezekiel ('E' (God) will make strong'), one of the four greater prophets, is spoken of in ch. I. 3, as 'the priest, the son of Buzi,' and this description by the editor of his prophecies is the only extant reference of another writer to him. On the

capture of Jerusalem by Nebuchadnezzar, he was carried into Mesopotamia with Jehoiachin, king of Judah, and settled at Tel-abib on the R. Chebar. Here in the fifth year of the captivity (592 B.C.), the call to the prophetic office came to him. He continued it for twenty-two years. It is noteworthy, then, that E. was both prophet and priest, and it is this unique blending of the two which makes his work remarkable. The influence of Jeremiah is particularly strong in his writings. The book of E. has never had its authenticity severely questioned, though a Talmudic tradition ascribes the authorship to the great synagogue, to which E. did not belong. It may be divided into two great parts, the div. coming at the end of either ch. 32 or ch. 39. Chapters 1-39 fall into three divs.: (1) before the siege of Jerusalem, threatening the complete overthrow of the kingdom of Judah on account of its alienation from God; (2) during the siege, threatening the surrounding nations with divine punishment for their scorn of Judah; (3) after the siege, an exultant prophecy of the future. See J. Smith, *The Book of Ezekiel*, 1931; J. Harford, *The Book of Ezekiel*, 1935; A. Guillaume, *Prophecy and Divination*, 1938; H. Robinson Wheeler, *Two Hebrew Prophets: Studies in Hosea and Ezekiel*, 1948.

Ezija, see ECIJA.

Ezo, see YEZO.

Ezra, the Scribe, is said to be one of the descendants of Sheraiah the high-priest who had been put to death after the taking of Jerusalem by Nebuchadnezzar. He first appears in the Biblical narrative as a Jewish exile, living in Babylon during the reign of Artaxerxes Longimanus, by which monarch he was held in great favour. After the seventh year of the reign of Artaxerxes, he was permitted to lead a band of from 1400 to 1600 men with women and children out of Babylon to Jerusalem. In Ezra vii. is given the decree by which Artaxerxes makes the arrangement for this journey, but advanced critics are agreed in declaring it to be spurious. On his arrival at Jerusalem, E. found that the Jews had intermarried with the surrounding nations, and on the authority of the law he called upon them to sever this connection. The result was the institution of a special 'congregation' devoted to the temple and the law. E. is noted as a restorer of the text of the law, and was held in high

repute by later Jews. See *Primitive Christianity*, 1711.

Ezra and Nehemiah, the Books of, naturally form one work, both being continuations of the books of Chronicles. It is impossible to consider them apart, as both are constructed from the same sources, and both have undergone the same revision. The book of Ezra falls into two parts, of which the first, chs. i.-vi., tells the hist. of the Palestinian Jews from the first year of Cyrus down to the sixth year of Darius Hystaspes. Of this section, the portion from iv. 8 to vi. 18 is written not in Heb., but in Aramaic, the common tongue of the Semitic peoples at this time. The second div. of the books, chs. vii.-x., describes the return of Ezra and his company in the seventh year of Artaxerxes, and his action with reference to the mixed marriages. In the original ch. vii. 12-26 is in Aramaic. The book of Nehemiah tells how that Jewish leader was sent by the Persian king as governor of Jerusalem to restore the walls of the city, and describes the manner in which he carried out his work in face of the opposition of Sanballat. The whole work is of a piece with the Chronicles, and was written in close connection with them. There are some difficulties in regard to the chronology of the two books which have not yet been cleared up. See H. H. Howorth, *Unconventional Views*, 1901; G. Bose and W. Sanday, *The Ezra Apocalypse*, 1912.

Ez Zebdani, prosperous tn. of Syria, about 20 m. N.W. of Damascus, surrounded by celebrated apple orchards and vineyards. Not far off is a remarkable rock-pinnacle, resembling an uplifted finger, which appears to have been a sacred pillar worshipped as a Symbol of Baal Moloch. Even to-day it is venerated by the Muslim peasantry, and is visited by processions of Dervishes. Once every year at Zebdani a Muslim sheik of approved sanctity rides on horseback over the prostrate bodies of fanatics who voluntarily permit themselves to be trampled upon.

Ezzelino da Romano (1194-1259), It. Ghibelline leader, was descended from Eccelin, a knight, who had received the fief of Romano, near Padua, in Italy. E. had such a reputation for cruelty that he was called 'the tyrant,' and we find him pictured in Dante's *Inferno*. He has also been made the subject both of a drama by Eichendorff (1828), and of a novel by Canth (1838).

F, the sixth letter of the Eng. alphabet, had originally (i.e. in the Semitic alphabet) the phonetic value of *v-w*, and was called *waw*. A form of it became the Gk. *digamma*, which was a consonant having the value of *w*. In some Gk. dialects, however, there was no need for this letter, and it was given up; in others it survived, but gradually it was discontinued and finally it only survived as the numeral 6. Another form of the Semitic *waw* became the Gk. *upsilon* (see the letter U). The Etruscan alphabet, being of early Gk. origin, contained the *digamma*. The Etruscans, however, expressed the sound *f* either by a sign having the form of figure 8, or by the combination *w-h*. Also the Romans adopted this combination to express the sound *f*, but at a later stage the *h* was dropped. Thus the Gk. *digamma* (F) came to represent the Lat. sound *f*, whereas the Gk. *upsilon* was adopted both for the consonant *v* (q.v.) and the vowel *u* (q.v.). The Lat. F was taken over by all alphabets descended from the Rom. character.

F is a 'voiceless labio-dental spirant.' Etymologically it corresponds in general to the Gk. *φ*. Cf. Enk. 'father,' Gk. *πατήρ*; 'foal' and *πῶλος*; 'five' and *πέντε*; 'fire' and *πῦρ*. In O.E., if between two vowels, *f* was pronounced like *v*. In modern Eng., the word 'of' is the only example of this sound for *f*. The letter F is used in various abbreviations, e.g. for 'fellow' (F.R.S.), 'Fahrenheit,' 'Fluorine' (in chemistry), and others. See also ALPHABET.

F, in music, is the fourth note in the ascending diatonic scale of C, major and minor, the sub-dominant of the scale. The bass or F clef is on the fourth line of the staff, the note on that line being F, and the other notes above and below being named accordingly (*g*, *a*, *b*, etc.). The scale having the note F as its tonic is the scale or key of F. It represents 'forte' (loudly) in music, being usually written *f*; *ff* stands for 'fortissimo' or 'piu-forte.'

F., Fahr. (abbr. for *Fahrenheit*), the name applied to a thermometer, so called from its inventor, Gabriel Daniel Fahrenheit, who substituted mercury for spirits of wine, thereby greatly improving the instrument.

Fabaceæ (in botany), see LEGUMINOSÆ.

Fabroni, A., see FABRONI A.

Faber, Cecilia Francisca Josefa Böhi von (1797-1877), Sp. novelist, who used the pseudonym of 'Fernan Caballero.' She was born at Morges, in Switzerland, and in 1813 her father, a Ger. merchant who had married a Sp. lady, settled in Spain with his family. Her first novel, *La Gaviota*, was pub. in 1849. She also pub. *Cuentos y Poesías populares Andaluces* (1869), the earliest collection of Sp. folk-tales and songs.

Faber, Frederick William (1814-63), Eng. Oratorian and hymn-writer, nephew of G. S. Faber, born at Calverley, Yorkshire. Till 1845 he remained a clergyman of the Anglican Church, and was then converted to Catholicism, and was ordained priest. He founded a religious community at Birmingham, later merged in the oratory of St. Philip Neri, with Newman at the head. In 1849 a branch was formed in London, with F. as president. His *Collected Hymns* were pub. in 1861, including 'O Gift of Gifts, O Grace of Faith,' and 'Paradise, O Paradise'; and his complete works in prose and verse in 1914. See J. E. Bowden, *The Life and Letters of Frederick William Faber*, 1869; G. C. Faber, *Oxford Apostles*, 1933.

Faber, George Stanley (1773-1854), celebrated Anglican divine, uncle of F. W. Faber, b. in Yorkshire. He graduated from University College, Oxford, became fellow and tutor of Lincoln College, Oxford, 1793; Bampton lecturer, 1801; rector of Stockton-on-Tees, Durham, 1803. In 1832 F. became master of Sherburn Hospital. His greatest book is *The Origins of Pagan Idolatry* (1816). Among his other works are: *Horæ Mosaicæ* (1801), *On the Mysteries of the Cabiri* (1803), *Difficulties of Infidelity* (1824), *Difficulties of Romanism* (1826), *View of the Prophecies Relating to Judah and Israel*; and *The Sacred Calendar of Prophecy* (1828), *The Primitive Doctrine of Justification* (1837), *Eight Dissertations upon the Prophetic Promises of a Mighty Deliverer* (1815). See G. S. Faber's memoir in *Many Mansions in the House of the Father*, 1854.

Faber or Fabri, Jacques (c. 1455-1536 or '37), Fr. humanist and precursor of Protestantism; properly, J. Lefèvre d'Étaples, latinised into J. Stapulensis; b. at Étaples. Went early to Paris to study; in 1486 to Italy, where he remained sev. years. On his return, he propagated Aristotelian principles, by trans. and paraphrases. F. met an old pupil, Guillaume Briçonnet, who had become bishop of Lodève, and who accommodated him in the abbey of St. Germain-en-Laye. He made a Fr. trans. of N.T., and his biblical commentaries aroused the antagonism of the Sorbonne. Removed to Meaux (of which Briçonnet had become bishop), he was protected by Francis I. Later accompanied Marguerite of Valois to Blois, where he finished trans. of Bible. In 1531, Marguerite removed him for greater safety to Nérac, where he died.

Faber or Fabri, Johannes (1478-1541), Ger. theologian; b. at Leutkirch in Swabia. Real name, Helgerlin. Studied theology and canon law at Tübingen and at Friburg in Breisgau, became doctor in canon law. In 1518 he was appointed vicar-general of the diocese of Constance.

He was friendly with Erasmus, Melancthon, and Zwingli: but, when the breach came, he chose the orthodox side, and became known as the Hammer of the Heretics—from his work, *Malleus . . . in Næræsim Lutheranan* (Cologne, 1524). He was prominent in many disputations and in 1531 became bishop of Vienna, where he died.

Faber, John (1684–1756), *see under* ENGRAVING.

Faber, John (Johan), the Elder (c. 1660–1721), Dutch mezzotint engraver and draughtsman, b. at The Hague. One of the first artists to work in mezzotint, he came to London about 1687, and died at Bristol. His pen-portrait of 'Simon Episcopus' on vellum is in the British Museum. Among his other best works are 'Portraits of Founders of Colleges at Oxford and Cambridge' (begun 1712): 'The Heads of the Philosophers' (after Rubens); 'Humphrey Lloyd of Denbigh, Antiquary,' 1717; 'Dr. Wallis, Mathematician' (after Kneller); and portraits of Bishops Atterbury and Hough, of John Caspar and Dr. Sacheverell.

Fabia (orchid), *see* ORCHID.

Fabia gens, one of the oldest and most distinguished patrician clans or houses of anc. Rome, probably of Sabine origin, claiming descent from Hercules and a daughter of the Arcadian Evander. It was one of the two gentes entrusted with the management of the 'Lupercalia' (Ovid, *Fasti*, ii. 375). The chief family names under the republic were Ambustus, Buteo, Labeo, Licinus, Dorsio, Vibulanus, Pictor, and Maximus. Among its most famous members were:

(1) *Cæso Fabius Vibulanus*, Rom. general, who with his brothers, Quintus and Marcus, held the consulship for seven years (485–479 B.C.), being consul himself 484, 481, and 479. He was popular with the plebeians, and won victories over the Volentes and Æqui. In his third consulship, the Fabian family made a campaign against Veii alone. Cæso led out 307 of them, and they settled on the Cremera. After gaining some successes they were trapped in an ambush and all slain by the Volentes, except one youth (477 B.C.). (*See* T. Mommsen, *Römische Forschungen*, vol. ii. 1855).

(2) *Quintus, Fabius Maximus Rullianus*, a famous general, consul five times between 322 and 295 B.C. He was twice dictator of Rome, fought in the second Samnite War, gaining victories (325, 322), and at Sentinum, over united Gauls and Samnites (295). (*See* Livy, viii., ix.)

(3) *Quintus, Fabius Maximus* (nicknamed Verrucosus and Ovicular), known to fame as 'Cunctator' (delayer), described by Ennius as 'unus qui nobis cunctando restituit rem,' was repeatedly consul, censor, and dictator of Rome (221, 217 B.C.). As consul (233) he conquered the Ligurians and was granted a 'triumph.' Sent as ambas. to Carthage, he became leader and dictator in the war with Hannibal. His slow, defensive policy, known ever after as 'Fabian' (*cf.* FABIAN SOCIETY), did not at first favour with his contemporaries,

but after the crushing defeat at Cannæ (216), it was at once resumed. In 215 Maximus ravaged Campania, was consul for the fifth time (209), and recaptured Tarentum. He opposed Scipio's aggressive policy, and died in 203 B.C.

(4) *Quintus, Fabius Pictor* (b. c. 254 B.C.), first Rom. prose historian, the 'father of Lat. hist.,' lived at the time of the Second Punic War. He served in the Gallic War (225), and died after 216. His works (written in Gk.) were known as *Annals of F. Pictor*. Only fragments of his hist. (from the time of Æneas to the Hannibalic war) are left.

Fabian Society, an association founded in London (1883) for the advancement of Socialism. Similar organisations now exist in many other cities. Its rise was due to private discussions on literature and the social duties of the times, started by an Amer., Thomas Davidson, who called his society the 'Fellowship of the New Life.' Meetings were first publicly held in 1888. The name is adopted from the famous Rom. Fabius 'Cunctator,' in token that the Society desires to fulfil its aims gradually (it was Mr. Sidney Webb [later Lord Passfield] who first used the phrase 'the inevitability of gradualness') by educational and legislative methods, and not by any sudden violent upheaval. Among its earliest members were George Bernard Shaw, Sidney Webb, Sydney Olivier, and Graham Wallas. In 1885 there were about forty members. They were as 'vaguely anarchistic and insurrectionist in their ideas and their expression of them as any group that had existed before them' (Shaw). But the forty members and those who joined them within the next two or three years contained sev. who united intellectual ability to an appreciation of practical possibilities; and soon after the failures of Labour agitation at this time, they used their own critical abilities, and in 1886 began to prepare a series of proposals to deal with unemployment. This was 'the first tract that contained any solid information,' says Mr. Shaw. Like the early Fabian documents it was the work, not of one hand, but of a group, one of whom was Sidney Webb. But it was too mild for the zeal of most of the members of the society. In the following year, however, was issued *Facts for Socialists*, of which the fifteenth ed. appeared in 1944. Next to the *Fabian Essays*, this is the most characteristic of Fabian pubs. *Fabian Essays in Socialism*, to give the full title, were delivered first as an unadvertised series of lectures in London, ed. by G. B. Shaw and pub. by the F. S. at its own expense. The seven essayists were Bernard Shaw, Sidney Webb, William Clarke, Sydney Olivier (later Lord Olivier, Governor of Jamaica), Graham Wallas, author of *Human Nature in Politics* and a prominent member of the London School of Economics, Annie Besant, who later forsook the society for theosophy, and Hubert Bland, for thirty years treasurer of the F. S. The *Essays*, having no such emotional appeal as e.g. Henry George's *Progress and Poverty*, did not

secure the circulation of the latter; but they undoubtedly appealed to persons with Radical leanings in need of a philosophy, and when, a few years later, the Independent Labour Party was formed that body took its philosophy as well as many of the facts used in its propaganda direct from Fabian sources. The *Essays* derive directly from the Utilitarians in politics. Shaw's contribution shows its origin in the economics of Ricardo. Webb's essay, entitled *Historic*, was on 'The Development of the Democratic Ideal,' his inspiration being the writings of Bentham and J. S. Mill. Olivier's was on the morals of Socialism but was not a noteworthy contribution as compared with the others. The *Essays*, though signed by their individual authors, were a collaboration, and each separate contribution was criticised by the other contributors and by the editor before it was admitted in its final form. *Facts for Socialists* consists of true statements drawn from authoritative sources and are facts for Socialists to use in converting the country to their views. Led by Shaw and Webb, the Fabian Society had come to believe that out of the mouths of its own papers, its own records, and its own statistics, Socialists could convict capitalism of inefficiency as well as immorality, and leave it, in the minds of those who could read and listen, without a leg to stand on,' (Margaret Cole). *Facts for Socialists* was the first fruit of this belief which Sidney and Beatrice Webb later coined into a phrase 'measurement and publicity', and it may fairly be said that the immense mass of the pub. works of the Webbs is in fact a vast expansion of *Facts for Socialists*, particularly on local gov. and trade unionism. A latter-day pub., *Fabian Colonial Essays*, issued in 1945, shows the extension of Fabian principles to the field of colonial reform; but not all the contributors reveal the same outlook of Socialism as the antidote to undesirable conditions in the 'backward' parts of the Brit. Colonial Empire. See E. Pease, *History of the Fabian Society*, 1916; G. B. Shaw, *Early History of the Fabian Society*; G. D. H. Cole, *The Fabian Society, Past and Present*; and Margaret Cole, *The Fabian Society over Sixty Years*.

Fabii, see FABIA GENES.

Fabius, Planciades, see FULGENTIUS.

Fable (Lat. *fabula*, story). The term F., at one time applied to any fictitious narrative, is now more often restricted to a particular kind of literary composition, in prose or verse, of a more or less humorous nature, in which beasts or even inanimate objects are the actors and speakers and a moral truth is brought home to the reader by their means. According to Dr. Johnson, 'a "F." or "apologue" seems to be, in its genuine state, a narrative in which beings irrational and sometimes inanimate (*arbores loquuntur, non tantum ferae*) are, for the purpose of moral instruction, feigned to act and speak with human interests and passions.' The definition of La Fontaine is a poetic rendering of this. His name is

pre-eminent in this connection, and while other Fr. writers of Fs. (Marie de France, Corrozet, Florian) are only classed as 'fabulists,' he is known as 'le fablier.' Fs. differ from myths in that they are intentionally made or invented, whereas the latter merely grow and develop out of existing legend. Parables and Fs. are very much akin, their use being strictly parallel to the use of metaphor. Neander's distinction was that in Fs. human passions and actions are attributed to beasts, but in parables the lower creation are only employed to illustrate the higher life, and the bounds of probability and possibility are never exceeded. There is often a close affinity between Fs. and proverbs. The origin and diffusion of Fs. is a much-discussed subject, but it seems probable that their earliest home was Hindustan. They arose out of the beast Fs. of savages, and the moral element appears to be a later development, essential to the F. as we understand it at the present day. La Fontaine, who describes his Fs. as 'une ample comédie à cent actes divers,' says that an apologue has two parts, body and soul (the story and the moral).

Among the earliest known examples are *Pancha Tantra*, or *Fables of the Brahma Vishnu Sarmam* (second century B.C.); *Katilah*; and *Dinma*, or fables of Bidpai (Pulpai), of which *Hipodésa*, a modernised form, has three Eng. trans. These passed from India through Persia and Arabia, finally to W. Europe. Other E. collections were those of the Arabian Lokman, and Buddhaghosha's *Parables*. Æsop, famous among the Gks. (c. sixth century B.C., Herod. ii. 134), doubtless derived many of his fables from such E. sources. (See versified version of Babrius, third century A.D., and J. Jacob's ed. of *The Fables of Æsop*, 1889). Phædrus was the Rom. imitator of Æsop. Horace's fable of *The Town Mouse and the Country Mouse* seems to have a purely Rom. origin, unlike any others. The names of Aphthonius (c. A. D. 400) and F. Avianus form a link between classical and medieval writers of Fs. The oldest known Ger. writer is Stricker (thirteenth century), but the medieval *Reineke Fuchs* goes much further back. Other names deserving of mention are Gellert (1716), Lessing (1759), Hagedorn, Pignotti, Kryloff (trans. by Ralston), Prior, Gay, Andersen, Yrlarte (*Blackwood's Magazine*, 1839). Kipling's *Jungle Book*, Rostand's *Chantecler*, and Maeterlinck's *L'Oiseau Bleu* may be considered as modern revivals of the fable-form in literature. J. C. Harris's *Uncle Remus* (Brer Rabbit) tales are not properly fables, but records of the folk-lore of the African-Americans. Theodor Benfey (1809-1881), Emmanuel Cosquin (1841-1922), and Joseph Jacobs (1854-1916) are all modern writers on folk-lore. See G. E. Lessing, *Über das Wesen der Fabel*, 1760; Robert, *Fables médées des XII^e, XIII^e et XIV^e siècles* . . ., 1825; Jakob Grimm, *Reinhart Fuchs*, 1834; Keller, *Untersuchungen über die Geschichte der griechischen Fabel*, 1862; E. B. Tylor, *Primitive Culture*, vol. i., 1871; O. Weddigen,

Das Wesen und die Theorie der Fabel, 1893; K. T. Murray, *Selected Fables*, 1920.

Fabliaux, group of entertaining compositions, in the form of tales in eight-syllable rhymed verse, numbering over 100, and forming a marked section of Fr. medieval literature. The word 'fabliau' is really a diminutive of 'fable.' A fabliau always had reference to some event and was usually satirical and comic in quality. F. seem to have existed as early as the eighth century; but all the early examples are lost. The oldest preserved appears to be *Richeut*, about 1136, and the most modern are those of Jean de Conde and Watrquet at the beginning of the fourteenth century.

Fabre d'Eglantine, Philippe François Nazaire (1755-94), Fr. dramatic poet, b. at Limoux, and beheaded in Paris. In spite of the hostility of his many enemies, he was successful with his *Le Collatéral* and was thereby encouraged to follow it up with his *Philinte de Molière ou la Suite de Misanthrope*, which remains his masterpiece. *L'Apothécaire* followed in 1790, but in 1794 he was arrested by the Committee of Public Safety on the charge of forging a decree of the National Convention relating to the company of Invalides. Robespierre, who prosecuted, had no real belief in the substance of the accusation, but later he was charged with enriching himself in the course of his public duties for the revolutionaries, though in fact he was an ardent supporter of the Revolution. His verse is somewhat difficult, but his comedy is well conceived if inappropriate in expression.

Fabre, Jean Henri (1823-1915), Fr. entomologist; b. at Sainte-Léonie in Aveyron. In middle life was prof. at the Natural Philosophy College of Ajaccio and the Lycée of Avignon. He was an opponent of evolutionary theory. He retired in 1871 to Sérignan where he died. F. wrote some of the most fascinating books on insects ever produced. They are filled with acute observations on the life and death of the creatures and are of deep interest to laymen. They have been trans. into all modern languages. Among his works are *Life and Love of the Insect* (1911) and *Social Life in the Insect World* (1912).

Fabri, Jacques, see FABER, JACQUES.

Fabri, Johannes, see FABER, JOHANNES.

Fabriano, city of Italy in the prov. of Ancona, 44 m. S.W. of the city of Ancona. It is situated at the base of the Apennines, and possesses a cathedral and the Rosenti Museum. The manufs. are paper and parchment. In the Second World War the cathedral roof was damaged, as also were the churches San Biagio, Santa Caterina and Santa Maria del Popolo and the Bishop's Palace. Pop. 9000.

Fabriano, Francesco di Gentile Da (c. 1360-c. 1423), It. painter, b. at Fabriano, and called after his b.p. He belongs to the early Umbrian and Sienese schools, and painted chiefly in Florence, one of his finest extant pictures being the 'Adoration of the Kings' painted for the church of the Holy Trinity in Florence. A 'Madonna with Saints,' now in Berlin

Museum, belongs to the same period. In 1426 he executed paintings for Pope Martin V. in the church of San Giovanni, Rome; but this, together with other works, has been destroyed. His pictures indicate, for the most part, a joyful and cheerful disposition, and he had a great love of splendour and rich colouring. F. belongs to the transition period of the fifteenth century.

Fabricius, Gaius, surnamed Luscinius (i.e. 'the one-eyed'), Rom. general and statesman of the fourth and third centuries B.C., in later ages renowned as a model of incorruptibility. He was the first member of the Fabrician gens to settle in Rome. After the defeat of the Romans by Pyrrhus in 280 at Heraclea, F. was sent to treat for ransom, and though Pyrrhus attempted to bribe him, all attempts were vain. During his second consulship, F. was successful in negotiating terms of peace with Pyrrhus. He gained a series of victories over the Samnites, Lucanians, and Brutians, and on his return to Rome received a triumph. In 276 F. was censor, and carried out with great vigour the old Rom. sumptuary laws.

Fabricius or Fabrizio, Girolamo (1537-1619), an It. anatomist and surgeon, educated at the univ. of Padua. He studied medicine under Fallopius. Harvey, the discoverer of the circulation of the blood, was amongst his students. His chief work is his *Opera Chirurgica*.

Fabricius, Jan, Dutch dramatist, b. at Assen, 1871. He went to Batavia in 1892 and took up journalism, taught himself Eng., Fr., and Ger., and returned to Holland in 1902. After an unsuccessful venture as a tourist agency and a return to the Dutch E. Indies he came back home in 1914 and made a great success as a dramatist. His works include *Met den handschoengetrouwd* (1906), *Onder één dak* (1914), *Nonni* (1916), *Demon* (1922), *Cesare als Gastheer in de Gevangenis* (1927), *Mrs. Jim* (1938) and short stories *Glimpses of Java* (1939). He lives in England.

Fabricius, Johannes Albertus (1668-1736), Ger. classical scholar and bibliographer, b. at Leipzig. His great reputation is founded on his two literary synopses, the *Bibliotheca*. At different times of his life he studied both medicine and theology, and he is known among theologians for his collections of apocryphal and pseud-epigraphical literature.

Fabrics, Textile, the name applied to those F. produced by weaving, and embraces the production from various raw materials of cotton, wool, silk, flax, hemp, jute, and synthetic substance (made from wood, coal, etc.) which provides remarkable variety of surface. The simplest form of T. F. is the primitive method in which the threads cross at right angles, regularly passing over and under one another, and a great variety of goods can be made in this way. The checks and stripes in the Scottish clan tartans are thus produced, and the thick corded effect, obtained in materials of the *repp* nature. The production of pile F. is one of the most important developments of plain weaving. They are woven with two warps, one being

looped over crossed wires, and the other standing out above the main body of the cloth. The loops are either cut, or remain uncut. An instance of the former treatment is shown in the *Wilton* carpet, and of the latter in the *Brussels* carpet. Chenille used with such good results in tapestry and carpets, is another example of the plain 'weave.' Historically, T. F. are of ant. date. Homer and other early writers speak of the weaving of the Gks. who used to work (principally in wool) designs and patterns of mythological subjects on their tapestries. The Egyptians also were celebrated from quite early times for their T. F.

The supply of raw material and the adaptability of the people to a manufacturing life are the chief influences which control the estab. of the textile industry in any particular country. The earliest forms of machinery used were the hand-loom and spinning-wheel, and the manuf. of homespun from wool was one of the first of textile industries to spring up among the people. It has now secured a foothold in nearly all countries in which wool F. are required for clothing. The fabrication of cotton had its greatest growth in India, and the industry has developed to a considerable extent of recent years in China, Japan, the E. Indies, and Mexico. It is in the S. U.S.A., however, that the most wonderful growth of this industry has taken place; and its steady advance is evidenced by the fact that more and larger mills have been built, and the old ones developed and enlarged.

To China and Japan we owe our fine and beautiful F. of silks. The silkworm flourishes in these countries and labour is cheap and plentiful. These nations (in normal pre-World War years) produced F. of a costly and beautiful nature, which could not be equalled by the more highly-civilised nations; though the introduction of the silkworm into Central and W. Europe caused a wonderful increase and advance in the manuf. of silks in France, Italy, Switzerland, and Austria. The Gers. (prior to the Second World War), too, and the U.S.A. in recent years made a great success of the industry. In England alone the industry seems to have declined a good deal during the last sixty or seventy years, though the cotton industry, during the same period, developed to an extraordinary degree. The silk industry was developed in the U.S.A. in 1870, and since then has made exceedingly rapid growth. It is now, however, being produced synthetically in the form of Nylon. A new use for Nylon is a mixture fabric, at present being made mainly for export only. A nylon thread is worked in with ordinary wool. The material which results is a nylon-worsted. At present it is a lightweight fabric suitable for women's clothes, but may in the future be used for men's suitings. The main advantages are its extra hard-wearing quality.

Although statistics are not available, it is probable that in the 1930's the E. nations, China and Japan, led the way in the manuf. of silk. The growth of the

textile industry in Europe was made difficult before the Second World War by the rapid changes of fashion, largely brought about by the desire of big manufacturers to produce the material and effect attractive to buyers, and their unwillingness to keep in stock F. that are out of fashion.

Textiles may be said to reflect the life of nations, and, in the Victorian era, people became insensitive to beauty in their scramble for wealth; pattern and design were ignored, and there was a lack of taste and need for selection. Much is owed to Wm. Morris, and a few of his contemporaries for giving us among other things beautifully designed textiles. His silks, chintz, and tapestries were exhibited in the first Arts and Crafts Exhibition in 1888; and Sir Arthur Liberty, renowned for his soft satins and soft 'Liberty' designs, exhibited textiles at the Paris Exhibition in 1889. These beautiful Fs. contrasted with the crude colourings prevalent in the 1880's. In the early twentieth century there was a marked distaste for patterned textiles (with the exception of the Morris Productions) and the 'Art Nouveau' evolved, plain textiles and wall coverings prevailing. However, in 1911, Picasso and the first Post-impressionists exhibited their work in London, and as a result colour and abstract design became the vogue. Sir Ambrose Heal, Wm. Foxton, and others, provided modern designs in textiles; and, after the First World War, Tootal Broadhurst Lee, The Edinburgh Weavers, Morton Sundour, and others, brought out new weaves; distinctive painters were commissioned as designers; and the local Art Schools also had their influence on fabrics and design. Material and machines increased, dyes improved and a fast dye evolved. Some weaving was almost three dimensional, textiles having fringes, ridges, knobs, etc. Tweeds were used for furnishings; and, in 1928, abstract design was uppermost. In the years following, bright colours gave way to neutral tones; and in the Exhibitions of 1933 and 1935 more or less Cubist design was being used in Brit. textiles. Later, this yielded to conventional patterns of natural objects—leaves, flowers, etc. Design became all important, and Modern Textiles, formed by a group of artists for the production and sale of well designed textiles, included among its designers such famous artists as Paul Nash. Unfortunately, the Second World War stopped all this in Britain, for the time being; but recently much effort has been concentrated on textile design for export mkt., and exquisite figured orandies, smart printed piques, printed woollen goods of such fineness that they have to be woven on a carrier which is afterwards melted away, are being produced. Perhaps one of the most interesting ventures is that of Morton Sundour in Unit designs, by means of which certain basic lines and colours can be interchanged or enlarged to make a variety of patterns. (See Noel Carrington and Muriel Harris, *British*

Achievement in Design, 1946.) See also CARPETS; DESIGN; DIAPER; and articles on cotton, flax, and other materials. See T. R. Ashenhurst, *Wearing and Designing of Textile Fabrics*, 1893; A. Barker, *Analysis and Reproduction of Textile Fabrics*, 1894; W. Morris, lecture on Textiles in *Arts and Crafts Essays*, 1899; R. Glazier, *History of Textile Fabrics*, 1923; J. Read, *Textile Design and Fabric Structure*, 1931; Grace Lovat Fraser, *Textiles by Britain*, 1948; and *The Textile Manufacturer's Year Book*.

Fabrizi, Nicola (1804-85), It. patriot, was b. at Modena. He estab. himself at Malta and aided Crispi in the revolutions of 1848 and 1860. Landing at Pizzolo, he joined Garibaldi at Palermo, and was governor of Messina and minister of war under the Garibaldi dictatorship. In 1866 he was chief of staff to Garibaldi. His political aims were to secure the return of Crispi to power and to obtain concord among the chiefs of the Left party. F. was whole-hearted in his passion for liberty, to which he devoted his whole life.

Fabroni (Fabroni), Angelo (1732-1803), famous It. biographer, sometimes called 'the Plutarch of modern Italy.' Educated at Faenza and Rome, he was a good Lat. scholar, and appointed tutor to the sons of Leopold of Tuscany (1773). His chief work is *Vitae Italorum Doctrina excellentium qui Saeculis XVII. et XVIII. floruerunt* (1778-1805). F. became prior of the church of San Lorenzo, Florence, 1767. He also wrote *Laurenti Medicei Vita* (1781) and *Vita Magni Cosimi Medicei* (1788-89).

Facade (from the It. *facciata*, *faccia*, the face), front exterior of a building. It is generally used in referring to the front elevation of more important buildings of considerable magnitude, though the term is not necessarily restricted to these. It is usual, however, to speak of the 'front' of a house, and the F. of a palace, cathedral, etc. The back elevation is spoken of, as the 'rear' F., and the side, as the 'lateral' F. The sides of a court are also called Fs., and distinguished as the E. or W. Fs., etc. The term originally was used to describe the outline of the aisle terminations, but it was later adopted as a design complete in itself, and used in secular and eccles. building.

Facatativa, tn. of Colombia, in the dept. of Cundinamarca, 20 m. N.W. of Bogotá. Elevation about 8500 ft. It was formerly a fortress of the Chibcha Indians, whose last chief was killed here in 1538. Pop. 8000.

Fachinetti, Giovanni Antonio, see INNOCENT IX.

Faciolati, Jacopo (1682-1769), It. lexicographer and philologist, b. at Torreglia, near Padua. The revival of the study of ancient literature was the chief subject to which F. gave his attention, and with the assistance of his pupil, Egidio Forcellini, he brought out a new ed. of the *Lexicon septem Linguarum*. F.'s mastery of Lat. style, as displayed in his epistles, has been much admired for its purity and grace. He was known throughout Europe as one of the most enlightened and zealous teachers of the time.

Facia, see FASCIA.

Facial Angle is formed between a line drawn from the nostrils to the ear and another line from the nostrils to the forehead. It is an important feature of anthropometry, or the method of measurement used in anthropology. A protruding jaw indicates an animal type, and, therefore, the highest, most intellectual type of face indicates almost a right angle. Camper (1722-89) was among the first to define the F. A., his followers including Cloquet, Jacquart, Cuvier, and Kollmann. See ANTHROPOLOGY.

Facility, in Scottish law, a word applied to mental deficiency to differentiate it from idio. If a person voluntarily places himself and his property under the care of one or more trustees, the case is called one of *voluntary interdiction*. The persons so engaged are called interdictors, and a facio person may not transact business—or, if he does, it is null—without the consent of the interdictors. If the court of session appoint interdictors for a facio person, the case is called one of *judicial interdiction*. Even in cases where there has been no interdiction, a contract signed by a facio person is null if it can be proved that such a person was imposed upon contrary to his own interests.

Factor, mercantile agent employed to transact business for another. He is entrusted with the management and disposal of goods, his remuneration for which is called factorage or commission. Unlike a broker, a F. buys and sells in his own name. The first Factors Act was passed in 1825, in the reign of George IV. It enacted that a F., entrusted with the goods of another should be recognised as the legal owner of those goods, so far as to give validity to any contracts made by them with any persons dealing on the faith of that ownership.

Factor (Lat. *facere*, to make), in mathematics, is a number which, when multiplied by other numbers, makes up the product. Each of the numbers so multiplied is called a F. Thus 3 and 2 are Fs. of 6, since $3 \times 2 = 6$. A F. may also be called a *divisor*, because a product can be divided by any of its Fs. without remainder. The Fs. of 12 are 2, 3, 4, and 6, and of $x^2 - y^2$ are $x + y$ and $x - y$. When a number cannot be divided without remainder by any number except itself and unity, it is called a *prime number* (q.v.). Thus 2, 3, 5, 7, 11, 13, 17, etc., are prime numbers.

Factor, Judicial (from Lat. *facere*, to do), in Scotland is an officer appointed by the Sheriff Court for the purpose of managing property on behalf of one who is for some cause or other incapable of managing it himself.

Factory Legislation—Great Britain. The Factory and Workshop Acts (all of which were repealed and in part reenacted in the consolidating Act of 1937) have for their object the amelioration of the conditions under which the various classes of workers conduct their operations. The foremost provisions of these Acts are those which regulate the sanitary or hygienic condition of the workplaces,

and those which relate to the safety of workpeople, with especial reference to industrial injury, the limitation and control of working hours, particularly of child workers, the protection of child labour, and the more efficient administration of the Acts by means of factory inspectors. These Acts mark an epoch in the social development of civilisation, and the state of things effected by them at the present day contrasts so vividly with the industrial Eng. of a century ago as to make it incredible that the social regeneration did not come sooner than it did. In the middle of the eighteenth century the country still reposed on the ruins of the medieval hierarchy of classes, with its taint of serfdom and bondage. The rise of the tns. was slowly dissolving the ties of inborn status, but 'the movement from Status to Contract' was only complete with the industrial revolution brought about by the almost synchronous invention of labour-saving devices by Arkwright, Crompton, and others. With these came the beginning of a new horror—the utter anarchy of private enterprise. Gone was the domestic workshop, and in its place came the factory with single rooms crowded with workers specialising on one single process (see also DIVISION OF LABOUR). The doctrine of *laissez faire* and freedom of contract was soon to reap its consequences in the picture of 'women working half naked in the coal mines; infants bound to the loom for fifteen hours in the heated air of the cotton mill and kept awake only by the overlooker's lash; hours of labour for all, young and old, limited only by the utmost capabilities of physical endurance; and complete absence of the sanitary provisions necessary to a rapidly growing population.'

Small wonder that profits were reckoned at hundreds, and even thousands per cent where 'white slavery' was carried to such a pitch that medical observation reported the 'rapid spread of malformation of the bones, curvature of the spine, heart disease, rupture, stunted growth, asthma, and premature old age among children and young persons.' Even the sort of feudal times or, later, agric. labourer, had some sort of personal relationship with his master; the worker, however, being 'free' to contract, took all the incidents of the contract he had 'chosen' to make, the ultimate expression of which was that he was in no better position than the handle or particular part of the machinery, it was his duty to manipulate. First Carlyle, and then Mill, Darwin, Spencer, Ruskin, and others ruthlessly analysed the individualist view of life, either directly or indirectly, by searching accounts of the evolution of the conception of the social organism, and parallel with the development of the lessons derivable from this, public opinion was soon expressing itself in practical legislative measures, antithetical to the dogmas of current political economy; e.g. in Drainage Acts, Local Improvement Acts, Public Health Acts, and the forerunners of the modern Factory Acts.

The first piece of factory legislation to the credit of Eng. statesmen was the Morals and Health Act, 1802, which provided for the ventilation and cleansing of cotton mills and factories, and for the clothing, hours of labour, and religious education of apprentices employed therein. The exciting cause of this Act was no doubt, the epidemic of fever in 1784 in the Manchester cotton mills which directed public opinion to the dangerous and unhealthy conditions to which the child workers were subjected. The Act, however, did little more than remedy the more glaring abuses of the apprenticeship system, and it was not until after the application of steam power to manuf. that the wholesale employment of children called for the next Act, the Cotton Mills Act, passed in 1819. This Act, which the celebrated Robert Owen was partly instrumental in passing, limited the age at which children might work in factories, and the time of their labour to seventy-two hours per week. From that year to 1856 a series of Acts such as the Act of 1844, limiting the labour of children in calico print works to six and a half hours a day; and Ashley's Act of 1845, forbidding night work to women, were passed, containing regulations respecting the safety, hours, meal times, and holidays of children, young persons, and women.

But so far legislation only affected the textile and allied industries. Another great fault in the early Acts was that they were almost totally deficient in provisions for enforcing the law, this matter being left entirely to the individual bias of the local magistracy. In 1825, however, the efforts of Lord Ashley were successful in securing the appointment of the first skilled inspectors, a body of persons whose wide judicial and ministerial powers were in strange contrast to the merely inquisitorial functions of the modern factory inspector. From 1860 to 1864 Acts were passed to include in the existing factory legislation a number of non-textile industries. The Act of 1864 was remarkable for a departure in two directions: (1) it included by the generality of its enactment provisions that benefited all classes of labour irrespective of sex or age, e.g. by providing for more effective ventilation so as to remove injurious gases, dust, or other impurities; and (2) it assimilated its provisions in some respects to those of the Coal Mines Regulation Acts, by adopting the special rules system of these Acts, especially in regard to 'safety' precautions. By the combined operation of the Sanitary Act, 1866, and the Workshops Regulation Act, 1867, local authorities were invested with powers of administration to secure the general sanitation not only of factories but of all places where manual labour was employed in the manuf. or finishing of articles for sale. As may be gathered, the whole course of the legislation up to the great consolidating Act of 1878 was unsystematic and unsystematic. Acts of Parliament were passed purely *ad hoc* to deal with evils the existence of which was only occasionally brought home by the inquiries of

successive Commissions or the representations of men like Robert Owen. The net result was that there were up to 1878 a score of more or less unrelated statutes with a mass of regulations framed by inspectors or others avowedly in pursuance of the provisions of these statutes. In 1878, as the result of another Royal Commission, the Consolidating Act of 1878 appeared. Like all Consolidating Acts (*q.v.*), this Act made some changes; it increased the minimum age of child labour in textile factories to ten; it made

providing by special requirements the conditions under which certain occupations scheduled by the Home Office as unhealthy and dangerous might be carried on; (5) the restriction of the employment of women shortly after childbirth; (6) control of overtime work; and (7) the reduction of the hours of labour for children.

A striking modern feature in 1893 was the first appointment of women inspectors, a principle which was extended subsequently in a number of other directions.

provision for holidays and pauses in the continuous hours of the fixed working-day. Into the detailed provisions of this Act it is not necessary to enter, because the additional legislation of 1883, 1889, 1891, 1895, and 1897 soon made it incumbent on the legislature to pass a second Consolidating Act in 1901. The Acts from 1878 to 1895 were directed mainly to: (1) The development of a specialised hygiene in factory life; (2) the more efficient application of the ordinary Public Health Acts to factories and workshops by successive transference of powers from the factory inspectors to local sanitary authorities; (3) the development of provisions for securing a greater measure of safety against accidents, *e.g.* by the adequate fencing of machinery in factories; (4) the development of the system of regu-

There were encroachments in 1891 on the hitherto unfettered power of the employer of exclusively adult male labour to conduct his operations without legislative interference other than in the details of sanitation.

parts of the F.

men were those 1. safety, such as cleanliness and ventilation, means of escape in case of an outbreak of fire, and fencing of machinery, and regulations in regard to dangerous trades. None the less the enhanced stringency in these latter respects of the provisions of the Factory and Workshop Act, 1895, was a considerable concession to the moral obligations towards male adult workers, and it found still more adequate expression in the codifying Act of 1901. The departures of the Act of 1895 in the

requirements as to the sanitary condition of premises in which outworkers were employed and the maintenance of a proper temp. in workplaces of great humidity, and annual returns of persons employed, the investigation of accidents, and the particulars of wages due to piece-workers were all re-enacted and strengthened in the Act of 1901. The Act of 1901 was a much more ambitious piece of legislation than its predecessors. It repealed and re-enacted with new features all the pre-existing Acts. Notable additions were made in the direction of more efficient means for securing sanitation, and for ensuring safety in dangerous trades. The minimum age of child employees was raised to twelve (subsequently further amended by the Education Act, 1918, and the Employment of Women, Young Persons and Children Act, 1920, both repealed and re-enacted by later Acts), and numerous regulations were made for establishing a strong administrative control over the industries included directly or indirectly in the Act. It is desirable to reproduce here the main provisions of the Act of 1901, because, although the Consolidating Act of 1937 repeals all antecedent Factories and Workshops Acts, most of the fundamental provisions of the Act of 1901 are re-enacted in the Act of 1937. The article will conclude with a detailed Summary of the Act of 1937 in which the chief changes introduced by the new Act are specially emphasized.

The Act of 1901 applied to textile and non-textile factories, and to 'workshops,' the difference, generally speaking, being that if mechanical power were used in the particular manufacturing process the place was a factory; if not, and only hand-power was used, it was a workshop. Textile industries being as a rule more deleterious to health than non-textile, the provisions affecting them were more stringent than in the case of non-textile factories and workshops. Such of the provisions of the Act as related to dangerous machines, accidents, and regulations for dangerous trades were also applicable *inter alia* to docks, wharves, quays, and private railway lines or sidings used in connection with factories.

Persons to whom the Act of 1901 applied.—These comprised: (1) young persons, i.e. boys and girls between the ages of fourteen and eighteen, or, where an educational certificate has been obtained, between thirteen and eighteen; and (2) women, i.e. females above eighteen. Men were contemplated no less by this Act than by its predecessors as being able to look to their own interests, and, generally speaking, the only provisions that applied to them were those which were designed to secure efficient sanitation and safety, i.e. those sections which related to cleanliness, ventilation, fencing of machinery, regulations for dangerous trades, and means of escape in case of fire. In the case of women and young persons, there were not only special regulations as to sanitation and safety, but meticulous provisions as to working hours, meal times, holidays, and overtime. Children

(i.e. persons between the ages of twelve and fourteen) were also included in the Act, which contained, for their protection, stringent provisions as to safety and health; and this Act also contained an unconditional prohibition of employment of any child under twelve years of age—in which latter respect the Act supplemented the Elementary Education Amendment Act, 1899, which made it unlawful to employ any child under twelve so as to prevent full time attendance at school. But these and the like provisions (such as those of the Employment of Children Act, 1903, which absolutely forbade the employment of children in any occupation likely to be injurious to life, limb, health or education, regard being had to his physical condition) became redundant, for the Education Act, 1918 (repealed and re-enacted by the Education Act of 1921 which in its turn was repealed by the Education Act of 1944) prohibited altogether the employment of children in factories, workshops, mines, and quarries; and a 'child' in this context was defined (by reference to the Education Act, 1921) to be a person of any age 'up to that at which his parents cease to be under the obligation to cause him to receive efficient elementary instruction or to attend school under the enactments relating to elementary education; and a child will, for this purpose, cease to be of school age at the end of the school term in which he attains the age of fourteen (or fifteen if this age is fixed by byelaw).' Finally, under the Employment of Women, Young Persons and Children Act, 1920, the general prohibition of the employment of children under fourteen was extended to *any industrial undertaking*. (See further under CHILD WELFARE; and for the legislation in regard to children generally, see under CHILDREN ACTS, 1908-33, which Acts amended the Employment of Children Act, 1903.) It may also be observed that the first factory Acts prescribed the minimum age of children allowed to be employed as eight.

Health and safety.—The provisions in the Act of 1901 for ensuring the sanitary condition of factories and workshops, were designed to keep them free from effluvia, secure proper ventilation and periodical lime-washing of staircases, ceilings, and inside walls, and also to prevent overcrowding; and ensure the maintenance of a reasonable temp. As to 'safety' the Act provided that dangerous parts of machinery, like mill gearing and wheel races, must be fenced, means of escape in case of fire provided, and steam boilers kept in proper condition. It regulated the use of self-acting machines by, *inter alia*, disallowing any woman or young person to work between the fixed and traversing part of any such machines and provided that the doors of a factory or workshop must open from the inside. A court of summary jurisdiction was (and is) empowered to prohibit the use of dangerous machines or premises. As to accidents, the Act, as amended by the Notice of Accidents Act, 1906, provided that all serious accidents must be notified

to the inspector of the dist., and in certain cases to the certifying surgeon of the dist. Power was also given to the home secretary to direct a formal investigation of any accident occurring in a factory. The Notice of Accidents Act, 1906 (sects. 4 and 5) was repealed so far as it relates to factories and workshops by the Consolidating Factories Act of 1937.

The 'employment' provisions covered hours and holidays, overtime, night work, and fitness for employment. The hours of employment in textile factories for young persons and women were fixed at a twelve-hour day, of which not less than two hours must be allowed for meal-times. Half-holidays must be allowed on Saturdays. There were exceptions to the above general provisions, especially in the case of five hours' spells in certain textile factories provided the employment began at 7 a.m., and the whole time between that hour and 8 a.m. was allowed for meals. Then followed analogous provisions as to hours in non-textile factories and workshops. Under this part of the Act the employment of females within four weeks after childbirth was prohibited. Employers were also compelled to obtain medical certificates of the fitness for employment of young persons under sixteen. The Act also threw on the employer the duty of seeing that child employees attend school during part of the day.

The Act also compelled the employers in the case of dangerous and unhealthy industries to notify certain industrial diseases contracted in a factory or workshop, such as lead-poisoning, arsenical poisoning, and anthrax.

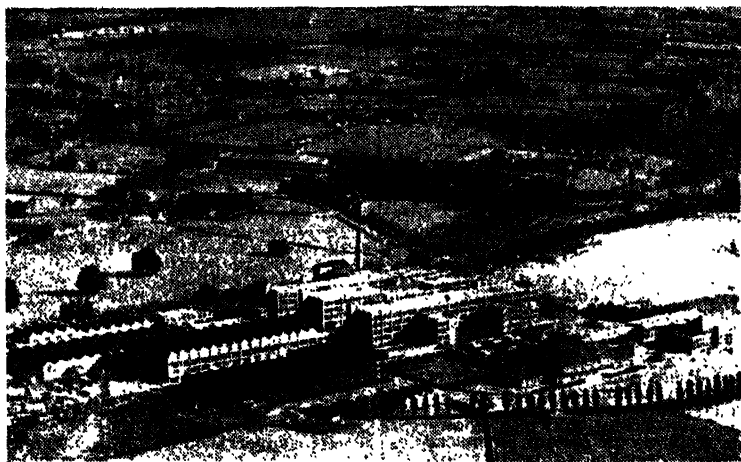

That part of the Act which relates to administration provided for the appointment, duties, and powers of factory inspectors and certifying surgeons. Local authorities were given concurrent powers of entry, inspection, and taking legal proceedings with inspectors.

Since the Act of 1901 the principal amending or additional Acts passed are the Notice of Accidents Act, 1906 (repealed as to the sections relating to factories and workshops and re-enacted by the Factories Act, 1937); the Census of Production Act, 1906; the Factory and Workshop Act, 1907 (repealed and re-enacted in 1937); The Employment of Women Act, 1907 (repealed and re-enacted by later Acts); the White Phosphorus Matches Prohibition Act, 1908 (repealed and re-enacted in 1937); The Shops Acts, 1912 and 1913; the Education Act, 1918 (noticed *supra*); the Employment of Women, Young Persons and Children Act, 1920 (repealed by the Education Act, 1944); the Women and Young Persons (Employment in Lead Processes) Act, 1920 (repealed by the Factories Act, 1937); and a number of other Acts most of which have been repealed and re-enacted, such as the Factory (Workmen's Compensation) Act, 1923; the Lead Paint (Protection against Poisoning) Act, 1926; the Shops (Hours of Closing) Act, 1928; and the Factories and Workshops (Cotton Cloth Factories)

Act, 1929. The Notice of Accidents Act required notice of 'dangerous' occurrences, even though bodily injury has not been caused thereby, and in other respects strengthens the procedure as to notifying accidents. The Census of Production Act amended the Act of 1901 by allowing slight modifications in certain cases of the intervals of time for sending in return of persons employed. The Factory and Workshop Act of 1907 brought under the general provisions of the Act of 1901 all laundries that were not private house laundries. It also prescribed special regulations in regard to the use of stoves for heating irons, and fans for regulating temp. in laundries. The Act was applied with necessary modifications to charitable or reformatory institutions, not already subject to gov. inspection, where any manual labour was exercised in making, repairing, ornamenting, washing, or adapting for sale articles not intended for use in the institution itself. The Employment of Women Act, 1907, took away the exemption given by the Act of 1901 in respect of the period of time for employment of women in flax scutch mills, and thus brought that industry into conformity with the general provisions as to periods of employment. The White Phosphorus Matches Prohibition Act, 1908, prohibited the use of white or yellow phosphorus in the making of matches, and the sale or importation of matches so made. The provisions of the Truck Acts as to payment of wages in current coin will be found under TRUCK ACT. The Lead Processes Act of 1920 was an important measure for the protection of persons engaged in certain dangerous occupations where poisonous lead is used. Previous legislation dealing with this commodity had been limited to safeguarding the health of workers in lead-making factories and no provision was made for the safety of those who dealt with it as a completed article. The fact that lead is so widely used in manufacturing processes made further precautions necessary. The Act provided that all women and young persons employed in any processes where it was used should be medically examined at periodical intervals and also that there should be proper hygienic rules for its handling. The Factory (Workmen's Compensation) Act passed in 1923 placed the onus of responsibility for the workman's welfare more fully upon the employer than had hitherto been the case, and increased the amounts of compensation. The question as to what constituted a notifiable accident was decided by the rule that one which caused more than three days' absence from work came within that category. The Factories and Workshops (Cotton Cloth Factories) Act, 1929 (repealed and re-enacted by the Act of 1937) empowered the Secretary of State to strengthen the existing statutory regulations governing the use of artificial humidity, in accordance with the report of Jan. 23, 1928, of the Committee appointed by the Home Office in 1924 to inquire into the question. The Shops Act, 1913, makes special pro-

vision for the application of the principles of the Act of 1912 to refreshment houses and hotels, etc., which latter Act provides that no assistant may be employed for more than sixty-five hrs. a week exclusive of meal times, with provision for ann. holidays and twenty-six holidays on Sunday in every year. The Shops Act, 1928, provides the exact hrs. of Saturday employment with special exceptions in the case of holiday resorts, the sale of tobacco and perishable or urgently needed goods, such as medicines. There are also a number of other Acts incidentally affecting factory workers, such as the Shop

requirements for safety. It is evident that conditions in many factories when the Act was passed would have had to be completely changed before they could satisfy all the conditions laid down in the Act. Whether all factories during the stress and urgency of war-time requirements could comply with the regulations or whether they had had time before 1939 to effect the necessary changes, might seem doubtful; and again, in the difficulty after the war in obtaining building labour it would seem that the pre-1937 conditions must to an extent still prevail. In 1937 there were about

J. S. Fry and Sons, Ltd.

FACTORY AND SUNSHINE: SOMERDALE, BRISTOL
A modern factory for the manufacture of cocoa and chocolate.

Clubs Act, which makes it an offence in an employer to include under the conditions of employment a term that any workman shall discontinue his membership of any friendly society.

The Factories Act, 1937.—This Act reshaped and largely transformed the factory code. The Act and its concomitant regulations control in detail the conditions in which all factory work is done and, for women and young persons, the maximum number of hrs. that they may work on any day or in any week, and the maximum number of hrs. (overtime) in excess of the standard which they may work in any year. The Act controls the lighting of factories, their ventilation and temp.; it increases the amount of space to be allowed to each person; requires the provision of washing facilities, and is stricter in its requirement of the removal of dirt and workroom refuse; and requires floors to be cleaned at least once a week. There are also many new

167,000 factories and 73,000 workshops on the registers of the Factories Dept. of the Home Office. The Act of 1937 abolishes the distinctions in the then existing law between factories and workshops, and between textile and non-textile factories, and its provisions were made to apply to 'domestic' factories and workshops, which were previously under only limited regulation, and to 'men's' workshops in which no overcrowding restrictions had applied. In addition the Act reaches certain classes of premises which were theretofore outside the scope of the Factories Acts, such as making and mending fishing nets, the manuf. of furniture; and builders' yards.

As regards *hours of work*; the weekly hours to be worked by young persons under sixteen were reduced to forty-four, subject to the power of the home secretary to raise the hrs. to forty-eight provided certain strict conditions can be satisfied, as that a forty-eight-hr. week would

not be injurious to the health of the young people, and that their occupation is likely to lead to permanent employment in the industry. With these exceptions in favour of young persons under sixteen, the normal limit of working hrs. for women and young persons is altered to forty-eight a week as against the previous total of sixty (or fifty-five and a half in textile factories); there is a daily limit of nine working hrs. as against ten and a half (ten in textile factories), and a maximum 'period of employment' (i.e. the whole time from starting to finishing work including intervals for meals and rest) of eleven hrs. (as against twelve), and there must be no work after 1 p.m. on Saturday. Employment beyond forty-eight hrs. a week is not permitted for young persons under sixteen, but overtime employment beyond forty-eight hrs. is permitted for women and young persons over sixteen up to 100 hrs. in a calendar year. For women only the 100 hrs. may be increased to 150 in industries liable to seasonal pressure (previously employment beyond forty-eight hrs. a week was permissible in non-textile factories up to 624 hrs. in the year, and in certain industries subject to seasonal and other pressure, up to 669 hrs. for women and in the textile factories 390 hrs.) The permitted overtime is generally related to a factory or dept. of a factory (irrespective of the number of persons working) and not to individual workers: the proviso is that 'the overtime for the factory shall not exceed in the aggregate one hundred hours in any calendar year or six hours in any week and shall not take place in the factory in more than twenty-five weeks in any calendar year.' But to this general rule there is an exception which allows the home secretary in certain circumstances to permit overtime to be reckoned by reference to the individual. This exception is subject to a condition that no women may work more than seventy-five hrs. overtime and no young person more than fifty hrs. overtime in any calendar year. The home secretary also has power to reduce the overtime allowed for any industry if he is satisfied that this can be done without serious detriment to the industry. He may also prohibit or restrict the overtime employment of young persons in any process if he is satisfied that it would prejudice their health. There are also special exceptions in respect of laundries, blast furnace workers and milk and cheese factories. Certain occupations not formerly regulated as to hrs. are included in the scope of the Act, e.g. a young person whose work in a factory consists in delivering goods or running errands.

A young person on being taken into employment must be certified as fit for employment, i.e. the certificate must say that the young person is fit and not merely that he is not unfit.

The amount of space to be allowed for every person employed in a workroom is increased from 350 cu. ft. to 400 cu. ft. But this requirement was not immedi-

ately applied to then existing workrooms and, under certain conditions, exemption might continue for five or ten years. But notwithstanding this exemption the dist. inspector may require suitable mechanical ventilation in any case where he thinks it necessary on account of the particular circumstances, and if the ventilation is not provided as required, the exemption will cease to apply to the particular workroom. During the second period of five years effective and suitable mechanical ventilation must be provided in every case. After ten years the exemptions were to cease. This decennial period expired in July 1948.

A reasonable temperature is required in every workroom and the Act specifically provides that in rooms in which sedentary work of a light nature is carried on a temp. of not less than 60° must be maintained after the first hr. A thermometer must be placed in a suitable position in each room. Ventilation and lighting must be 'effective and suitable' and the Home Office may prescribe standards of lighting. Requirements as to the provision of sanitary accommodation are enforceable by the dist. councils, but the standard required is laid down in Home Office regulations.

The safety provisions are too numerous to describe in detail; but a large number of them are re-enactments of provisions in the Act of 1901 and subsequent legislation. A new and important requirement is the training and supervision of young persons working at dangerous machines, the net effect of the provisions being that the young person must have been fully instructed in the dangers and as to precautions to be observed; he must have been sufficiently trained in the use of the machine and he must be 'under adequate supervision by a person who has a thorough knowledge of the machine. Also in regard to transmission and other machinery, the cleaning of machinery by women and young persons, and hoists and lifts, the safety provisions are elaborated and strengthened by the Act. The previous law required every hoist and lift to be securely fenced. The new Act requires every hoist and lift to be of good mechanical construction, sound material and adequate strength and to be properly maintained; and it lays down detailed requirements as to fencing and other precautions in the interests of safety. New requirements are included to meet the case of new machinery; vessels containing dangerous liquids; chains, rope and lifting tackle; cranes and the like; construction of and maintenance of passages and stairs; safe means of access; security of ladders; precautions with respect to explosive or inflammable dust, gas, or vapour; steam receivers and steam containers; air receivers; and water-sealed gas holders. The requirements as to means of escape in case of fire are strengthened and extended. Every factory to which this section applies must have a certificate from the dist. council that the means of escape are adequate having regard to the circumstances of

the case.' Where the conditions are found to be so dangerous that the factory ought not to be used, an inspector may apply to a court of summary jurisdiction for an order prohibiting the use of the factory.

The duties of workpeople respecting safety appliances are laid down in a provision, which is novel in factory legislation, to the effect that they shall not interfere with or misuse any means, appliances, etc., provided for securing the health, safety, and welfare of the employees; and where any appliance for securing health and safety is supplied they shall use the appliance and not wilfully and without reasonable cause do anything likely to endanger themselves or others.

An underground room may not be used as a factory if certified by an inspector as unsuitable. New underground rooms must be notified before being taken into use, and the consent in writing of the inspector must be obtained if the room is to be used for any prescribed process of a hot, wet, or dusty nature or liable to give off fume. Underground bakehouses must be examined by the dist. council every five years.

The Act is essentially a codification of principles to which the regulations give a form that can, if necessary, be varied if industrial processes or conditions are altered. See Redgrave, *On Factory and Workshop Acts*; G. D. H. Cole, *Workshop Organization*, 1928; and the ann. reports of the Chief Inspector, pub. by H.M.S.O.

Labour problems received attention during the peace discussions at Versailles, and an International Labour Organisation was created by the Peace Treaty. This organisation was passed on to the League of Nations, under which it has done much useful work for the protection of operatives whose tasks involve special or unusual perils such as those from fumes, infection, dust, poisoning, strain, or accident. It also makes provision for instruction to be given on such medical and scientific points as should reduce or avoid risks.

Factory Inspectors, see **FACTORY LEGISLATION**.

Faculty: (1) A term formerly applied in philosophy to a fundamental function of the mind. Modern psychologists, however, regard the mind as a unity, not possessing faculties, but different activities. (2) In eccles. law, a F. is a dispensation or licence. *The Court of Faculties* is the court of the archbishop of Canterbury for granting certain dispensations, such as marrying without pub. of banns. This authority rested in the pope till the reign of Henry VIII. The sittings are held at 23 Knight-riding Street, Doctors' Commons. Its chief officer is called the master of faculties, and attached to the court are a registrar, deputy registrars, a record keeper, and a seal keeper. *A Grant of Faculty by the Ordinary* is given by the consistory court of the bishop of the diocese, and is necessary in order to effect any alterations in or additions to a church or parsonage. See R. Phillimore, *Ecclesiastical Law*, 1895. (3) The word

is also applied to a branch of learning. In this sense it is derived from Lat. *facultas*, which was used in medieval times to translate Gk. *δύναμις*. Thus, the faculties of medieval univs. were art, theology, medicine, and law. This use has since been further extended to include the body of members of a profession. Thus, in Scotland, certain groups of profs. are called 'faculties.'

Faed, John (1819-1902), Scottish painter, son of a millwright, b. in Kirkcudbright; was elected an A.R.S.A. in 1847 and R.S.A. in 1851; his paintings, such as 'The Cottar's Saturday Night,' are genre studies of humble Scottish life.

Faed, Thomas (1826-1900), Scottish painter, brother of John F., b. at Burley Mill. He was best as a painter of domestic genre, his pictures of this kind being 'Reading the Bible,' 'Mitherless Bairn,' 'The First Break in the Family,' 'Baith Faither and Mither,' etc. Consult W. D. McKay, *The Scottish School of Painting*, 1906.

Fæmund, see **FAMUND**.

Faenza, tn. of Italy, in the prov. or Ravenna, situated on the Lamone (anc. Anemo), 31 m. S.W. of Bologna. It is a beautiful city enclosed by old walls. In the Vittorio Emanuele Square, which is surrounded by arcades and ornamented with a beautiful marble fountain, is the cathedral of San Costanza, the church of San Michele, and the city hall, once the palace of Manfredi. The cathedral dates back to 1474, and contains some beautiful work by Benedetto de Majana, Innocenzo da Imola, and others. Majolica is manufactured and there are silk spinning and weaving works and sulphur refineries. New Zealand troops of the Eighth Army (q.v.) entered F. on Dec. 16, 1944. Owing to bitter Ger. resistance, prolonged over some weeks, the city and its monuments sustained severe damage, though the Cathedral escaped with a few slight shell-holes in the roof. The International Museum of Ceramics was destroyed and though, in 1940, most of the ceramics had been moved to deposits all these deposits were severely damaged, but much of the material under the ruins of the museum building was recovered. The public library was partially destroyed and 40,000 books were lost. Pop. 40,000.

Faerøe Islands (Dan. *Færøer*, sheep is.), group of is. belonging to Denmark, and situated in the N. Atlantic between the Shetland Islands and Iceland, 300 m. N.W. of the former. They number twenty-two, of which seventeen are inhabited. They almost all present a steep and precipitous coast seaward, the cliffs being 1000 to 2000 ft. high. The harbours do not afford a very safe anchorage, but they are washed by warm currents, and are always free from ice; the currents which run through the sounds are swift and dangerous, and storms and whirlwinds are very frequent. The surface is almost everywhere hilly, attaining to the height of 2502 ft. in Strömø and 2756 ft. in Osterø. All timber for building purposes is imported from Norway, as there are no trees in the islands, but the

rocks are covered with moss and ferns and the soil is rich in peat and coal. There is little cultivable soil, and only hay and potatoes can profitably be produced. The inhab. rely chiefly on the sea for their animal food. The ann. massacre of whales, schools of which are driven into the harbour of Thorshaven and there slaughtered, is an important event. The chief sources of wealth are fish (both fresh and dried), fish oil, and skins, wool, sea-bird feathers (especially loons). The largest is. are Strömö (28 m. by 8 m.), Osterö, Vaagö. Sandö, and

the Unionist Party. Area 540 sq. m. Pop. 29,100. See K. Williamson, *The Atlantic Islands*, 1948.

Faesi, K. Robert, Swiss poet and playwright, b. at Zürich. Prof. of Ger. literature in Zürich Univ. He is one of the few successful dramatists that Switzerland has produced. His tragedy *Odysseus und Nausikaa* (1911), his drama *Opferspiel* (1925), and his comedies *Die offenen Türen* and *Die Fassade* (1913) are of a quality unusual in the Swiss theatre and are his best plays. As literary historian, he has written on A. E. Frohlich, Paul Ernst,

FAEROE ISLANDS : KTVIVIK

Royal Danish Embassy

Söderö. The cap. and chief port of the group is Thorshaven in Strömö; Kirkebø on the same is. was formerly the seat of a bishop. The inhab. are almost exclusively of Norwegian descent, and speak an old Norse dialect, although Dan. is the language used in the law courts, churches, and schools. Since 1854 they have enjoyed a certain amount of self-government, electing a local assembly, but they send representatives to the Copenhagen chambers. Their religion is Lutheran. The F.I. were first colonised in the ninth century, and belonged to Norway until 1380, when they passed to Denmark. After the seizure of Denmark by the Gers. in April, 1940, Brit. troops occupied the F.I., but it was announced that they would be given back to Denmark after the war. In Sept. 1946, the people of the F.I. voted in favour of the is. separating from Denmark, and becoming a Republic. The plebiscite was the culmination of a struggle dating from 1906, when a Home Rule party was started in opposition to

Carl Spitteler, Rainer Maria Rilke, and K. F. Meyer; also *Gestalten und Wandlungen der Schweizer Dichtung* (*Forms and Changes in Swiss Poetry*), (1922). In 1928, received Swiss Schiller Prize for his collection of poems, *Der Brennende Busch*. Other poems *Aus der Brandung*, 1917, inspired by the 1914-18 war.

Fagan, James Bernard (1873-1933), dramatist; attended Trinity College, Oxford, and afterwards was on the stage (till 1899). He wrote *The Prayer of the Sword* (1904), and *The Earth* (1909); trans. *False Gods* and adapted *Bella Donna* (1911); but his most successful work was *And So To Bed* (1926) with the diarist, Pepys, as the chief character.

Fagging, a system prevalent in Eng. public schools by which a junior boy performs certain duties for a senior, such as running errands, stopping balls at cricket, tidying his study. The system was fully estab. at Eton and Winchester during the sixteenth century. The system usually has the full approval of the authorities.

The arguments in its favour are that it gives a certain amount of autonomy to the boys, and that it prevents bullying. It tends to make the younger boys helpful and willing, and devolves responsibility upon the elder boys, who are accountable for the good conduct of their fags and to protect them against bullying. A similar system known as *Pennalism* was introduced into the Ger. univs. during the seventeenth century, and is estab. in Amor. colleges, where it is known as *hazing*. School fagging was discussed at the Annual Conference of Educational Associations in January 1931, when the subject was brought forward by the Society for Experiment and Research in Education. The gravamen of criticism of the system was that there were better ways of teaching discipline and self-sacrifice, and that unless very carefully controlled and supervised, the system lent itself to cruelty and taught servility rather than service.

Faggot Votes, votes artificially created for party purposes, chiefly at co. elections, by transferring sufficient property to give a bare qualification for the franchise to persons who would otherwise be unable to vote. The transfer was made by nominal sale of property merely under mortgage. This practice was checked by Lord Somers's Act of 1896, and by the Representation of the People Act of 1884.

Faguet, Emile (1847-1916), Fr. critic and man of letters, b. at La Roche-sur-Yon. He was a master in schools at La Rochelle and Bordeaux, and in 1897 became a prof. at the univ. of Paris. Appointed a member of the French Academy in 1900. He was dramatic critic to the *Soleil* and literary critic to the *Revue bleue*. Among his works are *Histoire de la littérature française depuis le XVII^e siècle jusqu'à nos jours* (1900-01); and monographs on Flaubert (1899); Zola (1903); *Propos de théâtre* (1903-10), and *Histoire de la poésie française de la Renaissance au Romantisme* (1923-34). See A. Séché, *Emile Faguet*, 1904; also A. Belis, *La Critique à la fin du XIX^e siècle*, 1926.

Fagus, genus of Fagaceae to which also belong the sweet chestnut and the oak. In addition to *F. sylvatica*, or beech, the species native to Great Britain, there are about fifteen others, some of which have beautifully-tinted or sharply-toothed leaves and are well known in cultivation.

Faïore, grey copper ore of two varieties, *arsenical* and *antimonial*. The former occurs crystallised and massive, and consists chiefly of arsenic, copper, iron, and sulphur. The latter occurs crystallised in modified tetrahedrons, and consists chiefly of antimony, copper, iron, sulphur, and zinc.

Fahln, see **FALUN**.

Fahluite, or **Triklasite**, hydrous silicate of aluminium and iron, being an alteration product of the mineral *loilito*, due chiefly to its hydration. It usually occurs in regular hexagonal prisms, though its primary form is a right rhombic prism. Its colour is yellowish, greenish, and blackish-brown.

Fahrenheit Thermometer, see under **THERMOMETER** and **THERMOMETRY**.

Fahrenheit, Gabriel Daniel (1686-1736), Ger. physicist, b. at Dantzic. He lived in England and Holland, studying natural physics, and the manuf. of meteorological instruments. He invented certain improvements in the construction of thermometers, notably the use of quicksilver for alcohol, and devised the scale with freezing-point at 32°, boiling-point at 212°. He was elected a Fellow of the Royal Society of London (1724), and contributed papers to the *Philosophical Transactions*.

Faidherbe, Louis Léon César (1818-89), Fr. general, b. at Lille. In 1852 went to Senegal, of which he was appointed governor. The work he accomplished in Fr. W. Africa culminating in his defeat of El-Hadj Omar, is his most enduring memorial. Villard thus does justice to him: 'Il sut s'adapter et adapter toutes ses souffrances, il les sacrifia au sénégau et à son avenir. Il prit des mesures qui à coup sûr devaient détruire l'oeuvre présente mais faire naître de magnifiques remplacements...' Faidherbe vit grand, vit juste, dut son cher Sénégal au souffrir.' When he died he had just put the finishing touches to his book *Le Sénégal : La France dans l'Afrique Occidentale*. It is through Senegal that France plays a decisive part, political and moral, in W. Africa, and it was F.'s colonisation that really led to control over a vast continent. In the Franco-Ger. War, he commanded the N. Army. He withstood the attack near the R. Hallue, but was severely beaten at St. Quentin in 1871. When peace was signed, F. was sent by the Fr. Gov. to Egypt to study the monuments and inscriptions. His archaeological works include *Collection des inscriptions numidiques* (1870), *Épigraphie phénicienne* (1873), *Essai sur la langue poul* (1875). See lives by Fulcrand, 1890, by I. M. Brunel, 1897, and Villard, and also 'Faidherbe,' by Robert Delavignette in *Les Techniciens de la Colonisation* (ed. C. Julien) 1946.

Faidit, Gaucelm (c. 1160-c. 1215), celebrated Provençal troubadour, b. at Uzereche, Limousin. He was at first a *jongleur*, and wandered about with his wife, Guilhelma Monja, to the different European courts. In 1202 he accompanied Boniface III. of Montserrat to the crusades. Sev. of his songs are exhortations to the young and the strong to take part in the Holy War. Among his masters were Richard Cœur de Lion, whose death he lamented in a beautiful *planh*, Raymond d'Agoult, and Geoffrey of Brittany. Sev. songs and fragments of love lyrics are extant and are of great beauty. See R. Meyer, *Das Leben des Troubadours G. Faidit*, 1876.

Faience, or **Fayence**, general term applied to glazed earthenware, porcelain, and other kinds of pottery, and derived from the tn. Faenza in Italy, where it was first made.

Failsworth, tn. of Lancashire, England, 4 m. N.E. of Manchester. Its chief industry is cotton manuf. Pop. 17,600.

Fain, Agathon Jean François, Baron (1778-1837), Fr. historian, and secretary to Napoleon I., b. in Paris. A member of the Committee of Public Safety on the outbreak of the Revolution; then of the Directory and of the Consulate. Later he became archivist and secretary to Napoleon, whom he thereafter accompanied on all his campaigns, until the Emperor's abdication in 1814. Resumed his functions in 1815, but retired into private life on the return of Louis XVIII. In 1830 Louis Philippe made him first secretary of the Cabinet. His works on the military and diplomatic events of his time, including those of the Empire, are marked by accuracy and conscientious treatment, the years 1812, 1813, and 1814 being particularly well covered.

Fainéants, Rols, the 'Do-nothing Kings.' Nickname of the later Merovingians of France, namely Thierry III., Clovis III., Childbert III., Dagobert III., Childeric II., Thierry IV. and Childeric III. They were so called because during their regins the rule of the country virtually lay in the hands of the mayors of the palace.

Fainting, or **Syncope**, sudden loss of sensibility due to arrested circulation. The term is particularly applied to minor cases of shock where the condition of insensibility is transitory. The observable symptoms of F. are a sudden pallor of the face and loss of control over the muscles. The patient falls more or less suddenly and remains inert without any movement whatever. The eyes are half-closed or shut, the limbs are limp, the pulse is very weak or disappears altogether. It may be distinguished from epilepsy by the lack of movement and from catalepsy by the characteristic pallor. A feeling of faintness may not proceed as far as collapse; the patient feels dizzy, staggers for a moment, and suddenly recovers. The immediate cause of F. is an insufficient supply of blood in the brain. This may be brought about by actual loss of blood due to injury, or by poverty of blood due to a weakened condition, or may be preceded by a nervous disturbance. When F. is due to mental emotion, the medulla oblongata is over-stimulated to a condition of partial paralysis; the respiratory functions are sluggishly performed, the heart contracts feebly, and the circulation fails.

Treatment.—When assailed by a feeling of faintness, the patient should sit down and press the head downwards between the knees, when the flow of blood to the brain should be re-established. If the patient has already collapsed, he should be laid down with the head as low as possible and the respiratory functions stimulated by cold water on the face, by pungent aromatic vapours in the nostrils, by compressing and relaxing the ribs, etc.

Fair (Lat. *feriæ*, holidays), large mkt., held periodically. A fair was usually held on a holiday or a saint's feast to take advantage of the concourse of people. According to Cicero, the Gks. utilised the religious games for trading purposes, and the Romans, too, traded during the

ann. feast at the temple of Voltumna in Etruria. During the reign of Edward I. of England it was felt that the churchyards or immediate precincts of the churches and abbeys were being desecrated by Fs., and a law, embodied in the Statute of Winton, was passed to check the custom of holding Fs. near a place of worship. Courts of summary jurisdiction were formed to deal with any disputes or questions that might arise during a F., the date and duration of which had to be publicly made known beforehand. The traders who managed the F. were usually itinerant merchants, who went from place to place with their wares. At the time when means of communication were few, the F. was of great importance, but with the advance of civilisation is passing away. St. Bartholomew F. was held in London at Smithfield till 1855. Other famous Fs. were Stourbridge F. near Cambridge, which lasted for three weeks, Glasgow F. and Greenwich F. In England the F. has in many cases developed into a mkt. for live stock. One of the largest horse Fs. is held annually at Horncastle, in Lincolnshire; Exeter has a F. in Dec. for horses and cattle; Ipswich has one for lambs in Aug.; and Nottingham has an Oct. goose F. Some Fs., such as that of Gloucester, are famous for the agric. produce sold. In some country tns. such as Witney, the old-fashioned F. still remains. Fs. are still common on the Continent. Leipzig before the late war had three ann. Fs., each lasting three weeks, where leather, cloth, and furs were the chief commodities sold. Other Fs. of note were those of Frankfurt-on-Main and Frankfurt-on-the-Oder, Beaucatre in France, Bergamo in Italy, Debreczen in Hungary, and Corky in Russia. Siberia had Fs. at Klakhta and Irbit, and Arabia at Mecca. The F. has many points of similarity with the *melâ* of India. Consult Henry Morley's *History of the Fair of St. Bartholomew*, 1859; Cornelius Walford's *Fairs, Past and Present*, 1883; and *The Law relating to Markets and Fairs*, by Pease and Chitty, 1899. This term in the U.S.A. applies now solely to industrial exhibitions and what are known in England as fancy bazaars. In the former are included the 'state' and 'county fairs,' one of the first of which was the New York World's Fair opened in 1853 by a company formed in 1851 (see also under EXHIBITIONS).

Fairbairn, Andrew Mardin (1838-1912), Scottish theologian, b. near Edinburgh, and educated at Edinburgh and Berlin Univs. In 1877 he was appointed principal of the Alredale Congregational College, Bradford, a post which he gave up in 1886 on receiving a similar appointment at Mansfield College, Oxford. Author of *Studies in the Philosophy of Religion and History* (1876), *Studies in the Life of Christ* (1881), *Christianity in the First and Nineteenth Centuries* (1883), *The City of God* (1883), *Religion in History and in Modern Life* (1884), *Christ in Modern Theology* (1893), *Philosophy of the Christian Religion* (1902), and *Studies in Religion and Theology* (1909).

Fairbairn, Sir William (1798-1874), Scottish civil engineer, b. at Kelso, in Roxburghshire. In 1804 he began his apprenticeship at the Percy Main Colliery, N. Shields, where he became a friend of George Stephenson. In 1817 he began a business of his own in Manchester, entering into a partnership with James Lillie, which lasted till 1832. He introduced improvements in mill works and water wheels, substituting iron for wood in the shafting. He was one of the first to build iron ships, which he floated on the Forth and Clyde Canal. In 1835 he estab. shipbuilding works at Millwall, London, and was consulted by the Brit. Association on the supposed defects in iron caused by hot-blast furnaces. He carried out the construction of the tubular bridge across the Menai Strait, designed by Robert Stephenson, and himself invented the rectangular structures of the Britannia and Conway bridges. He wrote extensively on engineering subjects. See lives by W. Pole, 1877, and S. Smiles (in *Lives of the Engineers*), 1861.

Fairbanks, Douglas (1883-1939), Amer. cinema actor (real name Douglas Ullman); b. May 23, at Denver, Colorado. He was educated at Jarvis Military Academy, Denver, E. Denver High School, Colorado School of Mines, and Harvard Univ. He then took to the stage, under the tragedian Frederick Warde—his first part being François the lackey in *Richelieu*. After a period of Shakespeare, in whose plays F. did not shine, he joined the company of Herbert Kelcey and Effie Shannon. He next became a clerk in a broker's office in Wall Street. After that, he and two acquaintances went as 'hay-stewards' in a cattle-boat to Liverpool—tramped through England, France, and Belgium, working at odd jobs, for three months—then returned to America. For a little while he was in a machine-shop; next, rambling in Cuba and Yucatan. When he returned to the States, he took up acting again. His first appearance on the New York stage was in 1901. He starred in *Man of the Hour* and *The Gentleman from Mississippi*. Married Anna Beth Sully, of Providence, Rhode Island in 1907. After 1915 confined himself to the films such plays as: *The Half-Breed*, *The Habit of Happiness*, *The Good Bad Man*, *Reggie Mizes in*, *The Mystery of the Leaping Fish*, and *Manhattan Madness*. In 1917 he owned his own producing company. His outstanding pictures include: *The Mark of Zorro*, *The Three Musketeers*, *Robin Hood*, *The Thief of Bagdad*, *Don Q*, and *The Black Pirate*. Divorced, 1918. Married, secondly, March 28, 1920, the film-actress Mary Pickford (who obtained a divorce, 1935).

Fairbury, co. seat of Jefferson co., Nebraska, U.S.A., 67 m. S.W. of Lincoln, and centre of a farming co. with various industries. Pop. 6300.

Fairfax, Edward (c. 1580-1635), Eng. writer, b. at Denton in Yorkshire. His reputation rests on his trans. of Tasso's *Gerusalemme Liberata*, pub. in 1600 under the title of *Godfrey of Bullioigne, or the Recoverie of Jerusalem, done into English*

Heroical Verse. His poem has great beauty; Dryden compared him as a poet with Spenser, and Waller acknowledged that he owed to him the harmony of his numbers. He also wrote eclogues, one of which appeared in Mrs. Cooper's *Muses' Library* (1737) and a *Discourse on Witchcraft*, pub. by Monckton Milnes in the *Miscellaneous* of the Philobiblon Society, 1621.

Fairfax, Sir Henry (1837-1900), Brit. admiral. He distinguished himself as a lieutenant on the *Ariel* in suppressing the slave traffic of the E. coast of Africa, and in 1872 acted as naval attaché to Sir Bartle Frere in an expedition to the sultan of Zanzibar. In 1877 he was appointed to the command of the *Britannia*, when he personally superintended the studies of Prince Albert Victor and King George V. He was in command of the *Monarch* at the bombardment of Alexandria (1882).

Fairfax, of Cameron, Ferdinando, second Baron (1584-1648), Eng. general of the Parl. forces, son of Thomas F., first baron, of Denton, Yorkshire. His name is associated chiefly with the conflict in Yorkshire. When the king left the Parliament and estab. his quarters at York, the Commons sent F. to report on the king's movements, and F., by protesting against the presentment of the grand jury of Yorkshire, received the thanks of Parliament. He commanded the forces in Yorkshire, but was severely defeated at Adwalton Moor; later he turned the tables on the Royalists at Selby and again at Pontefract. See Sir C. R. Markham, *Life of the Great Lord Fairfax* (i.e. the third Lord F.), 1870.

Fairfax, Thomas, third Baron Fairfax of Cameron, son of Ferdinando (1612-71), second Lord F., was b. at Denton, Yorkshire. Went to St. John's College, Cambridge, where he matriculated. Fought in the siege of Bois-de-due (1629), and later in the first Scottish War, but it is as a general for the parliament during the Civil War that he is best remembered. He captured Leeds and Wakefield in 1643, and in the following year had a command at Marston Moor. In 1645 he was appointed commander-in-chief of the parl. army, and in that year defeated Charles I. at the battle of Naseby. He was one of the king's judges in 1649, and was opposed to his execution. He was a man of great courage and a brilliant general. See *The Great Lord Fairfax*, 1870, which also contains a list of pamphlets relating to his campaigns. See also the *Maseres Papers*.

Fairfield, par. and vil. of Derbyshire, England, adjoining Buxton. Pop. 6700.

Fairfield, city of Jefferson, co. Alabama, U.S.A., 5 m. W. of Birmingham, an industrial suburb of B. founded in 1910 to provide for the employees of the U.S.A. Steel Corporation. Pop. 11,700.

Fairfield, city of S.E. Iowa, with important manufs., the site of Parson's College (Presbyterian). An ann. Chautauque assembly is held here. Pop. 6700.

Fairford, vil. of Gloucestershire, England, on the Colne at the foot of the Cotswold Hills, 9 m. E. of Cirencester. It is

noted for its old church in the Perpendicular style, built by John Tame in the fifteenth century. It has fine stained-glass windows of Flemish workmanship. See J. G. Joyce, *The Fairford Windows*, 1872. Pop. 1800.

Fairhaven, tn. of Bristol co., Massachusetts, U.S.A., situated at the mouth of the Acushnet R., on Buzzard's Bay, opposite New Bedford. It has manufs., a good harbour, some fine public buildings, and is a summer resort. Pop. 10,900.

Fairhead, or **Benmore Head**, promontory on the N. coast of Ireland, co. Antrim, 5 m. N.E. of Ballycastle. It is of columnar basaltic rock, 636 ft. high.

Fairies and Elves (Fr. *fée*; Low Lat. *fata*, from *fatāre*, to enchant; Lat. *fatum*, fate; O.E. *alf*; Dan. *alf*; Icelandic, *alfr*), supernatural beings existing in the mythology and folklore of all nations. They have often been represented as tiny, winged sprites, sometimes malignant, sometimes benign, who possess a mysterious power over human destinies. They need not, however, be diminutive beings, and have often appeared in the shape of humans. The fairies of Teutonic and Celtic lore probably owe much to the sirens, nymphs, and fauns of classical mythology.

They have often taken the form of a beautiful woman who has beguiled men by her charms. Such were the Sicilian Sirens, whose singing on the rock near Cape Pelorus had such a fatal attraction for all seafarers until Ulysses, by an artifice, sailed safely past them, whereupon they drowned themselves in the sea. There are fairy lemans in Homer, elf-maidens in Scandinavian literature, and R. L. Stevenson, in *Island Nights' Entertainments*, says that they are not uncommon in Samoa. A striking description of the elf-woman, who has pale kings and princes and warriors in thrall, occurs in Keats's ballad, *Lg Belle Dame sans Merci*. Fairies are soulless beings, but by marriage with a man may attain immortality. Fouqué made use of this superstition in his story of the water-nymph, Undine. When fairies have left their own country to marry and live with men, they have generally been bound by some restriction, which, when disregarded, brought great misery. Melusine built a great castle for her husband, and lived for many years in happiness. Once a week, however, she became a serpent from waist to feet, and the condition was that her husband should never see her when she was thus transformed. But he surprised her one day in her bath, and with a shriek she vanished for ever from his side, only appearing from time to time as a warning of approaching death in his family. According to another superstition, fairies have to pay a yearly tribute to the powers of hell, and for this purpose they are always trying to steal little children, leaving changelings in their place. The peasants of Ireland still fear for their children, and never dare to speak of the little people as otherwise than 'good,' lest they should take offence and revenge themselves by robbing the cradles. Adults,

too, have sometimes been allured to fairyland. They are then undone, and can seldom return from that country. Kirk (d. 1692), the author of *The Secret Commonwealth of Elves, Fauns, and Fairies*, it is said, was carried off by fairies. He appeared, however, to a friend, and said that on his next visit, if the friend threw a dagger over his shoulder, the enchantment would be broken. The friend failed him, and Kirk has never again been seen by mortal men. In the old ballad, Janet really effected the escape of Tamlane from fairyland. A human being is undone if he eats fairy food, and Falstaff, it will be remembered, dared not speak to fairies or be a witness of their doings: 'He that speaks to them shall die; I'll wink and couch: no man their works must eye.' Fairies can be very malicious—Falstaff was pinched by his friends disguised as fairies and hobgoblins. This is the ordinary practice of elfish creatures, and thus Lyly in his *Endymion* has Corsetes pinched black and blue by fairies. There always have been good and bad fairies. As in the old nursery fairy tale of the *Sleeping Beauty*, so at the birth of Ogier le Danols six fairies were present, five of whom gave good gifts, but the sixth was a bad fairy. In England, the fairy has been, in general, a domestic spirit, who visits houses at nights, sweeps the floor, threshes the corn, or skims the milk: but 'crofuld out of doors he flings, ere the first cock his matin rings.' The Ger. fairy is equally helpful, and is called *Kobold*, a goblin. Belief in fairies has, however, diminished in England, but the country people of Cornwall are still persuaded of the existence of pixies, who, they say, are really the lost souls of babies who have died before baptism. (See F. Hitchens' *History of Cornwall*, p. 97, 1824). Considerable interest has been aroused of late years in Celtic fairy legends through the writings of Andrew Lang, W. B. Yeats, Ernest Rhys, and others. Irish fairies dwell in crevasses and underneath old tumuli, in some ways the Irish leprechaun thus resembling the black earth elves of Scandinavia, who burrowed underground dwellings, where they retreated with stolen treasure. Scottish fairies, brownies, kelpies, and the like are supposed to be more malignant than their Irish brethren, and are creatures of storms and tempests.

Consult L. F. Maury, *Les Fées du Moyen Age*, 1843; T. Keightley, *Fairy Mythology*, 1850 (new ed. 1910); W. Sikes, *British Goblins*, 1879; J. Grimm, *Deutsche Mythologie* (Eng. trans.), 1880-88; T. Gorer, *Fairy Legends of Ireland*, 1882; W. B. Yeats, *Celtic Twilight*, 1883, 1902; and *Fairy and Folk Tales of the Irish Peasantry*, 1888; W. Camble, *Scandinavian Folk-lore*, 1896; Sir J. Rhys, *Celtic Folk-lore*, 1901; R. Hunt, *Popular Romances of the West of England*, 1923; G. Willoughby-Moade, *Chinese Ghouls and Goblins*, 1923; M. W. Latham, *Elia-bethan Fairies*, 1930; J. MacCulloch, *Were Fairies an Earlier Race of Men?*, 1932; L. Spence, *The Minor Tradition of British Mythology*, 1948.

Fair Isle (Norse *faar*, a shire), a small isolated is. of the Shetlands, Scotland, situated between the latter group and the Orkneys, 24 m. S.W. of Sumburgh Head. It has an area of 6 sq. m., its sandstone cliffs are high and rocky and it has an extremely indented coastline. The industries are fishing and knitted articles. The Moorish patterns of the hosiery and other garments made here are believed to have come through the wrecked crew of one of the Armada vessels in 1588. The is. is a stepping stone in the migratory movements of birds on the wing each autumn and spring to and from Britain, and research into the origins, routes, wintering areas, feeding habits, etc. of the myriad migrators has been estab. there. Pop. 80.

Fairlie, vil. of N. Ayrshire, Scotland, situated on the E. shore of the firth of Clyde, 2½ m. from Largs. It is noted for yacht-building. Pop. 1400.

Fair Maid of Kent, Joan, daughter of Edmund, earl of Kent, granddaughter of Edward I.; so called on account of her beauty. Eventually wife of the Black Prince.

Fair Maid of Norway (1283-90). Margaret, daughter of Eric II. of Norway, and granddaughter of Alexander III. of Scotland; died on her way from Christiania to succeed Alexander on the Scottish throne, an event which gave rise to a struggle for the crown by rival claimants.

Fairmont, tn. of W. Virginia, U.S.A., and the cap. of Marion co. It is situated on the Monongahela, 55 m. S.E. of Wheeling, at an important railway junction. It ships great quantities of coal and manuf. glass, textiles, etc. Pop. 23,100.

Fair Oaks, or Seven Pines, railway station of Virginia, U.S.A., situated 7 m. E. of Richmond. It is noted as the scene of a battle, in 1862, of the Civil war, when the Union forces under McClellan gained a victory over the Confederates under Johnston. The former lost 5031 men, while the latter lost 6134.

Fair Rosamond, Rosamond Clifford, the mistress of Henry II. of England. Popular legend has it that she was held in a secret tower at Woodstock, in the heart of a labyrinth which only the king could thread.

Fairy Rings, bare or green circles in pastures or meadow lands which were once thought to be the scene of the midnight revels of fairies. But sceptics in fairy lore have long been armed with a rational and scientific explanation of the phenomenon. The rings are caused by the growth of the subterranean mycelium of fungi, which radiate outward to find fresh soil and nourishment. The circles are bare because the *Agaricus campestris* (common mushroom), or *Marasimus oreades* (the F. R. champignon), has exhausted the fertility of the earth, so that grass cannot grow, but as soon as the fungi begin to decay the ground becomes refertilised by the rich nitrogenous products of putrefaction and the grass grows greener than ever.

Faisal, King of Iraq, see **FKISAL**.

Faisans, *lie des*, or *l'isle de la Conterence*, is. with many historical associa-

tions in the R. Bidassoa, which is on the frontier between France and Spain. Here in 1659 was concluded the 'Peace of the Pyrenees' between Mazarin and D. Luis de Haro.

Faith is the acceptance of truth on the authority of another who reveals it (actual F.) or that quality or spiritual vision of the soul which enables it to transcend the confines of the visible and actual and to realise the eternal truth of all the unfathomable mysteries of God. In the Epistle to the Hebs., it is defined as 'the substance of things hoped for, the evidence of things not seen,' and in Christian theology is regarded as the gift of the Almighty, without which there can be no salvation.

But though the meaning of F. is clear in the abstract, and F. is a force of universal recognition, yet it cannot be expressed or comprised in any formal definition, so that the varying interpretations given to it from time to time must be regarded as diverse, but not conflicting, manifestations of a single and fundamental spiritual vision or capacity. Some regard faith as that divine strength in a man's soul, which wins for him the essential gift of God's grace, whilst others conceive of it as that instinctive and unwavering conviction that the supreme goodness of the Saviour is strong enough to wash away all his impurity and sin. Sometimes, as in the works of Thomas Aquinas, an antithesis is implied between F. and reason, that is between knowledge accepted or credible (divine) authority or deduced from sensible evidence. In not a few Calvinistic churches and stern religious brotherhoods, such as that of the Plymouth Brethren, divine law is deemed an arbitrary expression of God's will, the observance of which is demanded from all believers, even though it appeal to their blind but passionate F. rather than to their reason. A gentler conception is that the reasonableness of the Divine Will is inscrutable, and that a Christian must never lose F. in its ultimate justice in spite of the calamities which overtake many a Job of this world, and in spite of the many other anomalies which seem to belie this belief.

A classification of the different forms or aspects of F. is sometimes attempted. F. is called human or divine according as it is based on man's or God's authority. Habitual F. adheres permanently to the soul; actual F. is the inception or exercise of habitual F. F. is explicit if its object is clearly perceived by the believer's mind; implicit, if it is only known generically and *in globo*.

Faithfull, Emily (1835-96), Eng. philanthropist, devoted her life to the improvement of the status, remuneration, and sphere of labour of working women. In 1860 she started the *Victoria Press*, in which the printing was in the hands of women, and from 1863 to 1881 she continued to publish the *Victoria Magazine*, and to plead in its columns for greater equality between the sexes. Her lectures, both in Great Britain and the States, revealed to the public her noble

aims and the disinterested nature of her work.

Faith-healing is a mind cure, resting on the firm conviction that, as suggested in James v. 14, pain and disease may be dispelled without medical aid, a lively faith in Divine Power being the one *sine qua non*. The miraculous recoveries which took place in the temples of the Gk. god, Æsculapius, no less than those effected by the king's touch all through the Middle Ages, must be regarded as instances of F. So also may be regarded some of the cures brought about by belief in the efficacy of relics, shrines and holy places such as Lourdes, the tombs of the saints and St. Winifred's Well in Flintshire, and perhaps even some of the miraculous cures worked by Christ and His apostles. The Waldenses, Moravians, and the Peculiar People of a later date all trusted to prayer and anointment with oil for the relief of sickness, whilst faith cures were an integral part of the beliefs of Pietists, and many sects of Puritans and Methodists, as well as afterwards of the Irvingites and Mormons. Professor Blumhardt and Dorothy Trudel conceived of healing rather in the sense of the medicine men of savage tribes, that is, as the expulsion from the body of an evil and tormenting spirit, whilst modern Christian Scientists go so far as altogether to deny the existence of physical suffering and disease. (See CHRISTIAN SCIENCE.) Psychologists attribute so-called cures by faith to powers of suggestion which are peculiarly developed in any assemblage where the nervous and emotional activity is high. In Jan. 1931 the Lower House of Convocation of Canterbury passed a resolution in favour of Spiritual healing. The resolution petitioned the Archbishop of Canterbury to appoint a joint committee to draw up a provisional service for Unction (anointing the sick with oil) and Imposition of Hands for temporary use until a permanent and fully authorised form could be issued under Synodical sanction. See E. R. Mickleth, *Miracles and New Psychology*, 1922; C. H. Brooks, *Practice of Auto-suggestion by the Method of E. Coué*, 1922; J. M. Hickson, *Heal the Sick*, 1924; G. G. Dawson, *Healing; Pagan and Christian*, 1935.

Faithorne, William (1626-91), Eng. painter and engraver, born in London. He was imprisoned as a Royalist in the Civil war, and when released he went to France. Returned to England about 1650 and carried on work as an engraver and printseller. His engraved portraits include those of Oliver Cromwell and Charles I. F. wrote *The Art of Graving and Etching* (1682).

Faiyûm, fertile prov. of Upper Egypt, lying W. of the Nile, a little above the head of the delta, and 65 m. from Cairo. Geographically it is a S. oasis in the Libyan desert, irrigated by means of a canal (or Bahr-Yusuf) running through a narrow gorge to the Nile valley. Its area is about 670 sq. m., a portion of which is occupied by a sheet of water, the Birket-el-Karun (35 m. long), known to the ancients as Lake Moeris, by the shores of which

stood one of the wonders of the world, the famous 'Labyrinth.' The chief crops are cereals and cotton, but the prov. is also noted for its figs and grapes. Olives, too, and rose trees, from which the inhalemanuf. attar of roses, are grown. Other productions are sugar, flax, hemp, oranges, peaches, and pomegranates, and F. also has a good breed of sheep. The cap. is Medinet-el-Faiyûm, which is a

Canadian Pacific
AN INDIAN FAKIR

great agric. centre. Important explorations have been made by Flinders Petrie at the sites of anct. cities in this prov. Dr. Johnson, Librarian of Oxford Univ., has also made interesting discoveries of papyrus rolls in excavated tombs in this region in the years immediately preceding the First World War. Pop. (prov.) 671,800; (tn.) 72,400. See R. H. Brown, *Faiyûm and Lake Moeris*, 1892; P. Viereck, *Faiyûm*, 1928.

Faizabad, or **Fyzabad**: (1) Cap. of the Muslim ter. of Badakhshan, Afghanistan, on the Koksha R., 87 m. E.N.E. of Kunduz, and N. of the Hindu Kush. Murad Beg deported all its citizens to Kunduz in

1821 and razed the tn., but it is now once more a flourishing entrepôt for Afghanistan and the Pamir. See also **BADAKSHAN**. (2) City in the United Provs. of India. Ajodhya, once a city of great native splendour, is now a suburb. The Mausoleum of the Bahu Begum is the finest in Oude. It is 140 ft. high. Bahu Begum was one of the two Begums of Oude whose alleged ill-treatment was a subject of indictment of Warren Hastings. Ajodhya is one of the seven sacred Hindu shrines. The Janam St. han Temple is 200 by 150 ft., with walls 45 ft. high; $\frac{1}{2}$ m. to the N. is Ram Ghat, where Rama was cremated. F. is the headquarters of a dist. and of a div. Once the cap. of Oude, it has fallen into decay since the death in 1816 of Bahu Begum, who resided here for many years. Pop. 60,000.

Fajardo, tn. and dist. on the E. coast of Puerto Rico. There are sugar plantations and orange groves in the fertile 'environs,' whilst the tn. itself is a busy entrepôt. Pop. (tn.) 7000, (dist.) 16,000.

Fakenham, tn. 20 m. W.S.W. of Cromer, Norfolk, England. It has an important corn market and a fourteenth-century church. Pop. 2800.

Faking, see **FORGERY IN ART**.

Fakirs (from Arabic *fakir*, poor), are usually called dervishes in Persia, Turkey, and Egypt, dervish meaning 'a religious Mussulman beggar.' The Fs. of India are properly Hindu ascetics, who belong to strict religious orders, but the term F. is also applied to wandering charlatans, who profit by the villagers' superstitions to gain nefarious livelihoods. See **DERVISHES**.

'**Falaba**,' S.S., a liner of over 4000 tons belonging to the Elder Dempster Company. During the First World War, when on her way to Sierra Leone, she was torpedoed by a Ger. submarine off the S. coast of Ireland on March 27, 1915. She received only the briefest warning, and sank within a few minutes, with the loss of over one hundred lives. Indignation in America was widespread over this outrage, which, however, was eclipsed on May 7, 1915, by the sinking of the S.S. *Lusitania*. Both incidents were direct contributory causes to the entry of the U.S.A. into the War.

Falaise, tn. 22 m. S.S.E. of Caen, in the dept. of Calvados, N.W. France. It is on the Ante, and is the cap. of an arron. There are cotton yarn and hosiery manufs. and tanning is carried on, but the tn. is famous for its castle, where Wm. the Conqueror was born. It is a square structure crowning a high rock, and dates mostly from the twelfth century. A famous fair is held annually in the suburb of Guibray, which lies due E. Pop. 5600.

Battle of the 'Falaise Pocket.'—The name given to the Ger. débacle on the W. Front, Aug. 12-22, 1944. The Gers., under the supreme command of Marshal Rommel, had hoped to drive to Avranches when they began their attack of Aug. 7 with a formidable armoured force of four Panzer divs., elements of a Panzer Grenadier div. and supporting infantry, which they had concentrated in the

Mortain area. With this force Rommel counted on thwarting the further advance of the Allies in Normandy. Rocket-firing Typhoons dived on the spearhead of the Ger. armoured columns and destroyed or damaged many tanks. In spite of these checks the Gers. persisted and the battle continued for many days. It was not until Aug. 12 that the first signs became evident that the Gers. had resigned themselves to the impossibility of attaining their objective and at last contemplated withdrawal. But they had clung too long to a position from which military wisdom would have suggested a much earlier retreat. Two days previously the Allied

W. F. Mansell

FALAISE CASTLE

The birthplace of William the Conqueror.

Command had decided to seize the opportunity for encirclement offered by the unsound tactics of the Gers. With Amer. Third Army forces at Argentan and the Canadians at Falaise, the stage was set for the 'Battle of the Pocket,' with the Gers. struggling desperately to keep open the gap between the two tns.—Mortain and Argentan—from which to extricate their forces from the W. By Aug. 13 the withdrawal from Mortain eastward was under way. Infantry reinforcements were now hurriedly brought back from across the Seine—five divs. crossing during the week preceding Aug. 12; but it was too late now for them to be able to save the situation. In the pocket, the Ger. strategy was to line the S. lip through Argentan with their armour as a defence against the Amer. forces while they extricated what they could of their forces through the gap, and, at the same time, to oppose against the Canadians a strong defensive barrier of two Panzer divs. at Falaise. By this means, resisting fiercely, the Gers. succeeded in holding open the jaws of the Allied pincers long enough to enable a proportion of their forces to

escape. As usual, the Gers. concentrated on saving their armour and left the bulk of the infantry to its fate. A considerable part of the half-dozen or more Panzer divs. managed thus to get away but some seven infantry divs. and part of an eighth, together with some of the 10th and 21st Panzer Divs. were trapped. Until Aug. 17 there was a steady seep eastward through the gap, but then came a convulsive surge to get out on the part of all ranks, and the orderliness with which the retreat had hitherto been carried out collapsed suddenly. All now became chaos and confusion as the remaining forces in the pocket struggled to get out through the diminishing corridor by Trun, which was all that remained of the escape route. Allied Air Forces now swept down on the choked mass of transport and there was no sign of the Luftwaffe offering any opposition. The consequent destruction assumed immense proportions as the Allied aircraft and artillery combined in pounding the trapped Gers. By Aug. 20 the gap was finally closed near Chambois and by the 22nd the pocket was eliminated. The lovely wooded countryside W. of Argentan had become the graveyard of the army which, three months earlier, had confidently waited to smash the Allied invasion on the Normandy beaches. (See Gen. Eisenhower's Report to the Combined Chiefs of Staff, H.M.S.O., 1946. See also WESTERN FRONT IN SECOND WORLD WAR: BATTLE OF NORMANDY.)

Falangists, Sp. Fascists, who co-operated with Gen. Franco in the Sp. Civil war, 1936-39. Their tendency towards social radicalism brought them up against the Conservative military caste and they were repressed in 1938. Franco, however, assumed the leadership of the F. and they were soon the only political organisation tolerated in Spain. Their former leader, Antonio Primo de Rivera, son of the one-time Sp. dictator, was shot by the Republicans. The F. were undoubtedly under Ger. and It. influence during the Civil war.

Falashes (from Ethiopic *falas*, a stranger), tribe of Hamitic stock and Jewish religion, who are subject to the kingdom of Tigré in Abyssinia. They speak Ethiopic (or Ge'ez), and their O.T. and other sacred books are written in this language, not in Heb. Though their religion is infected with pagan beliefs, such as faith in the potency of the evil eye, they practise a higher morality than their Christian rulers. Unlike their co-religionists, they live by agric., not by commerce. Until 1800 they had their own king, and are remarkable for their voluntary segregation from other tribes or sects.

Falco, Gian, see PAPINI, GIOVANNI.

Falcon, most northerly state in Venezuela, bounded N. and W. respectively by the Caribbean Sea and the gulf of Venezuela (also by Zulia), and southward by the state of Lara. Tropical bogs and sandy levee's line the coast. Inland trade passes through Coro, the cap., the one seaport being La Vela de Coro. Pop. 232,600.

Falcon (Lat. *falco*, Teut. *valken*), a name given to certain members of the Falconidae (q.v.) a family of birds of prey which catch their quarry on the wing. They have short curved beaks with one notch in the upper mandible; the wings are long and pointed, and the toes elongated. *Falco candicans*, the Greenland F., is white in colour, and is sometimes called the white gerfalcon; *Hierofalco*, the gerfalcon, is singular in having plumage of a slaty grey; *F. gyrfalco*, the Scandinavian F., and *F. islandicus*, the Iceland F., migrate southward in winter, the latter occasionally reaching Britain; *F. peregrinus*, which, together with the northern F. and other species, is used in falconry, ranges over Europe, China, Japan, N.E. Africa, and N.W. India. This species is known in England as a migrant, and is found nesting on lofty cliffs; it is amazingly swift in flight and devours game and birds of all kinds. See also FALCONRY.

Falcone, Aniello (1860-65), It. battle painter, is the most famous of Ribera's pupils, and himself the founder of a school. In his battle-scenes, taken both from biblical and secular stories, he shows himself a careful painter, capable of suggesting some of nature's animation. During Masaniello's revolt (1647), he organised his pupils into the 'Compagnia della Morte' (company of death), and paraded the streets by night to murder Spaniards. F. wisely went into exile on the restoration of peace.

Falconer, Hugh (1808-65), Brit. botanist and paleontologist. During his first stay in India (1830-42), he was superintendent of the botanic garden at Saharanpur, and during his second (1847-55), held a similar post at Calcutta. He discovered the *asafetida* medicinal plant in India, and urged the cultivation there of tea and the cinchona bark. During his invaluable geological researches in the tertiary deposits of the Siwalik hills he made a splendid find of fossils including the Mastodon and an enormous pre-historic tortoise. His *Fauna Antiqua Sivalensis* (1846-9) was never finished. He is justly regarded as a martyr to science, for overwork undoubtedly undermined his health.

Falconer, Sir Robert Alexander (1867-1943), Canadian clergyman and educationist, b. at Charlottetown, Prince Edward Island, Canada, son of Dr. A. Falconer, clergyman. Educated at Queen's Royal College, Trinidad and at London and Edinburgh Univs. Also studied at Berlin, Leipzig and Marburg. Ordained Presbyterian minister, 1892. Taught N.T. Gk. at Pine Hill Presbyterian College, Halifax, from 1892-1907, and was Principal there from 1904-07. Appointed President of the Univ. of Toronto at the age of 40, being there from 1907-1932. Under his guidance the univ. was organised into a highly efficient whole. In 1925 in England he gave the Sir George Watson Lectures on Amer. Hist. President of the Royal Society of Canada and of the Royal Canadian Institute.

Falconer, William (1738-69), Scottish poet, belonged to a large family, all of whom were deaf and dumb except himself.

His famous *Shipwreck*, first pub. in 1762, was based on a personal experience, for he was one of the few survivors of a merchant vessel which foundered off Cape Colonna, Greece. In spite of the somewhat offensive mixture of the artificial, elegant style of Pope with the breezy, technical dialect of a sailor, the life and vivid descriptive passages of the poem are ample excuse for its popularity. In 1764 he directed a rhymed lampoon, 'The Demagogue,' against Wilkes and Churchill and in 1769 pub. his *Marine Dictionary*.

Falconet, name given to a small field gun introduced in the fifteenth century. With culverins, sakers, and demi-cannons, etc., falcons formed the lighter ordnance up to the eighteenth century.

Falconet, Etienne Maurice (1716-91), Fr. sculptor, b. at Paris, spent twelve years in St. Petersburg (1766-78), where he executed for Catherine II. a colossal statue in bronze of Peter the Great, which stands in the square of the senate. He held the anct. sculptors in small esteem, which perhaps accounts for the somewhat meretricious taste apparent in even his fine 'Milo of Crotona.'

Falconidae, family of diurnal birds of prey, comprising the falcons, hawks, kites, buzzards, eagles, etc., and constituting, with the vultures the typical Accipitrines. The head is crowned with feathers, and the female is larger than the male; the two sexes associate in pairs and mate for life.

Falconry (from O.F. *fauconnerie*), the art of training falcons and hawks for the chase. Hawking is commonly regarded as a synonym, but is properly restricted to the practice of F. in the field. Its antiquity is an estab. fact, but no one knows where or when this 'aerial warfare' was first introduced. There are records proving its early popularity in Asia Minor, Turkey, Persia, Tartary, and China, and it is interesting to read Marco Polo's almost incredible yet undoubtedly veracious account of how Kublai Khan, the great Emperor of Tartary and China, went hawking in the thirteenth century. Pennant has suggested Scythia as the birthplace of F., arguing that thence it spread all over N. Europe and especially to Norway, where falconers attained such remarkable proficiency. In India the art seems to have been practised from time immemorial, the hawks being trained to the boldest flights, to stoop at the antelope and wild boar, besides at the gazelle and the stag. Here, moreover, as in the E. generally, these birds are still used for hunting, and the native Indian gentry still train their largest falcons 'to kill deer by pitching on their heads and picking out their eyes.' To turn to Europe, it is written how even in the eighth century the 'grand fauconnier' in France was 'an officer of great eminence,' with an ann. salary of 4000 florins, and as many as 300 hawks. In England, the early Britons of the days of the Rom. occupation were skilled in F., whilst among the Saxons there is mention of it in the reign of Ethelbert (760). King Alfred is commended as a falconer, and from the Nor-

man Conquest till the seventeenth century, kings, princes, barons, lords, and even ladies were affected with the hawking mania, William I., Stephen, Edward III., Henry VIII., and Queen Elizabeth being the most enthusiastic of its royal devotees. Change in fashion, but above all the introduction everywhere of the fowling-piece, which so vastly increased the quarry, whilst at the same time doing away with the difficulty and expence of breeding, training, and keeping the hawks, led to the rapid decrease of the sport after the Commonwealth, so that, by the end of the seventeenth century, F. had fallen into general decay. The last owner of heron-hawks died in 1871, yet the foundation of the Old Hawking Club about the same time served to prevent the art becoming entirely obsolete. Hawks are now trained and used at R.A.F. airfields to clear runways and air approaches of birds in flocks.

Stringent and oppressive laws were early made respecting F., as of all other forms of field sport. Thus, under the Normans the privilege of keeping hawks was reserved only for persons of the highest rank, and it was not till the Carta de Foresta had been wrested from King John that the privilege was extended to all freemen. In Edward III.'s reign, every person finding any species of hawk was instructed by statute to take the same to the sheriff of the co., or to suffer two years' imprisonment; moreover, the stealing of a hawk was made a felony. According to a decree of Henry VII., the stealing or destruction of falcons' eggs brought on the offender a penalty of imprisonment for a year and a day, the term being reduced under Elizabeth to three months. A sixteenth-century ordinance, which forbade hawking from Easter till after the harvest, is of interest as indicating a consideration for agriculture and a smaller regard for the falconers' interests. Further regulations assigned the sort of hawk proper to persons of different ranks.

Thus the eagle, vulture, and merloun were for an emperor; the gerfalcon and tiercel of the gerfalcon, for a king; the falcon gentle and the tiercel gentle, for a prince; the falcon of the rock, for a duke; the falcon peregrine, for an earl; the bastard, for a baron; the sacre and sacret, for a knight; the lanier and laneret, for an esquire; the marlyon or merlin, for a lady; the hobby, for a young man; the goshawk, for a yeoman; the tiercel, for a poor man; the sparrowhawk, for a priest; and the kestrel, for a knave or servant.

'Eyasses,' or 'eyesses,' are birds taken from the nest and reared wholly or partially in confinement. These may be flown at pigeons, blackbirds, grouse, partridges, wild duck, pheasants, and indeed all minor quarry. 'Passage,' or wild-caught, falcons are entrapped during the migration or passage from N. to S. in the autumn by means of a decoy-pigeon and a lownet. They are usually better-tempered, swifter, and higher-couraged than the eyas, and are especially used for rooks, herons, and sea-gulls. The

training of the eyes differs from that of the passage-hawk, as it has everything to learn, including the way to catch and kill its own prey. The nestling is put on a straw-covered platform in an outhouse, and is fed three times a day on lean beef. If it receives insufficient food, 'hunger-traces' will appear like knife-marks across the point where a feather joins the flesh, and should these break the bird becomes useless. Before the young hawk is allowed to fly, 'jesses,' that is, leather straps are set round its legs, and above them bells are attached with thongs called 'bewits.' It is then allowed some weeks of liberty, when it is said to be 'flying at hawk,' the object being to instil in it a little native wildness: for desire for food brings the bird, at intervals, back to its home.

The training for eyasses is practically the same as that for wild-caught falcons. 'Hooding,' that is, obscuring the light by means of a leathern cap, is the first operation as a 'hooded' bird will sit quite quietly, and will not damage her feathers or, otherwise get out of hand by 'bating,' that is, fluttering from the fist or perch. Feeding is only once a day, and always upon the gloved hand. Soon the hawk is 'called off' to the 'lure.' The most common kind of 'lure' consists of a flat leather-covered piece of lead, to which pigeon's wings are attached, and also on either side a piece of raw meat. This is later used for luring the falcon back to its owner after a fruitless flight, and this is why the bird is made acquainted with it from the very first. During the training, the hooded hawk is perched on an assistant's hand, being fastened thereto by a leash, whilst the falconer, at a distance of 20 yds. or more, flourishes the lure. When the bird is unhooded, it flies to the flesh on the lure, which is her reward for the flight. After a time she can be trusted to do this without being held by the line or leash. Finally, she is 'entered' at the 'quarry,' that is, she is allowed to go off from the fist to kill a live fowl dangled at the end of a long line. She is then ready to be flown at wild game. The elaborate processes which belong to the management of a hawk are responsible for the development of a whole technical language to describe them. A few have already been mentioned; whilst as regards the behaviour of the hawk, 'to mount' means to wait on high; 'to bind,' to fasten on the quarry in the air; 'to stoop,' rapidly to descend on her prey from a height; and 'to tower,' to soar high above it.

Hawking has an extensive bibliography, including Lady Juliana Berners's *Boke of St. Albans*, 1486; G. Turberville's *Booke of Falconry*, 1575-1611; H. Schlegel and A. Wulverhorst, *Traité de Fauconnerie*, 1844-53; and the standard Eng. work entitled *Falconry in the British Isles*, by F. Salvin and W. Brodick, 1855. See also G. E. Freeman and F. H. Salvin, *Falconry: its Claims, History and Practice*, 1869, 1873; G. Lascelles, *Falconry*, 1892; E. B. Michell, *The Art and Practice of Hawking*, 1900; R. Blome,

Hawking, 1929; and A. Fleming, *Falconry and Falcons*, 1934.

Faldstool, was originally a folding seat, which a bishop in the Rom. church would use when not enthroned in his own cathedral. The word was later applied to the small desk at which, in Eng. churches, it is customary for the clergyman to read or chant the litany.

Falémé, or Tenne, important trib. of the Senegal in Senegambia, W. Africa. Rising in Futa-Jallon, it flows northward to the confluence above Bakel. Cascades and rapids impede all navigation 120 m. from the mouth.

Falerii (mod. Civita Castellano), one of the twelve chief cities of Etruria, lying 32 m. N. of Rome. It was finally reduced to Rom. rule in 241 B.C. The fine walls

A GATE AT FALERII

with towers and gates are the sole remnant of Rom. days, the site having been abandoned after A.D. 1033.

Falernian Wine, noted and favourite wine of the Romans. Its name was derived from Falernus Ager, a dist. of Campania, Italy, about 20 m. N. of Naples. Horace described it as 'surpassing all wines.' Later, the quality of the wine decreased, on account of the lack of careful cultivation.

Falguière, Jean Alexandre Joseph (1831-1900), Fr. sculptor and painter, studied at the Ecole des Beaux-Arts. His statues are superior to his work in oils, but in these latter he displayed a fine appreciation for the most delicate gradations of light and shade, an appreciation which plastic art almost invariably develops. Of his oil paintings 'Acis and Galatea' deserves mention, whilst his 'Wrestlers' and 'Fan and Dagger' hang in the Luxembourg. Splendid and arresting vitality animates all his sculpture, one of the most impressive illustrations of which is his 'Triumph of the Republic' (1881-86), a quadriga for the Arc de

Triomphe in Paris. 'Joan of Arc,' 'Balzac,' and 'Lamartine' exhibit his skill in historical portraiture.

Faliero, Marino (c. 1274-1355), doge of Venice, gained an illustrious victory in 1346 over the Hungarians who were trying to storm Zara, but after his election as doge in his native city in 1354 all his good fortune deserted him. Petrarch describes F. as wise and clear-headed, a description which does not tally with his behaviour as doge, for he suddenly developed an overweening ambition, and, weary of the insolence of the nobles, entered into a conspiracy with the common people to destroy them. But the plot failed, F. was executed, and the Council of Ten became stronger than ever. See Byron's *Marino Faliero* and A. C. Swinburne, *Marino Faliero: tragedy*, 1885.

Falk, Paul Ludwig Adalbert (1827-1900), Prussian statesman. Bismarck, having determined on an anti-Catholic policy in 1872, welcomed F. as minister for education. It was F. who drafted the four measures known as 'Kulturkampf,' by which the state arrogated to itself direct control over eccles. matters. A reaction in governmental policy coupled with the death of Pius IX. obliged F. to resign his office in 1879.

Falkenhayn, Erich Von (1861-1922), Prussian general, b. at Thorn. Was in the China Expedition, 1900. Chief of Staff of the XVI. and later of IV. Army Corps. Appointed in 1911 Commander of 4th Guards (Infantry) regt. General, 1913. Ger. minister of war in 1914. Chief of the Ger. Headquarters Staff and successor to Gen. Von Moltke; the frustration of whose plans at the first battle of the Marne and in E. Prussia called for a reconstruction of the Staff. His staff work was undeniably good, and though aided by such generals as Von Mackensen, not to speak of the popular idol Hindenburg, it is not too much to say that credit is mainly due to him for the battle of Tannenberg on the E. Front, the repulse of the Allies at Loos, Neuve Chapelle, and elsewhere on the W. Front, and the failure on the Gallipoli peninsula. In 1916, however, the Ger. armies met with disaster at Verdun, where Pétain repulsed probably the heaviest blows delivered in the war, and on the Somme, where the great retreat to the Hindenburg Line had to be organised. These Ger. failures were capped by the sudden entry of Rumania into the war; but Falkenhayn proved equal to this new belligerent, and gradually reduced its army to a negligible quantity. In these operations he was Commander of the 10th Army. The Ger. Press, however, were disappointed over the general results of 1916, and Falkenhayn was accordingly shelved for Hindenburg, going on a mission to Turkey. After this he dropped out of public notice, and was put on half-pay at his own request in 1919. See life by H. v. Zuehl, 1926.

Falkenhorn, Nikolaus von (b. 1886), Ger. soldier in the First and Second World Wars. Lieutenant-general in command of the 21st Army Corps in the Polish cam-

paign (1939). Promoted general of infantry and put in command of the forces which seized Norway and expelled the Brit. forces (May 1940). Commander in the White Sea region in the Russo-German campaign, July 1941. Superseded in 1944 by Lothar Rendulic (Nov. 1944).

Falkirk, municipal burgh and mkt. tn., 11 m. S.E. of Stirling, in Stirlingshire, Scotland. It stands high and overlooks the fertile Carse of F. To the N. and S. respectively pass the Forth and Clyde and Union Canals, whilst its port, Grangemouth, is 2½ m. to the N.E. Within 3 m. of the tn. are the Carron ironworks and some extensive coal-fields, which account for the supremacy of F. in the light casting trade of Scotland. Local mkt. days have reduced the importance of its three ann. trysts or fairs. Historically F. is noteworthy as the scene of two battles, one in 1298, when Edward I. defeated Wallace, and the second in 1746, when the miserable performance of the Brit. dragoons under Gen. Hawley secured an easy victory for Prince Charles. The remains of Sir John de Gruhame, a friend of Sir Wm. Wallace, and those of Sir John Stuart, who were slain at the battle in 1298, lie in the churchyard. F. with Stirling and Grangemouth send a member to Parliament. Pop. 33,000.

Falkland, Lucius Carey, second Viscount (c. 1610-43), was educated at St. John's College, Cambridge, made a happy marriage, which his father regarded as a mésalliance, and settled down at his country-seat to study Gk., which he soon mastered. F. was a man of lofty ideals, unflinching integrity, and true intellectual vision, whose whole life was rendered a despair and tragedy, because he was obliged to live through the bitter and hopeless struggle between Charles and his parliament. As a member of the latter he in vain lifted up his voice to secure some semblance of a trial for Strafford, and it was the violence and illegality of the Puritan party which forced him over to the side of the king, whose empty promises he at first believed. Clarendon, his friend, who writes that 'mankind could not but admire and love him,' persuaded him to accept the secretaryship of state. The duplicities of the Royalists broke his heart, and realising that the hour of compromise had passed and that his was a completely isolated position, splendid though it was, he voluntarily ended a brief but unhappy existence by courting and winning death at the battle of Newbury.

'Falkland, Samuel,' see **HEIJERMANS**, HERMAN.

Falkland, royal burgh, 9 m. E.N.E. of Kinross, in the E. of Fifehire, Scotland. Brewing of ale and linen-weaving are still carried on, but the old-world vil. is noted for its anct. palace of the Stuarts. James III. converted Thane's Tower into a royal palace in 1538, and two round towers in the W. wing were added by James V. who died here in 1542. As a child Queen Mary loved to stray in its woods, and the castle is full of historic association. It was restored in 1888, but before that day Carlyle had likened it to 'a protrusive shin-bone

striking through the soil of the dead past.' Pop. 800.

Falkland Islands, group, forming a Crown colony of Great Britain in the S. Atlantic Ocean, lying some 300 m. E. and somewhat to the N. of the Straits of Magellan between 51° and 53° S. lat., and 57° and 62° W. long. In addition to the two main is., known as E. and W. Falkland, which are divided by the Falkland Sound, the group comprises about 200 smaller is. clustered around them within a space of 120 m. by 60 m. The area of the group, according to the Admiralty chart, is: E. Falkland and adjacent is. 2580 sq. m., W. Falkland and adjacent is., 2058 sq. m. The coast line is deeply indented, and has many fine harbours and anchorages. The surface of the is. is hilly, reaching a maximum elevation of 2315 ft. in Mount Adam on W. Falkland. There are no rivers navigable at any distance from the coast. The whole area is wild moorland interspersed with outcrops of rock and angular boulders called 'stone runs' the origin of which is conjectural. The soil is mainly peat varied by large areas of sand. The general appearance of the land is one of bleak inhospitableness. Trees are almost entirely absent and the scenery is not unlike that of parts of Scotland. There is no cultivation except near the farm settlements and shepherds' houses where vegetables, oats and hay are grown. The climate is characterised by the same seasonal variations as in the United Kingdom, though the winters are slightly colder and the summers much cooler than in London. The ann. rainfall averages only 26 in. The only tn. is Stanley, the cap., situated on a natural harbour entered from Port William, at the N.E. corner of the group. The whole acreage of the colony is divided into sheep farms carrying on the average between 8000 and 35,000 sheep or about one sheep to every 3 to 5 ac. The colony has no resources of known value apart from the production of wool, skins and tallow. A large number of sheep are exported to Chile. The pop., which in 1939 was 2400, is almost entirely white and has been derived largely from the United Kingdom. There is a considerable element of Scandinavian blood. The F. I., called by the Fr. 'Iles Malouines' and by the Spaniards 'Islas Malvinas', were discovered on Aug. 14, 1592, by John Davis in the *Desire*, one of the ships of the squadron sent to the Pacific under Cavendish. Capt. Strong in the *Welfare* sailed between E. and W. Falkland in 1690 and called the passage the Falkland Sound in memory of Lucius Cary, Lord Falkland, and from this the group afterwards took its Eng. name of 'Falkland Islands' although this name does not appear to have been given to it before 1745. The first settlement was estab. in 1764 by de Bougainville on behalf of the king of France, at Port Louis on E. Falkland; but in the following year Capt. Byron took possession of W. Falkland and left a small garrison at Port Egmont on Saunders Is. The Spaniards bought out the Fr. and forcibly ejected the Brit. 1766-70. Later the group remained with-

out voluntary occupation until 1829 Louis Vernet, who enjoyed the nominal protection of the Republic at Buenos Aires, planted a new colony at Port Louis. Finally, in 1833, Great Britain who had never relaxed her claim to the sovereignty of the F. I., expelled the Argentine soldiers and colonists, and resumed occupation, which has been maintained without interruption to the present day. In 1844 the headquarters of the Gov. were removed from Port Louis to Stanley, then called Port William. On Dec. 8, 1914, they were the scene of the naval battle in which Adm. Sturdee destroyed Adm. Graf von Spee's squadron (see next article). A memorial commemorating this victory was unveiled at Stanley in 1927.

The *Dependencies* of the F. I. are divided into two main groups, the one consisting of S. Georgia with the S. Orkneys and the S. Sandwich Is., and the other of the S. Shetlands, with Graham Land. Large areas of land in the Antarctic Continent are also comprised in the Dependencies. There is no permanent pop. in the Dependencies except in South Georgia where the figures fluctuate with the seasons of the whaling industry. Apart from sealing on a small scale, the only industry in the Dependencies is whaling, and whale and seal oil and by-products of the whale, such as guano, are their sole products. Constitutionally, the Dependencies are subject to the same authority as the colony proper, that is to say, to the Governor and to the Executive and Legislative Councils of the F. I. (See SOUTH GEORGIA; SOUTH SHETLANDS.)

The Brit. claim to the Dependencies, though contested, is strong: for Graham Land was first visited in 1820 by Edward Bransfield R.N. and, apart from the expeditions of Scott and Shackleton, there have been far more Brit. expeditions to Antarctica (76) than by any other nation, the next being Norway (29) and America (24). The Dependencies were declared Brit. possessions by letters patent of 1908 and 1917, and S. Georgia has had a resident magistrate since 1909. In recent years there has been much activity on the British Falkland Island Dependencies Survey, whose main task has been meteorology and the mapping of unexplored parts of the mainland. In this work the Survey took over the duties previously performed by the Discovery Committee (*q.v.*), whose ships were diverted in 1939 for war uses; and from that year until 1943 Graham Land and the southernmost group of is. were not visited annually as they had been for the previous twenty-nine years. For the 1943-44 season two ships were acquired—the *Fitzroy* for carrying stores and the minesweeper *William Scoresby*—and an expedition was fitted out under Lt.-Cdr. J. W. S. Marr, R.N.V.R. to complete the mapping of Graham Land, the estab. of wireless weather stations and the economic survey of this Antarctic sector. So far as conflicting territorial claims are concerned it is to be observed that Norway has sovereign claims to the area between Coats Land, in the Dependencies, and the

Australian Antarctic Ter. whose validity is accepted by the United Kingdom, Australian and New Zealand Govs.; and France's claim to Adélie Land is also recognised by Britain. The Governor of the F. I. sailed in Jan. 1918 in a frigate to the F. I. Dependencies sector of Antarctica mainly for the purpose of re-establishing Brit. stations at Admiralty Bay on King George Is., S. Shetlands, and at Port Lockroy in the Palmer Archipelago. At the same time the Brit. Gov. protested to the Argentine Gov. against the attempt by their navy to establish meteorological installations on Brit. soil in the S. Shetland Is.

See L. B. Mackinnon, *Account of the Falkland Islands, 1840*; G. Schulz, *The Falkland Islands, 1891*; J. R. St. Johnston, *The Falkland Islands, 1920*; V. F. Boyson, *The Falkland Islands* (with notes on the natural history, by R. Vulliamy), 1924; J. Goebel, *The Struggle for the Falkland Islands: a Study in Legal and Diplomatic History, 1927*; F. C. Ommancey, *South Latitude, 1938*.

Falkland Islands, Battle of. Naval battle of the First World War, fought on Dec. 8, 1914, in which the Brit. Adm. Sturdee, completely avenged the defeat of Rear-Adm. Cradock off Coronel (q.v.). The Ger. squadron comprised the armoured cruisers *Scharnhorst* (flagship) and *Gneisenau*, light cruisers *Leipzig*, *Dresden* and *Nürnberg*, under the command of Adm. Graf von Spee. The Brit. squadron consisted of the two battle cruisers *Invincible* and *Infexible* (17,250 tons, 25 knots, carrying eight 12-inch and sixteen 4-inch guns), the armoured cruisers *Cornwall* and *Kent* (each 9800 tons and carrying fourteen 6-inch guns) and the light cruisers *Glasgow* and *Bristol* (4800 tons, two 6-inch and ten 4-inch guns). The *Scharnhorst* and *Gneisenau* carried twelve 8-inch guns. The intention of the Ger. squadron (betrayed, it was alleged by the Gers., from Chilean sources), was to bombard the Falkland Is. and Von Spee reached the vicinity of this Brit. colony on Dec. 8. The appearance of the Brit. squadron was a complete surprise and the Ger. ships promptly took to flight. Their speed, however, was inadequate, and they were brought to bay, the Gers. being outmanoeuvred for position and out-ranged in gunfire. All the Ger. ships, with the exception of the *Dresden* (q.v.), were sunk. The *Scharnhorst* was sunk three hrs. after the first shot was fired, the *Gneisenau* two hrs. later. The *Leipzig* was sunk by the *Cornwall* and the *Nürnberg* was sunk in flight by the *Kent*. The Ger. casualties were 2000 officers and men, the Brit. seven killed and four wounded. There were no survivors of the *Scharnhorst*, while of the *Gneisenau's* complement of 700, fewer than 100 were rescued. Von Spee himself perished. The secrecy of the Admiralty's move against Von Spee's raiding squadron was signal proof of

efficiency. Adm. Sturdee was awarded a baronetcy for his victory. The vital importance of this victory lay in the fact that it prevented Von Spee from establishing himself in the W. Indies and thereby raiding 20 million tons of sea-borne grain and meat supplies intended for Great Britain. On the defeat of Cradock's squadron at Coronel, the Brit. Admiralty at once prepared this counterstroke, and Adm. Sturdee, on Nov. 11, steamed away with the cruisers *Invincible* and *Invincible*, reaching the Falklands with almost unprecedented speed. By Dec. 7, when anchored in Port Stanley, he had been reinforced by Adm. Stoddart in the *Carnarvon* and by the cruisers *Cornwall*, *Kent* and *Glasgow*. The Brit. squadron coaled all night, and was still coaling when the look-out station reported that the Ger. squadron was approaching, it being then nearly 8 a.m. By 10 a.m. all the Brit. ships were under way, and the first shots were fired just before one o'clock. In 6½ hrs. from that time the battle was over; the Ger. squadron having no reasonable chance against the attacking squadron. The whole campaign in these waters is of importance in that it illustrates Great Britain's essential vulnerability. There was no parallel in Brit. maritime hist. to the dangerous economic consequences that threatened Coronel. Brit. national security was actually in danger through a more or less obscure defeat in a remote corner of the Pacific at the hands of a detached raiding squadron, and only the prompt extinction of the raiders could have restored confidence to the merchant navy.

Fall, The, expression used in Christian theology for the spiritual change engendered in Adam and Eve after their temptation by Satan in the Garden of Eden, a change due to their knowledge of, and contamination with, sin. This account of the entrance of sin into the world is responsible for some of the fundamental doctrines of the theology professed by orthodox Christians, Catholics and Protestants alike. By sin, Adam lost the divine life of supernatural grace which was his heritage. Inasmuch as Adam is the supreme head or source of humanity, all mankind must bear the taint transmitted for all time from Adam as the penalty for his (Adam's) unique transgression of God's will. But the burden of this 'original sin' has been lifted from mankind because Jesus was crucified to restore divine life to mankind and to avert from all who believe in Him the punishment which would otherwise be meted out after death for their share in Adam's fall. Thus the merits of the Saviour give to the Faithful eternal life.

Falla, Manuel de (1876-1946), Sp. composer b. in Cadiz. At the Madrid Conservatory he studied composition under Pedrell, the founder of the modern national Sp. school of composition, and the piano under Trago. In 1905 his 'La Vida Brava' won the prize offered by the Academia de Bellas Artes for a national opera but it waited eight years for its first performance. From 1907 to 1914 de

F. lived in Paris, receiving friendly encouragement from Debussy, Ravel, Dupas, and others, but he returned to Spain at the beginning of the First World War. His ballet *The Three-Cornered Hat*, was performed by the Diaghilev Russian troupe in 1919, being very popular. Also the ballet *El Amor Brujo (Magician Love)* was successful, and other equally successful compositions are *Master Peter's Puppet Show (El Retable de Maese Pedro)*, a marionette opera; *Nights in the Gardens of Spain* (1916), for piano and orchestra, a Harpsichord Concerto, and *Four Spanish Pieces for the Piano* (1909). F. was a student of Sp. folk song and arranged a number of festivals to maintain its cultivation.

Fallacy (from Lat. *fallax*, deceptive) is false reasoning or argument. In spite of the countless varieties of confused thought and ambiguity, it is customary to adopt some classification of F. Thus Bacon in his *Novum Organum* divides them into four *Eidola* (False Appearances), whilst Mill regards all Fs. as belonging to one of the five following categories: (1) Fallacies of Simple Inspection, which embrace all Natural Prejudices; (2) Fallacies of Observation; (3) of Generalisation, including Induction; (4) of Syllogism or Ratiocination; and (5) of Confusion, under which come all cases of ambiguous language. But by far the most famous subdivisions of F. are those based on Aristotle. According to him all Fs. are either material, that is misstatements of facts, said therefore to be *extra dictionem*, or *in re*; verbal that is arising from the misuse of words; or formal or logical, that is arguments which transgress the laws of true demonstration, technically called the Syllogism. Fallacies of the second and third species are said to be *in dictione*, or *in voce*. Under the first heading come *Petito principii*, or *Circulus in probando* (arguing in a circle); *Non sequitur*, or the F. of false cause; *Ignoratio Elenchi*, or irrelevant conclusion; and Fallacy of Accident from the general to the particular.

Fallada, Hans (b. 1893), Ger. writer, born at Greifswald. His real name is Rudolf Ditzgen. He depicts in his works the effects on the unheroic individual of the problems of everyday life, e.g. unemployment. He is best known for his work *Kleiner Mann—was nun?* trans. as *Little Man, What Now?* (1933). Other works: *Who Once Eats out of the Tin Bowl* (1934), *Once We had a Child* (1935), *Sparrow Farm* (1937), *Damals bei uns daheim* (1942), *Der ungehebre Mann* (1945).

Fallerleben, Hoffmann von, see HOFFMANN.

Fallières, Armand (1841-1931), Fr. statesman, b. near Agen, S. France, son of a blacksmith. Practised as an advocate at Nérac. Entered Chamber of Deputies in 1876, and was Under-Secretary of State to Jules Ferry at the Fr. Home Office in 1880, and then, successively, minister of the Interior and Prime Minister. President of the Fr. Republic 1906 to 1913 and president of the Senate eight times.

Falling or Shooting Stars are small extraterrestrial planetary bodies which travel through space in countless numbers and with an illimitable variety of orbit. It is estimated that the smallest, in spite of their flame due to momentary combustion, are no bigger than large grains of sand, and further that their velocity, which is deduced from the length of its fall and the duration of its flight—rarely a second—varies from 60 to 400 m. per min. The services of photography have now been enlisted for the more accurate investigation of these meteoric bodies, but it has long been observed that star showers appear to diverge from one point, there being innumerable points or 'radiants,' as they are called, for the different showers. Thus those that proceed from Perseus are called Perseids, and other meteor swarms, such as the Leonids, Taurids, Pegasids, and Lyrids are similarly named after the constellations from which they seem to shoot. But their apparent radiation and diversity of flight are an illusion of perspective, their tracks being really parallel and subject to fixed orbital movements. On a clear but moonless night, a watcher of the heavens may see as many as ten an hour with his naked eye, whereas with a good telescope he would see at least twenty times that number. Indeed astronomers compute the number of falling stars through which the earth daily passes as some twenty millions. When they first become visible in the atmosphere they are usually from 40 to 75 m. above the earth's surface, whilst the fiery particles are on an average 250 m. apart, though in heavy showers they may be as near as 20 m. See METEORS.

Fallopian Tubes, The, so called because they were discovered by a Pisan professor, Fallopius, form the uteroperitoneal canal and carry the ova through a small opening, the ostium abdominale, among the fimbriae or fringes at the end, into the womb cavity. See UTERUS.

Fallopio (or Fallopius), Gabriello (c. 1523-82), It. anatomist. His chief physiological discovery was the function of the tubes, now called Fallopian after him, whilst in the anatomical field he made careful studies of the sphenoid and ethmoid bones and the internal structure of the ear. The *Observationes Anatomicae* (Venice, 1561), was the only treatise by F. to appear in his lifetime. His collected works, under the title *Opera genuina omnia* also pub. at Venice, appeared in 1584.

Falloux, Frédéric Alfred Pierre, Comte de (1811-86), Fr. politician, first revealed to the public his enthusiasm for the old order of things under the Bourbons in his *Histoire de Louis XVI.*, 1840. His love of education and liberty was rather peculiar to his own personality, and met with small sympathy among the legitimists to whom he belonged. As a reward for his support during the Revolution of 1848, Louis Napoleon made him minister of education, and he was able to pass the ultra-Catholic 'Loi Falloux' (1850).

Fallow (probably derived from the O. E. *fealp*, a harrow), land ploughed and tilled

but not sown for a certain period, usually a year. It was early discovered—witness the Mosaic injunction that every seven years the land must have a 'Sabbath rest,' i.e. lie fallow—that the soil decreases in fertility if continually sown with grain. Thus farmers resorted to the practice of 'fallowing,' a practice which may well be as old as agriculture itself, the object being to destroy the weeds, such as couch grass (*Triticum repens*), to disintegrate the soil, and to give it a thorough aeration. The Romans left their cultivated fields F. every alternate year, but improved crop rotations have well-nigh done away with the need of 'bare fallow,' except, perhaps, for extremely clayey soils which cannot, otherwise, be adequately cleansed. The succession of green after wheat crops is found sufficient to refresh the earth and is, of course, much more economical than to leave it quite cropless. Land submitted to this process, the green crops being potato, turnips, etc., is called 'green fallow.' Perhaps the most serious drawback to true or bare Fs. is that the nitrates are washed out, as there are no plant roots to retain them, so that the soil must be dressed with guano or manure before re-cultivation in order to restore the needful organic matter.

Fallow Chat, see **WHEATEAR**.

Fallow-deer, name given to sev. genera of Cervidae, a family of ruminant ungulate mammals; they are characterised by the expansion of the upper part of their antlers into palmate form. Usually they stand about 3 ft. high, and have small heads, large ears, and rather long tails. In colour they are fawn, with a number of large white spots, or they may be yellowish-brown, or, more rarely, dark brown. *Dama vulgaris*, the commonest species, is a native of N. Africa and the countries bordering the Mediterranean, but was introduced into Britain at an early period; *Cervus mesopotamicus* is a native of the mts. of Laristan; *C. giganteus*, erroneously called the Irish Elk, is a fossil deer of enormous size, the antlers having in some cases a span of 11 ft.

Fallow Finch, see **WHEATEAR**.

Fall River, city and port of entry, on Mt. Hope Bay, at the mouth of the Taunton R., in the Bristol co. of Massachusetts, U.S.A. It is one of the chief centres for the manuf. of cotton goods in the U.S.A. Other industries include the dyeing and finishing of textiles and the manuf. of fur goods, cordage, pianos, and men's hats. The Fall R., a small affluent of the Taunton, which here makes a descent of about 130 ft. in half a m., furnishes water power for the city's industries. Many of the buildings of F. R. are of red granite, quarried in the vicinity. There are sev. parks, Notre Dame College, a textile school, and a conservatory of music. Pop. 115,400..

Falmouth: (1) Seaport and markt. tn. in Cornwall, England. It lies 7 m. S. by W. of Truro, and its harbour is probably the finest in England. There are two graving docks, and foundries, engineering works and ship repairing yards. Granite, china-clay, copper ore, rope, and fish are

exported. F. has a wonderful climate, and nowhere in the S. of England do tropical plants flourish more luxuriantly. It has become a popular holiday centre, Penennis Castle was built in 1543 for the defence of the harbour, which is now a favourite yachting water, and the permanent anchorage of the once-famous tea clipper, the *Cutty Sark* (q.v.). Millions of oysters are dredged from the harbour every year. Pop. 13,400. (2) Tn. 18 m. E. of Montego Bay in Cornwall co., Jamaica. Pop. 2500.

False Bay, lies 25 m. S. of Table Bay, in the S.W. of the prov. of the Cape of Good Hope, S. Africa.

False Hellebore, see **VERATRUM**.

False Imprisonment, the incarceration or the detention anywhere of any person against his will and without lawful authority. In Scots law the abuse is called 'wrongous imprisonment.' The injured individual may either apply for a writ of habeas corpus, or may make an indictment against his unlawful detainers, and he is further at liberty to enter into an action for damages. See **MALICIOUS PROSECUTION**.

False Money, see **COINING**.

False Point, name of a harbour, cape, and lighthouse in the Cuttack dist. of India, so called because it is often mistaken by sailors for Point Palmyras, which lies 1½ further N. Although the port was not opened till 1860, it is the best between Bombay and the Houghi, its commercial value being largely increased by the cutting of the Orissa canals.

False Position, in arithmetic, a former method of solving a problem by one or two suppositions (also called the 'rule of trial and error'), now largely replaced by the direct method of equations.

False Pretences, see **FRAUD**.

False Swearing, see **PERJURY**.

Falsetto, expression used in singing to denote the highest register of a male voice. A F.-singer can so blend his top notes with his chest register that there is no perceptible break in passing from one to the other. As to how the larynx is affected in the production of F. tones, there is still great diversity of opinion.

Falsification of Accounts was made a misdemeanour, punishable with penal servitude for seven years, under the Larceny Act of 1861, and in Scotland is an offence under the Debtors Act of 1880. By the terms of the former Act every director or officer of a public company or body corporate is liable to the above penalty if he omit to make a full and true entry of properties received in the proper books or accounts, his purpose being to practise fraud; or if he falsify, mutilate, or destroy any book or valuable security belonging to his company or corporation; or if he make a false entry or omit to set down an important particular, or if he concur with others in doing either of these two things; or, again, if he make, circulate, or pub. any written statement of account which he knows to be untrue in any important particular, or if he concur in doing any of these three things. By the Falsification of Accounts Act of 1875

the terms of the above Act, with the penalties attaching thereto, were extended to clerks, officers, or servants who may try in any of the above ways to defraud their employers.

Falstaff, Sir John, a famous comic character in Shakespeare's *Henry IV.* (Parts I. and II.) and the *Merry Wives of Windsor*. His prototype, than whom he could hardly be more unlike, was a Lollard martyr, Sir John Oldcastle, who appears in *The Famous Victories of Henry V.*, an old play which Shakespeare adapted. Oldcastle was altered to Fastolfe so as not to shock Protestants, a Sir John Fastolfe (c. 1378-1459) having actually existed. Indeed, this Fastolfe, like the inimitable F. of the plays, earned a reputation—undeserved it seems—for arrant poltroonery in the Fr. wars.

Falster, Dan. ls., 30 m. long, and varying from 2 to 13 m. in breadth, off the S. coast of Zealand in the Baltic. Malaria is endemic in the marshes, but the soil is well watered and yields good crops. Pop. 30,000.

Falticeni, or **Folticeni**, tn. 65 m. S. by E. of Czeronowitz on an affluent of the Sereth, and cap. of the dept. of Suceava, Rumania. Pop. about 10,000, one half Jews.

Falu, or **Fahlun**, tn. and cap. of the dist. (län) of Kopparberg, 50 m. W. of Gävle in Sweden. The Kopparberg Mining Company, which has been in existence since 1284, controls the oldest copper mines of Europe. Up to the year 1900 there had been mined some 35 million tons of copper ore. Its present copper output is insignificant, but the company owns many iron-ore mines and large sulphate and sulphite and paper mills. F. has two medieval churches and a seventeenth century tn. hall. It has also an excellent industrial museum. Pop. 14,000.

Fama, in classical mythology, is the personification of Rumour, and finally came to be identified with Evil Report. The Gks. erected temples to her at Athens and Smyrna, but the Romans did not follow their example. Sophocles conceived of her as the daughter of Hope.

Famagusta, or **Famagosta**, seaport tn. on the E. coast of Cyprus, 2½ m. S. of the anct. Salamis. Arsinoe was founded by Ptolemy Philadelphus in 217 B.C. The Christian refugees from Constantia in the reign of Mu'awiyah settled in Arsinoe, which soon became an archbishopric of the Orthodox Church, the name being changed to F. It is now famous for its walls and the fine cathedral of St. Nicholas. The Christians live in the suburb of Varosia, the Moslems, within the walls. F. is the port at which many travellers land in Cyprus, a special train conveying them thence to Nicosia, the cap. In the wealth of historical remains and antiquities of Cyprus, the Venetian fortifications and the church of St. George of the Latins, in F. are noteworthy. Grants by the Leverhulme Trustees for research have given a new impetus to the clearance and investigation of the monuments and fortification of F. The Cyprus Gov. railway runs

from F. through Nicosia to Kalokhorio. Pop. 9000.

Familiar (from Lat. *familiaris*, to do with the family), a demon or supernatural spirit, who is the slave of wizards, magicians, and all necromancers, and who responds to his master's call and carries out his wishes. The idea of such an attendant spirit is world-wide. Thus the Arabs used to believe in the Aladdins or genii of the lamp, whilst Eskimos are still superstitious about their 'torn gaks,' and the Hindus and Persians had faith, like the Romans, who set great store by their 'Lares' and 'Penates,' in presiding household deities. In the Dark Ages all Europe recognised the power of the magicians of Salamanca to imprison evil Fs., and the Christian conception of guardian angels may be connected with belief in such spirits. Agrippa's dying anathema pronounced on his black dog, who embodied his F., is worthy of quotation: 'Abi, perdisa Bestia, que me totum perdisit.'

Familiars of the Holy Office were lay officers of the Court of Inquisition whose chief duties were to apprehend and imprison the accused. They were so called because they were admitted to the secrets of the body they served.

Familists, see FAMILY OF LOVE.

Family, **The**, means in modern times the social group consisting in the narrower sense of the man, his wife, and his children, and in the wider sense of all those who, in varying degree, can claim kinship with that F. whether from the father's or the mother's side. As with all primal origins, the nearer the historian approaches to its final source, the greater is his difficulty in securing reliable data. But from the welter of confusion and doubt there arises this fact, namely, that the most primitive type of F. was matrilineal, that is one in which kinship was counted only on the mother's side. Such is the case with the Nairs of Malabar, whose social organisation is of the rudest kind, and also among all tribes with whom 'beenah' marriages prevail. Among the Nairs the true F. comprises the woman with her children, mother, and brothers. The husband as a necessary constituent of the group is unknown, the procreation of children being dependent on the casual visits to the woman's house of men who come there for that purpose and then depart. Under these circumstances the uncles, her brothers, become the guardians of the younger generation, and eventually make its members their heirs. The term 'beenah' is taken from Ceylon and describes all marriages which result in the man going to live with his wife's folk and forsaking his own tribe in order to secure adoption into the woman's. Such a practice was popular among the Semites of Arabia until comparatively recent times. Moreover, the Book of Genesis offers indubitable evidence that it was the custom among the Hebrews in some remoter period. The 'beenah' husband came to live with the woman in her tribe and among her kinsmen, his offspring being invariably counted among his wife's and not his own F.

A slight advance on the Nair F. is that found among certain savages in Tibet and constantly referred to, on that account, as 'Tibetan polyandry.' Here the wife goes to live with a number of brothers belonging to some other tribe, who are all by turns her husband. The head of the F. is the eldest brother, who can lay lawful claim to all the woman's children: when he dies, the next brother succeeds, and when all the brothers are deceased their privileges pass to the brotherhood's eldest son. The marriage custom of the Britons, as described by Caesar, bears some resemblance to this, whilst in Strabo there is recorded a similar polyandry among the Arabs, and from the Mahabharata it is clear that an identical custom once prevailed among the Hindus. Such is the evidence of ethnology prescinding from revelation as a possible source of knowledge.

Polyandry certainly seems quite at variance with all preconceived notions of the relative position of man and wife in bygone ages, hence many investigators regard it as a corruption of a more primitive family institution, induced by economic pressure or sloth. Polyandry has, indeed, a purely practical and economic basis. Mankind in early days had a tremendous struggle for existence, and found it necessary to restrict the number of women by infanticide, as well as by polyandry. It was not till the food supplies became more assured and until such developments as the domestication of cattle came about that men found they could afford to have a wife each, and began moreover to attach a value to the field as to the household work of the other sex. The matriarchal character of the F. was a natural result of the uncertainty of fatherhood and the practical impossibility, in many cases, of discovering it. Exogamy—that is, marriage outside of the tribe—has been the fashion among all races for all known time, and it is this, coupled with female kinship, which accounts for the diffusion of the totem F. throughout numerous tribes—a fact for which Maine, with his patriarchal theory of the development of the F., could offer no satisfactory explanation. Totem F. must have been isolated at first. Afterwards, when exogamy was introduced, the children of the woman would naturally adopt her totem—that is, worship the plant or animal which she regarded as sacred, and after they had grown up and married, would carry her totem with them to a strange group or tribe. This hypothesis satisfactorily explains the existence of distinct clans within the same tribe.

The male kinship, which was the rule in the polyandry of Tibet, contains the germ of the modern patriarchal, as also of the monandrous, F., and it is obvious that the purchase system was a further step in that direction. Thus Isaac gave a bride's price or bridal gifts for the privilege of taking Rebecca away to his own people, and purchase marriages were from early periods common among Arabs and Hindus. There was no doubt a long struggle between the Nair and 'beenh' Fs. on the

one hand, and the purchase system on the other, but in spite of the sacred and valid nature of a kinship established in a totem group, the latter tended everywhere to survive and finally to oust the other. The 'Levirate' was another aid to the establishment of the man's supremacy over his wife and children. For by this process, which was adopted by both Hindus and Hebrews, he might allow his brother or a friend, for a sum of money or else for love, to borrow his wife, and might then appropriate to his own family any offspring from their promiscuous association. This was a favourite means for a wealthy man to strengthen his kindred or F., for he was legally the parent of all his wife's children, no matter to whom she bore them. When, with the growth of true paternal and other higher feelings, the idea took root that actual procreation was essential to the claim of fatherhood, then the patriarchal F. may be said to have been firmly established. Monandry became the rule, and with the decline in the status and importance of women, and likewise with the growth of what is now called conjugal infidelity, polygamy became a recognised and even lawful licence, as indeed it still is among the Ashantis and most of the aboriginal tribes in Australia to-day. Rome offers the most perfect example of a rigidly patriarchal F. Indeed the Eng. word is derived from the Lat. *familia*, which meant primarily a 'household of slaves.' That this same word came to include his wife and F., with the rest of his domestic property, may not unfairly be taken to illustrate the small esteem in which the *pater familias* regarded them. Indeed the *patria potestas*, or 'power of the father,' was absolute, including even the power of life and death over all his immediate dependents and relatives. But it is a hopeless error to argue, as has not infrequently been done, that the Rom. system is the type of the group or F. from which have sprung all tribes and nations, even though the legendary growth of Israel from Jacob and his twelve descendants, and the Genesis story of the peopling of the world from the posterity of Noah lend support to such a theory. See B. S. Phillpotts, *Kindred and Clan in the Middle Ages and After*, 1913; H. Bordeaux, *Pierres du Foyer*, 1917; E. S. Hartland, *Primitive Society*, 1921; E. B. Goss, *Hebrew Families*, 1927; E. B. Reuter and J. R. Munner, *The Family*, 1931. See also ENDOGAMY; ETHNOLOGY, *Society*; EXOGAMY; PARENT AND CHILD; POLYANDRY; POLYGAMY; TOTEMISM.

Family Allowances. A system, which prevails in Canada and the U.S.A., under which the state makes an allowance to mothers on widowhood or incapacitation of the husband or who are without adequate means of support. In Canada, mothers' allowances are granted, under Acts of Parliament in seven of the nine provs. Manitoba was the first to make such provision in 1915, and the example has been followed by the other W. provs. and by Ontario, Nova Scotia and Quebec. The conditions governing the grant of the allowance vary, however, as between the

different provs., e.g. incarceration of or desertion by the husband is not admissible in some provs., but, subject to qualifications, is in others. The maximum amount varies from \$42.50 a month for the mother and first child in Brit. Columbia, with \$7.50 for each additional child, to \$30 for a family in Saskatchewan. Opponents to F. A. argue that it would tend to encourage an imprudent increase in the size of families; but this does not appear to be borne out by facts in America.

Child endowment was the analogous principle in England (prior to the passing of the Family Allowances Act, 1945), and in the continental countries of Europe. This is the principle of supplementing wages by a payment in respect of dependent children, and the system has been in force in England and on the continent as far back as 1795, the first instance occurring in England in that year. It also prevails in Australia. See on this Eleanor Rathbone's *Disinherited Family: a plea for the Endowment of the Family*, which contains a complete survey of the system in various countries. A new chapter in developing the welfare of the children of Britain was opened, however, by the Family Allowances Bill, which provided for financial assistance from the Exchequer to over 2,500,000 families in which there was more than one child. Under this measure, an allowance of 5s. a week was to be paid to parents for each child after the first in a family, the estimated cost to the Exchequer being £57,000,000 for the first year. Sir Wm. Jowitt, Minister of National Insurance, in moving the second reading on March 8, 1945, said that the primary object of the Bill was to ease the financial burden which oppressed parents with large families, and so promote the health and well-being of the children. Under the Bill the gov. also decided to give a great increase in the free meals and milk for children in grant-aided schools, the scheme costing £60,000,000 a year when fully developed. Its committee of the House an amendment was agreed to providing that the allowance should be paid to the mother in the case of the family of a man and his wife living together. Before further progress was made the coalition gov. ceased to exist. The new minister, on June 11, submitted fresh clauses intended to meet objections, particularly on the score of the treatment of the families of servicemen. He said (contrary to the argument of the previous minister that payment of allowance to servicemen involved duplication of allowances), the gov. thought that members of the forces were as much entitled to benefit as any other wage-earner and they would receive the F. A. in addition to any other allowance paid to them. The Bill was then passed through its remaining stages and received the Royal Assent on June 15, 1945.

Family Compact, name given to various treaties between the reigning Bourbon dynasties of France and Spain, also including Naples and Parma, during the eighteenth century. These treaties were made in 1733, 1743, and 1761. They

aimed at establishing the Bourbon dynasties in Italy, and also at checking the expansion of England in the colonies of the American continent at the expense of France and Spain. They are an important feature in the great eighteenth century wars of the Polish and Austrian succession.

Family of Love, or Familists, religious sect founded by David Joris at Delft in Holland (1501-56). They taught that religion was nothing but love which united man with God, and that there was no need for any doctrine or ceremony. Blunt in his *Dictionary of Sects* (1874) avers that they also denied the reality of sin, and were Antinomians; he divides them into two congregations, known as the 'Family of the Mount' and the 'Essentialists.' The teaching was brought to England by Henry Nicolai, and in 1575, having been attacked by the Puritans, they petitioned Parliament for toleration. This was, however, not granted, and five years later we find Elizabeth ordering them to be put down as a 'damnable sect.' They are mentioned in the writings of George Fox and Henry Moore, but seem to have disappeared during the seventeenth century.

Famine, scarcity of food-products of such a nature that the population of a dist. or country is reduced to actual starvation, or the serious danger or probability thereof. The causes of such a scarcity are principally meteorological, i.e. prolonged drought, or sometimes excessive rainfall and storms, leading to floods and the destruction of crops and stores. Crop diseases, the ravages of locusts and other pests, are among other causes; and the decimation of an agric. pop. by war, plague, etc., and economic causes which deprive a pop. of means of purchasing food-stuffs have also contributed to a state of F. The opening up of the world's food products to all nations by the development of rapid mechanical transport has been the main reason why the risk of F. has materially declined, and transport facilities are the principal object in combating a F. when it occurs to-day. Though serious Fs. occurred in Russia in 1892 and 1905, it is chiefly in the E., in such a vast and unorganised country as China, that F. on a large scale is dreaded. Still more marked is the ever-present threat of Fs. in India, where the people are to a large extent dependent on agriculture, and where a failure of the monsoon for a single year may result in a total failure of the crop. It is not so much the actual want of food-supplies that is the serious factor to be combated, as the immediate want of purchasing power resulting from cessation of the only money-producing labour. Thus the great Indian schemes of famine fighting include not only constant development of irrigation and transport, but elaborate relief works, loans, etc. Problems of food supply and distribution loomed large in Bengal during the Second World War, owing to the rise in prices of agric. produce and raw material and hoarding of supplies. This was advantageous to the peasant cultivator but fatal for the general population of Bengal.

It is estimated that 1,500,000 men, women and children died in Bengal in 1943 and 1944 as a direct result of the famine and the consequent epidemics (see report of Sir John Woodhead's Famine Inquiry Commission, pub. in India, May, Sept. 1945.)

Famund, or **Faemund**, lake of Norway, situated 85 m. S.W. of Trondhjem. It is about 38 m. in length, and its greatest width is 5½ m. The Oster Dal flows from it.

Fan, see **FLABELLUM**.

Fan. This term, derived from Lat. *vanus*, the F. used for winnowing chaff from grain, is used for various devices for creating a current of air, and thus cooling the atmosphere of a room, as in the propeller-shaped electric F. or in other elaborate devices for regulating the temp. driving fresh air into or otherwise ventilating a room or building. The 'punkah' of the E. attached to a rope which is steadily pulled by a servant, is familiar to all travellers and residents in India. It is, however, as the light implement, carried in the hand and used for cooling the face, that the F. has historical and artistic interest. Of these F.s., there are two main types, the rigid and the folding F.; the first consisting of a circle or segment of a circle of light material fixed to a handle by radiating plates of wood, etc.; the second in which these radiating plates fold together and bring the flexible leaf into a small flat compass. The folding F. came originally from Japan, and was thence brought to China and so to Europe. In the E., F.s. were used by both sexes, and were the central feature in many elaborate ceremonies. The Jap. had war-F.s., coloured bright red, and there are some fans which possess a small poniard concealed in the handle. The Chinese devoted much marvellous art in carving the ivory, tortoise-shell, etc., sticks of the handle. The fixed F. dates from very ancient times. A wooden handle, which once held ostrich feathers, is in the museum at Cairo; it belonged to Amenhotep, the Pharaoh of Egypt of the seventeenth century B.C., and feather-F.s. borne by slaves and servants are found on monuments of all ages. They were used in the medieval Church to keep flies from the chalice; large feather F.s. *flabella*, are borne behind the pope in processions and in many E. and other countries, the state-F.s. are attributes of royalty and power. The folding-F. was used in England in the reign of Henry VIII. They were introduced from Italy to France by Catherine de' Medici. Spain was the centre for the decoration of F.s., while the carved and decorated framework was made in France and sent to Spain. In the eighteenth century many of the first artists, Boucher, Watteau, Lancret, etc., designed the decorations and scenes to be painted on F.s., and Fr. F.s. of this period, painted on fine vellum, called 'chicken skin,' silk, etc., are highly prized. Charles Conder (q.v.) painted many exquisite silk F.s. There is a fine collection of F.s. of every age and country in the Victoria and Albert Museum, S. Kensington, London.

The design of a F. depends mainly upon the amount of air which it is required to move and the pressure against which it has to move it. F.s. for moving large volumes of air against very little pressure, such as ventilating F.s., have either large blades (about 3 ft. long) and revolve slowly, or small blades and revolve quickly. F.s. which have to compress or exhaust air against a pressure of two-inch water gauge or more are usually centrifugal and are constructed on much the same principle as the centrifugal pump. *Centrifugal* or *paddle-wheel* F.s. are those in which the impeller discharges air in a direction at right angles to the axis of the shaft. These F.s. are used for drying apparatus, forcing draughts for boilers, dust exhausting and the conveying of grain and other similar materials. The horse power of the motor required to drive the F. depends on its use; a small domestic F. only requires a motor of ½ h.p., but large forced draught blowers, such as are used in power-houses, require anything up to 50 h.p. To secure economy of power, the right type of F. must be chosen. For ventilation purposes a propeller F. should be used. *Propeller* or *air-screw* fans are those having impellers which discharge the air in a direction parallel to the driving shaft, the impeller being that part of the F. which in rotating imparts movement to the air. One of the most common uses of a F. is on the engine of a motor vehicle, where it is situated behind the radiator. Belt-driven from the crank-shaft, its purpose is to increase the efficiency of the cooling system by accelerating the flow of air through the radiator tubes. Where the air is sucked down a duct the duct should be at least of the same diameter as the F. blades, and sharp bends should be avoided in the ducts, but where sharp bends and small ducts have to be used, a centrifugal F. is the best.

Fan-bearer, see **FLABELLIFERA**.

Fanariots, descendants of the Gks. of noble birth who remained in Constantinople after its capture by Mohammed II. in 1453; so called from Fanar, the quarter in which they dwell; they rose at one period to great influence in Turkish affairs.

Fandango, Sp. dance, of Moorish origin. It is a mixture of the *seguidilla* and *bolero*, and is danced by two people, a male and female, to the accompaniment of the guitar and castanets, and sometimes the tambourine, the music being quick and lively, and played in triple time.

Fanfare (Sp. *fanfarria*), blast of trumpets, used at public ceremonies to announce the approach of a sovereign. It is used in Beethoven's *Fidelio*, in Wagner's *Lohengrin*, and in Schumann's 4th symphony.

Fanning, coral is. belonging to Britain, situated in the N. Pacific Ocean, and forming part of a group. It lies in lat. 3° 30' N., and long. 150° 13' W., and has an area of 15 sq. m. The name is derived from Capt. Fanning, an Amer., who discovered the group; the is. was annexed by Great Britain in 1888. F. together with Wash-

ington Is. 66 m. N.W. by W. of Fanning Is. were included in the Gilbert and Ellice colony by an Order in Council of Jan. 27, 1916. Pop. of both Is. (1938): 30 Europeans, employed on Pacific Cable Station; and 300 Pacific islanders in copra industry; and about 25 Asiatics.

Fano, tn. and seaport of Italy in the prov. of Pesaro e Urbino. It is situated on the Adriatic coast, 8 m. S.E. of Pesaro, and 29 m. N.W. of Ancona. There are the ruins of a white marble triumphal arch to Augustus, also a cathedral, which possesses valuable paintings. The manufs. are silk goods, bricks, etc., and a trade is carried on in corn and oil. In the Second World War the Gers., under the pretext of creating road blocks, mined and destroyed the bell-towers of five churches and the Vanvitelli tower of the Palazzo della Ragione. The churches, generally, escaped serious damage as also did the tn.; but in the church of S. Agostino, the painted ceiling by Ferdinando Bibbiena and frescos in the church of S. Domenico sustained some damage. Pop. 12,000.

Fano, an is. of the N. Frisian group, situated in the N. Sea, off the W. coast of Jutland. It belongs to Denmark, and has an area of 20 sq. m. The cap., Norby, is a summer watering place, and contains a school of navigation. The inhabs. are engaged in fishing and boating. Pop. 3300.

Fans, **Fangs**, or **Ba-Fan**, race of Aborigines, occupying the dist. between the Gabun and Ogowe rvs. in Fr. Congo, W. Africa. They are a cannibal race, with fine physique, woolly hair, and a chocolate complexion, lighter than that of the negroes. They wear practically no clothing, but tattoo their bodies and deck themselves in jewellery. The men are warlike, and good hunters; they are skilled in iron, brass, and copper work. They are believed to be moving westwards in large numbers. Cannibalism has diminished since their contact with civilisation, but their morals have deteriorated. See Mary Kingsley, *Travels in West Africa*, 1897, and Sir R. Burton, 'A Day with the Fans,' in *Transactions of the Ethnological Society* (vols. iii. and iv.).

Fanshawe, Sir Richard (1608-66), Eng. ambas. and poet, b. at Ware Park, Hertfordshire, and educated at Jesus College, Cambridge. He entered the Inner Temple in 1626, and afterwards travelled in France and Spain. Until 1638 he was secretary to the Brit. embassy at Madrid, and on the outbreak of the Civil War fought on the Royalist side. He became secretary to the Prince of Wales, and in 1648 naval treasurer under Prince Rupert. At the Battle of Worcester (1651) he was taken prisoner, but was released, and took refuge on the continent, returning to England at the Restoration. He died in Madrid, where he had been sent as ambas. in 1661. He trans. Guagnini's *Pastor Fido*, 1617; Camoens' *The Lusiad*, 1655; and wrote some original verse. See Lady F.'s *Memoir*, 1876 (pub. 1820).

Fantasia (It. signifying fancy, caprice) is the name applied to musical composi-

tions in which the composer follows his fancy, and is not bound down by fixed forms. A F., however, is not without form; it generally consists of sev. sections, each being independent of the others in form. It is frequently the case that one section interrupts a previous one, and often a brilliant cadenza is used; but the whole is united. An example of this is to be seen in Mozart's F. in D minor. The student of music should examine variations in the Fs. by Mendelssohn, Mozart, and Schumann.

Fanti, name of a negro tribe of the Ishl group inhabiting the Gold Coast, W. Africa. In the early nineteenth century the Fs. were subjugated by the Ashantis, a race belonging to the same stock as themselves, and have since accepted Brit. protection. Missionaries have been sent out to them by Wesleyan Methodist and Swiss societies. They fought on the side of the Brit. in the Ashanti War (1817-74), but although of strong physique, proved cowardly allies. See A. B. Ellis, *The Tshi-speaking People of the Gold Coast*, 1887; and Sir H. Brackenbury and G. Hnyshé, *Fanti and Ashanti*, 1873.

Fantin-Latour, Ignace Henri Jean Théodore (1836-1904), Fr. artist, b. at Grenoble, the son of a pastel painter. He studied under Couture, and first exhibited in the Salon in 1861. He moved in the artistic circles of Paris and London, and numbered among his friends Corot, Delacroix, Courbet, and Whistler. His 'Hommage à Delacroix' is a portrait group containing Whistler, Beaudelaire, Legros, Champfleury, and himself. His other notable portrait groups are 'Un Atelier à Batignolles,' 1870; 'Un coin de table,' 1872; and 'Autour du Piano' 1885. He also exhibited some fine lithographs, and some beautiful paintings of still life. See *Times* by G. Hédard, 1906; A. Julien, 1909; G. Kahn, 1926.

Fantoccini, see **MAISONNETTES**.
Fan-tracery Vaulting, in architecture, a method of vaulting employed in the Perpendicular style, and so called on account of its resemblance to a fan. The ribs radiate from one point in the same curve, and are equidistant, terminating at the apex of the ceiling. The intermediate spaces between the ribs are generally filled in with smaller ribs and with decorative ornaments which give it the name of *fan-tracery*. The ceiling of Henry VII.'s chapel in Westminster Abbey is one of the most wonderful achievements of architecture. Other fine examples of this kind of vaulting may be seen over the staircase of Christ Church, Oxford, and in the cloisters at Gloucester and Canterbury.

Fantuzzi, anct. It. family the members of which were natives of Bologna:

Giovanni Fantuzzi, called the Elder (d. 1391), lawyer; held sev. important posts in Bologna.

Giovanni Battista Fantuzzi, doctor of philosophy, wrote a book on peripatetic philosophy, 1536.

Gaspario Fantuzzi (d. 1532), Lat. scholar.

Giovanni Fantuzzi, the Younger (d. 1646), was prof. of philosophy in the Univ.

of Bologna, and a member of the corporation called 'Gli Antichi.'

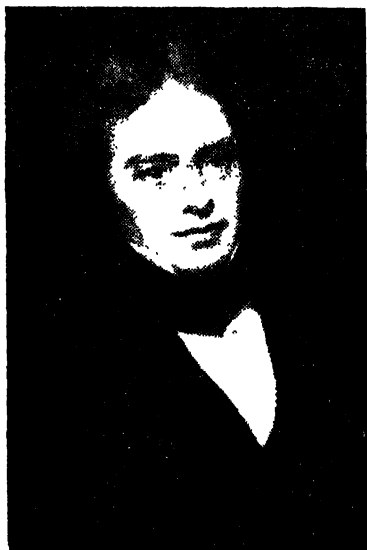

Paoletto Fantuzzi (d. 1661), poet and senator. A collection of his lyric poems appeared in 1647.

Giovanni Fantuzzi, scholar of the eighteenth century; pub. an important work on the literary hist. of Italy (1781-1794).

Fanu, Joseph Sheridan Le, see LE FANU.

Farad, name derived from Michael Faraday, given to the unit of electrical capacity, i.e. the capacity of a body which, when raised to a potential of one volt, has a charge of one coulomb or unit quantity of electricity. It is divided into a million *microfarads*, one microfarad being equal to 10^{-18} of a C.G.S. unit.

Faraday, Michael (1791-1867), distinguished Eng. natural philosopher,

MICHAEL FARADAY
A painting by Thomas Phillips

chemist, and electrician, b. at Newington Butts, near London, his father being a blacksmith. He was early apprenticed to a bookbinder, but all his spare time was devoted to scientific reading and experiment to the best of his opportunities. He managed to attend some lectures by Sir Humphry Davy, and in 1813 the great scientist took his case in hand, and made him an assistant in the laboratory of the Royal Institution. He then travelled for some time with Davy on the Continent, and on his return devoted himself to chemistry, in which study he greatly assisted Davy in many ways. In 1827 he

succeeded his benefactor as prof. of chemistry in the Royal Institution, and in 1832 he was made D.C.L. From this period he continued his work not only on chemistry, but also on the manuf. of glass for optical purposes, and the study of electricity and magnetism. Among his extremely numerous discoveries may be named those of the condensation of gases into liquids by pressure (1823), the decomposition of hydrocarbons by expansion (1827), electro-chemical decomposition (1834), magnetic rotary polarisation (1845), and various later researches in connection with diamagnetism. In 1829 he commenced a series of Christmas lectures at the Royal Institution, which were primarily addressed to young people. They found, however, a much wider audience. F.'s publs. are numerous, the most important being: *Experimental Researches in Electricity* (1839-55), *Chemical Manipulation* (1827, 2nd ed. 1842), *Lectures on the Non-metallic Elements*, and *Lectures on the Chemical History of a Candle* (1861). See J. Tyndall, *Faraday as Discoverer*, 1868; B. Jones, *The Life and Letters of Faraday*, 1876; and lives by J. H. Gladstone, 1872; W. Jerrold, 1891; S. P. Thompson, 1898; W. Ostwald, 1924.

Faraday's Law, see ELECTRICITY.

Faradisation, application for medical purposes of a faradic current of electricity. Whereas a galvanic current is continuous, a faradic current is interrupted, the interruptions occurring regularly. Both kinds are used diagnostically and therapeutically; in the former case faradism being used for the diagnosis of nervous and muscular disorders, in the latter in cases of general exhaustion, acute articular rheumatism, etc.

Farāizi, Muslim sect formed in Bengal during the nineteenth century to check the abuses into which the Mohammedan Church had fallen. Its adherents base their doctrines and rules of life solely on the Koran.

Farazdag (nickname; real name, Abu Firas Hammām ibn Ghālib) (c. 642-c. 732). Arabian poet, b. at Basra. His nickname means The Fat. His writings are chiefly satirical—written against people in Basra. He had to flee—first to Kufa, then to Medina, whence he was expelled by the Khalif for licentiousness. He was permitted to return to Basra, where he died. See J. Hell, *Das Leben des Farazdag*, 1903.

Farce (It. *farsa*, from Lat. *farvere*, to stuff), form of dramatic art which makes no pretence of holding the mirror up to nature, aiming at exciting laughter by means of absurd situations and extravagant buffoonery. While the province of comedy is to reveal the humorous interplay of character upon character, and that of burlesque is to caricature some particular fashion, style, or human type, the object of F. is solely to amuse. Rude pantomimes and Fa. prevailed in very early times among the Gks. and Roms. It exists in the primitive drama of all nations. *Gammar Gurton's Needle* is an early form of Eng. F., which, in the hands of Shakespeare, developed into true comedy.

Farciennes, tn., Hainaut, Belgium, 6 m. E. of Charleroi, with coal and metal industries. Pop. 10,700.

Farcy, outward manifestation of glanders, a contagious disease that attacks horses. It takes the form of ulcers or F. buds which appear on the limbs. See HORSES—DISEASES.

Far Eastern Area, Khabarovsk Ter. of Asiatic Russia, of some 630,000 sq. m., extending along the Siberian coast of the Pacific to the Arctic, including Kamchatka (q.v.) and is. of the Sea of Okhotsk and Sea of Japan. The surface is mountainous and covered with forests or tundra in the N. The Yablonoi and Stanovoi Mts. extend along the entire length of the area diagonally from S.W. to N.E. The total forested area is 900,000 sq. km. and constitutes one of the most important natural resources. The Amur and Anadyr are the chief rivs. The climate is severe. The inhab. include Chukches, Koriaks, Itinguses and others and total some 275,000. Furs (chiefly sable) and fish abound. Coal is found, and gold on the Amgun Riv. Agriculture and cattle-breeding are being developed in Kamchatka and there are sev. large state collectivist farms. Most of the pop. in the Vladivostok area is engaged in agriculture, industry (chiefly wood-working and flour-milling), and transport. A railway runs from Khabarovsk (or Habarovsk) the cap., to Grahskaya and Vladivostok (cap. of the S. Utri dist.) the most important tn.

Far East Campaigns in Second World War, see PACIFIC CAMPAIGNS.

Farham, mrkt. tn. of Hampshire, England, 5 m. N.W. of Portsmouth. The industries include the manuf. of bricks, earthenware, leather, and ropes. There is a flourishing trade in corn and timber, but F. owes its prosperity largely to its proximity to Portsmouth. Pop. 11,500.

Farel, Guillaume (1489-1565), Fr. reformer, b. near Gap in Dauphiné, France. He studied in Paris, where he was converted from being an ardent Rom. Catholic into an equally ardent Protestant and promoter of the Reformation. He preached with vehement fervour throughout France and Switzerland and made many converts. His friend Calvin was the organiser, while he was the preacher, of the Geneva Church (1535-38) until the two reformers were expelled from the city. He wrote some polemical works on purgatory (1534) and the Lord's Supper (1555). See lives by Ancillon (1691) and F. Bevan (1893).

Farwell Cape, S. extremity of Greenland, situated by the E. entrance to Davis Strait. It is seldom visited on account of the dangerous currents.

Fargo, largest city of N. Dakota, U.S.A., cap. of Cass co., on the Red R. of the N. It is the seat of the N. Dakota Agric. College, a busy grain-trading centre and distribution point for farm implements. There are some fine parks. Pop. 32,500.

Faria y Sousa, Manuel de (1580-1649), Portuguese historian and poet. The work of his life was a compilation of a hist. of the Portuguese in all parts of the world,

but it was never completed, although sev. vols. appeared after his death, *Europa Portuguesa* (3 vols.), *Asia Portuguesa* (3 vols.), *Africa Portuguesa*. His sonnets and eclogues are mostly contained in *Noches claras* (Madrid), 1621-26, and the *Fuente de Aganipe*.

Faribault, co. seat of Rice co., Minnesota, U.S.A., on the Cannon R., 52 m. from St. Paul by rail. It is the seat of the state schools for the deaf, the blind and the mentally defective. It lies to the S. of the beautiful S. Minnesota lakes and has various manufs. Pop. 14,500.

Faridkot, tn. and native state of India in the Punjab. The tn. has a railway station and is 84 m. from Lahore. During the Sikh wars in 1845, the Raja of F. exerted himself in the Brit. cause, as did also his son in 1857 in the Mutiny. Pop. (dist.) 130,000.

Faridpur, tn. and dist. of India in E. Bengal. The tn. stands on the Ganges, and has a railway station and a gov. high school. The dist. has an area of 2300 sq. m., and is flat and uninteresting, and the climate is damp. Rice is the prin. crop. Most of the trade is conducted by riv., although the E. Bengal Railway to Calcutta crosses the dist. Pop. (tn.) 11,700; (dist.) 2,000,000.

Faridu'd-Din 'Attar, Persian mystic and religious poet of last half of twelfth and beginning of thirteenth century A.D. There is no certainty as to the precise period of his life. He wrote *Mantiqut-Tayr*: i.e. Speech or Parliament of Birds—a long mystical and allegorical poem. His *Madharu'l-'Adab* (Manifestation of Wonders) caused his expulsion from Nishapur. He afterwards lived chiefly in Mecca, where he produced inferior work. Another extant work is trans. as *Book of Good Counsels*. F. is said to have perished in the invasion of Persia by the Mongols under Genghis Khan.

Faridun, or **Faridoun**, in Persian legend, an Iranian king, one of the chief heroes of the Shahnamah. He was the son of Abtin and Firanak, and the story goes that on his birth he was sought out by Tohak, whom he was destined to dethrone. Abtin was killed, but Firanak escaped with Faridun and reared him in Mt. Alburz, and when he grew up he overthrew Tohak, captured his cap. on the Tigris, and ruled long and prosperously.

Farigoule, Louis, see ROMAINS, JULES.

Farina, Johann Maria, inventor of the celebrated perfume, Eau de Cologne (q.v.).

Farina, Salvatore (1846-1918), It. novelist, b. Jan. 10 in Sardinia. He began by studying law, but afterwards devoted himself to literary work and settled at Milan. His many books, which are written in a simple style, are remarkable for their sentimental humour (in this F. has been compared with Dickens) and their cunning irony. His masterpiece is *Il Signor Jo* (1880).

Farinacci, Roberto (1893-1945), It. politician, born of working class stock in N. Italy; became a railway worker in his native Cremona, then one of the chief centres of Socialism; educated himself in the law and rapidly rose to local

eminence. Joined the Fascist movement and created a strong Fascist Party in Cremona. Anticipated the march on Rome by seizing the city before Mussolini's Blackshirt columns could reach the cap. In 1924 he was made secretary of the Fascist Party and soon exceeded his predecessors in violence. One of his victims was the ex-minister and editor Amendola. For two years he ran the political machine of the Fascist Party and then was suddenly dropped for no stated reason; but after two years' exile from power he was brought back into active life by being made a minister of state. In his newspaper, the *Regime Fascista*, he became one of the best-known Fascist publicists, adopting an extreme pro-Nazi attitude. A strong supporter of Imperial expansion, he volunteered for service in Abyssinia and fought through part of a campaign. In the Second World War he fought in Albania as commander of the Blackshirt battalion. He escaped the purge of the Fascists and remained one of Mussolini's most violent supporters, but was executed in 1945 following the defeat of the Ger. armies in Italy.

Farinaceous Foods, are those which contain starch. The word 'farina' means literally meal or flour formed from grain, when ground, and consists, therefore, of starch, gluten, etc., but it is generally now applied to the farinaceous matter contained in other vegetable products, such as the potato, when it consists almost entirely of starch or fecula, or beans and peas, etc. Among the many F. F., sago, arrowroot, and tapioca are types of the large class of dried foods which are imported into the country, and these consist practically of pure starch and are very nutritious when cooked with milk. Maize, too, though not yet regarded as a food for human beings, has very considerable nutritive qualities, since it contains more carbon and nitrogen than is found in an equal weight of wheaten flour, besides a considerable quantity of free hydrogen, which is found in the fat, a substance in which the grain is somewhat rich. Besides this, it exceeds all other grains in point of economy, but the great objection to its use is its rough taste. It has, however, been used by the poor of Ireland since the potato famine, and in the W. part of America. F. F. give heat and energy to the body, but are not flesh formers although very often an excess of such foods is stored up as fat.

Farinati, Paolo (c. 1522-1606), It. painter of the family of the Uberti, b. at Verona. He was a pupil of Niccolò Giolino and A. Badile, but studied also the works of Parmigiano. He formed his style partly on Titian and Giorgione, although in colouring he is inferior to both, but in form he learned more from the works of Giulio Romano. Of his pictures 'The Multiplication of the Loaves' is generally considered to be his best. His other notable works are: 'A Presentation in the Temple,' 'The Marriage of St. Catherine,' 'The Murder of the Innocents.'

Farinelli (1705-82), Neapolitan singer of great eminence, whose real name was

Carlo Broschi, b. at Naples. He studied under Porpora, and went from Rome to Vienna, where the Emperor Charles VI., who delighted in accompanying him on the harpsichord, loaded him with presents. In 1734 he came to England, and so delighted his audiences with his singing that Handel was obliged to dismiss a rival company over which he presided. From England he went to Spain, where he remained twenty-five years, and was much appreciated by Philip V. and his son Ferdinand VI., both of whom suffered from chronic melancholia.

Farlingdon ('fern hill'), or **Great Farlingdon**, mkt. tn. in the Abingdon parl. div. of Berkshire, England. It has trade in corn, sheep, and cattle, and is interesting for its church of All Saints, a large cruciform building of the Early Eng. period, and for Farlingdon House, built by Henry James Pye (1745-1813), the poet. Pop. 2700.

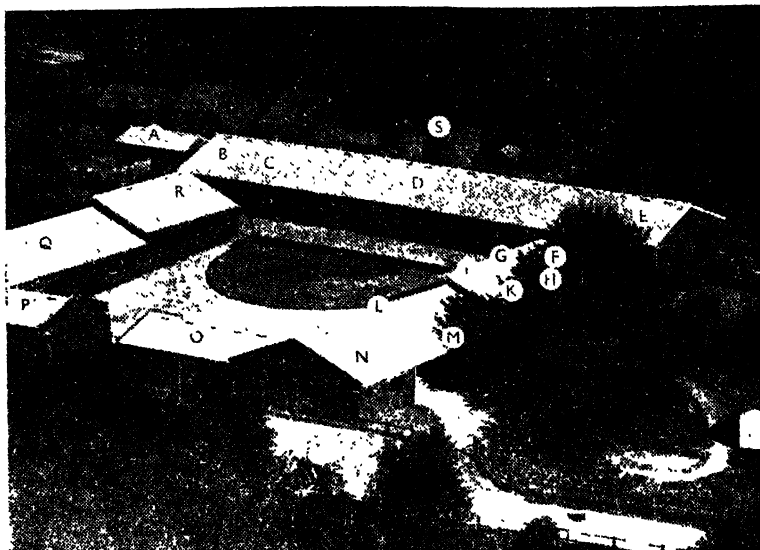

Farington, Joseph (1747-1821), Eng. artist and diarist. He executed many engravings of scenes in the Eng. Lake Dist. His interesting diary was first pub. in 1921-22.

Farini, Luigi Carlo (1812-66), It. statesman and historian. In 1861 he became minister of the interior in the last ministry of Cavour, whom he succeeded as Premier, 1862-63. His chief pub. was *Il Stato Romano* (4 vols., 1850), partly trans. by Gladstone. See his letters to Gladstone in *Mémoires sur les Affaires d'Italie* 1859: *Lettres sur les Affaires d'Italie* (Paris), 1860; and E. Parri, *Luigi Carlo Farini* (Rome), 1878.

Farm (Fr. *ferme*, from medieval Lat. *firma*, fixed payment), term used to denote a piece of land let or rented for cultivation or pasturage, together with the necessary buildings. The term 'farmer' is often used to denote a man who owns as well as cultivates land. In America the farmer generally owns the land he cultivates. **Farm holdings** consist of the residence for the farmer and his family, cottages for the F. labourers, and the F. steading. The dwelling-house varies to some extent with the size and character of the holding, the 'rules of the estate,' the fashion of the dist., and the taste and social standing of the tenant. Modern F. dwelling-houses upon holdings of about 200 acs. and upwards are both commodious and comfortable, substantial in construction, if not ornate in external appearance, usually surrounded by simply but tastefully laid-out grounds and a moderately sized garden. The dwelling-house should be 50 to 200 yds. from the steading, and preferably upon higher ground, and so situated that from the farmer's parlour and bedroom windows the whole homestead can be seen. **Servants' cottages** should be near the homestead at the opposite end from the farmer's dwelling-house. They should be plain, substantial, and roomy. They are often built in one continuous row, and sometimes in pairs but rarely singly. Each family should have three or four compartments, with a separate door and a separate garden for garden produce. At the present time they

are more fully provided than they were before 1870. It is usually found that where there is good accommodation for the labourers, the supply of agric. labour is abundant and of good quality. The *farm steading* is the term used to denote the buildings, etc., used for storing crops, stock, F. implements, and machines. The cost, character, and capacity of the steading depend on the size of the holding, the system of farming pursued, and also with

The most common and convenient plan for a F. steading is in the form of three sides of a square, with a wing down the centre. In most modern farmsteads the spacing between centre and side wings is devoted to courts for cattle, and most of the season's dung is placed in one of these courts. Straw barns should be near the centre of the steading and the classes of stock receiving most straw accommodated nearest to the straw barn. Root store

A NEW FARM AT LITTLE BERKHAMSTED, HERTFORDSHIRE

A, Bull boxes and yards; B, calf pens, C, mixing room; D, cowhouse; E, dairy and sterilising room; F, office and staff room; G, foaling box; H, saddle room; I, calving box; K, stable; L, loose boxes; M, tractor shed; N, tool room; O, implements; P, implements; Q, stock pens and cattle shelters; R, granary; S, silos. Built by George W. King Ltd., Hitchin (architect, L. A. Hartless).

the tastes of the landowner, and sometimes with the fancies of the tenant. They often are determined by the 'rules of the estate.' The greatest steading accommodation is wanted on mixed husbandry Fs., and also where a large quantity of home-grown produce is consumed by cattle in winter. Unfortunately on such a F. the maximum expenditure falls where the land is least able to bear it, viz., in cold dists. such as N. of Scotland, where substantial houses have to be built for harbouring the stock in winter. The F. steading should be situated as near as possible to the centre of the holding, on dry and airy elevation. There should be an abundant water supply, and proximity to stagnant water should be avoided. The open part should be exposed to the S.

should be easily accessible from the cattle compartments; hay store from the stable; dairy from the cow-house, and stock-yard from the threshing mill and straw barn. *Ventilation.*—Careful attention is needed in ventilating the whole of the steading. A sufficient current of air is needed overhead to keep the atmosphere pure without draughts upon the animals. Concrete is largely used in the construction of F. buildings, while galvanised corrugated sheet-iron is largely used in roofing courts for cattle. In America F. buildings are generally of wood. It is common there for all compartments of the steading to be under one roof of great dimensions. A prominent feature of the most modern Fs. is the extensive use of machinery, often electrically operated, for

such tasks as milking, haymaking, and the cutting, grinding, and crushing of food for stock. Motor power has largely superseded horses for transport and tillage.

In Britain to-day our cottages are out of date and farm buildings still more so. Thus, in some cases it will be found that the large barn was really designed for the use of the flail. Again, there are stables which were erected over a century ago, and the greater part of the buildings were ox stables, built to house the teams which worked the land in those days. Fire is an ever-present danger where electricity and internal combustion engines are used in old buildings close to wood and thatch. The barn entrance was quite convenient when horses in shafts could back a load to its destination; but a tractor or trailer, carrying a big load, is not so easy to manoeuvre. Much labour and energy are wasted in carrying sacks of corn and artificial manures on men's backs. Every well-organised F. should grow some corn and use some artificial manures. Hence storage barns are necessary and they should have doors at both ends, be dry and rat-proof, and down the centre should be a carriage way to enable a tractor to load, drive in at one end, unload and drive out at the other. Implement sheds should be designed on the same principle, especially as tractor machinery is so much bigger and heavier than the old horse machinery. Between the two World Wars a number of new cow-sheds have been built. To secure a licence to produce milk for sale, the law requires a certain standard. In some cases landlords found it cheaper to build a new shed rather than convert an old one, but often no advice was taken to ensure that the design was sound and owing to faulty design the result may be that cows crowd at the entrance and it is difficult to get each animal into her proper standing. Progressive milk farmers, in order to obviate waste of time between milkings on washing down the sheds, prefer to have a milking parlour which will accommodate about twice the number of cows usually milked at a time, combined with covered yards divided into pens, so that no more than a dozen cows lie together for the night. At present (1949) there are not enough houses of any sort to go round. A number of decisions must be made when the time comes for rehousing those labourers who earn comparatively high wages. Stockmen and those in authority must live close to their work. Hence most of these houses must be built close to the F. buildings where the men find employment. The rest of the staff on a F.—the day-men and the tractor drivers—need not live on the spot when motor bicycles and small cars are within their means. Tied and service cottages are required. A cowman must live near his cows and the shepherd near his flock. Beyond that, there is no need for this type of cottage provided there is sufficient accommodation within range of the F. for those who work on it but who need not be at the beck and call of animals. See F. Sykes, *This Farming Business*, 1944; M. E. Seebohm, *The Evolution of the*

English Farm, 1927; D. R. McHardy, *Modern Farm Buildings*, 1932; E. Gunn, *Farm Buildings—New and Adapted*, 1945. See also AGRICULTURE; DAIRYING; GARDENING.

The study of farm management in the United States, where farms and ranches attain a vast size unknown in Great Britain, has become of such importance that chairs in this subject were established in various universities during the early part of the twentieth century. Experience and research have now furnished data for instruction in F. M. In the univ. are taught the best and most profitable methods of producing field crops and livestock; soil and climatic conditions are studied; the relative merits of various forms of farm implements and equipment are analysed; the problems of labour are discussed; a certain amount of accountancy is taught in order that farm accounts may be properly kept; and the marketing of produce is a feature of the student's course. See R. L. Adams, *Farm Management*, 1921; L. A. Moorhouse, *The Management of the Farm*, 1925; F. App, *Farm Economics, Management and Distribution*, 1928; K. W. Campbell, *Farm Management*, 1940; J. Scott Watson and J. More, *Agriculture: The Science and Practice of British Farming*, 1945.

Farman, Henry, Anglo-Fr. aviator, b. 1874 at Cambrai. One of the pioneers in aviation. In Oct. 1907 he flew 820 yds. in 52½ secs., and in the same month of the following year journeyed in the air from Châlons to Rheims, covering a distance of 16 m. in 20 mins. This was the first cross-country flight, and was accomplished in a Voisin biplane, improved after the pilot's own designs. The speed attained was 78 kilometres per hour. F. was the first man to fly to New York. During the First World War, his works at Billancourt supplied aeroplanes to allied forces.

Farmer, Richard (1735-97), Eng. scholar and critic, b. at Leicester and educated there, and at Emmanuel College, Cambridge, of which he became classical tutor and master in 1775. In 1773 he became chief librarian to the univ.; in 1780 he was appointed to a prebendal stall at Lichfield, and two years later to one at Canterbury, which he exchanged in 1788 for that of a canon residentiary of St. Paul's. He twice declined the offer of a bishopric made to him by Pitt in recognition of the Tory principles he strove to propagate in Cambridge University. He called himself the 'pioneer of commentators' and in his *Essay of the Learning of Shakespeare* (1767), his only work of any importance, proved that the dramatist derived his knowledge of classical and foreign literature from trans.

Farmers' Clubs exist for the twofold purpose of furthering agric. interests and promoting social intercourse among men who are following the same agric. occupation. Meetings take place usually on market days, in most of the big agric. centres throughout the country. The Farmers' Club, estab. at 2 Whitehall Court, London, S.W. 1, has a large membership of farmers, stockbreeders, landowners,

and other persons interested in agriculture. It was estab. in 1843 at the instance of sev. members of the Royal Agric. Society of England and the Smithfield Club. Meetings are held annually there when papers are read on current agric. subjects and on legislation affecting agriculture. The National Association of Young Farmers' Clubs has its headquarters in 26 Bedford Square, London, W.C. 1, where is pub. the monthly paper *The Young Farmer*. The first of the Young Farmers' Clubs was estab. by the United Dairies in Jan. 1921, at Hemvock, Devon, and attracted the interest of Lord Northcliffe, who set aside a section of the Ideal Homes Exhibition at Olympia for their show in 1922, and offered a gold cup for competition among the young farmers of America and of Britain. Later the Ministry of Agriculture interested itself in clubs, in which each young farmer personally rears his own stock. F. Cs. are a feature in the U.S.A., and of Canada, especially in the three prairie provs. of the dominion. There are also in the U.S.A. a number of boys' and girls' clubs in connection with agric. extension work. In America, experimentation, improvement in marketing, discussion of anti-pest methods, and the organisation of co-operative marketing are all prominent activities in F. Cs., while demonstrations in educational work and agric. competitions are periodically organised for the common benefit of members.

Farmers General (ancient Rome), see **PUBLICANI**.

Farmers-General, those individuals who sought from the state or controller of taxes the privilege of collecting the taxes in return for a certain fixed sum paid into the treasury, such as the 'publicani' of classical and N.T. times. The system of *fermiers-généralux* was very prevalent in France before the Revolution of 1789. It was largely responsible for the Revolution, and was swept away in it.

Farm-servants, see **LABOURERS**.

Farnaby, Giles (c. 1560-c. 1600), Eng. composer, b. probably at Truro, Cornwall. He lived in London where he married in 1587, and took the Mus. B. at Oxford in 1592. He composed pieces for voices (madrigals) and over fifty virginals.

Farnaby, or Farnable, Thomas (c. 1575-1647), Eng. grammarian and schoolmaster, the son of a London carpenter. He was educated at Merton College, Oxford, and at a Jesuit College in Spain. He was for some time a follower of Drake and Hawkins and fought in the Low Countries. On his return to England he opened a school in Goldsmith's Rent, London, which became famous all over Europe. He was the chief classical scholar as well as the chief schoolmaster of his time. He prepared a new Lat. grammar and an annotated ed. of most of the great classical authors, and these elaborately annotated eds. were extraordinarily popular throughout the seventeenth century. Ben Jonson was a friend of F. and contributed commendatory Lat. elegies to his ed. of *Juvenal and Persius*. John Owen eulogises F.'s Seneca in his 'Epigrams.'

Farnborough, urban dis. and part of Hampshire, England, situated in the Haslingstoke par. div., 2½ m. N. of Aldershot, and 32 m. S.W. of London. A part of the Aldershot camp is in the par. and also an aerodrome. The remains of Napoleon III. and the Prince Imperial are buried in a mausoleum built by the ex-Empress Eugénie at F. Hill. Pop. 16,000.

Farnborough, Baron, see **MAY, SIR THOMAS ERSKINE**.

Farne, Fearn, or Fern Isles, or **The Staples**, group of about 30 small is., in the N. Sea, in lat. 55° 38' N. and long. 1° 37' W. They belong to Northumberland, England, and are from 1½ to 7 in. off the coast, 20 m. S.E. of Berwick, 3 m. S.E. of Holy Is. Noted as a breeding place for sea birds and Atlantic seals. Here Grace Darling's heroic rescue took place in 1838; in 1843 sixty people from the *Pegasus* were drowned. Two lighthouses stand upon the largest of the is., and upon this also is St. Outhbert's tower, the remains of a Benedictine priory. The is. were acquired by the National Trust in 1925, as a result of a public appeal.

Farnese Family, The, illustrious and powerful It. family whose early hist. is obscure. Its importance dates from 1534, when Cardinal Alessandro Farnese was elected pope as Paul III. He alienated the duchy of Parma and Placentia for his natural son Pierluigi Farnese. Placentia was occupied by Charles V. in 1547, but the duchy of Parma was ruled by the Farnese for over two centuries. **Alessandro Farnese** (1545-92), the third duke of Parma, was a famous statesman and general, and became governor-general of the Netherlands under Philip II. of Spain. His son and successor, **Ranuccio I.** (1569-1622), instituted the savage persecutions against supposed 'witches' and 'heretics.' He was succeeded by his second son, **Odoardo** (1612-46), who quarrelled with Pope Urban VIII. about the possession of Castro, which was eventually razed to the ground during the reign of his son **Ranuccio II.** (1630-94). Ranuccio's two sons **Francesco Maria** (1678-1727), and **Antonio** (1679-1731) both died childless and were the last of the male line of the Farnese. The duchy of Parma passed to Don Carlos of Bourbon, son of Philip V. of Spain and Elizabeth Farnese (1692-1766).

Farnese Palace, in Rome, one of the finest specimens of Rom. Renaissance architecture. It was begun under Paul III. when he was Cardinal Alessandro Farnese, and completed by his nephew in 1586 under the direction of Michelangelo. It was inherited by Don Carlos, afterwards King of Naples and Spain, and most of the pictures and antique sculpture were removed to Naples. It now houses the Fr. embassy to Italy.

Farnham, mkt. tn. of Surrey, England, situated on the R. Wey, 38 m. S.W. of London. It is the centre of a hop dist. Wm. Cobbett was born here in 1762, and is buried in the par. churchyard. F. is historically interesting. Its castle was built by Henry of Blois, brother of King Stephen, destroyed by Henry III. and rebuilt and garrisoned by Charles I. It

was restored in 1684 by Dr. Morley, bishop of Winchester. The ruined keep was repaired in 1913-14. Moor Park was the last retreat of Sir Wm. Temple, who died here on Jan. 27, 1699, and it was here that Dean Swift wrote many of his works. The cottage in which Miss Johnson lived is still called *Stella's Cottage*. Mother Ludlam's and Foot's caves are near by, also the remains of earth-works called Caesar's Camp. Many Rom. coins have been found. Pop. 18,200.

Farnol, John Jeffery (b. 1878), Eng. novelist. Studied engineering, but, after a course of art study, began writing fiction for Eng. and Amer. magazines. For two years he worked as a scene-painter at the Astor Theatre, New York. His great success was 'The Brood Highway', a study of Eng. rural characters in the heroic vein of the old-time workers. Other novels of the same picaresque genre: *Bellane the Smith* (1915), *The Money Moon*, *The Amateur Gentleman*, *Chronicles of the Imp* (1916), *The Loring Mystery* (1925), *The Jule of Destiny* (1931), *The Way Beyond* (1933), *The Crooked Furrion* (1937), *Murder by Nail* (1942), *My Lord of Wrybourne* (1944).

Farnworth, tn. of Lancashire, England, situated on the R. Irwell, in the Radcliffe-cum-Farnworth par. div., 2½ m. S.E. of Bolton and adjoining it; it is also 12 m. N.E. of Liverpool. There are collieries, iron works, tile and brick fields in the dist., and the manuf. of cotton goods and sail canvas is carried on. Pop. 27,300.

Faro (from 'Pharaoh,' a picture of an ant. Egyptian king on one of the cards of the old Fr. pack), a game of hazard with a full pack of cards, popular in France in the reign of Louis XIV. and still in the U.S.A. The 'bank' is held against an indefinite number of players.

Faro, seaport tn. of Portugal, cap. of the dist. of the same name, in the prov. of Algarve. (1) The tn. is situated at the mouth of the Rio Vermoso, at the back of three is., which help to form a fine roadstead. It is the chief port of S. Portugal, and exports fruits, wine, anchovies, cork, etc. A wall surrounds the tn., built probably by the Moors, and there is a cathedral, which is supposed to have been a Rom. basilica. There is an arsenal and military hospital, with sev. educational estab. and convents. F. was almost destroyed in 1755 by an earthquake. Pop. 13,000. (2) The dist. has an area of 1936 sq. m. Its climate is extremely fine, and almonds, dates, figs, wheat, olives, etc., are grown. Pop. 317,600.

Faro Islands, see FAROE.

Farquhar, George (1678-1707), Irish dramatist, went on the stage after leaving Trinity College, Dublin, and in that city, about 1695, made his debut as Othello. He is generally supposed (on the authority of his biographer, Thos. Wilkes) to have left college in 1695 on account of the death of his patron, Bishop Walsman of Dromore, to become a corrector of the press. In a subsequent appearance he accidentally stabbed a fellow-actor, and was so distressed that he retired from the stage, though from all accounts he suffered from

stage fright and failed as an actor. He now turned his thoughts to play-writing, and his *Love and a Bottle* was successfully produced at Drury Lane in 1699. In the following year *The Constant Couple* was performed, and was an even greater success. This was followed by *Sir Harry Wildair* (1701), and in this play at his own benefit at Dublin he played the title-role. *The Inconstant*, or *The Way to Win Him* (1702), *The Twin Rivals* (1702), and *The Stage Coach*, a farce in one act (with Motteux), (1704). His last plays were *The Recruiting Officer* (1706) and *The Beaux' Stratagem* (1707). He got into financial difficulties and the duke of Ormonde, whom he styles his 'general' in the dedication to *The Recruiting Officer*, advised him to sell the lieutenant's commission which he then held, in order to pay his debts, promising to give him a captaincy. He acted on this advice, but the duke failed him and F. sickened and died in despair. He belonged to the Congreve school of dramatists, and had some wit and gaiety in abundance, but no higher sense of morality than the majority of his contemporary playwrights. See W. Connelly, *Young George Farquhar*, 1918.

Farr, William (1807-83), Eng. statistician, b. at Kenley in Shropshire. He studied medicine in Paris and London, but gave up the practice of his profession to accept the post of compiler of abstracts in the registrar-general's office. In 1851 and 1861 he was assistant-commissioner, and in 1871 head commissioner for the census. His chief pub. are: *Tables of Lifetimes, Annuities, and Premiums* (1861), *English Reproduction Table* (1880), and *Vital Statistics* (1885).

Farragut, David Glasgow (1801-70), first admiral of the United States navy, b. at Knoxville in Tennessee. He entered the navy in 1810, became lieutenant in 1825, commander in 1841, and captain in 1855. Although a Southerner by birth, on the outbreak of the Civil war in 1861, he adhered to his allegiance to the gov. at Washington, and in 1862 was appointed as rear-admiral to the command of the W. Gulf Blockading Squadron, with which he forced the passage of the Mississippi and captured New Orleans. In 1861 he captured Mobile and in the same year was invested with the newly created rank of vice-admiral, on which he retired from active service. He was made admiral in 1866.

Farrand, Livingstone (1867-1939), Amer. anthropologist and psychologist; from 1893 till 1901 he was instructor in psychology at Columbia Univ. He was from 1901 till 1903 adjunct prof. of psychology at Columbia; and then, until 1914, professor of Anthropology at same univ. Appointed by Rockefeller Foundation to direct work in France against tuberculosis. From March 1919 till Oct. 1921 was chairman of central committee of the Amer. Red Cross. In 1921, elected President of Cornell Univ. Wrote: *Basis of American History*, 1904.

Farrant, Richard (fl. 1564-80), Eng. composer of church music. He became a gentleman of the Chapel Royal under

Edward VI.; became organist of St. George's Chapel in 1564, and returned to the Chapel Royal in 1569. His name is best remembered in connection with the anthem, 'Lord, for Thy Tender Mercy's Sake,' and a chant based on it, but the authorship has not been satisfactorily established, being claimed for John Hilton.

Farrar, Frederic William (1831-1903), Eng. divine, b. at Bombay, and educated at London Univ. and Trinity College, Cambridge. From 1855-70 he was assistant master at Harrow, and from 1871-76 headmaster of Marlborough College. He was elected fellow of the Royal Society in 1864, univ. preacher in 1868, honorary chaplain to the queen in 1869, and Hulsean lecturer in 1870. He became canon of Westminster and rector of St. Margaret's in 1876, archdeacon in 1883, and Dean of Canterbury in 1895. In 1858 he began his literary work with the schoolboy story, *Eric, or Little by Little*, followed by *Julian Home* (1860), and *St. Winifred's* (1883). He pub. a number of books on classical and modern philology, but it was by his theological writings that he attained his greatest popularity. *The Witness of History to Christ* (Hulsean Lectures) appeared in 1870. Other works include: *The Life of Christ* (1874, 12th ed. 1875), *Life of St. Paul* (1879), *Early Days of Christianity* (1882), *Lives of the Fathers* (1888), *Darkness and Dawn* (1889), and *The Bible, its Meaning and Supremacy* (1896).

Farrar, Geraldine, Amer. operatic soprano; b. Feb. 28, 1882, at Melrose, Mass.; daughter of Sydney F., storekeeper. She received musical education from Mrs. J. H. Long in Boston, Mine. Thursty in New York, Trabadello in Paris, and Lilli Lehmann in Berlin. On Oct. 15, 1901, she made her debut at the Royal Opera, Berlin, as Marguerite in Gounod's *Faust*, with such success that she immediately had a three years' contract. From 1906 till her retirement from the stage on April 22, 1922, she was a leading soprano at the Metropolitan Opera House, New York. She appeared on a concert platform in 1927.

Farrell, bor. in Mercer co., Pennsylvania, U.S.A., on the Shenango R., close to Sharon city, with which it is industrially conjoined. Steel, castings, tin-plate manufs. Pop. 13,800. The name has been changed from Sharon since 1910.

Farrell, James Thomas (b. 1901), Amer. journalist and novelist and critic, b. at Chicago and educated at Chicago and New York univs. Worked in a gasoline filling station and as a salesman. Received the John Simon Guggenheim Foundation Fellowship in Creative Literature. His experiences as a baseball enthusiast and as a student in Catholic schools on the S. side of Chicago are the background of his novel *Young Lonigan* (1932). This was followed by *Gas House Mcintyre* (1933) and the trilogy *Studs Lonigan* (1935) for which he was awarded \$2500 from the Book of the Month Club. Other novels are *No Star is Lost* (1938); *Father and Son* (1940); *\$1000 a Week and other stories* (1942); *Bernard Clare* (1946).

Also three vols. of short stories: *Calico Shoes* (1934); *Guillotine Party* (1935); and *Can All This Grandeur Perish?* (1937). He has made a detailed and constant use of the naturalistic technique, especially in his chief book, *Studs Lonigan*. His characters live in the depressed areas of the S. side of Chicago and among street gangs and petty criminals. Most of them are casual in their morality and many are merely vicious. His writing shows the influence of James Joyce, Dreiser and Proust, but he reveals his keen interest in the ordinary facts of modern American life and his impatience with social and economic inequalities. Other works: *A Note on Literary Criticism* (1936); *My Days of Anger* (1943), and *Literature and Morality* (1947).

Farren, Elizabeth, Countess of Derby (c. 1759-1829), Eng. actress, and daughter of George F., an actor. She made her first appearance in London at the Haymarket in 1777, as Miss Hardcastle, in *She Stoops to Conquer*. This success was followed by Rosina in Colman's adaptation of *The Spanish Barber*, and many others. In 1782 she succeeded Mrs. Abingdon at Drury Lane. She played Hermione, Olivia, Portia, and Juliet, but her most successful rôles were Lady Betty Modiste, Lady Teazle, Lady Towly, and Lady Fanciful. In 1797 she married Edward, twelfth earl of Derby.

Farren, Ellen, commonly known as **Nellie Farren** (1848-1904), actress, came of an old theatrical stock, and made her first appearance on the stage at the age of five. She played many parts at Sadler's Wells, the Victoria, and the Olympic theatres, and earned the reputation of being both clever and versatile. It was only after she went to the Gaiety in 1868 and played prurient parts in burlesques that she became famous. She remained there, a great 'draw' in London, until 1891, when ill-health compelled her retirement from the stage.

Farrer, Sir Thomas Henry, first Baron (1819-99), Eng. statistician and civil servant, b. in London, and educated at Eton and Balliol College, Oxford. He was called to the Bar in 1844, but ceased to practise on entering the Civil Service as secretary to the Marine Dept. of the Board of Trade in 1850, a post which he held until 1886. He was an advanced Liberal in politics, and a strict free-trader. His theories on trade and finance are embodied in his writings: *The State in its Relation to Trade* (1883), *Free Trade versus Fair Trade* (1886); and his letters and essays in *The Times* and *Contemporary Review*. He pub. *Study in Currency* in 1898. He was created a baronet in 1883 and a baron in 1893.

Farriery, art of horse-shoeing. It is of anc. origin, and there is evidence that the art was practised by the Celts. It does not seem to have been in use among the Gks. or Romans. The art probably began to grow common after the overthrow of the W. empire towards the close of the fifth century. It has only recently been introduced into Japan, where the former practice was to attach slippers of straw to

the horse's feet, these slippers being renewed when necessary. In modern times the art has undergone many changes and improvements, as the methods formerly adopted were considered injurious to the animal and a considerable loss to the owner. The following are some of the chief causes of these evils: (1) Paring the sole and frog; (2) applying shoes which were too heavy and of the wrong shape; (3) using too many and large nails; (4) applying shoes too small and removing the wall of the foot to make the feet fit the shoes; (5) rasping the front of the hoof. These were often caused by unskilled workmen, who combined the duties of blacksmith and shoosmith in one trade, although they were not qualified. According to modern principles, shoes should be: (1) As light as compatible with the wear required of them; (2) the ground face of the shoe should be concave, and the face applied to the foot plain; (3) heavy draught horses alone should have toe and heel calks on their shoes to increase the foothold; (4) any excess of growth of the wall or outer portion of horny matter should only be removed in re-shoeing. Care is to be taken in keeping both sides of the hoof of equal height; (5) the shoes should fit accurately to the circumference of the hoof and project slightly beyond the heel; (6) as few nails as possible should be used; (7) the nails should take a short, thick hold of the wall so that the old nail holes may be removed in the natural growth and paring of the horny substance. The need for shoeing a horse's feet is generally well known. The foot is composed of a horny substance which becomes very brittle and breaks away, especially under the influence of moist weather, or of extra strenuous work. In order to prevent this, the rim of iron is placed on the foot and can be renewed from time to time. The shoes and nails are now manufactured with great economy by machinery. The advent of modern methods of locomotion and means of transit have greatly impeded the art of F. In the eighteenth and nineteenth centuries every vil. had its shoosmith, who, as mentioned above, combined his art with that of the blacksmith, thus causing evils which were only stamped out by modern systems of F. See J. Jeffray, *Address on the Present State of Farriery*, 1786; W. Douglas, *Horse-shoeing*, 1873; W. Hunting and A. Mattinson, *The Art of Horse-shoeing*, 1922; C. Holmes, *The Principle and Practice of Horse-shoeing*, 1928.

Farrukhabad, or **Farukhabad**, dist. and city of India, in the Agra div. of the United Provs. The dist. has an area of 1718 sq. m., traversed by a metre gauge branch line of the Bombay, Baroda and Central India railway. The chief products are indigo, sugar-cane, and potatoes. The cap. is Fategarh. The city of F. is situated near the Ganges, 86 m. N.W. of Cawnpore, and has a gov. gun-carriage factory. Pop. (dist.) 860,000; (tn.) 60,400.

Fars, or **Faristan**, one of the five great provs. of Persia (Iran), extending along the N. shore of the Persian Gulf. The

name is the same as the Gk. 'Persis,' which, originally the name of the prov. now called Iran, has come to be the name by which the whole empire is called. The prov. is traversed by mt. chains running parallel with the coast, intersected by fertile valleys, rich in pasturage, vines, and fruits, and studded with lakes, the chief of which is Lake Bakhtegan. The rivs. are small and seldom flow into the sea. The climate varies greatly according to the altitude. The prin. products are dates, rice, olives, cereals, cotton, and wine. The cap. is Shiraz (pop. 129,000). The area of Fars is about 53,000 sq. m. and the estimated pop. 750,000.

Farshut, or **Farshiout**, tn. of Upper Egypt, situated near the R. Nile, 20 m. S.E. of Girgeh in a picturesque country of astonishing fertility. Pop. 17,000.

Farsley, manufacturing tn. of W. Riding, Yorkshire, England, situated 3½ m. from Bradford. It has scribbling, spinning and cloth manuf. mills. Samuel Marsden, who first introduced Australian wool into England, and passed his life as a missionary in Australia and New Zealand, was born here. Pop. 6000.

Farther India, see **INDO-CHINA**.

Farthing (A.-S. *feorþa*, a fourth, and *ing*, a diminutive) is the smallest Eng. bronze coin, and is equal in value to the fourth of a penny. It was instituted as a silver coin in the reign of Edward I., in which form it continued until the time of Mary. James I. granted a patent to Lord Harrington of Exton in 1613 for the manuf. of copper Fs., but it was not until 1672 that they came into circulation in any number. In the reign of Charles II. tin Fs. were also in circulation for a short time. In 1860 copper Fs. gave place to bronze, in which form they have continued. The experiment of issuing half Fs. was tried in 1842, but not proving successful, the coins were demonetised in 1869. In 1853 the last year in which they were minted, 913,920 half farthings were coined. The present value of these coins is up to 1s. 6d. each according to date and condition. Half- and quarter-farthings were minted between 1839 and 1856 for use in Ceylon, and in 1844 one-third farthings were also struck for Malta. In 1897 the practice was adopted of darkening them before issue, that they might not be mistaken for half-sovereigns.

Farthingale (O.F. *verdugalle*, corruption of Sp. *verdugado*, from *verdugo*, a stick), case or hoop upon which were hung voluminous skirts. The material of the F. was originally wood and later whalebone. It was of Sp. origin, and reached its most exaggerated form in the seventeenth century, when it consisted of a flat circular surface, projecting from the bodice. It was the forerunner of the crinoline (q.v.) of the eighteenth and nineteenth centuries.

Farukhabad, see **FARRUKHABAD**.

Farwell, Sir George (1845-1915), Eng. lord justice: second son of Frederick Cooper F., of Tettenthal, Staffs; graduated from Balliol College, Oxford, and was called to the Bar in 1871. Decided the crucial point in the Taft Vale railway case, 1900, concerning the liability of trade

union funds to attachment for damages. In 1906, after being for seven years judge of the High Court, he was made lord justice.

Fasces were bundles of rods carried in ant. times by the lictors before the chief

magistrates of Rome symbolising their supreme power over the lives of the people. These rods were made generally of birch-wood or elm, and an axe protruded from the centre. Besides being borne before the magistrates they were also carried before kings and emperors, and in republican times before consuls and praetors. The number of F. was not the same in all cases, but varied according to the dignity of the magistrate. Twelve was the number allotted to a consul, and six to a praetor. In 508 B.C. Valerius Publicola set forth a mandate that in the city the axe should not be carried, since the consuls no longer had the power of life and death in Rome. The axe was present in the case of a dictator, who was preceded by twenty-four lictors, bearing the same number of fasces.

Fascia, or **Facia**, architectural term denoting the bands into which the architrave of the Ionic and Corinthian orders is subdivided. In the Roman Corinthian order the fascia are often divided into small mouldings. The bands are known as the first or upper F., the second or middle F., and the third or lower.

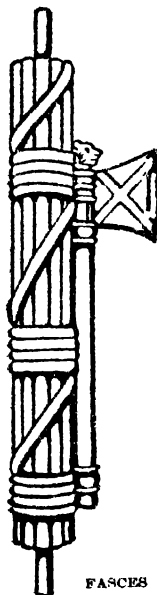

Fascines are brush-wood faggots used for military purposes. They are generally about 18 ft. in length, not quite a foot in thickness, and are bound tightly together by means of wire or withes. They are used for roofing magazines, for bridge and road making, and also for revetting the steps and slopes of field-works. When cut up into one-third of the length, they can be utilised in filling up a ditch, trench, etc., and are especially useful for supporting structures in marshy ground.

Fasciola, parasite which causes liver rot in sheep, see LIVER-FLUKE and TREMATODES.

Fascism. The name given to the political movement which arose in Italy soon after the First World War to deliver the country from Bolshevism, restore its economic equilibrium, and raise it to its rightful place in the family of nations. The movement was led by Benito Mussolini (q.v.), and successfully dominated administration in Italy from 1922 until

1943. The symbol of F. (*Fascismo*) is the same as that of the lictors of Imperial Rome—a bundle of rods (*fasces*) with an axe in the centre, and the *Fascista* salute is that of the ant. Rom.—by outstretched arm. The military organisation of the National Fascista Party—as it was officially constituted, with its Great National Council—was entirely on Roman lines, with Rom. names like 'legion', 'consul', 'centurion', 'triarii', 'senior' and so forth. The coins bore on one side the Rom. *fascio*, and special gold coins were issued to celebrate the anniversary of the famous 'March to Rome' of Oct. 21, 1922, which carried F. triumphantly into power. Discipline was most rigorous; and the motto of F., 'No discussion, only obedience,' serves to explain the rapidity of the sudden mobilisations and demobilisations carried out by the organisation. F. also possessed a large and powerful Press and a publishing house in Milan. But the decisive factor in the victory of F. was over and above all, the personality of its leader, the so-called *Duce*, Mussolini, the very soul of the movement.

F. did not, however, present an absolutely new political phenomenon, but was really part of the general historical development of nations, and it reveals the theoretical influence of Machiavelli and Nietzsche and also of Sorel and Pareto. It has been compared to the 'krypteia' of Sparta, and the 'eterie' of Athens, or other similar expressions of self-defence of strong active groups or classes, uniting and forming centres of resistance. Other illustrations may be found in the list of the Church in Italy, in the It. Communes, in England, in Germany, and in the Clubs of the Fr. Revolution. It came as a reaction to the complete apathy and disorder in parl. State functions in Italy and to the hypnotism of the It. working classes under the gospel of Lenin following the 1914-18 War, conditions which in 1920 were rendering the country an easy prey to the Communist peril. It was a time when the economic chaos was complete; foreign exchanges were disorganised; the police impotent; the Carabinieri insulted and even killed by the Communists. Resistance came from the patriots of the Trentino, the Carso and other battlefields of the War, and the first encounter between them and the Communists was in 1921 at Bologna, which date marks the wane of Bolshevism and the rise of F. Progress was at first slow; for the State was impotent and the only practical policy was force. But masses of the working classes were soon enrolled among the Fascist syndicates scattered all over Italy, and these began activities by settling many important economic disputes and strikes. The army was secretly or openly in favour of F., and, contrary to the hopes of the Communists, would never have marched against the Fascisti. The very generals of the regular army wore the black shirts of the organisation, and themselves directed the march to Rome. In the closing months of 1922 the members of F. increased by leaps and reached even to the Alps and S. Italy. Finally, in 1922,

FASCES

after a great meeting at Naples and after the March to Rome, Mussolini and his influential quadrumvirate, formed by Gen. de Bono, Cesare de Vecchio, Italo Balbo, and Michele Bianchi, the secretary-general of the party, was summoned by the King to form the first Fascista Cabinet. In his opening speech before the reconstituted Chamber, Mussolini declared the foreign policy of F. in these words: 'No imperialism, no aggressions, but an attitude which shall do away with the policy of humility which has made Italy more like the Cinderella and humble servant of other nations. Respect for international treaties at no matter what cost. Fidelity and friendship towards the nations that give Italy serious proofs of reciprocating it. Maintenance of E. equilibrium on which depends the tranquillity of the Balkan States and therefore European and world peace.' The invasion of Abyssinia some fifteen years later can no more be reconciled with this early statement of Fascist policy than his other imperialist aspirations. (See *infra*.) At Trieste, on Feb. 6, 1921, Mussolini made it clear that F. did not believe in the principles of the League of Nations, nor in those of the Red International, nor in the possibility of general disarmament; and he formulated the positive demands of F. as follows: revision of the treaties of peace where these might prove the cause of new wars; economic annexation of Fiume; emancipation of Italy by the development of her productive forces; renewal of relations with the ex-enemy countries, but subject to the maintenance of the existing It. N. and E. frontiers; vindication of the rights of Italy as regards its colonies; replacement of the old diplomatic representatives by others from the special univ. faculties; and the furtherance of the It. colonies in the Mediterranean and beyond the Atlantic by economic and educational means and by rapid communication.

The Fascist Party (as in other European totalitarian States) was the only authorised political organisation in Italy during the period of the prevalence of F. The social system aimed at was the Corporative State (*q.v.*). F. claimed to be neither capitalist nor socialist. It maintained private property but subjected its use to State control. Trade unions and manufacturers' associations, both Fascist-controlled, were bound to co-operate in the Corporation. Spirit and organisation in the Party were militaristic. The statute of the Party described it as a civil militia at the orders of the *Duce* or leader and dedicated to the service of the State, and that its chief aim was to achieve the greatness of the It. people. The Party was anti-liberal and anti-democratic, and stood for nationalism and imperialism. F. upheld violence, rejected civil liberties and claimed the monopoly of education in its youth organisations, the *Avanguardisti* for young children and the *Avanguardisti* for youths up to eighteen. The party maintained its own army with a training and standing almost equal to those of the regular army.

F. in its first decade certainly transformed the whole material, moral and political structure of Italy. Its achievements included, apart from the successful assertion of It. foreign policy in the Adriatic and Mediterranean, many great enterprises within the country itself. The more important of these were the reorganisation of the mercantile marine and the improvement of harbours; city planning; afforestation schemes which have clothed bare mts. with verdure; the reservation of special roads for motor traffic (also, later, in Libya) and the improvement of roads generally; and the creation of a network of airlines. One of the most beneficial schemes was that of land reclamation, begun in 1928, under which about 30 million acs. were reclaimed, an undertaking which, together with irrigation schemes, gave work to tens of thousands of men, besides increasing cereal production by some 20 million quintals, and thereby conducing to the emancipation of Italy from that dependence of foreign food which, as shown above, was one of the declared objects of F. from its inception.

It has been objected to F. that, like other institutions founded on dictatorships, it must be for ever providing spectacular benefits in order to retain popularity; and undoubtedly the Fascist State, in carrying out its ideals, did assume heavy financial burdens. Yet the material benefit to the country did up to a point outweigh the disadvantages inherent in all dictatorships, and for some time operated as a powerful influence on the imagination of the It. people as a whole. F. welded the country together, and, by a remarkable re-awakening of patriotism, tended to obliterate the old distinctions between the N. and S. and remove the traditional antipathies between city and city. It further strengthened national unity by effecting a conciliation between Church and State and by the settlement of the Rom. question. This latter, crystallised in the Lateran Treaties, was, perhaps, in these earlier years, Mussolini's most remarkable achievement; for the definite recognition by the Vatican of the House of Savoy as the legitimate rulers of Italy and of Rome as the cap. of the kingdom revitalised It. patriotism as perhaps nothing else could have done. But by 1940, when it became evident that Mussolini was waiting for a suitable opportunity to declare war on the allies, the sympathies of the Vatican were manifestly on the side of the latter. It is clear, however, that the estab. of F. entailed the abrogation of many fundamental rights of man, hitherto regarded as sacrosanct. This is exemplified in the Law of Dec. 24, 1925, defining the attributes and prerogative of the Prime Minister. Under this law Ministers were responsible to the King for the administration of their departments, but only to the Premier for their policy; and the Premier, with the Royal consent, could abolish or create new Ministries, and he alone could determine Cabinet policy as a whole or discuss policy with the King. (See also CORPORATIVE STATE.)

Jews co-operated with the Fascist Party from the beginning and held important posts; when Mussolini adopted an anti-semitic policy under Nazi influence in 1938, they were driven out. Other leaders besides Mussolini included, as well as the quadrumvirate noticed above, Count Ciano (*q.v.*), A. Starace, D. Alfieri, E. Rossoni, Italo Balbo (*q.v.*), and A. Farinacci (*q.v.*). F. served as a model to a number of similar political movements in other countries, notably, of course, to National Socialism (*q.v.*) in Germany and Falangism in Spain and, indeed, in a broader sense, the term 'Fascist' came to be used to describe almost any reactionary or authoritarian ruler, irrespective of profound diversities; as, e.g., Marshal Pétain (*q.v.*), whose policy as leader of the Vichy Gov. was increasing collaboration with Hitler; Salazar, the Prime Minister of Portugal, whose policy was formed on mildly Fascist lines; and Peron, the present dictator of the Argentine Republic, whose sympathies appear to be anti-bourgeois.

F., in the last decade of its influence, is associated principally with the Imperialist aspirations of Mussolini, during which period his public acts and statements presented a series of contradictions, crowned, as he became involved in the inevitable consequences of his overweening ambition, by an exemplary succession of betrayals. His political rake's progress was hastened by the Stresa Conference (1935), for this conference paved the way to the creation of the Axis (*q.v.*). Mussolini, after Stresa, imagined that he had the implied consent of Britain to his openly revealed designs on Abyssinia. The Axis was launched during the Sp. Civil war when he and Hitler in a flibustering adventure helped to establish a Fascist regime under Franco, but it did not take final shape until Italy's adherence to the anti-Comintern Pact (*q.v.*) in Nov. 1937. At this time Mussolini still retained some sense of the value of friendly relations with the Western Powers and he actually concluded a treaty of *bon voisinage* with Britain and opened similar negotiations with France. But he was already too far committed on the other path for these treaties to be implemented and soon Fascist Italy's bond with Nazi Germany was cemented by a military alliance. In 1939 without warning or pretext he invaded Albania with whose king Italy had a treaty of friendship of ten years' standing. When war broke out between Germany and the W. Powers fascist Italy announced that she would take 'no initiative' in the war. Historians may speculate on what basis of agreement with Hitler Mussolini took this step. The determining point of Mussolini's duplicity herein is that he delayed Italy's entry into the war until he felt convinced that Hitler's triumph was assured. Encouraged by the apparent success of this baseness he then attacked Greece—also a friendly country—without warning in the manner of the customary Nazi technique. But here his treachery availed him nothing and his armies had to be succoured by his

German ally. From that time, perforce, he allowed himself and his country to be drawn more and more ignominiously in the train of Hitler. On July 21, 1943, following the invasion of Italy, the Fascist Grand Council met and carried a hostile vote against Mussolini, who had returned from a conference with Hitler without the expected assurances of Ger. military assistance against the Allies. Marshal Badoglio (*q.v.*) was charged by King Victor Emmanuel to assume power. He dissolved the Fascist Party, and removed or purposed to remove Fascists from office. When Gen. Alexander's advanced guards entered Rome (June 4, 1943) the King, after investing his son with the office of Lieutenant of the Realm, went into retirement in order to leave the way open for the gov. of a co-belligerent Italy to be reconstituted on broader foundations, with the least possible relation to the old Fascist regime. The final *saure qui peut* of the Fascist hierarchy was precipitated by the victorious advance of Field-Marshal Alexander's armies into the N. of Italy and the surrender of the Ger. armies of Kesselring on April 29 (1945). The previous day the fallen and fugitive ex-Duce was apprehended and lynched by It. partisans in Milan. F. seems to have been more or less eliminated by 1946 when, after the elections of June 2, the new Christian Democratic Party emerged with over 200 seats, being only slightly outnumbered by the Socialists and Communists combined. See further under MUSSOLINI.

Fashion (adapted from *Fr. façon*; Lat. *factio*, making, *facere*, to do, or make), used in the sense of the pattern or mode in which a thing is done, particularly employed in the sense of the customary or usual way in which a thing is done, and hence applied to the manner or custom prevalent or characteristic of a particular period, more especially as regards dress or costume. The terms fashion and fashionable are also applied to occupations, pursuits, education, etc., as well as to the necessities of dress, though it is in the latter sense it is chiefly used. The inven-

tion of weaving may be said to be responsible for the greater variety in the matter of garments; prior to this skins were, of course, the earliest form of clothing. Variations of costume were unknown to most matrons of the auct. world, and in the E. they are as unchanging in this respect as in everything else, the word F. not having the same significance there as it has in the W. The Romans spread their dress, together with their civilisation, over Europe, and in the fifth century it was gradually modified by the close-fitting garments of the races of the N. It may be said that in the W. the hist. of conquest is the hist. of F. Thus the auct. Briton made his garments of skins, which in Roman times developed into the skin coat or tunic, and later, doublet, and this in time became the prototype of the modern coat and waistcoat. F. in its modern sense may be said to have begun in the fourteenth century; for it is then that complaints seem to have first arisen of clothes being cast aside for others of newer style. Prior to the nineteenth century men's clothes were as sumptuous and delicate in texture as women's and Pepys, in his *Diary*, records how he had his wife's gowns cut up into waistcoats for himself. A marked feature in men's dress in the fourteenth century was the change from close-fitting tunic and hose to long, loose garments. Dress was originally a symbol of rank, strictly prescribed for the various classes of society, as clearly shown by the sumptuary laws prevailing from the thirteenth to the seventeenth century; but in the modern days this state of things has fallen into disuse except in the case of uniforms in the airforce, army, and navy, law, church, etc. Nowadays everyone can clothe himself as he pleases irrespective of station and rank. Political and religious opinions have been at times symbolised by dress, as in the case of the Puritans and Quakers, but nowadays the clergy are practically the only class of the community who mark themselves off from other men.

Dress attained its highest point of significance in France during the latter half of the eighteenth century, when it marked the various stages of the Revolution. Fashionable attire grew more and more eccentric and various with the increase of political turmoil: the women of France began to clothe themselves in the styles of Greece and Rome, the gorgeous and stately dresses of the courts of Louis XIV. and Louis XV. having disappeared with the old régime.

In the eighteenth and nineteenth centuries, fashions of the well-to-do women swung from the 'romantic' clothes which were in keeping with the extravagant and 'romantic' houses built in England at the end of the eighteenth century, to the simple and almost Quakerish dresses worn during the reign of Queen Victoria. Waists have been small, and waistlines have moved up and down. As dresses became less formal the waist line rose, heels were flatter, and less stiff silk was used, muslin, calico, and chintz taking its place; fine embroidery

was used as a decoration. Feet and ankles appeared and disappeared under sweeping or ankle length-skirts. Women's hair was cut short at the beginning of the nineteenth century, dressed in small ringlets, and fringes were worn, but by about 1830 it was long again and dressed high with fantastic bows and curls. Bonnets and hats followed the prevailing dress style, e.g., with the classical lines worn around 1760, bonnets were designed on the Grecian helmet, and later developing into the poke bonnet which lasted beyond 1860. Hats during the first half of the nineteenth century were very large and much overtrimmed; but after marriage small bonnets were worn, and this fashion remained until the 1880s. Later, the low-crowned, straight-brimmed straw hats ('boaters') arrived. Parasols had been carried since about 1775, and women carried bags which they called 'indispensables'. The crinoline was introduced from Paris, in 1854, and lasted about ten years. By 1865 women's skirts were becoming straighter in front and bunched in the back. But when women were educated together in colleges, and were beginning to play games after 1870, suitable costumes were needed. Women's rights and suffrage were discussed; women entered the professions; fashion responded to these moods, and in the early eighties her figure was concealed under bunches and folds of material. Extravagant fashions followed the Franco-Prussian war, sleeves were puffed, the full bustle returned and every extravagance in dress was encouraged. Then came the gay nineties, when dresses were over-decorated, but not beautiful. However, towards the end of the century, with the advent of the safety bicycle and lawn tennis, women's clothes became less hampering, so giving them more freedom and happiness. *Vests* were worn by women in 1884, at the time when mechanically-propelled vehicles were permitted to travel at 12 m.p.h. along untarred roads, to keep the dust from their hair. In the nineties the Amer. C. D. Gibson, originated the 'Gibson Girl' who figured in Amer. illustrations and advertisements. He thereby influenced the fashion of his day, and did much towards fostering freedom in women's clothes. This period was superseded at the end of the First World War by that of the 'flapper' with bobbed hair and knee-length skirts.

Some changes took place in men's clothes during the eighteenth and nineteenth centuries. For instance, knee breeches descended to mid-calf; shoes were tied instead of buckled; pantaloon of stockinette were worn to the ankle, with black silk socks and pumps for evening. Broad-brimmed Napoleonic hats replaced three-cornered ones, and gradually the crowns rose and, by the end of the eighteenth century the first tall silk hat had arrived. Men's hair was cut short; side whiskers were worn; collars stood up each side of the chin; dark cravats covering shirt fronts and collars. Coats were cut away to reveal silk waistcoats. Men's sleeves were worn

full at the top and gathered or pleated into the armholes; wide topped trousers narrowing at the bottom and strapped under the instep were made in white or coloured nankin; mackintoshes came in (Charles Macintosh having invented waterproofing in 1825). By 1855 mous-taches, which had previously been the privilege of the military, appeared. Later, men's trousers and sleeves became tight and the skirted frock-coat was generally worn. During the industrial period, however, men's clothes became greyer and greyer and more uniform.

At the beginning of the twentieth century, women's skirts became tighter, sleeves plainer, and in 1911 the long tight (hobble) skirt came in. Women adorned their dresses with hand-made lace, and large hats were worn. Clothes were made of woven fibres of wool, hair, cotton, flax, or silk. Later, artificial silk or rayon was produced from wood pulp, costing much less than pure silk.

The First World War had a far-reaching effect on women's mode of dress. Utility and serviceability attained a wider recognition than ever before, and women even defied attempts to impose upon them fashions which they felt would interfere with their freedom of movement and action. Women wore uniform, and tailor-made costumes came into wear. Elaboration ceased and simple 'slip-on' dresses were worn on all occasions. Waistlines

dropped to almost hip level. The abbreviated skirt, at one time carried to an undignified extreme, was favourably regarded by women for day wear, in place of the long, hampering, and unhygienic skirts of former days; sleeveless, low-necked, frocks were seen on r.v. and tennis court, cloche hats were worn and neutral shades prevailed.

Between the World Wars, Paris and Vienna may be said to have set the fashion in women's dress, while London was rapidly gaining in popularity, and Savile Row tailoring was still regarded as the mark of a well-dressed man. By 1926, skirts were beginning to be worn longer, and full length evening dresses returned. Women were less corseted than for many decades.

Men's wear during Edwardian times was formal, and the frock-coat and top hat were seen on Sundays and special occasions. The bowler hat, which had been the informal country hat of the 1850s, became the height of fashion for town wear. Later, the soft felt ('Trilby' or 'Homburg') was fashionable, and remains so. The 'lounge' suit has become the formal wear for town, and flannel or corduroy trousers with tweed jacket, knitted woollen pull-over, Amer-lumber-jacket, or battle-dress blouse, are worn in the country or on informal occasions.

Children's clothing followed the fashion

of their elders, up to the early eighteenth century. They were hampered in movement, the boys being dressed in long coats, periwigs, tight knee breeches, high heels, and tricorn hats. But in the 1770s, children's clothes were being considered specially for them, and not as diminished replicas of their elders' fashions. Little boys wore long loose trousers, and shirts with low necks; but little girls still wore long frocks. At the end of the eighteenth century, frocks, made of soft cotton materials in white or pastel shades, were simple and charming (as seen by Kate Greenaway illustrations). At the beginning of the nineteenth century, bonnets were worn, collars frilled and goffered, 'Empire' frocks made in soft light materials appeared. Later, girls wore large hats, leg-of-mutton sleeves, and pantaloons. 'Back interest' appeared in little girls' frocks during the 1870s, frills, large bows, and fullness; and 'sailor' suits came in for boys. Eton collars and bow ties appeared a few years later. Thick dark materials were used for children's clothes by 1890, and smocking decorated the more expensive frocks. A new style of trousers, called 'shorts,' were worn by boys at the end of the nineteenth century, and also the black velvet 'Lord Fauntleroy' suit. White and cream replaced the dark materials of the preceding period, but some little girls still wore long frocks. However, in the early twentieth century children's clothes were shortened, boys trousers and girls frocks being worn just below the knee; and embroidery decorated cotton frocks. In 1914 the waistline dropped to around the thighs and remained there for two years. At this time a greater variety of materials was being used for children's clothes—the harder wearing tweeds, flannels, and serge for boys; and brightly coloured and patterned ginghams, voiles, and soft silks for girls. Knitting had become a habit and knitted jumpers and dresses became fashionable. Little girls' hair was cut short and large bows appeared. Clothes for children have now become much less cumbersome—dungarees, lumber suits, and play-suits for summer wear are sensible and popular garments.

For some years before, and during, the Second World War, sleeves were full and shoulders square. Skirts were worn shorter during the war: women went into uniform; and austerity reigned in Britain. The tailor-made costume with short blouse, or the tailored shirt frock, was generally worn. Paris fashions, although continuing throughout most of the war years, had little or no influence in Britain until almost three years after the war in Europe had ceased, when the 'New Look' came in with a flourish. It was accepted with eagerness; fresh interest was awakened in women's clothes; but its exaggerated lines gradually became modified. The nipped-in waist with full, short, basque, rounded shoulders, full skirts, calf or ankle length, was the fashionable suit for the spring of 1948. Summer fashions varied from the extreme

in design to the simple, well-cut frocks; and the 'New Look' suit, made in rayons and linens, was popular. Straw hats returned; the bonnets and pancake hats from Paris decorated with artificial flowers and tulle; together with the 'boater,' predominated.

In the autumn of 1948 the 'New Look' was very much modified and easier to wear. Sloping shoulders, tight waists, simple bodices with emphasis on skirts, calf-length for day wear, and longer for formal occasions. Skirts had two lines: the fullness which appeared at the hips in the ballerina skirts has now given way to pencil-slim lines, sometimes with fullness disguised in pleats or panels; or they flare from a slim hipline. The 'Gibson girl look' became popular again—tailored silk and soft chiffon blouses returned. Costume jackets still have nipped-in waists, rounded shoulders, and moderately curved hiplines, worn with either very slim skirts, or skirts moderately flared from the hips. Coats are full-backed loose or tent-like for informal or sports wear, collars and cuffs being large and hoods are sometimes seen. Formal coats are fitting to the waist with flared hemlines, and back interest. Weathercoats have at last been designed to brave wind and rain and yet look attractive. Proofed gabardine and corduroy are used for this purpose, and also a new material from Franco, called 'Contre Plaque.'

Dresses were sharply divided between the simple cut of the calf-length day dress, to the extravagant and striking fashions of formal afternoon and evening wear. 'Romantic' evening dresses with 'back interest' were designed, and the 'Empire' style reappeared. Many were décolleté and usually accompanied by fitted boleros or jackets. Also in the expensive models, tight hobble skirts and spectacular bustles were seen; but these exaggerated styles were ignored in the popular designs for the majority. In 1949, accessories were all important. For evening wear long Fr. suede gloves and scarves, and stoles are being worn to cover the shoulders in décolleté dresses. Fur was used as a trimming to emphasise large collars, cuffs, and pockets. Day jackets of velveteen trimmed with astrakan were worn over pleated skirts. Muffs were carried again, and fur booties worn. Umbrellas appeared in gay taffetas with rosette tops. In the hats for the winter no one style predominated but all fitted well on to the head and there was no ornamentation at the back to embarrass high-collared topcoats. Soft felt was used, almost all trimmed with veiling. Feathers were an important feature, and the bonnet came back. High-heeled shoes returned, and the court shoe was being generally worn. Some of the fabrics used included the woollens for all-day wear in pastel shades, seasonal shades being predominant. Checked and speckled tweeds of Scottish influence, and blanket and pilot cloths were used for sports and travel wear. Pile-surfaced woollens, such as velours and broadcloth,

are used for the more formal coats. Reversible overcoatings which need no lining, were popular for top coats. Formal afternoon and evening dresses were made of fine wools, rayons, taffetas, satins, and stiff silks. Velvet returned for evening wear. Corduroy material lends itself to so many uses in women's clothes, such as the informal slacks, sports jackets, formal coats and dresses, etc. Jewel colours predominate in this material, such as ruby, emerald, sapphire, etc. Nylon, which is a synthetically produced silk, is now widely used for stockings, underclothing, blouses, etc.

The development of athletics among women has greatly influenced their clothes. In the early days of lawn tennis women wore frocks or blouses and skirts in the prevailing fashion, but when skirts became long in the early 1930s a tennis costume at last appeared: stockings were gradually discarded; shorts were worn; and a sports suit was estab. quite independently of the fashion of the day. Bathing suits have to-day become extremely brief, consisting of brassiere tops and slips, but there is now a tendency towards the classical one-piece swim suit with V neck. Beach wear varies from the 'ballerina' beach-dress to the loose-fitting sailor's tunic worn over a swim suit or calf-length slacks. Full length slacks, in various materials—corduroy being popular for its hard-wearing qualities—are an easy garment for the present-day woman. Some riding clothes still retain their early nineteenth-century look. Men's shooting or country dress was specially designed about 1770, but in the early years of this century 'plus-fours' were designed for golfers, but later these became daily wear for some. Men have long discarded the top hat once worn for cricket; and tight knee-breeches and shirts have been replaced by cotton shorts and vests for football. Many developments of sports clothes have been Brit. products, the harder wearing woollen materials coming from Scotland; and with finer tweeds and smarter cuts it is expected there will be a new step forward in sports wear and that Britain is likely to excel in this product both at home and abroad. The kit of the present-day skiing enthusiast, skater, or woman aviator, would excite the envy of the old-time 'emancipated' cycling woman whose attempt to introduce the 'bloomer' costume was frustrated by public opinion. Women's stockings and underclothes, too, have changed from calico and cotton to pure or artificial silk; they are well cut and quite unlike the straight short-line chemises of former days. Silk petticoats are in fashion again, with the long skirts and frocks.

Fashion has changed much in this century, and it is difficult to say exactly what influences it. Wars, and post-war extravagances; economics, availability of fabrics; sport and education; all tend to have their influence, but it is the designer, himself, who dictates and most women follow his lines. Fashoda (renamed Kodak in 1904), port on the W. bank of the Upper Nile, Egyptian Sudan, 459 m. S., by riv., of Khartum. It is the cap. of the *madiria* (prov.) of the Upper Nile. The station is built on a flat peninsula, separated, when the Nile is high, from a low-lying is. in the riv., with which it runs parallel, by a narrow strip of swampy ground. The climate is most unhealthy. F. is the residence of the 'Mok', or king of the Shilluk tribe. The Egyptian military post was estab. at F. in 1865, which was also an important trading station. In 1883-84 the post fell into the hands of the Mahdists. In 1898 the Fr. commandant, Marchand, with a force from the Congo, hoisted the Fr. flag there. Sir Herbert Kitchener, having just captured Khartum, re-hoisted the Brit. and Egyptian flags at F., and invited Marchand to withdraw. The latter refused, and the matter was referred to London and Paris. The Fr. protested that the Egyptian occupation of the Sudan had been suspended by the Mahdist domination and that it was open to them to make a settlement on the Nile. For a while the tension between the two countries was extreme, but in Dec. of the same year France, uncertain of the support of Russia, ordered the withdrawal of the Marchand expedition.

Fast and Loose, also called Pricking at the Belt, a cheating game much practised by sharpers at the fairs, especially by gypsies in the time of Shakespeare. A leathern strap is rolled or doubled up with a loop in the centre, and placed edgewise on the table. The sharper then seeks for some one to bet that he can catch the loop with a skewer, which looks easy; he then unrolls the belt in such a way that

the catching of the loop is an impossibility. From this game comes the expression 'to play fast and loose'; the modern name of the game is 'Prick the Garter.'

Fasti (Lat. *fastus*, lawful), the days on which it was lawful to do business. In early Rom. days such days were declared by the priests and later set up in the Forum on tables called *F.*, which were practically the equivalent of calendar. They were of two kinds, the '*F. sacri*,' or '*kalendares*,' strictly the calendars of the year, containing the list of lawful and unlawful days, the days for festivals and courts, etc., and the '*F. annales*,' or '*historici*,' which contained the names of the consuls and other magistrates, and such historical events as were considered worthy to be noted. See Ovid, *Fasti*.

Fasting, is strictly abstinence from all food and drink for a given period, but it is much more commonly used for abstinence from certain kinds of food only.

(1) *Religious*.—It is an accompanying feature of nearly every known form of religion; its motives and modes of practice varying, of course, according to race, climate, and civilisation. The origin of the practice is buried in obscurity; some authorities suggest that it arose from the custom of providing food for the dead, others that it was a preparation for the receiving of sacramental food, and others that it is the subjection of the lower nature in order to exalt the higher for the seeing of visions. Whatever the motive, partial or complete abstinence from food at stated periods was practised at a very early date by Parsees, Hindus, Egyptians, Assyrians, Gks., and Roms. It was a prominent and inseparable feature of the Jewish ritual. The solemn national fast on the tenth day of every seventh month (the Day of Atonement), the penalty for the non-observance of which was death, was the only public fast ordained in the Books of Moses (Lev. xvi. 29-34; xxiii.), but the practice of private and occasional public fasts, at periods of national calamity, is frequently recorded (Judges xx. 26; 1 Sam. vii. 6; 2 Sam. xii. 16). During the captivity the fasts of the fourth, fifth, seventh, and tenth months were instituted to commemorate certain incidents in the downfall of the nation. The number of special fasts mentioned in the N.T. and practised by the Pharisees and the disciples of St. John the Baptist (Luke xviii. 12; Mark ii. 18), although insisted upon by the Pharisees, were really voluntary, and were probably never practised by the sect of the Sadducees and others. There is no reason to doubt that our Lord observed the one great national fast, but He neither upheld nor practised the fasts ordained by the Pharisees. The apostles and the fathers of the early Christian Church, however, influenced probably by such passages as Matt. ix. 15, not only practised it themselves, but instituted *F.* as an obligatory practice for all the members of the Church. In the Rom. Catholic Church there are the great forty days' fast of Lent, the quatermonth fasts of three days in one week of each of the four seasons, while every Friday there

is abstinence from all flesh foods, and on the eves of certain feasts. In the Gk. Church the practice is followed with much greater severity, and the fast days cover about three-quarters of the year. In the Anglican Church *F.* is regarded only as a useful exercise, praiseworthy, but never obligatory, and not in itself a means of grace; the Prayer Book, however, enumerates the forty days of Lent, all the Fridays in the year with some exceptions, Ember days, Rogation days, and the eves or vigils of certain festivals. In Scotland the sacramental fast days so long observed have almost entirely fallen into disuse. The Moslems, as an offshoot of the Jewish and Christian communities, adopted the practice of *F.* with many others; they regard it as an efficacious means of averting the wrath of Allah in national calamities, and of mitigating the penalties of sin. The month of Ramadan, in which Mohammed brought the Koran from Heaven, is strictly observed as a complete fast for all the faithful, eating, drinking, and smoking being forbidden from sunrise to sunset, and voluntary fasts are common. See H. Nelson's *Festivals and Fasts of the Church* (24th ed. 1782); E. I. Lane, *Modern Egyptians*, 1836; Liesmayr, *Die Entwicklung der Christlichen Fastendisziplin*, 1877; E. Westermarck, *The Principles of Fasting*, 1907; R. Arbesmann, *Das Fasten bei den Griechen und Römern*, 1929. See also JEWS and MOHAMMEDANISM.

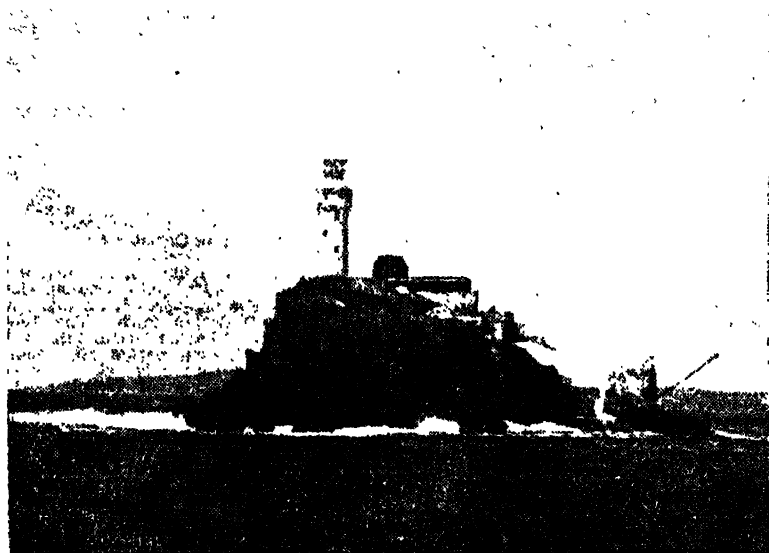

(2) *Medical*.—It is more especially to the abstinence from solid food that the term *F.* is applied. By experiments it has been proved that water is a great prolonger of life, so that whereas the human body cannot survive total abstinence for more than eight days, by taking water freely it is possible to sustain life for thirty or forty days. A Welsh girl, in 1859, who pretended that she had lived for two years without food, was put under the observation of doctors and deprived of food and water, but she died within eight days; whereas, in 1888, a Frenchman named Jacques, fasted from solid food for thirty days, but took water freely, and the same experiment was successfully tried for forty days by an It. named Lucel, in 1890. Some embombed miners survived for ten days in 1876, being kept alive by the aqueous vapour in the mine. Observations have proved that the body wastes less rapidly when kept warm and at rest; the external application of salt water has sometimes kept shipwrecked sailors alive, but they seem especially liable to delirium. The process of starvation is observed in the waste of the various tissues of the body, first the fatty tissues, and then the proteids of the muscles; emaciation is, of course, invariable, and a lowered temp., while apoplexy and intestinal ulceration are frequently accompanying features. A craving for food is insistent in the first days of a total fast, but diminishes, and torpor succeeds it. See J. Oldfield, *Fasting for Health and Life*, 1924.

(3) *Political or Contumacious*.—*F.* has, in modern times, been frequently resorted

to as a means of securing political ends. Thus, in the earlier days of the Feminist movement, 'suffragettes' fasted in the hope of furthering the attainment of their political goal. Hunger-strikes have frequently led to political embarrassment in Ireland, where persons convicted of unlawful activities against the State, have sought by this means to foment national sympathy for their 'martyrdom.' Forcible feeding is generally attended in these cases, but in others the attempt has been

with honour in France until 1440, but never completely cleared himself of the popular charges against him. He was reputed to have favoured Lollardy, which may account for Shakespeare's use of his name in Henry IV. when he dropped that of Oldcastle (*q.v.*). See *Chronicles of Monstrelet* and *Paston Letters*. See FAST-STAFF, SIR JOHN.

Fat, in chemistry, mixture of glycerides. When the suet of beef or mutton is heated in a muslin bag in water, and

FASTNET ROCK AND LIGHTHOUSE

L. Roumanus

unsuccessful and the 'hunger strikers' have either yielded or died.

Fastnet Rock, rock in lat. 51° 23' N. and long. 9° 36' W., situated about 4 m. S.W. of Cape Clear, off co. Cork, Ireland. A lighthouse erected in 1854 stands on the rock, and the light, which is revolving and 160 ft. above high-water mark, is visible for 18 m.

Fastolf, or **Fastolfe**, Sir John (c. 1378-1459), Eng. soldier probably b. at Calster, near Yarmouth. He served as a soldier in Ireland (1405-6), in Gascony (1413), and the campaigns of Henry V., and distinguished himself at Azincourt (1415) and 'the battle of the herrings' (1429). In 1423 he was appointed governor of Maine and Anjou, and created Knight of the Garter in 1423. The cause of the Eng. defeat at Patay (1429) was long a matter of dispute, and F. was deprived of the Garter by Bedford on a charge of cowardice, but was reinstated. He served

kneaded so that the membranes of the F. globules are broken, the melted F. may be collected in the form of a liquid which rapidly cools to tallow. If this tallow be heated to about 200° C. under pressure, it decomposes into glycerol or glycerin, a sweet syrup used in toilet preparations, and certain acids known as fatty acids. All the Fs., butter, lard, bone-fats, etc., and the liquid known as olive-oil, linseed-oil, palm-oil, etc., behave in this way. Glycerol is a trihydric alcohol, and, like the alcohols generally, reacts with acids to form ethereal salts, or esters. The esters of glycerol are termed glycerides, and are distinguished, according to the acids with which they are associated, as triacetin, tripalmitin, tristearin, triolein, etc. The chief glycerides present in Fs. are the solids tri-*almitin* and tristearin, and the liquid tri-*olein*. The relative proportions of solid and liquid glycerides determine whether the substance is a F.

or an oil at ordinary temps. Tallow, for instance, contains a preponderating proportion of tripalmitin and tristearin; lard, which is much softer, contains more triolein, while olive-oil contains a preponderance of triolein. At moderately high temps. the glycerides are decomposed by water into glycerol and their corresponding acid; thus, tristearin yields glycerol and stearic acid, triolein yields glycerol and oleic acid, and so on. The chief uses of Fs. are in the manufacture of soaps, as ingredients in articles of food, as lubricants, and as media for colouring matter, etc. Fs. constitute an important item in an ordinary diet. They contain a relatively higher proportion of carbon than protein, which is the chief constituent of lean meat; and as carbon is discharged in large amounts from the body, it is desirable to replace it by a corresponding preponderance of Fs. and carbohydrates in the diet. In Arctic regions, where the heat of the body has to be kept up by a plentiful supply of combustible material, human beings crave for F. to an extent incomprehensible to dwellers in temperate climates. See E. R. Bolton, *Oils, Fats, and Fatty Foods*, 1928; H. K. Dean, *The Utilisation of Fats*, 1938; T. P. Hilditch, *The Chemical Constitution of Natural Fats*, 1940. For F. in the digestive process, see DIGESTION. See also ADIPOSE TISSUE.

Fatalism, philosophic doctrine of the futility of human struggles against destiny, and is the basis of such different systems as those of Hegel and Herbert Spencer. The Stoics associated it with the idea of necessity, and contended that as such it was a power unalterable even by God. Theologically, it is the belief that life is governed by inevitable laws which depend on the arbitrary decrees of an Almighty, and also by the laws of nature; it is exemplified in Spinozism and in the later ideas of predestination. F. is essentially an Oriental conception, and is the predominating spirit of E. philosophy, literature, and religion, finding its strongest expression in the Mohammedan idea of Kismet.

Fata Morgana, It. name for a curious kind of mirage frequently observed in the Straits of Messina, and so called because it is supposed to be caused by the fairy (*fata*) Morgana of the Arthurian legends. An observer on the shore frequently sees men, ships, or houses, sometimes in the air, sometimes in the water, the same object frequently having two images, one inverted. The cause is the same as that of the desert mirage. See MIRAGE.

Fatehgarh, see FUTEHGHUR.

Fatehgarh, or Futehgarh, tn. of India, and the administrative headquarters of the dist. of Farrukhabad, situated on the Ganges in the Agra div. of the United Provinces. It was a Brit. military station since 1802. Scene of a European massacre (Indian mutiny, 1857). An Amer. Presbyterian mission settlement is here. Pop. 20,000.

Fatehpur (Futehpur). (1) Cap. of a dist. of the same name in the Allahabad div. of the United Provinces, India, 73 m. N.W. of Allahabad. It has two fine mosques,

and a trade in grain, butter, and leather, especially ornamental whips. The dist. lies in the S.E. corner of the Doab (*q.v.*), between the Ganges and the Jumna, with an area of 1618 sq. m., most of which is highly cultivated. Pop. of dist., 650,000; of tn., 15,000. (2) A fort. tn. of Rajputana, 145 m. N.W. of Jaipur. Pop. 16,000.

Fatehpur Sikri, former cap. of the Mogul empire, 23 m. W. of Agra, founded in 1569 by Akbar as a thank-offering for the birth of his son, Selim. The magnificent architectural ruins, enclosed by a high wall 7 m. in circumference, include a splendid mosque and sev. palaces, including that of Akbar. It was deserted within fifty years of its foundation owing to lack of water. Pop. about 6000.

Fates, *The*, see MOIRAE.

Father, see FAMILY; PARENT; and CHILD.

Fatherhood, *The Divine*, the metaphor of Fatherhood is used in most branches of the Christian Church to show the distinctive feature in the Christian idea of the relation of God to man. In ethnic religions the idea is foreshadowed, but before the coming of Christ it hardly went beyond the idea of God as the progenitor of all things. The idea of the personal and individual relationship between God and each of His creatures is an inherent part of the Christian faith. The Jews called Jehovah 'Father' (Isa. lxiii. 16), and called their own nation His 'Son' (Isa. xi. 1), but they only acknowledged Him as the 'Father of Israel'; the Gentiles were excluded. Christ included all men (Luke vi. 35) as 'children of God', although undoubtedly the phrase 'your Father' which occurs so frequently in the 'Sermon on the Mount' refers more particularly to His own immediate followers (Matt. v. vi. vii.). In this sense it is used by St. John (I. iii. 1-2), and still more clearly so by St. Paul in his use of the figures of 'adoption' (Roms. viii. 14-15), where he clearly shows his belief that it is only those who 'knowingly' are led by the Spirit of God who are His 'Sons.' As Christ Himself draws the distinction between 'My Father' and 'your Father' (N.B.—He never speaks of 'Our Father') so does St. Paul amplify it (Roms. viii. 15-17). Some few sects of the Christian Church, notably the Calvinists, have denied the 'Fatherhood' of God, regarding Him only as the 'Judge', which would account for the unbending sternness of their teaching. See H. S. Candlish, *The Fatherhood of God*, 1866; C. H. Wright, *The Fatherhood of God*, 1887; H. H. Wendt, *Teaching of Jesus* (trans. Wilson), 1892; A. B. Bruce, *Kingdom of God*, 1889; A. M. Fairbairn, *Christian Modern Theology*, 1907; N. Söderblom, *Das Werden des Gottesglaubens*, 1916.

Father of the Chapel, name bestowed on a person in any printers' trade society who is held responsible for seeing to the faithful performance of the duties and regulations by the members of that society. A chapel exists for each section of the trade, i.e. composing-room, stereotyping, etc., within each printing house.

Fathers, Apostolic, see APOSTOLIC FATHERS.

Fathers of the Church. The patriarchs are described in the O.T. as the 'Fathers of Israel,' and the early Christians, who looked upon themselves as spiritual Israelites, kept up the use of this title. But for long the Christians abstained from giving the name 'father' to their own spiritual heads, for they remembered our Lord's warning, 'Call no man your father upon the earth' (Matt. xxiii. 8). However, we read that the mob of Jews and pagans at the martyrdom of Polycarp cried out, 'This is the Christians' father.' In the fourth century we find that Athanasius defends the term *πατριάρχης* as having been earlier used by certain 'fathers,' and after this the word frequently occurs in councils, such as those of Constantinople and Chalcedon. In the stricter sense of the term, the Fathers of the Church are those writers of the early centuries who were remarkable for their perfect orthodoxy, and great sanctity, and their writings have ever been regarded as, after the Bible, the most valuable portions of Christian literature. The term is, however, also used to include Tertullian and Origen, and other writers either slightly or entirely heterodox. In the great *Patrologia* of the A. B. Migne, writers such as Theodoret of Mopsuestia and Pelagius are included, but these come under the last head of the sub-title, which runs: *Sive Bibliotheca omnium Patrum, Doctorum, Scripturumque ecclesiasticorum.* Those tainted with heresy or of very slight importance are, indeed, generally spoken of not as 'fathers' but as ecclesiastical writers (*scriptores ecclesiastici*), though they are sometimes included under the former title. Thus the study of patristics or patrology is not restricted to orthodox writers. Almost invariably the fathers of the first century are considered apart from the rest under the title 'Apostolic Fathers,' and so we have here a good starting-point. This distinctive title was bestowed upon the immediate friends and disciples of the Apostles, while the *patristic* period proper may be said to commence with the second century, but no definite date can be assigned as marking its termination. Migne, in his *cursor completus*, carries his patrology down to about 1200 for the Latins and to the Fall of Constantinople for the Gks., but for ordinary purposes this range is too extensive. A more common boundary is the time of Gregory the Great (d. 604) in the W. and that of John of Damascus (756) in the E. After this time the freshness and spontaneity of thought which mark the early writers almost entirely disappears. Two groups of the fathers stand out pre-eminent above the rest, and receive the title 'Doctors of the Church.' The W. or Lat. Doctors are Ambrose, Augustine, Jerome, and Gregory the Great; the E. or Gk. Doctors are Athanasius, Basil the Great, Gregory of Nazianzus, and John Chrysostom. The chief div. between the Apostolic Fathers and the limits named above comes with the Council of Nicea and the Conversion of

the Empire. Chief among the Ante-Nicene fathers may be named: Justin Martyr, Clement of Alexandria, Origen and Dionysius, Gregory Thaumaturgus, Methodius, Tertullian, and Cyprian. Chief among the Post-Nicene fathers we may mention Eusebius of Caesarea, Athanasius, Cyril of Jerusalem, Basil, Gregory of Nazianzus, Gregory of Nyssa, John Chrysostom, Theodoret, Cyril of Alexandria, Photius, Hilary of Poitiers, Ambrose, Augustine, Jerome, Rufinus, Leo the Great, John Cassian, Hilary of Arles, Vincentius, and the English Bede. See J. G. Dowling, *Notitia Scriptorum ss. Patrum*, 1839; H. G. Krüger, *History of Early Christian Literature in the First Three Centuries*, trans. 1897; F. J. Hort, *Six Lectures on the Ante-Nicene Fathers*, 1895, and various eds. of the fathers.

Fathom, measure of 6 ft. chiefly serviceable for taking marine soundings such as regulating cable lines; also used for mines. This metre is the standard for most European nations. The word fathom comes from the A.-S. *fæthm*, the measurement of the width to which the two outstretched arms extended.

Fathometer. Instrument for measuring the depth of the ocean, by measuring the interval of time that elapses between the production of a sound at the surface of the sea and the arrival of the echo from the bottom. Great strides have been made in recent years in the development of these instruments, first suggested in 1912 after the disaster to the *Titanic*. To-day every important ship is equipped with a F., and the reader is referred to *Wood's Sound Waves and their Uses* (1930) for an excellent account of the various types now used.

Fatigue: (1) In physiology, 'Muscular F.' is the diminishing of the contractions brought about by stimuli. The muscle is a machine for utilising the energy contained in its own chemical compounds: if the excitations of the muscles are continued beyond a certain point the muscle cells are poisoned by the excreta of their own waste chemical products. The muscle recovers if allowed to rest unstimulated for a time, or more quickly if washed with an innocuous but un-nutritious solution such as 6 per cent NaCl in water. The same waste-products of the muscles produce 'F.' in the unsheathed ends of the nerve-plates, and the central sensor and motor nerve cells exhibit the same phenomena and a general irresponsiveness to ordinary stimuli.

(2) In materials, F. is the term used to denote the weakening of a metal bar by a repeated succession of the strain of loads considerably less than the breaking weight of the bar, as when a car-axle breaks from the continued strains and blows which it experiences, or a member of machinery, such as a piston-rod, which is constantly in alternate tension or compression. F. of metals is due to a molecular change in the metal due to vibration or the constant application of a varying strain.

Fatigue-duty is that part of a soldier's work which is distinct from the use of arms and military drill, such as loading stores.

'Fatigue call' is the bugle note which calls to such duty, and 'fatigue dress' the uniform worn while engaged in it.

Fatima (600-632), daughter of Mohammed and Khediya. She was considered by her father to be one of the four perfect women of Islam, and was espoused to Ali, Mohammed's nephew and adopted son, when only fifteen years of age.

Fatima, vil. in Portugal that was the scene of miracles in 1917, now a place of pilgrimage.

Fatimides, name given to a dynasty of Arabia, which reigned for nearly two centuries over Egypt. Its founder, Obaidallah, claimed to be descended from Fatima, daughter of the prophet Mohammed, and Ismael, great-grandson of Ali. But later it was suggested that the founder of the dynasty had no right to the sovereignty, and that he was in reality descended from a family of heretics known as the Carmathian sect. When Obaidallah came into power, he assumed the title of Al-Mahdi, Commander of the Faithful, and reigned supreme over the whole Muslim world. But he became unpopular through his assassination of Al Shii and his brother; his reign was one long series of hostilities against surrounding powers. He d. in 933, and was succeeded by Al Qu'aim, who was much pestered by the conspiracies of Abu-Yazid and his sons. He was defeated by them at Kalrawan in 943, and in 944 was imprisoned in his own cap. He d. in 945 during the Siege of Susa, and was succeeded by his son Al Mansur Isma'il. Abu-Yazid was finally quelled by this sovereign. The centre of the F. power became ultimately transferred to Egypt in the reign of Mo'izz liden Allah, who expelled the reigning family and, assuming the title of caliph, founded the city of Cairo (970). But after his death the power of the F. gradually waned, and they were content to allow the gov. to fall into the hands of the viziers. The sovereignty of the F. was at last only recognised in certain external ceremonies and observances, such as the mention of them in public prayer, the impression coins, and the paying of tribute to the vizier of Cairo. The last F. caliph to reside in Egypt was Al-Adid. After his death, the founder of the dynasty of the Ayubides, Saladin, reigned over Egypt.

Fattening Foods, Fodder, and Forage Crops, term used to denote those foods which are mainly used for 'feeding up' cattle. Investigation has shown that in estimating the value of animal manure (feeding stuff for plants) 90 per cent of the nitrogen of food may be reckoned to be recovered in the case of feeding cakes, pulse, and other highly nitrogenous foods, 85 per cent in case of foods comparatively poor in hydrogen, e.g. cereals, roots, etc., and less than 65 per cent in the case of bulky feeding stuffs such as hay and straw. As a source of manure the value of fattening food is greater the more nitrogen they contain. Practically speaking, the whole of the mineral constituents and about nine-tenths of the nitrogen of food are recovered in the dung and urine. For

the same weight of dry substance consumed, oxen void more manure than sheep, and sheep more than pigs. The composition of the different foods given to fattening animals being well known, it is easy to calculate the amounts of nitrogen, phosphoric acid, and potash of the food which will be recovered in the manure. Each constituent having its mkt. value as a manuring constituent, the money value of the manure obtained from the consumption of a ton of any ordinary food of which the composition is known can be easily determined. Assuming ammonia to be worth 8d. per lb., potash 2d. per lb., and phosphate of lime 1d. per lb., the money value of the manure produced by the consumption of a ton of various foods can be deduced.

Fodder crops, or forage crops, are grown for consumption by live stock in the green or succulent state, and include numerous leguminous plants, a few cruciferous plants, any of the cereal crops in a green condition, and other grasses, including the ordinary hay crop if eaten fresh, or if stored as silage. Fodders have the important advantages of requiring a minimum of labour, and in some cases of growing so rapidly that they can be produced as catch crops in the intervals between the crops of ordinary rotation, while leguminous fodders actually improve and renovate the soil. Cabbages and thousand-headed kale are very nutritious fodders, and given a fair rainfall grow anywhere, resisting frost well and liking transplanting; they need a heavily manured soil, and can be consumed on the land by sheep or cut and eaten in the yards by cattle. Rape grows in any soil, and follows early potatoes or an early corn crop, or provides a succession of green food for sheep after two or three months. White mustard grows rapidly, providing a good sheep food in six weeks or less. Of leguminous fodders the varieties of clover are the most important. Crimson or It. clover, commonly called Trifolium, is grown as a catch crop after corn, the other needing usually a full year to provide sufficient growth. They are therefore sown with corn crops, commonly being broadcasted just before or after the first hoeing of the cereals. Lucerne is very valuable on dry calcareous loams and in dry seasons, owing to its deep rooting habit, yields an abundance of rich green food. In clean ground it can stand a number of years and be frequently cut. Sainfoin requires similar culture, and on limestone soils is of great importance in sheep farming. Vetches and tares are grown to provide a long succession of green food for sheep and also for cattle and horses. Lupins make a rich sheep food on poor sandy soils, and the young shoots of gorse are eaten readily and are utilised on otherwise barren land. Other important fodders are rye, grass, maize, and prickly pomefrey. See D. H. Robinson, *Leguminous Forage Plants*, 1937; J. S. Watson, *The Science and Practice of Conservation: Grass and Forage Crops*, 1939; M. Hall (ed.), *Five Hundred Varieties of Herbage and Fodder Plants*

(Commonwealth Agricultural Bureau), 1948.

Fatty Acids, group of organic compounds so called because the higher members are found combined with glycerol in fats (*q.v.*). They have the general formula $C_nH_{2n+1}CO\cdot OH$, and may be regarded as derivatives of the paraffins, the alcohols, or the aldehydes. The prin. members of the series are formic acid, acetic acid, propionic acid, butyric acid, valeric acid, heptylic acid, lauric acid, myristic acid, palmitic acid, and stearic acid. The first six, except acetic acid, are liquid at ordinary temps., possess a pungent smell, and are readily miscible with water and alcohol. The higher members are solids of a waxy or fatty nature, have little smell, are insoluble in water, but are dissolved by alcohol and ether. They are very stable compounds, and, with the exception of formic acid, they are oxidised only with difficulty.

Fatty Compounds, or **Aliphatic Compounds**, one of the great divs. into which the substances studied in organic chemistry are divided. The word "fatty" was originally applied to the acids derived from the paraffins, but is now extended to denote all compounds regarded as directly or indirectly derived from methane.

Fatty Degeneration, a derangement of metabolism by which the protein matter of the tissues, is replaced by fat. Under normal conditions, globules of fat pass from the digestive tract into the tissues, where they are either oxidised to keep up the heat of the body, or are stored in the cells of adipose tissue. Under certain morbid conditions, however, the oxidising capability of the cells seems to be interfered with. The cytoplasm is invaded by granules of fat which can be recognised by the usual fat-staining reagents. The manner in which the change is brought about is somewhat obscure, but it is always associated with some toxic agent. All dead and decaying matter in the body undergoes F. D.

Faucher, Léon (1803-54), celebrated Fr. statesman and writer on political economy. He both ed. and contributed to the political journals, the *Constitutionnel* and the *Courier Français*. In 1842 he visited England in order to study the industrial conditions and afterwards compiled his *Etudes sur l'Angleterre* (1845). At the close of the Revolution of 1848 appointed minister of public works for the dept. of Marne and later on minister of the interior. Served under Louis Napoleon, but resigned his office when the emperor advocated universal suffrage. He was a firm upholder of free trade.

Faulstich, Helena Saville (1817-98), Eng. actress, daughter of John Saville F. She took the Shakespearian parts of Juliet, Imogen, and Hermione, and made such an impression on Macready that he engaged her to take the leading characters in Lytton's *Duchesse de la Vallière*, *Lady of Lyons*, and in Browning's *Stratford*. She married Theodore Martin, in 1851; he was knighted in 1880.

Faults is the name given to any displacement of strata or veins in the earth's crust. They occur in the group of rocks known as sedimentary or stratified rocks. These consist of regular layers of rock of various kinds. Many railway cuttings show examples of rocks formed by sedimentary deposit, and the regular layers which the solid rocks thus exposed to view exhibit can easily be seen. Every running brook which carries down particles of sand, earth, or gravel and deposits them in the lower portions of the bed shows the agency which must have produced the various sedimentary formations. All such strata must have been formed in like manner during long periods of time, and what is now dry land must formerly have been under water. The highest parts of what is now the dry land of the globe were once covered by the

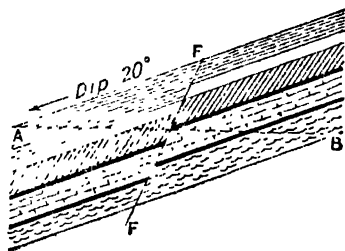

DIAGRAM OF FAULT (FF)

The angle made by the slope of the strata with the horizontal line AB is the angle of dip of the strata

ocean. It seldom happens that the sedimentary strata exhibit a horizontal arrangement through any great distance. More frequently they have been upheaved and displaced after they were first deposited. Sometimes the land has subsided so that the strata are displaced along a ridge, while another ridge remains quite firm. Thus, what is known as a *F.* results. The strata are inclined at various angles to the horizon, and sometimes the successive layers of deposit are bent and distorted, giving evidence of pressure exerted upon them. Earthquakes often cause *F.* in the strata. In many cases sedimentary strata are broken through by masses of igneous rocks, which, by their intrusion in a melted form, have often caused an upheaval of strata. *F.* are also caused by subsidence of the inner portions of the earth.

Faun, **Faunus**, rural deity in Rom. legend and regarded as the god and protector of shepherds. Later on the name became identified with the Gk. god Pan. *F.* was supposed to have been the third sovereign of the Laurentines; his predecessors Picus, the deity of storm and lightning and Saturnus, the god of seed-time and harvest.

Fauna, term used by naturalists in reference to the collective animal life of any dist. or of any period in hist. Thus we have the F. of the Brit. Isles, or the F. of the Antediluvian age. F. is derived from the F. of mythology, creatures who were regarded as the protectors of wild animals.

Faure, François Félix (1841-99), Fr. politician, b. in Paris, son of a furniture maker. He became a tanner and merchant at Havre, where he was very successful financially. Elected member of the National Assembly in 1881, he took a keen interest in economics and politics. Appointed under-secretary for the colonies in M. Férrier's ministry in 1888; vice-president of the Chamber in 1893; appointed President of the Republic in 1895 upon resignation of Casimir-Périer. It was through his diplomacy and tact that the Franco-Russian alliance was accomplished in 1897. See E. Maillard, *Le Président Faure*, 1897.

Fauré, Gabriel Urbain (1845-1924), Fr. musical composer, b. at Pamiers. He studied at the School of Sacred Music, directed by Medermeyer, under Dietsch and Saint-Saëns. He became choir-master at the church of the Madeleine in 1877, and organist in 1896. Director of the Conservatoire, 1905-20. His music includes pieces for the piano, pieces for the strings, orchestral music, cantatas, and opera—*Prométhée*; *Pénélope*. His *Birth of Venus* was performed at the Leeds Festival in 1898. See lives by A. Bruneau 1925; V. Jankélévitch, 1938; and N. Suckling (Master Musicians), 1946.

Fauresmith, tn. in the Orange Free State, cap. of the div. of the same name, about 65 m. from Kimberley. The Jagersfontein diamond mines lie a few miles to the S.E.

Fauriel, Claude Charles (1772-1844), Fr. historian and philologist, b. at St. Etienne. He was a student of Sanskrit and Arabic, as well as of Lat. and Gr., and was appointed a prof. in the Paris Faculté des Lettres. His lectures as prof. appear in *Histoire de la Poésie Provençale*, in which he attempts to prove that the old Sp. and Ger. poetry originated in France. His works include a trans. of E. Baggesen's *Parthenais* (1810), and A. Manzoni's tragedies (1823), and *Modern Greek Folk Songs* (1824), *Sur l'Origine de l'Epopée du Moyen Age* (1833), and his greatest work, *Histoire de la Gaule Méridionale sous la Domination des Conquérants Germains* (1836).

Faust. The legend of F. is held by many historians to be of Eastern origin, but its European interest devolves on a sixteenth century magician, F., or Faustus, of Suabia, reputed to have studied necromancy in Krakow and to have exploited Germany in the rôles of astrologer, diviner, medium, alchemist, and swindler, a veritable ally of Mephistopheles. The earliest hist. of F. appeared at Frankfurt in 1587, and was speedily followed by numerous and varied versions, each more embellished than the previous one, the chief of these being G. R. Widmann's (1599). From this, J. N. Pützer compiled

an encyclopedic version of which six eds. appeared between 1674 and 1726. The chief Ger. ed. of the period was pub. in 1712, under the authorship of 'Christlich Meynenden' (A Christian Believer). Meanwhile, due to the intolerant bigotry and narrow Protestant sympathies of the 1587 ed., which were strongly in keeping with contemporary religious prejudices, it appeared very rapidly in foreign trans., Dan. being the first (1588), Eng., Fr., Dutch, and Flemish following during the next six years, and Czech in 1612. The Eng. trans. was the basis of Marlowe's *Tragicall History of Doctor Faustus* (performed in 1594, pub. 1601), the finest of the early F. dramas. In Germany every little puppet-show had its own version of the legend, right up to the middle of the eighteenth century. In 1759 Lessing's dramatised version was written, but has since been destroyed save for a few sheets of MS.; it was in his hands that the legend first assumed the shape which has become definitive, a more modern and tolerant spirit superseding the stern uncompromising attitude of the earlier eds. Goethe was the first to introduce the Gretchen incident into his magnificent work (1798). This violation of the legend had no apparent reason, beyond broadening the secular dramatic interest to meet modern demands; and the innovation was condemned by purists as unjustifiable. However, it is Goethe's version—well called the 'divine comedy' of eighteenth century humanism—that has become recognised as the greatest literary achievement of the vast number that have been attempted on the same subject, and round it has arisen an important and extensive musical literature. Music was written for a production at Stuttgart (1832) by Lindpainter, and a score by Prince Radziwill was pub. in 1846. A choral dramatic legend by Borlitz, *La Damnation de Faust*, was performed at Paris in 1846, the text being derived by the composer and Gaudonnières from De Nerval's adaptation. The most famous setting is Gounod's *Faust*, performed at Paris in 1859—a very beautiful five-act opera to a libretto by Barbier and Carré. Boito's *Mefistofele* (Milan, 1868) is also from the same source as those of Gounod and Berlioz. On a lower plane altogether, and quite estranged from Goethe's masterpiece, is the *Faust* of Spohr, a romantic two-act opera to a wretched and vulgar text by Bernhard, produced at Frankfurt in 1818. Goethe's work has also inspired some 'absolute' music, notably the *Faust Symphony* of Liszt, and Wagner's *Faust Overture*. See H. G. Meek, *Faust, Man and Myth*, 1930; G. Blanquis, *Faust à travers quatre siècles*, 1934; P. Palmer and R. Moore, *The Sources of the Faust Tradition*, 1936.

Faust, Johann (a printer), see Fust.

Faustina, Annia Galeria, usually called **Faustina the Elder** (A.D. 104-141), wife of Antoninus Pius and mother of Faustina the Younger.

Faustina, Annia the Younger (c. A.D. 130-175), was the wife of Marcus Aurelius Antoninus and daughter of Faustina the

Elder (*supra*). Both were accused of gross profligacy, but there is some doubt of this, for they were both honoured after death by their husbands, who founded 'Puellæ Alimentariæ Faustinae' institutions for the relief of poor girls.

Fauvism, movement in art which originated in Paris in 1903 as a revolt against Impressionism. It became the name of a group of artists among whom were Matisse, Dufey, Derain, Lhote, Vlaminck, Marquet and Friesz. These sought to invest colour again with spiritual values. The name F. is derived from a slighting reference by the Parisian art critic, Louis Vauxcelles, to the gallery of works of the artists of the group. He called it a 'cage aux fauves,' or cage of wild-beasts.

Favara, tn. in the prov. of Girgenti, Sicily, about 4 m. E. of Girgenti. Its chief products are sulphur and marble. Pop. 21,600.

Favart, Charles Simon (1710-92), Fr. dramatist, b. in Paris. He was educated at the college of Louis-le-Grand, and his poem, *La France Délivrée par la Puellle d'Orléans*, obtained a prize at the Académie des Yeux Floraux. He became director of the Opéra Comique, which, under him, rose to a height of success. In 1746 he went with Maurice de Saxe to Flanders with a troupe of comedians, where he became very popular. In 1750 he returned to Paris and resumed his writing. Some of his works (all written 1754-63) are: *L'Anglais à Bordeaux*, *Les Trois Sullanes*, *Ninette à la Cour*, and *Mémoires et Correspondance Littéraire*, which gives valuable information of the literary and theatrical world of the eighteenth century.

Faversham, municipal bor. and riv.-port of Kent, about 10 m. from Canterbury. It dates back to about 811, and was a seat of the Saxon kings. It contains the remains of a Cluniac abbey, founded by King Stephen, in which he is buried, and has a grammar school which was started in 1527. It has a quarter sessions court and a separate commission of the peace. It is important for its oyster fisheries, which are under the direction of an ancient guild, as well as for its shipping trade in coal, timber, and agric. produce, including especially hops and cherries. There are also powder-mills in the vicinity; brewing, cement, and brick-making are carried on. Pop. 10,000.

Favonius is mentioned for the first time in 61 B.C., during the transactions against Publius Clodius for having violated the rites of the Bona Dea. On this occasion he joined Cato, whose sternness he imitated throughout his life, and went so far as to receive the nickname of the ape of Cato. He was a man of weak character and the motives of his actions were passion and personal animosity, and not the consideration of the public good. His only honourable action is the conduct he showed towards Pompey after his defeat.

Favonius, name given in Rom. mythology to a wind which blew from the W. or S.W., and usually prevailed in spring. It is the same as the Gr. *zephyrus*.

Favre, Jules Claude Gabriel (1809-80), Fr. statesman, b. at Lyons, and studied for the Bar at Paris. He took part in the Revolution of 1830, and openly declared himself a republican. He made himself conspicuous when Louis Napoleon was elected President of France, and tried to organise an armed resistance in the streets of Paris. He estab. his reputation by his defence of Orsini, 1858, and in 1870, after the defeat at Sedan, proposed the deposition of the Emperor Napoleon III. He was minister of foreign affairs under the Republic, and told Bismarck (1870) that he 'would not yield to Germany an inch of territory nor a single stone of fortresses.' He made sev. mistakes during the war, and on its conclusion withdrew from the ministry.

Favularia, species of fossil plants, found first in the Devonian period, but most prolific in the Carboniferous. It belongs to the genus *Sigillaria*. The stem branched dichotomously, the leaves were large, and the venation was parallel.

Favus, contagious skin disease, caused by a fungus parasite. It usually affects the scalp in man, but is occasionally found on other parts of the body. It also affects cats, dogs, cattle, mice, rabbits, and other animals. The growth consists of a number of yellow, circular saucer-shaped scabs, each surrounding a single hair. The scabs grow and become encrusted; ultimately they break off, leaving a bare patch without a trace of hair. The characteristic scab may then develop again, as it is extremely difficult to get rid of all traces of the parasite. The fungus was first described by J. L. Schönlein in 1839, and from the name of its discoverer is called *Acherion Schönleini*. It is more common in the E. parts of Europe than the W., and is often associated with uncleanly habits. Contagion may take place from animal to man. The treatment involves removing the crusts with every consideration for cleanliness. The parts should then be dressed with an efficient parasiticide.

Fawcett, Edward Douglas (b. 1866), Eng. philosopher, b. at Hove and educated at Newton College, Devon and Westminster school. In philosophy he is an idealist whose distinctive mark is the discussion of imagination as the fundamental reality of the universe (see *Contemporary British Philosophy*, vol. ii., 1925). Pubs.: *Divine Imagination*, 1921; *The World as Imagination*, 1918; *The Zermatt Dialogues*, 1931; *From Heslon to the High Alps* (1936); *The Oberland Dialogues* (on the soul), 1939. In his *Hartmann the Anarchist* (1893) he claims to have anticipated the romance of the war aeroplane.

Fawcett, Henry (1833-84), Eng. economist and politician, was b. at Salisbury. He was educated at King's College, London, Peterhouse, Cambridge, and Trinity Hall, where he became seventh wrangler in 1856, and was elected to a fellowship. He entered at Lincoln's Inn with the intention of becoming a member of Parliament through a career at the Bar, but was unfortunate to lose his eyesight in 1858. He, however, kept up all

his recreations, fishing, rowing, skating, as well as his studies. He was a disciple of Mill, and pub. in 1863 a *Manual of Political Economy*, the result of which was the election of Fawcett to the chair of political economy at Cambridge. In 1865 he was elected member for Brighton, and re-elected in 1868-74, and is spoken of as being a thorough Radical. In 1873 he took a prominent part in opposing Gladstone's scheme for univ. education in Ireland. He was a great advocate for the preservation of commons, especially those near large trns., and showed a marked interest in Indian affairs. In 1880 he was offered the place of postmaster-general by Mr. Gladstone, and estab. in 1882 the parcels post. He is also responsible for the introduction of postal orders, sixpenny telegrams, stamp slip deposits, and the increased facilities for life insurance and annuities. His pub. include *The Economic Position* (1865), *Pauperism* (1871), *Free Trade and Protection* (1878), *Indian Finance* (1880).

Fawcett, Millicent Garrett, Dame (1847-1930), b. at Aldeburgh, Suffolk. She was the daughter of Mr. Newton Garrett, and famous for her social and literary work, especially as an advocate of women's suffrage and the higher education and employment of women. In 1867 she married Henry F., the politician. She held the degree of LL.D. (Hon.), St. Andrews, and was president of the National Union of Women's Suffrage Societies. Pub.: *Political Economy for Beginners* (1870), *Tales in Political Economy* (1875), *Essays and Lectures* (jointly with Henry F.), (1872), *Some Eminent Women of our Time* (1889), *Life of Sir William Molesworth* (1901), *Five Famous French Women* (1906), *Women's Suffrage* (1912), *What I Remember* (1921).

Fawkes, Guy (1570-1606), Eng. conspirator, was b. at York. He was a zealous Rom. Catholic before he was of age, and served in the Sp. army in the Netherlands from 1593-1604. He came to England at the invitation of Catesby and was initiated into the gunpowder plot. He was entrusted with the actual accomplishment of the design owing to his exceptional courage and coolness. See GUNPOWDER PLOT.

Fawn, see under DEER.

Fay, Andráš (1786-1864), Hungarian poet and author, was b. at Kóhány in the co. of Zemplén. He was educated for the law, but settled at Pest, and devoted himself to literature. The pub. of his satirical fables (*Mesék*) in 1820 estab. his reputation, and he became one of the most popular authors of his time. He was also a writer of plays, romances, and novels. Of his novels the most famous are *The House of the Belleks*, and *Doctor Jávör*; both are humorous. He was founder of the first savings bank at Pest, and one of the founders of the Hungarian national theatre.

Fay, Morgue de, see MORGAIN LE FAY.

Fay, William George (1872-1947), Irish actor and theatrical producer, one of the founders of the modern Irish dramatic movement which grew into the Abbey

Theatre, and one of the creators of the style of quiet acting which made that theatre famous. After acting with a travelling circus company in Ireland and England, he took leading parts in Abbey plays until 1908, when he left, with his brother Frank, after a disagreement with the directors in policy. The Fays took a company to the U.S.A., but it had indifferent success. E. from 1910 acted in various London theatres and in repertory in the provs.; in Glasgow he was in charge of the Scottish National Players. In his late years he deserted the stage and took only occasional parts in films; his most successful part was that of Father Tom in the film *Odd Man Out* (1947).

Fayal, one of the Azores Is. It has a fine bay, on which floral, the chief tn. stands. Area about 37 sq. m. Pop. about 27,000. See AZORES.

Fayette, Comtesse de la, see LAFAYETTE, MARIE MADELEINE, COMTESSE DE.

Fayette, Gilbert Mottier, Marquis de la, see LAFAYETTE, MARIE JOSEPH, MARQUIS DE.

Fayetteville: (1) city in Arkansas, U.S.A., cap. of Washington co. It is the seat of the Univ. of Arkansas. There are deposits of coal in the vicinity, and the region round is noted for its fruit, especially apples. Pop. 8200. (2) city in N. Carolina, U.S.A., cap. of Cumberland co., situated on Cape Fear R., which has been rendered navigable as far as the coal mines of Chatham co. The former name of F. was Campbelltown, the change being made in memory of Lafayette. It was the scene of a terrible flood in 1908. Pop. 17,400.

Fayolle, Marie Emile (1852-1928), marshal of France, b. at Le Puy. Entered the Ecole Polytechnique in 1873, and afterwards joined the artillery. Instructor at Ecole de Guerre, 1897. Brigadier-general on retired list when the first World War broke out. On mobilisation, was given command of 70th Reserve div. Succeeded Pétain in command of 6th Army, Feb. 1916. Transferred to 1st Army in Dec. In May 1917 was in command of group of armies in centre, and in autumn was in Italy to assist at Caporetto. Soon recalled, did excellent work until armistice; was retained as general of div. on Gen. Staff, and made marshal Feb. 21, 1921.

Fayrer, Sir Joseph (1824-1907), surgeon-general and author. In 1850 he became assistant-surgeon in Bengal, and his connection with the Indian medical service lasted for forty-five years. He was a prolific writer on subjects connected with the practice of medicine in India, and above all on the venomous snakes of that country. His great work on *The Thanatophidia of India* is the best book on the subject.

Faz, see FIZ.

Fazogl, mountainous dist. of the Anglo-Egyptian Sudan, which is traversed by the Blue Nile. It produces gold, senna, gum, tamarinds, and ivory. Pop. about 500,000 (Funj negroes).

Fealty, was the service or duty served by a tenant to his superior lord in feudal

times. Lands were granted on the conditions of F., suit of court, and rent, it being stipulated that tenants and their heirs should take the oath of F. or fidelity to their lord, which was the feudal bond between lord and tenant: should attend the lord's courts and give assistance by serving on juries, etc.; and should pay certain ann. returns in military attendance, provisions, money, or whatever was required of them. The right of F. is still exacted from copyholders in England, and was in existence in the United States after the Revolution.

Fear. The emotion of F. arises in apprehending evil to come. Its characteristics are misery or depression, the prostration of the active energies, except in the form of running away from danger, and the excessive hold of the related ideas. The pain from some actual infliction, such as a blow, a deranged organ, a bitter taste, a discord, a loss, may be severe, but mere pain is not terror. Only when the mind apprehends some painful infliction still in the future, are we liable to the emotion. Although F. is one of the most elementary emotions, it is one of the most complicated. It presupposes the following mental laws and conditions: (1) For its explanation it is necessary to render a complete account of present pain, both physical and mental. On the mental side we must remember the stimulus of the will, on the physical side the manifestation of present pain, the spasmodic violence of the early stage and the prostration of the functions at all stages. (2) We need to understand the revival of pain in idea, and the subsistence of the state by purely mental forces. (3) Attention must be given to the state of expectation, or belief, as opposed to mere idea or fancy unconnected with any real occurrence. (4) The most characteristic feature in the situation of terror is uncertainty, ignorance, and darkness. In the case of a great but certain and understood evil, the ideal pain may be simply a measure of the reality of the case. The irregular, disproportionate, and eccentric courses connected with terror are brought into relief under future evil of unknown amount or character.

Characters of fear.—Physical. The usual and obvious signs of F. imply organic derangement and muscular relaxation, accompanied with strong efforts in particular directions. The result of the whole is a loss of power, and a vehement exertion to escape danger. **Mental.** The general description of the mental state of F. is massive pain or general depression of tone. The strongest figures for massive pain are applied to it, viz. melancholy, gloom, darkness, despair. The excited gaze is part of the voluntary strain. Intense watchfulness must accompany any efforts to avoid an evil agency. The shriek of terror would be in accordance with Darwin's view, of the original employment of the voice, viz. to call for help from companions. In fear we see the extreme case of the 'fixed idea,' or the influence of the feelings upon the conduct through the medium of the intellectual

trains. See A. Mosso, *La Peur*, 1908; W. B. Cannon, *Bodily Changes in Fear*, 1915; E. Williams and E. Hoag, *Our Fear Complexes*, 1924; G. F. Morton, *Childhood's Fears*, 1925; S. Freud, *Inhibitions, Symptoms, and Anxiety*, (trans.) 1936.

Fear, Cape, promontory on the Atlantic coast, forming the S. point of Smith's Is., in the S. of N. Carolina. This is, stands at the mouth of Cape Fear R. and has a lighthouse on its W. end. The riv. is 350 m. long, and is navigable as far as Fayetteville (120 m.). Its entrances were blockaded during the Civil war.

Fearne Isles, see FARNER.

Feast, or Festival, a day on which the ordinary labour of life is laid aside and enjoyment of a more or less religious nature is indulged in. Throughout the whole world, wherever the general religion of the country has been dear to the whole of the nation, the fixed state festivals have been associated with religion. Probably the Persians are alone among the world's nations in having no regular feasts, and this condition of theirs is artificial rather than natural. Egypt had many festivals, days consecrated to the Nile, Osiris, Ptah, and all her countless deities. The Hindu still observes his anct. festival in the anct. way, except that he must no longer offer human sacrifice. The earliest account of Gk. festivals—that in the *Iliad*—speaks of two alone, but in later times these increased greatly in number. The expenses of the festivals were met from the public purse. In the later days of the Rom. empire, the city revelled in innumerable feasts, those not only of her own anct. gods, but also those of the deities imported from the E. Different feasts became important at different times, but we may name the *Sementina* the festival of the seed-time in January; the *Lupercalia*, in honour of the god Pan; and the *Saturnalia*. Almost all of these festivals were celebrated by the pagan world with disgusting accompaniments. The Egyptian sensuality was surpassed by the E. debauchery introduced into Rome, and the excesses committed at the Hindu festival of Shiva are utterly unspeakable. The Heb., however, kept their feasts, described in the O.T., with the greatest strictness. (See PASS-OVER; PENTECOST; PURIM.) The Christian Church associated some of her festivals with the Jewish and some with the old pagan festivals, calling special attention to the religious significance. See M. Dresser, *De Festis diebus*, 1590; J. B. Tilliot, *Mémoires pour servir à l'histoire de la Fête des Fours*, 1741; T. Thistleton Dyer, *British Popular Customs*, 1911; W. Mead, *English Medieval Feasts*, 1931; F. Martin, *Observing Natural Holidays and Church Festivals*, 1910. See also CARNIVAL; CHILDRENS DAY; CHRISTMAS, CANDLEMAS DAY; CLAVIE, BURNING THE; CORPUS CHRISTI; EASTER; EPIPHANY; FOOLS, FEAST OF; GUY FAWKES NIGHT; HALLOWEEN; HOCKEY; HOLY WEEK; LADY DAY; LORD MAYOR'S DAY; MARTINMAS; MICHAELMAS; MAY DAY; PLOUGH MONDAY; SHROVE TUESDAY; ST. VALENTINE'S DAY.

Feather Grass, see *STIPA PENNATA*.

Feather River, in California, U.S.A., trib. of the Sacramento, which it joins about 18 m. above the city of Sacramento. It has a length of 250 m., and is navigable for steamers to Marysville. Gold is found on its banks.

Feathers, horny outgrowth of the skin which is peculiar to birds, and which corresponds to the scales of fishes and reptiles and the hair of mammals. Feathers as a rule consist of two main parts, axis and barbs, the former of which is divided into the quill, which is bare and hollow, and the shaft which bears the barbs. The quill is embedded in the skin, and has at its base a small hole through which the

of the contour F.; and powder-down F., which occur in patches, especially in birds of the heron tribe, and exude a fine dust or powder which gives a peculiar bloom to the plumage. As regards the colour of F., it is usually most prominent in the male birds. F. have been put to various uses. Of these perhaps the chief is their employment for stuffing beds, cushions, and quilts, and for this the F. of the elder-duck are most highly esteemed, those of the goose and swan coming next. F. are also used as quills for writing, and for personal adornment.

Feather-Star, or **Sea-Lily**, popular name of *Crinoides* (g.v.), a class of Echinodermata. The commonest species is *Antedon rosacea*.

Featherstone, urb. dist. in the Osgold-cross par. div. of the W. Riding of Yorkshire, England, about 24 m. from Pontefract. Large collieries are in the neighbourhood, and these afford employment for the inhab. Some miners were shot dead during a riot in 1893. Lord Bowen and his fellow-commissioners in the report on the F. riots dealt with the duty of soldiers called in to suppress riots and this report is the *locus classicus* on the point.

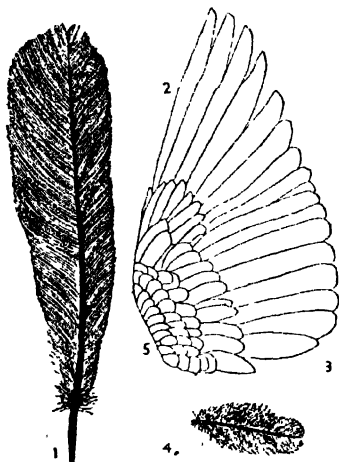

A soldier (says the report) for the purpose of establishing civil order is only a citizen armed in a particular manner. He cannot because he is a soldier be exonerated if without necessity he takes human life. The duty of magistrates and peace officers, to summon or abstain from summoning the assistance of the military depends in like manner on the necessities of the case. . . . To call for assistance against rioters from those who can interfere only under such grave conditions ought, of course, to be the last expedient of the civil authorities. But when the call for help is made and the necessity for assistance from the military has arisen, to refuse such assistance is in law a misdemeanour. . . . It is not usual to resort to extremities with rioters until after reading the proclamation under 1 Geo. I.; but this preliminary is by no means a condition precedent to the exercise of the common-law powers of suppressing riots.' (Parl. Paper, 1893-94, c. 7234). Pop. 15,000.

Febronianism, powerful movement which was propounded in 1763 in Germany by Johannes Nikolaus von Hontheim (1701-90) under the pseudonym of 'Justinus Febronius' with the object of restricting the papal power, and of giving independence to the national Churches.

February, second month of the year, containing twenty-eight days in ordinary years, but twenty-nine in leap years. It was introduced into the Rom. calendar by Numa as the last month of the year, and continued in this position until 452 B.C., when it was placed after Jan. The name comes from the Lat. *Februarius* from *februare*, to purify, and was originally the month in which the 'Februa,' or great Rom. festival of purification, was held.

Febronius, see HONTHEIM, JOHANN NICHOLAUS VON.

February Revolution, see under FRANCE—History.

nutritive sap passes during the growth of the F. The barbs which constitute the vane are lath-shaped and taper to a point, and each one supports a series of outgrowths known as barbules, so that each barb is like a tiny F. As a rule the barbs are linked to each other by means of the barbules, but in the running birds, e.g. the ostrich, they are free, hence the familiar loose plume. Many F., too, have an 'aftershaft' or second shaft springing from the under side near where the quill passes into the true stem. This is as a rule small, but in some birds, viz. the cassowary and emu, the aftershaft is as large as the mainshaft. There are several kinds of F.: Contour F., which form the general outline of the body and of which the 'flight F.' are most developed; down F., which are hidden by the contour F. and often form a very thick covering, as in gulls and ducks; fly-plumes, which are found in all birds in clusters at the bases

Fécamp, seaport tn. of France at the mouth of the R. Fécamp, in the dept. of Seine-Inférieure, about 22 m. N.E. of Le Havre. It has a tidal harbour and dock taking vessels of 20 ft. at neap tide, and of 26 ft. at spring tide. There are cotton, wool, and oil mills, as well as sugar refineries, tanneries, and a benedictine liqueur distillery. The chief imports are coal, timber, tar, and hemp, and the exports oil-cake, lint, cod, and benedictine liqueur, which is said to have been manufactured by the Benedictine monks of the abbey as far back as 1510. The tn. contains a sixteenth century church (St. Etienne) and the abbey church of La Trinité (c. 1190). Pop. 16,800.

Fechner, Gustav Theodor (1801-87), Ger. psychologist, b. at Gross-Särchen, near Muskau, in Lower Lusatia. Became prof. of physics in Leipzig, but subsequently devoted himself to psychology. His chief work on the subject was *Elemente der Psychophysik*, and though he follows Spinoza in asserting that bodily facts and conscious facts are two distinct sides of one reality, he is original in trying to discover a mathematical relation between them. He was in the main the originator of that species of psychology which investigates human faculties with the aid of exact scientific apparatus. He wrote also on the theory of colour and galvanism, as well as poems and essays. See lives by J. E. Kuntze, 1892; W. Pastor, 1904; and J. Hermann, 1926.

Fechter, Charles Albert (1824-79), Fr. actor, b. in London. He made his debut at the Comédie Française as Seide in Voltaire's *Mahomet*, after which he went to Berlin, where he achieved great fame by playing the part of Armand Duval in *La Dame aux Camélias*. In London his impersonation of Hamlet and Othello was an extraordinary triumph.

Fœciales, or **Fœtiales** (etymology uncertain), were Rom. priests, whose duty it was to determine the circumstances under which hostilities might be commenced, and to demand satisfaction from a hostile state. Four F. generally crossed the borders and launched a spear with appropriate ceremonies, to denote the proclamation of hostilities (*clarigatio*).

Fecundation, see **FERTILISATION**.

Federal Bureau of Investigation (F.B.I.), formed in 1908, a branch of the U.S. Dept. of Justice, for the investigation of crime and all offences against the law throughout the country. Its headquarters are in Washington, and it has offices in forty-two states.

Federal Council of Evangelical Free Churches. An organisation, whose members represent most of the churches of Protestant denomination in the U.S.A., which was formed in 1903 for the general purpose of acting in matters of common interest to the constituent churches. The Council carries out a number of particular objects through commissions. These particular objects include social service, research and education, the improvement of industrial relations, the promotion of international justice, the improvement of relations with the negro pop. or the

country, etc. The Council also acts as the liaison between the church and such national social agencies as the Red Cross, and the Child Welfare (q.v.) Movement. About 140,000 local churches are represented by the Council and the communicant membership is over 20 millions.

Federalist, The, was a collection of essays pub. in 1787-88 in New York at the instigation of Hamilton, to defend the new gov. They appeared in the semi-weekly *Independent Journal* of New York under the above title, and were written by Alexander Hamilton, James Madison, and John Jay. There were in all eighty-five essays, which were all collected and subsequently pub. in book form. The collection is still regarded as a classic textbook of political science. See *Everyman's Library* ed.

Federalist Party, The, was a political party which was in power in the United States, 1789-1801, and which practically died about 1820. Its chief leaders were Alexander Hamilton and John Adams, and Washington himself was also closely identified with the Federalists. The party reorganised the executive depts., created the federal judiciary and the territorial system, and introduced excise laws, a U.S.A. bank, a protective tariff and bounty system to develop manufs. and agric., and a postal system. They also began a new navy, but were prevented by the Democrats from going on with it. This was really the death-blow to the Federal party, since they were no longer able to protect their commerce by force, but had to do so by humiliating concessions to England.

Federal Reserve System, U.S.A., introduced by Congress in 1915 by way of reforming Amer. finances and freeing the banking world there from Wall Street's control. Under the system there are some twelve Federal Reserve banks vested with powers in their sev. areas, somewhat analogous to those possessed in England by the Bank of England. Every national bank is compelled to join the system. Each of the regional banks has large gov. deposits, each issues paper currency. The difference, however, between the Eng. and the Amer. method is that whereas the bank-rate in Great Britain responds easily and naturally to the laws of supply and demand, as the Bank is now responsible for the integrity of the paper currency, these Federal Banks of America have the larger liberty of regulating a currency in conditions of greater freedom and less responsibility. Undoubtedly these powers are used wisely, but the fact remains that the system gives opportunities for inflation which do not now exist in England. In 1936 the Federal Reserve Board came into office under the Banking Act of 1935. The Board has seven members, appointed by the President on the advice of the Senate. It has wide powers to control the supply of credit and to supervise banking.

Federal Trade Commission. An organisation set up by the Amer. Gov. in 1914 to check the growing menace of trusts and monopolies (see **Trusts—Commercial**).

'The struggle between the gov. and the trade combines ever since 1890, when the Sherman Act was passed, has been a record of legal victories for the gov. that have been practically mitigatory; and the action of 1914 was evidently an endeavour to control and influence powers that could not be broken. After the world war of 1914-18 the Wells-Pomeroy Act mitigated some of the older restrictions of anti-trust legislation by legalising the alliance of great firms with each other for the purpose of marketing their goods in foreign lands. The F.T.C., which was estab. to prevent unfair business practices in inter-state commerce, has investigated alleged violations of the anti-trust laws. See I. L. Scharfman, *The Inter-state Commerce Commission*, G. C. Henderson, *The Federal Trade Commission*, and T. C. Blaisdell, *The Federal Trade Commission*.

Federated Malay States, see MALAY STATES.

Federation and Federal States. A federation (Lat. *fœdus*, a league) is a union between two or more states, in which each retains its autonomy, while a central representative gov. controls matters of general concern. The Amphictyonic League of anct. Greece, the earliest on record, seems to have been religious rather than political. Among other Gk. leagues were: the Thessalian, very powerful about 370 B.C.; the Ætolian, a well-organised federation composed of a number of tribes living N. of the gulf of Corinth, having a general assembly which met yearly, and a permanent committee acting as an executive gov.; the Achean, which became a great political force about 251 B.C., originally comprising ten cities of Achaia, it ultimately included Athens, Megara, Ægina, and almost all the Peloponnesus; this, too, was a real federation. Coming now to modern hist., a remarkable and important league, the Hanseatic, was first formed by the cities of Hamburg and Lübeck about 1247 A.D. to protect their commerce against pirates and robber-barons. Gradually, over eighty tns. joined them, and the Hansa Federation (Old Teut. *hansa*, a defensive league), though never formally recognised by the empire, was for centuries a great power. It held its own courts of justice, enforced obedience among its members, and bargained and fought with kings and princes, on one occasion equipping a fleet of 248 ships, with 12,000 men. The Hanseatic Diet, held triennially at Lübeck, was not dissolved until 1630. Modern civilisation with its improved means of communication and transport, and with many highly organised communities capable of political combination on equitable terms, has facilities for more extensive federations than were possible in anct. times. Bavaria and Saxony could federate with Prussia, but no power of old could federate with Rome, and the holding together by mutual agreement of immense tns., like those of the U.S.A., would have been beyond human conception. Still, though conditions have altered, principles remain the same. A federation is not a mere

alliance from which either of the contracting parties can withdraw at will, nor is it a union in which one predominant power can assume control in local as well as general affairs. Safety and efficiency require a strong central gov., which must be fully representative, and must have command of foreign relations and of those internal matters which are of general concern, such as postal and telegraphic services, coinage and national defence. But this central gov. cannot administer innumerable local details over immense areas or among thickly populated tns. with varying interests; therefore each federal country or state must have a large share of autonomy. The adjustment of relations between principal and subordinate legislatures requires skilful statesmanship, and even when once arranged altering conditions and the growth of new ideas will sometimes raise fresh controversies.

The republic of Switzerland was first founded in 1307 by the men of Schwyz, Uri, and Unterwalden, and in about a century attained its present size, but remained communal rather than federal until 1848, when it was reorganised somewhat on its present lines. As the benefits of a solid gov. were realised, the powers of the federal parliament were strengthened in 1874, 1898, and again in 1907.

The medieval Ger. empire was a bulky and loose combination of states, sadly lacking in unity. It was broken up by Napoleon, but re-estab. with alterations in 1815. After the war of 1866 Austria was excluded, and in 1871 a federal empire was inaugurated at Versailles, with the King of Prussia as hereditary Ger. Emperor. The abdication of the Kaiser and the monarchs of the other Ger. states in 1918 led to the formation of the new republics of Prussia, Bavaria, Saxony, Württemberg, and others. But the Federation of the Ger. states remained in being, under a President (Field-Marshal Paul von Hindenburg, who assumed office in May 1925), and later under Hitler (*q.v.*), the last vestiges of autonomy of the sev. States of the Zollverein were merged in the Reich. For a thousand years the problem of unitarism versus federalism has been the main issue of Ger. hist. It has lost nothing of its poignancy under the quadripartite system of the occupying Powers and some indeed maintain that its solution is as important for the future of Central Europe as any decision made in the fields of economics or political education. But the problem of making federation living and workable is not confined to Germany. The adoption of federalist principles for the post-war reconstruction of the European Commonwealth was advocated by Mr. Winston Churchill as early as 1943 and some of his suggestions bear some resemblance to the rules of procedure embodied in the constitution of the Ger. Confederation.

Among the many national and geographical consequences of the First World War was the estab. of three new European countries which had many of the characteristics of Federated States. These were: (1) Poland, which, before 1939,

consisted largely of the ter. divided between Prussia, Russia, and Austria in 1772, and reconstituted as a nation after 1818; (2) Czechoslovakia, a number of states or parts of states, of which the old kingdom of Bohemia is the chief, including roughly the Slav populations that lie between Germany and Poland on the N. and Austria on the S.; and (3) Yugoslavia, consisting of the old kingdoms of Serbia and Montenegro, Croatia, Slavonia, and parts of the Banat, Bosnia, Herzegovina, Carniola, and Styria. Syria and Lebanon, consisting of the four states of Damascus, and Aleppo (*q.v.*), the Alaouites, and Lebanon are federated for certain purposes, but the constitution in each part is still in a rather unsettled condition.

The U.S.A. originally consisted of the thirteen colonies which united in 1775 to free themselves from Brit. rule; to these others have gradually been added. The struggle between centralisation and local autonomy has led to sev. great crises in their hist. Excessive claims of state sovereignty put forward by Kentucky and Virginia in 1798 and by S. Carolina in 1832 almost led to fighting, and in 1861 the great Civil war broke out over the same question, the S. states refusing to obey the federal gov., and claiming the right to secede.

Included in the Brit. Empire are three great federated colonies now called Dominions. The dominion of Canada was the first example in hist. of a free F. within an empire, free and autonomous, yet acknowledging the supremacy of the crown. The Commonwealth of Australia was constituted in 1901, the Union of S. Africa in 1909.

Brazil and Argentina are both federal republics, with constitutions resembling that of the U.S.A. (*See further infra.*)

Analysis and evolution of Federal Government.—The term 'federal government' is very loosely used in political discussion, but, generally, political scientists mean thereby an association of states, which has been formed for certain common purposes but in which the Member States retain a large measure of their original independence. They differ, however, about the particular form or type of association of states which they would appropriately describe as a federal gov. Hence the term has been applied, *e.g.*, to the old Austro-Hungarian Empire, the Ger. Reich of 1871-1918, the United States of America, the Union of S. Africa, the Commonwealth of Australia, various Lat. Amer. republics and the League of Nations—all of them associations of States, but each differing from the other in the form which that association has assumed. But the modern idea of what federal gov. is has been determined by the Constitution of the U.S.A. and many consider it to be the most important and certainly the most successful example; and in seeking a legitimate and convenient definition of federal gov., constitutional lawyers begin by examining the 'Federal Constitution' of the United States. The fundamental characteristic of the United States considered as an

association of states is that its Constitution establishes an association of states so organised that powers are divided between a general gov. which in certain matters—for example the making of treaties and customs tariffs—is independent of the gov. of the associated states, and, on the other hand, state gov. which in certain matters are, in their turn, independent of the general gov. It is important in this context to note the difference between the original Articles of Confederation of 1777 and the Constitution inaugurated ten years later. The difference lies in the fact that the present Constitution replaces the principle of the general gov. being subordinate to the regional gov. and dependent upon them, by the principle of the general and the regional gov. being co-ordinate and independent in their respective spheres. A similar evolution is observable in the case of some of the other associations mentioned above, which are often grouped with the gov. of the U.S.A. as examples of federal gov., *e.g.*, the Austro-Hungarian Empire which lasted from the *Ausgleich* or Compromise of 1867 until 1918. In 1867 Hungary, which had but little autonomy in the Hapsburg Empire, was granted a large measure of independence by the Emperor Francis Joseph and the Dual Monarchy or Empire of Austria and Kingdom of Hungary was estab. The Australian Constitution enacted in 1900 is an obvious illustration of a federal constitution. It estab. a gov. for the whole of Australia which, within a sphere, could exercise powers independently of the gov. of the states; while the latter, within a sphere, were enabled to act independently of the Commonwealth Gov. Neither the state gov. nor the Commonwealth gov. acting alone was authorised to alter the scope of the other's power as laid down by the Constitution. Both Commonwealth and State parliaments were to be limited in their powers, but not by each other; they were to be co-ordinate with each other but they were to be subordinate to the Constitution. Again, it is evident from a study of the Covenant of the League of Nations (*q.v.*) and from its practice, that it was a league of States and not of nations. Its organs, the League Assembly and League Council, were composed of representatives of the gov. of the Member States, and decisions upon most important matters were not binding upon a Member-State without its own consent. The Constitution of the Union of S. Africa embodies quite a different principle of association from those of the *Ausgleich* of 1867, the German Imperial Constitution, or the League of Nations, and it also differs from that of the United States and the Commonwealth of Australia. For in S. Africa the regional gov. were subordinate to the general gov. When the four self-governing colonies of S. Africa united in 1909 they set up a Parliament for the whole Union and four elective councils, one for each of the constituent provs. These Councils were empowered to make laws on a list of specified subjects set out in the Constitution, but these laws

were subject to the approval of the Union Gov. and were valid only in so far as they were not in conflict with an Act of the Union Parliament. Hence there is no question there of regional govts. being co-ordinate with the general gov. as in the United States or Commonwealth of Australia. It is evident, too, that the Union of S. Africa in its essentials is a unitary form of gov. and not federal though for some purposes it is often classed as a federal gov. The Swiss Constitution of 1848 follows the Amer. in many respects but in one matter at least it contains an important modification of the strict application of the federal principle: the courts must, under the Constitution, hold all laws passed by the Federal Assembly to be valid, though they may declare cantonal laws to be void as being in excess of authority. The case of Canada is unique: its Constitution, the Brit. N. America Acts 1867-1940, so divides the legislative powers between prov. and dominion legislatures as to give to the prov. exclusive control over a long list of enumerated subjects, while the dominion legislature enjoys exclusive control over the residuary subjects, which, 'for greater clarity' however, are also enumerated. In this respect the Canadian differs markedly from the Amer. Constitution: for according to orthodoxy, it is not sufficient that general and regional, provincial or state legislatures should each be independent in its allotted field; that field should be so mapped out that the residuary powers, as they are known, must lie with the regional or prov. govts. and, therefore, if this view be valid, then the Canadian is not a true federal constitution, whereas the Amer. Constitution is, for it precisely specifies the powers of the Federal Gov. and leaves the residuary powers to the States and, indeed, the same process, with modifications, is shown in the Commonwealth Constitution of Australia. In Canada neither the dominion nor the prov. legislatures has power to alter the Constitution so far as the distribution of powers is concerned. That power inheres in the Parliament of the United Kingdom alone. The Canadian courts may be called upon to declare dominion or provincial laws void for repugnancy to the Constitution and, thus far, the federal principle is rigidly applied. But the dominion executive has power to disallow any Provincial Act and may instruct the Provincial Lieutenant-Governor (who is appointed by the Dominion Gov.), to withhold his assent from Prov. Bills and to reserve them for the consideration of the dominion executive and may refuse assent to such reserved Bills. These powers of veto, as in essence they are, are all unitary elements in what is otherwise a strictly federal form of Constitution; they are matters in which the regional or prov. govts. are subordinate to the general or Dominion Gov. and not co-ordinate with it. Again, the Brazilian Constitution of 1891 also embodies the federal principle but (according to Prof. Wheare, a leading authority on federal gov.) there seems to be general

agreement among students of constitutional law that in practice its federal aspects were usually neglected. The Argentine Constitution of 1853, which remains substantially unaltered, is a federal constitution but here again the federal principle has not been applied substantially in practice. Prof. Wheare, says that from an analysis of the federal principle and its application to constitutions and govts. there emerges the conclusion that the countries which provide examples of federal gov. are the United States, Switzerland, Canada, and Australia; all others are merely quasi-federal. The test which he applies for federal gov. is simply this: 'Does a system of government embody predominantly a division of powers between general and regional authorities, each of which, in its own sphere, is co-ordinate with the others and independent of them? If so, that government is federal. It is not enough that the federal principle should be embodied predominantly in the written constitution of a country. That is something, but it is no guarantee that a system of federal government will operate. What determines the issues is the working of the system.'

We may briefly consider when federal gov. is appropriate. No doubt communities have been led to desire union from a variety of reasons. But in the modern federations some factors seem always to have been operative. These are: the need for a common defence; resentment of foreign interference and a realisation that independence can only be secured through union; some political association of the constituent communities prior to their federal union either in a loose confederation (*q.v.*), as with the thirteen Amer. States and the Swiss cantons, or as parts of the same Empire, as with the Brit. dominions; the hope of economic advantage, especially by way of protective tariffs; geographical propinquity; and similarity of political institutions. A consideration of these factors, all of which were operative in the case of America, Canada, Australia and Switzerland, may enable the student of constitutional hist. to decide how far a federal form of gov. can succeed with various communities, mainly Oriental, which to-day are struggling for independence: India, the States which form the Arab League, Brit. Malaya (or the Malayan Union), Indonesia; and Fr. Indo-China. While the above enumerated factors seem usually to have been present before the desire for union arose, it is instructive to find that some other factors are unexpectedly absent: thus community of language, or of race, of religion or of nationality have not been accounted as probable essential pre-requisites of the desire for union. No doubt common language or race contributed to union in the United States, Australia, and Germany, while common nationality also operated strongly in Italy and Germany; but, conversely, Canada and Switzerland provide striking examples of federations formed in spite of marked diversity of

language and race. (See K. C. Wheare, *Federal Government*, 1946.) See also CONFEDERATION.

Federation of British Industries. Estab. in 1916, and granted a Royal Charter of Incorporation in 1924, the F.B.I. is 'a voluntary association of Manufacturers and Producers for the promotion of their sev. and mutual interests, governed by an annually elected Grand Council.' It exists in order to encourage and develop Brit. manufs., and to safeguard the interests of Brit. producers both at home and abroad. It is entirely non-political. The F.B.I. collates the views of manufacturers on many points, e.g., taxation, factory legislation, shipping freights, smoke abatement and riv. pollution; these it presents in the proper quarter with the weight of organised industry behind it. It also assists its members by giving expert advice on numerous trade points, such as advertising, contracts, customs, exhibitions (the Brit. Industries Fair is held annually in London and Birmingham), fuel economy, insurance, overseas market. It issues four pubs.—the *F.B.I. Register*, the official list of members and also a comprehensive list of Brit. manufacturers, with a list of products, under 5000 headings; *British Industries*, its monthly organ, with a *Taxation Supplement* and an *Economic Supplement*; the ann. *Fuel Economy Review*; and the quarterly *F.B.I. Business Barometer*. The F.B.I. maintains a staff of experts on all points at its London headquarters in Tophill St., Westminster, London, S.W.; and it has representatives in nearly one hundred centres throughout the world.

Federici, Camillo (1749-1802), lt. dramatist, whose real name was Giovanni Battista Vlassolo, b. at Garesio in Piedmont. He was educated at Turin, and spent the early part of his life on the stage, but in 1778 settled at Padua and devoted himself to literature. He acquired a great reputation by his comedies, most of which were melodramatic in character. His complete works were pub. in 1816, and another ed. in twenty-six vols. at Florence in 1826.

Federzoni, Luigi, lt. journalist and statesman; b. 1878, at Bologna; son of Giovanni F. Edited *Resto del Carlino*, 1903-04; moved to Rome; directed foreign dept. of *Giornale d'Italia* from 1905; from 1913 ed. *Idea Nazionale*. In First World War, an artillery officer. Founder of lt. nationalist movement, led its merger into Fascism in 1922. Deputy, 1913. In 1922, first colonial minister under Mussolini; in 1924, minister of interior; in 1926, colonial minister again; in 1928, minister of interior again, and senator. In 1929, elected President of the Senate. Wrote *L'Africa Romana* (1929).

Fedor I., R. III., see FEODOR.

Fedra, see L'EGIRAMI, TOMMASO.

Fee, Fee Simple, and Fee Tail. F. (from Lat. *feodum*) is the same as fief or feud, and means an estate (q.v.) or interest in

land which can descend to the heir, or, in other words, a freehold estate of inheritance. In the feudal system of land tenure, under which there was a gradation of tenants in fee simple up to the supreme landowner, the king, the word was used in opposition to 'allodial.' Allodial land was land granted absolutely in perpetuity by book or charter (*hoc land*). Feudal land, on the other hand, was theoretically 'property lent,' and was held subject to the performance of the various feudal incidents, such as knight service and the payment of aids. An estate in fee simple means an interest in land descendible at the common law to the heirs general of the preceding tenant. Generally speaking the tenant in fee simple is the absolute owner in perpetuity. A tenant in fee simple can dispose of his land by deed or will for any interest and to whom he pleases. An estate in fee tail is a F. which is limited in its descent to the issue of the tenant. A qualified or *base F.* is created where a tenant in tail, not yet in possession, bars the entail by deed without first obtaining the consent of the protector. *See also* ENTAIL.

Fee Law, see FIEF.

Feeble-minded, see MENTAL DEFICIENCY ACTS.

Feeding, see FOOD AND FEEDING.

Feeling comprises all our pleasures and pains, together with states that are indifferent as regards pleasure or pain, and are characterised simply as excitement. Under the muscular F.s. and the sensations are detailed all the susceptibilities of a primary character, due, on the one hand, to the putting forth of muscular energy, and on the other to the operation of the outer world on the organs of sense. There remains a large dept. of secondary, derived, or complicated F.s., termed the emotions. F. proper may be divided into (1) Formal and (2) Qualitative. The former comprises oppressions, relief, harmony, and contrast, and the more elementary formal F.s., and also the more complicated F.s., e.g. hope, apprehension, doubt, tedium. The second division includes the lower F.s., or those of sense-pleasures and pains of colours and sounds, and the higher or intellectual F.s., the æsthetic, the moral, and the religious. The modes of derivation or composition of the emotions depend on contiguous growth or the associating process. Association operates in uniting together a number of separate F.s. into one whole, which is then connected with a special object, as in sexual love. *See also* EMOTIONS.

Fees: Architects' fees.—These will, in general, be fixed by express agreement. Where there is no express agreement an architect is entitled to reasonable remuneration, depending on the nature of the work to be executed. It is usual in express agreements to pay a commission varying according to the cost of the expenditure. The customary rates are well recognised, and will usually govern cases where there is no express agreement. This rate is six per cent on work costing £2000 rising on a graduated scale to ten per cent

on £100. This covers the preparation of plans and specifications, certificates for the builder, and measurements, etc. But where the work requires more than ordinary skill, such as in the case of alterations to existing buildings, designs of high-class fittings and furniture for a mansion, an architect is entitled to charge a higher rate. Where the plans are not used, it is customary to charge one quarter of full fees, if the work is only approximate and without plans. But where drawings sufficient for quantities to be estimated and a tender to be invested have been prepared, it is usual to charge two-thirds of full fees. In addition, the architect is entitled to his travelling expenses. Where the architect prepares bills of quantities, i.e. estimates of the labour and material required, he may claim an additional commission. (*See Quantity Surveyors*, p. 610). Where no works are carried out the remuneration is generally by the day, varying with the reputation of the particular architect. Three guineas a day is considered the minimum F. for a man of fair standing, and is generally allowed by taxing masters. The professional charges of architects are dealt with in rules issued by the Royal Institute of British Architects.

Clerical fees.—These are due principally in respect of marriages and burials. Where the marriage is by banns, the F. for the pub. of the banns is about 12s. 6d. in most parishes. In the case of a marriage by licence the F. varies according to the kind of licence. Banns are not necessary where the marriage is by bishop's licence. Such licence is to be obtained at the Vicar-General's office, 3 Creed Lane, Ludgate Hill, London, E.C., or at 1 Dean's Court, Doctors' Commons, E.C., at a cost of between £2 and £3. In country dists. a bishop's licence may be obtained at the offices of the bishop's registrars, or through his surrogates or deputies. When the marriage is by special licence of the archbishop of Canterbury, the F. for the licence stamp, etc., is £25. Such licence can be had on application, through a proctor of the Faculty Office, Doctors' Commons, and enables the marriage to take place anywhere and at any time. The cost of a registrar's certificate, where the marriage is to be so authorised, is 7s. where the parties live in the same dist., and 9s. if they live in different dists., the F. for a registrar's licence is £2 12s. 0d. where the parties desire to be married by licence. There are also F. payable to the incumbent on the solemnisation of the marriage itself when the marriage takes place in a church. There is no fixed scale, the rate being according to the custom of the particular church. Marriage F. are not uniform, and if excessive, there is power with the Diocesan Chancellor to moderate them. The minimum F. are generally one guinea to the clergyman and 5s. to his clerk or vergers. In poor dists. the charges are lower. A copy certificate of the marriage may be obtained at Somerset House for 2s. 7d. The marriage register may always be inspected on payment of 1s. Burial F. are by custom due

to the incumbent, but they can only be recovered in an eccles. court, for the common law does not recognise such F. Statutory Burial F. are, however, recoverable in the ordinary courts, where no express enactment provides for their recovery in the eccles. courts. A customary burial F. to be recoverable, must be of a fixed amount and reasonable. There may also be F. payable by custom for monuments and vaults. Tables of F. for burials may be fixed for any parish by the eccles. commissioners (q.v.) with the consent of the bishop of the diocese. A minister and his sexton are also entitled to F. for services in connection with a burial, the rate of such F. being in accordance with tables approved by a secretary of state. F. are not ordinarily payable for baptisms; but both on those occasions and on the ceremony of 'churaching of women' it is usual to make a gift or offering. See Sir R. Phillimore, *Ecclesiastical Law*, 1873, and Little's *Law of Burial*.

Engineering.—In both lump sum and schedule contracts, the percentage charges are half those for architectural work, but the same scale applies in respect of charges based upon time.

Legal fees.—In a wide sense legal F. means any F. provided for by law. In a narrower or technical sense it is practically equivalent to costs. Costs for legal work done may relate either to non-contentious or to contentious work. As in the medical profession, there is a recognised scale for a solicitor's remuneration, but a solicitor and his client may make a special agreement as to costs. In the case of contentious business the solicitor is not entitled to his costs until the bill has been submitted to the Taxing Master's office for approval (see Costs). The items to be seen on a solicitor's bill of costs usually make a formidable total, but the greater part is incurred for counsel's F., witnesses' expenses, and the preparation of documents for the hearing; so that in reality the profit of the solicitor is far below what is commonly supposed, especially when the time spent in the incidental work of preparing a case is borne in mind. The customary F. for a solicitor's attendance is from 6s. 8d. to one guinea a visit, according to the nature of the business and the time taken. Included in the bill of costs which a litigant (whom the court has ordered to pay the costs of legal proceedings) will have to meet, will be court F. (the F. and percentages will be found in either the *Annual Practice* or the *Yearly Practice* in the schedule to the *Order as to Court Fees*). These include, *inter alia*, F. on a writ of summons in the King's Bench Div. or, in

the Chancery Div., an originating summons, for the commencement of an action (30s.); entering appearance on a summons (2s. 6d.); on taking an affidavit (2s. 6d.); filing a notice of motion (5s.); presenting, in the Chancery Div., a petition to a cause or matter (£1) and answering a petition (£1); entering a judgment, decree or order given or directed or made in the trial of a cause (£2), or, in an undefended matrimonial suit (£1); entering a judgment pursuant to an order or certificate made in chambers (10s.). All these F. are payable ultimately to the Inland Revenue authorities in the form of stamps. A solicitor must submit his bill to the client before he is entitled to sue for his costs, and this whether it relates to contentious or non-contentious work.

Conveyancing (q.v.) and CONVEYANCE F. form one of the most remunerative sources of a solicitor's profits. There are two scales of conveyancing F., depending on whether the title to the land is or is not registered under the Land Registration Act, 1925. Solicitors' scale F. (where the title to the land is *not registered*) (a) as vendor's or mortgagor's solicitor for deducing title, and perusing and completing conveyance or mortgage (including preparation of contract, or conditions of sale); or (b) as purchaser's or mortgagee's solicitor for investigating title and preparing and completing conveyance or mortgage (including perusal and completion of contract) are on a sliding scale according to the consideration money (i.e. purchase, sale, price, etc., of the land.) The following table gives examples of the F. :—

CONSIDERATION MONEY	SCALE FEE
	£ s.
Under £100	4 10 (minimum fee)
£100 to £300	7 10
£300	22 10
£500	67 10
£10,000	105 0
£20,000	142 10
£30,000	130 0
£40,000	217 10
£50,000	255 0
£100,000	295 0

Rack Rent Leases.—Lessor's solicitor's F. (whether or not the title to the land is registered) for preparing, settling and completing the lease or agreement for a lease, and counterpart, at a rack rent (other than a mining or building lease) are on a scale of which the following rates are an example :

ANNUAL RENT

£65 and under
£70
£80
£100
£100 to £500

Above £500

LESSOR'S SOLICITOR'S SCALE FEE

(minimum) £7 10s.
£7 17s. 6d.
£9
£11 5s.

£11 5s for the first £100 rent, and at the rate of 3s. 9d. for every subsequent £5 of the rent.
£11 5s. for the first £100 rent, 3s. 9d for each subsequent £5 up to a total of £500, and at the rate of 1s. 6d. for every subsequent £5 of the rent.

Long Leases.—Lessor's or vendor's solicitor's F. (whether or not the title is registered) in respect of a building lease reserving rent or other lease for a term of 35 years or more at a rack rent are on a sliding scale as under :

ANNUAL RENT

£5
£50
£100
£500
£1000

Above £1000 at the rate of 7s. 6d. for every subsequent £5 of the rent.

VENDOR'S OR LESSOR'S SOLICITOR'S SCALE FEE

(minimum) £7 10s.

£21
£28 10s
£62 5s.
£99 15s.

Solicitor's F. on sales, purchases or mortgages of registered land.—Solicitor's F. (where the title to the land is registered with an absolute or good leasehold title under the Land Registration Act, 1925) for every completed transfer on sale, and on every charge, mortgage or transfer for value thereof are on a sliding scale, of which the following are selected examples :

VALUE OF LAND OR AMOUNT OF CHARGE

SCALE FEE

	£	s.	d.
£100 and under	2	5	0
£500	5	12	6
£1000	11	6	0
£5000	33	15	0
£10,000	48	15	0
£20,000	63	15	0
£30,000	78	15	0
£40,000	93	15	0
£50,000	108	15	0
£100,000	122	10	0

In transactions between £50,000 and £86,250 (inclusive) the amount chargeable is the same as on £50,000. Where the land is registered with a possessory or qualified title (*see* REGISTRATION OF TITLE) and no title excluded from the effect of registration is investigated, the above scale applies. If such excluded title is investigated the solicitor's charges for the transaction are by items. (Land Registry F. are payable to the Land Registry and do not form part of the solicitor's remuneration, to which they are additional.) In a conveyancing transaction, where a title is absolutely clear, the work involved is almost purely a matter of drawing and engrossing according to precedent. In these cases the client will be well advised to make some special arrangement.

There are scales of F. for drawing and perusing deeds, wills, or other documents. Generally these F. are 2s. per folio for drawing up the document, 8d. per folio for engrossing (*i.e.* copying out in a clear hand for preservation) and 1s. per folio for perusing. The F. for drawing each sheet of eight folios of an abstract of title (*i.e.* the list of the title to the particular land; *see* VENDORS AND PURCHASERS) is 6s. 8d. A solicitor is also entitled to a F. of 5 guineas daily for every day of not less than seven hours employed on the business of or in travelling for his client. The F. mentioned in this paragraph are basic

scales and subject to an increase of 33½ per cent.

Counsel's F. are fixed entirely according to the arrangement between themselves and the solicitors who employ them. It is customary to include in counsel's F. an

amount for his clerk according to a sliding scale varying from 2s. 6d. on a brief F. under 5 guineas to £2 10s. on a F. of 50 guineas or upwards. The clerk is entitled to sue the barrister for his F., but a barrister may not bring an action against anyone to recover his F., which are legally regarded as being in the nature of *honoraria*. The allowance for counsel's F. is entirely in the discretion of the taxing master. Separate F. are in general allowed for conducting a suit (the 'brief F.'), advising, settling pleadings, consultations, conferences, and commissions to take evidence abroad. Where a case extends over a day a 'refresher' may be allowed by the taxing master. A junior counsel customarily receives a F. equal to two-thirds of that of the leader. *See* Scott on Costs, *Annual Practice*, *Yearly Practice of the Supreme Court*. *See also* COSTS.

Medical fees.—These may be conveniently considered according as they are in respect of attendance on private patients, or by way of remuneration for attendance at the request of the police or to give evidence in a court of law. **Fees for attendance on private patients.**—The F. of a general practitioner are by the etiquette of the profession fixed on a sliding scale based on the income of the patient as indicated by the rental of his house. 'Special' visits are charged for at the rate of a visit and a half, a special visit being where notice to attend has not been given to the practitioner before starting on his daily round. In the case of houses of £10 to £25 rentals the F. for ordinary visits is from 5s. to 7s. 6d.; £25 to £50 from 5s. to 10s. 6d.; £50 to £100, from 7s. 6d. to 15s., and similarly where the patient visits the practitioner. Night visits are charged at double the rate of ordinary visits. The scale for detention per half hour is at the same rate as for ordinary visits. There is also a mileage charge varying from 2s. 6d. to 4s. The minimum F. for a consultation is 21s. In every case, but the F. generally charged by a consulting physician or surgeon is 3 guineas a consultation, or 2 guineas for the first and 1 guinea for each subsequent consultation. If the consulting physician or specialist calls upon the ordinary medical practitioner to meet him in consultation, the practitioner is entitled to charge double his ordinary F. as given above. The F. for a certificate of health is at the same

rate as for an ordinary visit. The charge for attendance on a servant is the same as that for the master, if the attendance was at the latter's request. The Insurance Acts deprive this convention of most of its force, as servants are entitled to medical benefits under the Act, and to be attended by a 'panel' doctor. The above customary rates apply in the absence of any express agreement between the patient and the doctor. A specialist, consulting physician, or practitioner can, of course, charge what he chooses if the patient agrees beforehand to pay such charge. No doctor on a hospital staff may receive a F. for work done at the hospital, any F. paid by hospital patients are payable to the hospital itself. Medical men may now sue for the F. by virtue of the Medical Act, but they must prove registration as a medical practitioner and possession of a diploma from a recognised examining body. The bye-laws of the Royal Colleges of Physicians and Surgeons prohibit a *fellow* from bringing an action, but such prohibition extends to no one else. Under the National Insurance Act (1946), insured persons entitled to medical benefits escape all liability for F. and cost of drugs. The medical practitioner on the panel for a specified area looks for his remuneration to the National Insurance Fund, and the amount, which is payable quarterly, includes a rate fixed by the commissioners in respect of each insured person on the practitioner's list, and other rates for various services rendered. Doctors (and dentists) who have joined the comprehensive National Health Service system (see NATIONAL HEALTH SERVICE), set up by the National Health Service Act, 1946, are not debarred from receiving fees from patients who do not take advantage of the State scheme. Capitation remains the main source of remuneration (as under the various National Insurance Acts) of doctors who join the State health service, but there is also a basic salary.

Fees of medical witnesses.—F. under Coroners Acts, 1887-1926: (a) for attending to give evidence at any inquest where no post-mortem examination has been made by the practitioner, for each day's attendance, £1 11s. 6d.; (b) for making a post-mortem examination and reporting result to coroner, without attending to give evidence at an inquest, £2 2s.; (c) for making a post-mortem examination and reporting result to coroner and for attending to give evidence—for first day, £3 3s. and for each subsequent day, £1 11s. 6d. No provision is made for mileage. F. in other courts—Home Office Orders in respect of witnesses giving professional evidence, provide as follows: there may be allowed to practising members of the medical (and legal) profession for attending to give professional evidence, allowances not exceeding the sums stated in the following scale: for attending to give evidence in the town or place where the witness resides or practises: if he attends to give evidence in one case only, not more than one and a half guineas a day; if he gives evidence on the same day in two or more separate and distinct cases, not more

than 3 guineas. For attending to give evidence elsewhere than in any town or place where the witness resides or practises, whether in one or more cases, not more than 3 guineas a day. Travelling allowances are also made for attending court from a distance of over 2 m. F. in Higher Civil Courts: in the Supreme Court of Judicature and in the Court of Appeal, a medical witness is allowed 1 guinea a day if resident in the city where the case is tried, and 2 guineas to 3 guineas if resident at a distance from the place of trial, inclusive of all except travelling expenses. For travelling expenses he is allowed a sum not exceeding 3d. per m. each way if there be a railway, and 6d. a m. each way if there be no railway. The basic scale of F. in co. courts, where witnesses may refuse to give evidence unless paid their expenses is 15s. for time given and 1 guinea a day for hotel expenses, for ordinary evidence as distinct from expert evidence; in the latter case the F. are from 1 guinea to 3 guineas for time given, and 1 guinea to 5 guineas a day for expenses. According to the 'Rules of the Supreme Court,' an expert medical witness in the High Court is entitled to a basic fee of 7 guineas a day for reading up a case in order to give evidence; but in most cases, of course, the remuneration is fixed by the parties calling the witness before the case comes on.

Under the Workmen's Compensation Acts, there is a statutory scale of F. payable to the medical practitioners acting as medical referees in cases of accidents to workmen.

Dental.—Extractions, fillings, scalings average 12s. 6d.-15s. each operation, for private patients. Dentures may cost any sum up to £30 or more. Dentists' professional expenses, including as they do mechanics' wages and the cost of dentures, are necessarily heavy. The present scale of F. accepted by the Ministry of Health for the National Health Service for dentists who join the service, is designed to produce £3858 gross a year—the sum recommended by the Spens Committee for an efficient dentist making full use of all appropriate assistance. The official scale is based on the average times taken for the various dental operations. By a regulation of the Ministry of Health (operating from Feb. 1, 1949) limiting the earnings of dentists, taking part in the National Health Service, the earnings of dentists will be paid in full up to £4,800 gross in a calendar year, but further earnings beyond this figure will be reduced by half. See also under DENTISTRY.

Accountants' Charges.—The following scale of F. is generally applicable, but for special work. F. are usually a matter of negotiation. For company audits, the F. is fixed by shareholders in general meeting. For preparing balance sheets, investigating accounts, etc., 5 to 10 guineas per day of 7 hrs., of principals' time; 3 to 5 guineas in the case of managing clerks (if chartered or incorporated accountants), 1½ to 2½ guineas (if not chartered, etc.); other clerks, 1 guinea and upwards. Receiver, liquidator and

trustee in bankruptcy, are usually paid a percentage on realisation of assets and dividends paid.

Quantity Surveys.—The customary charge as for preparing Bills of Quantities is $2\frac{1}{2}$ per cent on the estimated cost of the work up to £10,000, and 2 per cent above that amount, together with $\frac{1}{4}$ per cent for pricing out estimates; 4 per cent for measuring variations on contracts (i.e. $2\frac{1}{2}$ per cent upon the amount of gross additions and $1\frac{1}{2}$ per cent on gross omissions); $\frac{1}{4}$ per cent for preparing approximate estimates; and $\frac{1}{4}$ per cent upon the amount of the valuation, for surveying work in progress.

Stock-Brokers' Charges.—Stock-brokers' charges are fixed by the committee of the Stock Exchange, and vary considerably for different classes of stocks and shares. The usual charge on the most important securities is $\frac{1}{4}$ per cent, rising to one half per cent, in a few instances, with a minimum fee of ten shillings on less than £100 and twenty shillings on over a £100. The charges on buying and selling shares also vary, being mostly based on a fee of one penny on each ten shillings, with the same minimum as above.

Auctioneers.—For freehold and other leased property: on the first £300, 5 per cent; on the next £4700, $2\frac{1}{2}$ per cent; on the residue $1\frac{1}{2}$ per cent. The charges for selling chattels, stock, and effects are 5 per cent on the first £500, and $2\frac{1}{2}$ per cent on the residue. Special arrangements are usually made in relation to non-sales or subsequent sales. The charge for selling furniture, stock-in-trade and other goods on the vendor's own premises is 5 per cent on the amount realised, plus agreed costs for printing and advertising. The charge for selling horses and pedigree live stock is 5 per cent. Other live stock is $2\frac{1}{2}$ per cent, dead stock 5 per cent.

Estale Agency.—Sales by private treaty: First £300, 5 per cent, next £4700, $2\frac{1}{2}$ per cent; on the residue $1\frac{1}{2}$ per cent. Purchases: one half the scale for selling. If no purchase is effected the usual scale for valuation is charged, which is: £1 10s. per cent on the first £1000, 10s. 6d. per cent on the next £9000, and 5s. 3d. on the remainder, with a minimum fee of £5 5s.

Fehling's Solution, solution which is used for the detection and estimation of glucose and other 'reducing' sugars. It consists of a solution of cupric sulphate mixed with alkali and potassium-sodium tartrate. For use a small quantity of the solution is placed in a test tube and diluted with water. It is then boiled for a few seconds, after which the fluid to be tested is added drop by drop until its bulk is equal to that of the diluted fluid. If a reducing sugar (such as glucose but not sucrose, cane-sugar) is present a yellow precipitate of hydrated cuprous oxide is thrown down, which subsequently loses its water of hydration, and becomes reduced to ordinary red cuprous oxide.

Fehmarn, or Femern, is in the Baltic Sea, which belongs to the Ger. *Land* of Schleswig-Holstein, and is separated from the N.E. corner of Holstein by a channel one m. in breadth. It has an area of 73

sq. m., and is very fertile. Though bare of forest, corn is extensively grown and cattle are reared in the pastures. The fisheries form the chief industry. Burg is the cap. Pop. 12,000.

Fehmle Courts (Old High Ger. *feme*, court of justice), tribunals, often, but not always, secret, which became renowned in Westphalia about the twelfth century, and afterwards spread throughout Germany. They were composed of free citizens leagued together against feudal tyranny, and acknowledging no jurisdiction but their own. Important cases were tried in secret, when none but inflated members might attend, and the only permissible sentence, *death*, if pronounced, was certainly carried out, no culprit, however powerful, being secure. Implicit obedience was exacted from all members, who were known to each other by secret signs. See T. Lindner, *Die Feme*, 1888; C. W. Scherer, *Die westfälische Feme-gerichte und die Widenossenschaft*, 1941; and Scott's *Année de Geisteswiss.*

Fehrbellin, tn. of Brandenburg, Germany, situated 33 m. N.W. of Berlin. It was the scene of a battle in 1675, when the Prussians, under Prince Friedrich of Homburg and his marshal Derfflinger, defeated the Swedes under Wrangel. Pop. 2000.

Fehrenbach, Konstantin (1852-1926), Ger. statesman; b. at Wellendingen, Baden. In 1882, a lawyer in Freiburg. Sat, 1885-87 and 1901-13, as member of centre, in second chamber of Baden, over which he presided 1907-09. From 1903, in Reichstag of which he became President in June 1918. Presided over National Assembly, Weimar, Feb. 1919. Became Chancellor at head of minority gov., June 1920. Took part in conferences at Spa (July 1920) and London (March 1921). As refusal of reparations-demand led to 'sanctions,' F.'s cabinet gave place to Wirth's. In March 1924, F. became chairman of his party.

Fehrmann, Minny, see BREMA, MARIE. **Feijoo y Montenegro, Benito Jeronimo** (1676-1764), Sp. scholar. Became a Benedictine monk at the age of twelve. He is regarded as the initiator of educational reform in Spain. He boldly attacked the dialectics and metaphysics then taught everywhere in his native country; maintained Bacon's system of induction in the physical sciences. He pub. *Teatro critico universal* (1751-59), and *Cartas eruditas y curiosas* (1753).

Felding, Robert (1651-1712), known as 'Beau Felding,' was a member of the Denbigh family, and attached to the court of Charles II. He was noted for his numberless amours, his extravagance, and his profligacy. According to Swift, he married Mary, daughter of Barnham Swift, and wasted her fortune. He was given a regiment by James II., and later became a Rom. Catholic and followed James to Ireland.

Felding, Rudolf Robert Basile Aloysius Augustus, see DENBIGH, EARL OF.

Felding, tn. in N. Is., New Zealand, 99 m. N.E. from Wellington. It has dairy factories, freezing works, and flour mills. Pop. 4700.

Feint, see DEMONSTRATION, MILITARY.

Fels (**Fhels**), name of various assemblies in Ireland. The F. of Tara, which originated seven centuries before Christ, was mainly a national and political assembly, and was due to meet every third year for the purpose of 'preserving the laws and rules, but might be called at other times. It was presided over by the Ard-Rig, and consisted of the prov. kings and other distinguished men of Ireland, e.g. poets, historians, etc. After the proclamation of the laws the proceedings were festive in character. The last regular F. was held at Tara in 560 A.D.

Faisal (**Faisal**), King of Iraq (1883-1933), b. at Rahab, near Taif; son of Husain ibn Ali—afterwards Grand Sherif and Emir of Mecca, and, later, King of the Hedjaz; descended from Hasan, eldest son of Mohammed's daughter Fatima. In 1913 he became deputy for Jiddah in the Turkish parliament, and took part in the Arab national movement. He was at Mecca when the First World War broke out. With one of his brothers, he raised the flag of revolt near Medina, June 13: and, having failed in an attack on that city, he became chief of his father's N. army. His forces, co-operating with Allenby, marched from Medina to the E. bank of the Jordan. He met Allenby Oct. 3, 1918, and the same day rode into Damascus in celebration of the overthrow of Turkish power in Syria. He attended the Peace Conference in Paris, Feb. 1919.

In March 1920 he was back in Damascus; where his appointment as King, and the independence of Syria, were proclaimed. But, next month, Syria was 'mandated' to France; and either F.'s appointment was unpopular, or opponents contrived to make it seem so (he had publicly expressed sympathy with Zionism); and Fr. troops entered Damascus July 25. F., deposed, left for Haifa, and began to turn his attention to Mesopotamia, otherwise Iraq; for the throne of which his brother Abdullah (now King of Transjordan) had hitherto been a somewhat passive candidate. A referendum of Iraq notables resulted in a huge majority for his election: he was enthroned King, Aug. 23, 1921. In 1927 he came to London to negotiate the admission of Iraq to membership of the League of Nations. The Brit. Gov., as Mandatory, had by then substituted a treaty arrangement with Iraq in place of the mandatory regime, but full independence and membership of the League did not come until 1930, when a new Treaty of Alliance was concluded between Iraq and Great Britain. F. died in Switzerland and was succeeded by his son Ghazi, who was killed in a motor accident in 1939. See Sir T. Comyn-Platt, *King Faisal of Iraq*, *Empire Review*, Nov. 1926; Mrs. Stewart Erskine, *King Faisal of Iraq*, 1933; Sir H. Young, *The Independent Arab*, 1933. See also IRAQ.

Felth, Rhijnwils (1753-1824), Dutch poet and writer, b. at Zwolle in the Netherlands. He was educated at Harderwijk and at the Univ. of Leyden, and became mayor of Zwolle in 1780. He wrote novels, which have been very much criticised for their morbid melancholy, as well as

tragedies, didactic poems, and lyrics. Of his novels may be mentioned *Julia* (1783), and *Ferdinand and Constantia* (1785), both of which are written in emulation of *Werther*, and his best tragedies are: *Thirza* (1784), *The Patriots* (1784), *Lady Jane Grey* (1791), and *Inez de Castro* (1793). Among his poems are: *Old Age* (1802), *The Grave* (1792), a didactic poem, and *Odes and Miscellaneous Poems* (1796-1814).

Felaniche, or **Felanitz**, tn. in Majorca, Balearic Isles, Spain, situated 27½ m. S.E. of Palma. Fruit is extensively cultivated and wine is manuf. There is also a trade in cattle. Pop. 12,000.

Feldkirch, tn. of Austria and the cap. of the Vorarlberg dist. It is situated about 6 m. above the junction of the Rhine with the Ill. It has engineering works, bell foundries, and cotton and paper mills; Kirschwasser is manuf. F. previously occupied a strong military position, and is the seat of sev. administrative offices. Pop. 12,900.

Félegyháza, or **Kiskunfélegyháza**, tn. of Hungary, situated 65 m. S.E. of Pesth, on the railway between that city and Szegedin. It is a centre of a vine growing dist., and there are extensive orchards. Corn and tobacco are cultivated. Sev. Rom. relics have been unearthed in the neighbourhood. In the seventeenth century the tn. was destroyed by the Turks: it was rebuilt in 1743. Pop. 34,000.

Félibien, André (1619-1695), Fr. architect and historiographer, b. at Chartres. Went to Rome as Secretary to the Fr. ambas. and, while there, came upon a life of Plus V. in the library of Cardinal Barberini, which he trans. This seems to have started him in his career as a writer on artistic subjects. With the patronage of Colbert and Fouquet, he was successively historiographer of buildings, secretary of the Académie d'Architecture, and keeper of antiquities; but he devoted most of his life to writing. His *Entretien sur les vies et sur les ouvrages des plus excellents peintres anciens et modernes* (1686) won the praise of Voltaire. Another notable work was his *Description de l'Abbaye de la Trappe*, trans. into Eng. in 1871.

Felidae, name given to an extensive family of carnivorous mammals, of which nearly all the existing members may be included in the genus *Felis*. They are characterised by a little body, soft and often beautifully marked fur, feet provided with cushion-like pads and retractile claws, and short, strong jaws with formidable teeth. *F. domesticus*, the domestic cat, and *F. leo*, the lion, are typical and widely contrasted species; others are *F. tigris*, the tiger; *F. pardus*, the leopard; *F. onca*, the jaguar; *F. concolor*, the puma; *F. catus*, the European wild-cat, and *F. maniculata*, also termed *F. castra*, the Egyptian cat, which is regarded as the parent of our own domestic species. *Lynx*, sometimes termed *F. lynx*, is more frequently regarded as a distinct genus of Felidae, with *L. pardinus*, the pardini lynx, and *L. canadensis*, the Canadian lynx, as the most familiar species. (See illustration, p. 612.)

Felis (the cat genus), *see* CARNIVORA, CAT, FELIDÆ, LEOPARD, and TIGER.

Felix, name of five popes: *Felix I.*, bishop of Rome, who reigned from 269 to 274. He is said to have suffered martyrdom in the persecutions under Aurelian. *Felix II.*, anti-pope, was raised to the papal chair in 356 on the banishment of Liberius, who refused to condemn Athanasius, but was expelled from Rome on his return in 357. He was regarded as a saint and martyr, and died in 365. *Felix III.*, pope, ancestor of Gregory the Great, succeeded to the papal chair in 483 and held it until his death in 492. He excommunicated the Patriarch of Constantinople, and so produced the first

and was the brother of Regula, who was also regarded as a saint. Both brother and sister suffered for their religion, and the former was beheaded on the site of the great cathedral.

Felixstowe, tn. of Suffolk, England, which is usually considered as having derived its name from a Priory dedicated to St. Felix, Bishop of Dunwich, is situated on a peninsular between the rivs. Orwell and Deben in the S.E. of the co. It is a well-known seaside resort, much frequented on account of its cliff gardens, fine beach, and boating and bathing facilities, 12 m. from the co. tn. of Ipswich. It adjoins Harwich harbour, which was an important centre of naval activity dur-

LION (*Felis Leo*)

schism between the E. and the W. Church. *Felix IV.*, pope (526-530), was elevated to the papal see by Theodoric, contrary to the wishes of the clergy and people. *Felix V.* was the name assumed by Amadeus VIII. (1383-1451), when he was elected pope in 1439. He succeeded as count of Savoy in 1391, and was created duke in 1416, but retired to a hermitage by the Lake of Geneva in 1434, and three years later became pope, reigning as Felix V. (1429-49). He died at Geneva.

Felix, Antonius, Rom. procurator of Judea, was a freedman of Antonia, mother of the Emperor Claudius I., or of the emperor himself. He married Drusilla, daughter of Agrippa I., and wife of Azizus, King of Emesa, whom he induced her to desert, and procured the assassination of the high priest Jonathan, who had offended him by unpalatable advice. St. Paul was sent to be judged before Felix at Caesarea, having there preached of righteousness, temperance, and judgment to come, and was kept in custody for two years.

Felix, St., patron saint of Zürich, whose feast is celebrated on Sept. 11. He flourished at the beginning of the third century,

ing the First and Second World Wars, and it has also an R.A.F. sea-plane Station, from which the pioneers of the sea-plane made their first flights, and at which many new aircraft have been tried out. It is the headquarters of the Felixstowe Ferry Sailing Club, and there are ten other Yacht Clubs within 20 miles. Pop. approx. 12,000.

Fell, John (1625-86), English divine, son of Samuel F., dean of Christ Church, Oxford. He was b. at Longworth, Berkshire. In 1636 he gained a studentship at Christ Church and took orders; deacon, 1647; priest, 1649. During the Civil war he held a commission as ensign for the king, and at the restoration was made dean of Christ Church and chaplain to the king. In 1676 he was consecrated bishop of Oxford, also holding the deanery of Christ Church *in commendam*. He was an extraordinary disciplinarian, encouraged learning, and proved himself a capable administrator, but refused all interference. It was written of him that 'He was the most zealous man of his time, for the Church of England,' also 'that he was very rude, and most pedantic and pedagogical, yet still aimed at the public good.' His

stern discipline of the undergraduates led to one of them, Thomas Brown (*q.v.*), being threatened with expulsion unless he could trans. extempore epigram 33 of book 1. of Martial, to which he replied with the lines:

'I do not love thee, Dr. Fell,

The reason why I cannot tell:

But this I know, and know full well,

I do not love thee, Dr. Fell.'

He spent large sums of his own money on the building of Christ Church (*q.v.*). He wrote many learned and religious works, and is noted, too, for his services to printing and publishing.

Fellah, plural **Fellahin** (Arabic for ploughman), name applied to the peasantry of Egypt. They preserve to some extent the blood of the anct. Egyptians, but the mixture of race due to long ages of inter-marrying with the various peoples who have occupied the country shows in the wide differences to be seen in their colouring, ranging from a deep bronze to almost white. Physically the F. are a fine race: the men are powerfully built with well-shaped skulls, oval faces, and large, clearly-cut features; the women when young are often very graceful and beautiful. Most are Moslems in religion. Their huts are of mud, roofed with straw, and only a few of the wealthier of them have brick houses. As a class they are poor, but the growing prosperity of the country is lifting their condition, and the advantages of education, hitherto entirely denied them, may do much for them. They are a cheerful, good-natured, and most industrious people, and under discipline of Brit. officers become sound soldiers. See EGYPT.

Fellani, or **Fellata**, see FULANI

Fellenburg, Philip Emmanuel von (1771-1844), Swiss educationist: *b.* at Berne. After distinguishing himself at the univ. of Tubingen he studied the life of the peasants and workmen of Switzerland, and was influenced by Pestalozzi. In 1799 he bought the estate of Hofwyl, near Berne, and started an agric. college in conjunction with Pestalozzi, from whom he later separated. It was based on a new system of bringing all ranks of society close together by education; and in spite of the ridicule it first encountered, proved a success.

Fellhammer, vil. of Polish Silesia, near Schleswig, Gottesberg distr., 18 m. S.W. of Wroclaw. Pop. 6000.

Felling, tn. in Durham, England. It forms a suburb of Gateshead, and is in the Jarrow parl. div. Paper, glass, and chemicals are manuf. there. Pop. 26,000.

Fellowes, Edmund Horace (*b.* 1870), Eng. clergyman and musicologist, *b.* in London. Attached to St. George's Chapel, Windsor, since 1900. Hon. Mus.D. of Dublin (1917) and Oxford (1938). He has written works on Byrd, and Orlando Gibbons, and ed. the complete series of Eng. madrigal and late songs (68 vols.) and besides much Tudor Church music.

Fellow-feeling, see SYMPATHY.

Fellows, Sir Charles (1799-1860), Eng. archaeologist, *b.* at Nottingham. In 1820 he became a member of the Brit. Association. In 1838 he went on the first of

his four expeditions to Asia Minor. His second expedition resulted in the discovery of thirteen anct. cities in Lycia. The fourth expedition was the most famous and satisfactory: it resulted in twenty-seven cases of marbles, chiefly from Xanthus, being presented to the Brit. Museum. This pioneer of archaeologists penetrated to dists. unknown by Europeans, entirely at his own expense. He wrote sev. books on his travels. In 1845 he was knighted, receiving no other public acknowledgment of the work he had accomplished. Wm. James Muller (*d.* 1845), the Eng. painter, accompanied F. to Lycia, and made many beautiful and interesting sketches of the anct. works of art.

Fellowship (Oxford, Cambridge, and Trinity College, Dublin, Univs.) term applied to a member of the foundation of an incorporated college, sharing in the gov. and receiving an income from the college revenues. F.s. are conferred generally through open examination, on Bachelors of Arts, whose careers have been distinguished. There are prize F.s. involving no collegiate duties, and official F.s. which are attached to the teaching and tutorial staff. Honorary F.s. are conferred on distinguished persons. The Dublin Univ. fellows hold their office for life. At first fellows were restricted to persons who took holy orders and were celibates: this was abolished in 1858.

Fell Pony, see under HORSE.

Felltham, Owen, see FELTHAM.

Felo de se (literally a felon on himself, i.e. a murderer of himself), the legal term for a suicide, hence used in verdicts where juries do not find evidence of temporary insanity. See SUICIDE.

Felon and Felony, in Eng. law, a legal term for a special but ill-defined group of criminal offences. Whether a particular crime is a felony, a misdemeanour, or a summary offence, must be determined by reference to the common law and to various statutes. Roughly, felonies are the more serious forms of crime, such as were once capital crimes punishable by death, and involving attainder and forfeiture of estates. Treason has been classified as a special form, but is usually grouped as a felony. The prin. differences between a felony and a misdemeanour are that a private person may arrest a F. without warrant, that costs of prosecution are paid from public funds. One difference in the procedure for trying a F. is that the accused has the right to challenge, without stating a reason, any member of the jury (up to twenty). The tendency of modern legislation is to classify new crimes as misdemeanours; but beyond this, and the fact that in the early days of the development of our common law, a crime was usually a felony, no general rule can be laid down for differentiating between felonies and misdemeanours.

Felsite, term used by geologists for fine-grained igneous rocks of acid composition. They are composed chiefly of felspar and quartz in very minute particles. In colour, the rocks are usually of a reddish-yellow, and are hard and sometimes

nodular. They occasionally contain porphyritic crystals of clear quartz, and are then known as quartz-Fs. The variety of formation of these rocks has led to considerable discussion, and it cannot always be determined whether F. is an original substance, or the result of devitrification of primary glass. They are divided up into granite porphyries, orthophyres, felsitic rhyolites, etc. The term soda-Fs. is used of fine grained rocks containing large quantities of soda-felspar.

Felspar (from Ger. *Feldspath*), important group of mineral silicates, forming prin. components of various plutonic and volcanic rocks. For example, Lyell gives the minerals essential to granite (plutonic) in their order of importance as F., quartz, and mica, and the trachytic rocks (volcanic) are largely felspathic. The chief constituent of all Fs. (sometimes over 60 per cent) is silica; alumina sometimes reaches 30 per cent, and there are varying proportions of lime and soda. Fs. are classified according to their cleavage as monoclinic (including orthoclase, adularia, and sanidine) and triclinic (albite, anorthite, etc.). The sub-divs. are based on chemical composition and crystallography. Fs. decompose when exposed to weather, forming various soils, among others china-clay. Kaolin, from which fine porcelain is made, consists of decomposed orthoclase. The Fs. have a sp. gr. of from 2.55 to 2.75, and their hardness, 6 to 6.5, is less than that of quartz. Pure F. is colourless, but many varieties are finely tinted owing to the presence of various minerals. Among these are: Amazon stone, a green F. found in Russia and U.S.A., this is often cut and polished; moonstone, a translucent variety known as adularia (hence its sheen is called adularescence), found in Ceylon; Labradorite, generally dull, but sometimes playing with brilliant blue, purple, and other tints, then very handsome when polished; sunstone, called aventurine from its golden spangled lustre, like that of aventurine glass, found in Queensland, Russia, and U.S.A. The colouring of red and grey granites is due to the Fs. they contain.

Felstead, or **Felsted**, vil. in Essex, England, famous for its Public School, which dates back to its foundation as a grammar school by Richard, first baron Rich, 1561. It was a well-known Puritan school in the seventeenth century, and four sons of Oliver Cromwell were educated there. Since 1856 extensive new buildings have been erected and playing fields added, and the numbers have greatly increased. See A. Clark (ed.), *Foundation Deeds of Felsted School*, 1916. Pop. 2000.

Felsites, name given to volcanic rocks allied in composition to the granites. The name is also often used to describe anct. lavas allied to the Liparites or to Obsidians which have become devitrified. Certain Scottish rocks which were once classed as Fs. are really devitrified trachytes.

Felt, fabric produced by the 'felting' or 'matting' together of fibrous materials, such as wools, furs, and some hairs. The

hairs from wool are covered with serrations or minute hooks which can easily be forced together, so as to become 'matted.' Fibre Fs. are interesting as the art of felting preceded the art of weaving in the anct. civilisations of Asia. There are two classes of Fs., the woven F. and the fibre F. In the former, selected wools are used, such as Saxony wool, and woven into a cloth that will endure the subsequent shrinking or felting; to obtain the heavier Fs., two or three woven cloths are stitched together before they are subjected to the process of shrinking. The material is passed between hollow steam-beated rollers which are kept moist and warm, and the fabric, thus treated, tends to shrink and thicken and become dense enough to resist water. Fibre F. is divided into the F. used for hats, impregnated F., and the ordinary F. For the manuf. of F. hats, vegetable fibres, silk, hairs, furs, and wool are used; hair and wool being the most usual. The F. made for hats goes through the same process as other F.; for fur hat Fs., an air blast is used to carry fibres on to the required shape, and the F. is impregnated with stiffening agents. The prin. use for F. is for the linings of furniture, rubber shoes, undercarpets, slippers, steam engine packing, and covering steam hot-water pipes and all vessels which are to be insulated to prevent condensation, etc. The impregnated iron felt is a later development, used in the construction of bridges, etc., in the place of rubber. Asphalted F. is used for roofing, especially for wooden structures.

Feltham, vil. in the co. of Middlesex, England, situated about 4 m. E. of Staines. It possesses a number of nurseries and mrkt. gardens. Pop. 16,300.

Feltham, or **Felltham**, Owen C. 1602-1668), Eng. author⁷⁰, at Mutford, Suffolk. Noted for a vol. of essays entitled *Resolves, Divine, Moral and Political* (1623). His writing was modelled on that of Bacon, and has a certain charm. The later eds. of *Resolves* include a collection of poems entitled *Lusoria*.

Felton, John (1595-1628), member of an old Suffolk family estab. at Playford. He served as a lieutenant in the army, and the rejection of his repeated applications to the first duke of Buckingham, George Villiers, for promotion, on account of some personal enmity, bred a deep hatred. He went to Portsmouth and, mixing with the crowd of applicants who waited on the duke, stabbed Buckingham dead. Felton was hanged at Tyburn: on his way to the gallows the crowd blessed him publicly for delivering them from the hated duke.

Feltre, tn. and episcopal see of Venetia, Italy, in the prov. of Belluno. It possesses a fine cathedral with a sixteenth-century polygonal apse. The theatre, once the Palazzo del Consiglio, is attributed to Palladio. Pop. (tn.) 6500, (commune) 20,000.

Felucca, name of a particular kind of sailing boat used on the Mediterranean and in Egypt. It is a large boat built with a high bow and raking sternpost, and rigged with two or three masts, with lateen sails and a jib. It rides low on the water

and moves very swiftly, being the fastest sailing boat on the Mediterranean.

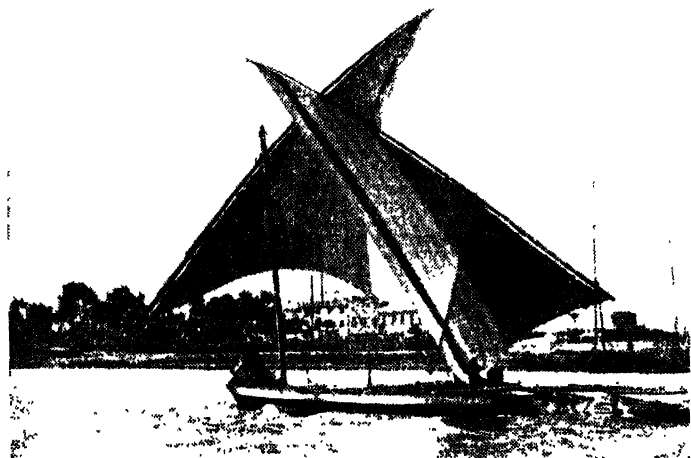

Female Suffrage, see **WOMEN'S SUFFRAGE**.

Feme, O.F. word, the modern being *femme*, used in English phraseology for 'woman'; *feme covert*, a married woman, i.e. protected by a husband, and *feme sole*, a widow or spinster.

Femern, see **Fehmarn**.

Feminism, belief in or advocacy of the influence of women in spheres conventionally reserved to men, or, more briefly, the movement for the equality of the sexes. The movement for extending the franchise

the growing plants; afterwards it must be cut and trimmed regularly or it will run to top, and gaps must be quickly stopped. Park F. are often constructed of posts and rails with feather-edge boards nailed on the latter, making a strong and neat enclosure. A sunken F., or 'ha-ha,' is one made along the bottom of a hollow which is invisible until one reaches its edge. In parts where stone is plentiful dry-walls are often constructed, in Aberdeenshire of granite boulders, in some Eng. cos. of pieces of limestone, the top and bottom layers being sometimes fastened with mortar. On moorlands earthen banks

A FELUCCA ON THE NILE

Canadian Pacific

to women in England had its intellectual genesis in the writings of John Stuart Mill. The great practical difficulty before emancipation lay in women's legal disabilities in the matter of acquiring their own separate property, a difficulty which was largely disposed of by the Married Women's Property Act, 1882. Legislation for giving the vote to women always passed the Commons from 1886 until 1911, being as regularly vetoed by the House of Lords. In 1918 a bill granting limited franchise was passed, and ten years later, full equality in this respect was attained. See also **WOMEN'S SUFFRAGE**.

Femur (thigh), see **LEG**.

Fences, are made for various purposes, such as enclosing animals on pasture-ground, protecting crops from straying cattle, affording shelter from wind, and marking off boundaries. The ordinary hedge and ditch of an Eng. farm makes excellent fencing, but is expensive in the matter of room, and where there are trees in the hedgerow they impoverish the ground. The hedge itself must be thickly set, and when new requires protection for

topped with gorse make excellent F. Where wood is scarce enclosures are often made of stout wire set up on straining-posts, with minor standards between.

Fenchoufu, city in Shansi prov., China, situated close to the r. b. of the R. Fen.

Fencibles, forces raised for local defence only, or on an emergency, e.g. the Eng. volunteers of 1804, at the time of Napoleon's threatened invasion.

Fencing, art of using a sword, foil or similar weapon, for attack and defence. In medieval times steel-clad knights fought with lances, axes, and heavy swords, but when armour was gradually abolished by the introduction of fire-arms personal encounters came to be fought most frequently on foot, and success in the *duello* depended mainly on good sword-play. Skilled instructors were required, and were found among the plebeian foot-soldiers, who had for generations 'trusted to their hands to keep their heads.' Schools of swordsmanship were estab. in Germany, Italy, and Spain, and at length, under Henry VIII., a Corporation of Masters of Defence was formed in England,

The teaching, however, was not by any means like that of to-day, as it included the wielding of the huge two-handed sword, sword and dagger, sword and buckler, and other weapons now obsolete. Rapier practice, the commencement of modern F., seems to have originated among the Its. who discovered that the use of a light swiftly-handled blade was not only prettier but also more deadly than the cut and slash of a heavier weapon. Light and swift must here be understood as comparative terms, for the early rapier was often four to five feet long and fairly weighty. For many years the new system was looked upon with disfavour in England: in Elizabeth's time we constantly find it referred to in opprobrious terms, both gentlemen and professionals speaking of it as a murderous and (of course) 'un-English' innovation. But the handiness and efficiency of the rapier gradually made it popular, as it could be worn on occasions and in places where a heavy sword and buckler would have been cumbersome and decidedly not ornamental. For the new school It. teachers were indispensable, and towards the end of the sixteenth century sev. estab. themselves in London, the most noted being Salvio and Rocco. The former left a treatise on *The Use of the Rapier and Dagger*, which may remind us of the duel described in *Romeo and Juliet*, Act III. scene 1, fought with these same weapons. Though excellent for cutting and thrusting, the rapier was still unsuitable for quick parrying, which was done with the dagger, so that in a duel or fencing-match both hands were employed. Sometimes instead of a dagger a second rapier was used, slightly shorter than the first; the pair were known as 'a case of rapiers.' Sev. well-defined movements of the body (such as the *incartata*, a spring to one side to avoid a thrust), prescribed by the It. school, gave rise to the frequent jeers about 'skipping' indulged in by Eng. fencers.

Tricks were then sedulously taught and practised which would now be condemned; in fact, in that age of chivalry our modern ideas of fair-play would have found little favour. Many a teacher professed to have the secret of some infallible stroke by which an opponent could be slain, blinded or crippled, and these strokes were often mercilessly put into practice. The famous, or infamous, 'coup de Jarnac,' by which Chabot de Jarnac hamstrung Vivonne de Châtelleraune in 1547, was an It. device taught him by Capt. Calzo, and was highly commended by Marozzo of Bologna, one of the most celebrated fencers of the time. Wearing concealed armour was so frequent that it became customary to search the combatants before a duel. One Millaud gained renown by defeating even this precaution when fighting the baron de Vitaut. He opened his shirt politely and showed his chest: the searcher was satisfied, but Millaud was wearing a very fine steel corset, painted to look exactly like flesh. He killed his opponent. These instances show the spirit in which combats were often carried on in those days, and

no doubt stories of this kind helped to intensify Eng. prejudice. Sword and buckler play went on flourishing in this country long after it had died out among the upper classes, lasting in fact down to the time of Queen Anne. It seems to have been specially popular in the W. cos. forming a prin. item at the 'Dover's meetings' at Wootton-under-Edge (Glos.) and other country revels. Its place was afterwards taken by single-stick bouts, like those described in *Tom Brown's School Days* and *The Scouring of the White Horse*. These contests were varied with boxing matches, and eventually led to the institution of the prize-ring.

The sword had a literature of its own in Italy and Germany even before the invention of printing, and by the end of the sixteenth century many works had been pub. on the subject, some of them dealing with the gentle art of quarrelling. Saviole, in his treatise, *Of Honour and Honourable Quarrels*, maintains that looking hard at a man in the street is a fair matter of challenge, and gives a case from Trieste, where this slight cause led to one man being killed, two others wounded, and a fourth beheaded. As to 'giving the lie,' Touchstone's discourse in *As You Like It* is elementary compared with the niceties of the duelling-book.

There were sev. distinct schools of fencing, the It., swift and crafty: the Sp., elaborate even to pedantry: and the Ger., which favoured not only the rapier but also heavier weapons. The two former were in turn popular in England and France until in the latter country, under Louis XIV., the invention of the court-sword, with its light three-sided blade adapted only for thrusting, did away with the rapier, and brought in small-sword F. The lead in this was naturally kept by France, and the Fr. style of play has been adopted everywhere except in Italy, which country has a traditional method of its own for this as for other F. The small-sword has a slight tapering blade, bayonet-shaped, and about 34 in. long, of which the half near the guard is the *forte*, the other half the *foible*. The foil used for practice has a steel blade, quadrangular in section and tipped with a round button, from which it takes its Fr. name, *fleuret* (It. *fioretto*). Foil play was greatly affected by the introduction of the fencing-mask, invented by La Boësière in 1780, and became quite different in style from actual fighting. With a sharp point every hit must tell, and sword practice was therefore cautious and comparatively deliberate, but with the foil and mask there grew up a convention that no hits were reckoned except those on the body, and even then only according to certain rules. This encouraged a much quicker style of play, and a turn with the foils is now one of the finest of athletic exercises, every muscle in the body and limbs being called into action. The It. school still keeps to the 'effaced' position, i.e. the fencer stands sideways with his right to the front so that the heart is not exposed, but the Fr. have abandoned this for a more natural atti-

tude, which gives greater freedom and does not tire the muscles so readily. Their grip on the handle is also much lighter than that of the *Its*. Many practical swordsmen have objected that conventional foil-play is entirely artificial; a hit for example in the fore-arm which 'does not count' might disable a man in actual fight. For this and other reasons foil-fencing has not been so popular in England as abroad. But a newer style has arisen in which the rules and conditions are such as to prepare for real combat. This is *épée-fencing*, in which an ordinary small-sword is used, tipped with a button, sometimes furnished with tiny points to mark a hit; every hit counts. This system was introduced into England in 1900; the London *Épée Club* was soon established, and has held many open tournaments. *F.* is one of the events of the Olympic Games.

Modern *sabre-fencing* is descended from the broadsword fighting of the Middle Ages, but with great modifications. The *It.* *sabre* of to-day is very light compared with ancient weapons, and is used for thrusting as well as cutting. One variety, the *sciabola*, is especially dangerous; besides the usual edge, it has also a 'false edge' on the back of the blade for about eight inches from the tip. In Germany the basket-handled *sabres* used in univ. duels were somewhat like the heavy swords carried by old Ger. *Reiters*, having flat curved blades about 32 in. long and 1 in. broad; they are not used for thrusting. Another favourite weapon with Ger. students was the rapier or *Schläger*, this also was used for cutting only. See also *DUEL* and *DUELLING*.

Burton, *The Sentiment of the Sword*, 1911.

Fénelon, François de Salignac de la Mothe (1651-1715), Fr. archbishop and writer, b. of good family at the Château de Fénelon in the prov. of Périgord. He came to Paris in 1666, and after a term at the Plessis College he entered the famous theological college of St. Sulpice, then recently founded. He took holy orders there in 1675, and in 1678 became director of the *Nouvelles Catholiques*, a Parisian institution for female converts from Protestantism. On the revocation of the Edict of Nantes in 1685, he accompanied a mission to the Protestants of Poitou and Saintonge. In 1689 Louis XIV. appointed him preceptor to his grandson, the duke of Burgundy, a position which he held for the next six years. The varied character of F.'s works is a proof of the originality and flexibility of his mind. They include theological and controversial works, of which the chief are the *Traité de l'existence de Dieu* (1712), and the *Maximes des Saints* (1697); educational and moral works: the *Traité de l'éducation des filles* (written in 1681, pub. 1689) for the daughters of the

Duchess of Beauvillier; and the *Fables*, the *Dialogue des morts* (1699)—the leading idea of which is that politics must be guided by moral principles—and the *Aventures de Télémaque* (1699), all composed for his royal pupil; political writings, of which the most important are *Plans de gouvernement*, and the *Direction pour le conscience d'un roi* (1711); critical works: the *Dialogues sur l'éloquence* (1718), and the *Lettre à l'Académie* (1716). The *Aventures de Télémaque* is a pedagogic romance, imparting moral teaching together with instruction in Grk. mythology and antiquities. The politics of the book are more or less Utopian and its satire was aimed at the king—whence his anger

FRANÇOIS FÉNELON

Engraving by J. Thomson from Vivien's picture in the Louvre

when it was pub. clandestinely. The *Plans de Gouvernement* was also directed at the king: in it F. advocates a limited monarchy in which the king may demand of his subjects only what is necessary for the good of the State, and in which authority would be shared with a strong and Christian nobility mediating between monarch and people. F.'s services to the duke of Burgundy, however, led to his advancement, and he was presented to the abbey of St. Valéry in 1691, and in 1695 became archbishop of Cambrai. About this time arose the controversy concerning the Quietism of Madame Guyon, who, accused of sharing the more extreme views of Molinos, was twice imprisoned. F. defended her so far as the attacks against her were personal, and this led to a long and acrimonious controversy with Bossuet, with whom he had previously been on the best of terms. Bossuet issued his *Instruction sur les États d'Oraison*, and F. took up the cudgels on behalf of Madame Guyon, and defended some of her teachings in his

Explication des Maximes des Saints sur la Vie Intérieure (1697). The latter was pub. first, in violation of an understanding between the two prelates, apparently without the knowledge of the author, and this led to their final estrangement. After some delay, during which the controversy grew more embittered, the Pope, pressed by Louis XIV., condemned the *Maximes des Saints* in 1699, and F. honourably accepted the decision in accordance with his own declared views on papal authority. Pope Innocent summed up the matter in the words, 'F. erred by loving God too much, and Bossuet by loving his neighbour too little.' Ordered by the king to retire to Cambrai, F. spent his last years in doing good pastoral work within the confines of his diocese. He was buried in Cambrai Cathedral. The only controversy of his later years had reference to the Jansenists, whom he opposed to the point of persecution. It is generally conceded that F. was in many ways a model archbishop, but for the rest his character has been the subject of much speculation and controversy. He was a born teacher, who combined the address of a *grand seigneur* with all the refinements of an accomplished ecclesiastic; gentle but also hard and inflexible when the case required it. He carried on a voluminous correspondence, and his many interests included politics, literature, and philosophy.

There are eds. of his works by J. B. Bossuet (1821-24), Lebel and Leclère (1820-30), Gosselin (1851) and *Correspondances* (1827). See J. B. Bossuet, *Histoire de Fénelon*, 1850; E. De Broglie, *Fénelon à Cambrai*, 1884; M. Masson, *Fénelon and Madame Guyon*, 1907; H. Bremond, *Apologie pour Fénelon*, 1910; A. Déplangué, *La Pensée de Fénelon*, 1930; E. Carcassonne, *État présent des travaux sur Fénelon*, 1939.

Feng Kuo Chang (d. 1920), President of the Chinese republic, July 1917-Oct. 1918; one of the generals of President Yuan Shikai, on whose retirement he became Vice-President under Li Yuan Hung. On deposition of Li and immediate collapse of Manchu restoration, he became President. Secession of S. provs. left him president of N. China only. Schemed to conciliate the S., while his ministers were of the pro-Jap. faction.

Feng Yühsiang, Chinese 'Christian general'; b. 1880, at Chaohsien, Nganhwei prov. Educated as a Baptist. He began his military career in Tibet, 1909. Brigade commander, 1913; military governor of Shensi and commander of eleventh div., 1921. Military governor, Honan, May 1922; commandant, Peking garrison, Oct. 1922. Chief of defence, N.W. frontier, 1923. Seized Peking, deposed President Tsao Kun Oct. 22, 1921. Joined Kuomintang, March 1925. Evacuated Peking, April 1926. Won back Shensi, Nov. 1926; Honan, May 1927. Member of the council of state, Nanking Gov. Oct. 1928. Expelled from Kuomintang May 23, 1929.

Fengtien, see LIAOTUNG.

Fenho, largest riv. in Shansi, China. It flows in a S.S.W. direction, and is a trib.

of the Yellow R. The lower course of the riv. is the only part navigable, and this only part of the year, as in winter it is frozen over.

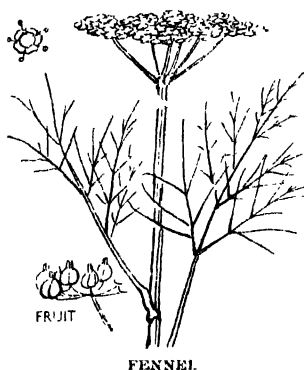

Fenians, or Fenian Society, name of a modern Irish-Amer. movement for the overthrow of Brit. rule in Ireland and the estab. of a republic. The name was derived from the anct. *fiann* or *féinne*, a legendary band of warriors in the heroic age of Ireland. The modern movement originated in America, where the Irish pop. had been largely increased by emigrants after the famine of 1846-47, and it was there that the first Fenian organisation was founded by John O'Mahony in 1858. The F. were particularly active in the W. states, but the movement soon had many ramifications, and agents were sent to Ireland and to the centres of Irish pop. in England. The result in Ireland was the 'Phoenix Conspiracy,' which was put down with little difficulty by the gov. James Stephens, one of the 'rebels of 1848,' and other prominent leaders were arrested, and *The Irish People*, ed. by Jeremiah O'Donovan (O'Donovan Rossa), a prominent member of the Phoenix National and Literary Society, was suppressed. Many prisoners were convicted of treason and sentenced to penal servitude. Stephens escaped from prison, and renewed the agitation in America. A raid into Canada occurred in 1866, but it proved a complete failure. The collapse of the movement dates from 1867, when an attempt at insurrection in Ireland proved utterly abortive. The Catholic priesthood never countenanced the movement, and the peasantry were lukewarm. Sev. outrages took place in England. A raid was made on the castle and military stores at Chester, but the raiders were betrayed. In the same year (1867) a police van, containing suspected F., was attacked at Manchester, and an attempt was made to blow up the wall of Clerkenwell Prison in London. The energetic measures of the gov. and the subsequent Irish reforms, inaugurated by Gladstone, restored tranquillity in Ireland. Fenianism, however, continued to smoulder, particularly in the United States, where another raid on Canada was frustrated by the U.S.A. Gov. The Clan-na-Gael, and United Irish Brotherhood were then the two great F. societies, and at the instigation of Michael Davitt they made the new departure which resulted in the Land League and the National League. The Phoenix Park assassination (1882) was connected with the extreme party. The ideas of the F. were partly adopted by Arthur Griffith who founded the radical nationalist party or Sinn Féin (q.v.) in 1902. See J. Rutherford, *Secret History of the Fenian Conspiracy*, 1877; Justin McCarthy, *History of our own Times*, 1880; J. O'Leary, *Recollections of Fenians and Fenianism*, 1896; and W. O'Connor Morris, *Ireland from 1798 to 1898*, 1898. See also HOME RULE; IRELAND.

Fenn, George Manville (1831-1909), Eng. novelist, the author of nearly 200 books of adventure for boys and girls. In some of his books he collaborated with

other writers, such as G. A. Henty. Among his best known books, and perhaps the most appreciated by boys, were: *In Freedom's Cause*, *Dick o' the Fens*, and *Quicksilver* (1896).

Fenneo, Moorish name for *Canis zerla*, also called *Vulpes zerda*, a species of fox native to N. Africa and ranging over the whole of the Sahara Desert. It has a coat of a pale fawn colour, which harmonises with its surroundings, black markings on the tip of the tail, and white round the eyes and on the forehead. The ears are huge compared with the size of the head, and give the animal a grotesque appearance. The body and head measure 15½ in. in length, and the tail 6½ in. The F. is a burrowing animal, and lines its habitation with feathers, hair, and other soft materials.

Fennel, name given to various species of Umbelliferae. *F. dulcis*, or sweet F., is cultivated in kitchen gardens and used

for culinary purposes, especially in fish sauces and with salmon. Sometimes it is boiled and eaten as a vegetable. The seeds contain oil; they are also infused, and fennel-water, which has carminative properties, is obtained. In a natural state the seeds are very bitter, but under cultivation they become sweet and aromatic and are used to flavour more disagreeable medicines. *F. vulgare*, the common F., occurs on the cliffs near the sea in Britain. Giant F., or *Ferula communis*, grows three or four ft. high, and the fibre of its stems is used as tinder.

Fennell, John Greville (1807-85), Eng. artist, naturalist, and angler. He was a member of the staff of the *Field* and the *Fishing Gazette*. In 1866 he wrote the *Curiosities of Angling Literature*, which he added to his *Fishing Gossip*. F. was a friend of Dickens and Gaskell.

Fenny Stratford, mkt. tn. in Buckinghamshire, England, situated in a valley on the l. b. of the R. Ouzel. There is a church of St. Martin, built in 1730, on the site of an older one, and it is the custom

to celebrate St. Martin's Day, Nov. 11, by a service in the church and the firing of small canon called the 'Fenny Poppers.' Pop. 4000.

Fens, low-lying dist. in the E. of England, situated W. and S. of the Wash, in Lincolnshire, Huntingdon. Cambridge, and Norfolk. The dist. covers about 70 m. in length, and roughly 35 m. in breadth. It represents a bay of the N. Sea now silted up, of which the Wash is the last remnant. It is intersected with many water-courses, and the rivs. Witham, Welland, Nene, and Great Ouse. Before the present system of drainage was developed, the whole dist. was water-logged and consisted of marshy swamps, wide pools, and lagoons. The Romans made the first attempt to drain the F.; they dug the Caer or Car Dykes from Lincoln to Ramsey and constructed earthen embankments along the Welland and the seashore, some miles of which can still be seen. An unsuccessful attempt was made in the reign of Wm. the Conqueror to drain Deeping Fm. After this the dist. was abandoned, although the forest portions were preserved for the hunting of the Plantagenet kings, and the isolated spots rising above the surrounding levels were occupied by many monasteries as early as the seventh century, such as Peterborough, Ely, Crowland, Ramsey, and Thorney, from which spread cultivation and a certain amount of drainage in their immediate neighbourhood till the dissolution of the monasteries. In the reign of Charles I. another attempt was made to drain Deeping and Holland F. on Dutch methods by Cornelius Vermuyden, and the initial efforts were made on the great scheme of the Nene and Ouse F., known as the Bedford Level (q.v.). The drainage of the other F. continued through the eighteenth and nineteenth centuries. Frequent flooding has been caused in the F. by the coincidence of high spring tides and rivs. swollen with water drained off the land. The system of sluices (closed at high tide) keeps the sea water from entering the rivs. but likewise prevents the riv. water from escaping to the sea. The consequent piling up of fresh water strains the banks and flooding follows.

A scheme proposed in 1948 by the Great Ouse Catchment Board to remedy the matter envisages the construction of a new riv. from Kentford in Suffolk through Mildenhall and Lakenheath to Denver. From Denver a relief channel would carry the water direct to an outfall at King's Lynn.

The only part of the original wild, undrained Fenland is Wicken F., S.E. of Ely, now vested in the National Trust and preserved as a unique natural 'monument,' of wild plant and animal life. The soil of the F. is extraordinarily fertile and indeed forms some of the most productive agric. land in England, while there are splendid pastures for cattle. The inhabs. have always been noted for their love of liberty. Boadicea ruled part of the dist. Hereward the Wake was a fenman, and Cromwell came from the dist., and this spirit showed itself in the steady, though

unreasonable opposition displayed to the various drainage schemes, the draining of enclosures always bringing trouble with the people who regarded the land as their own, and were tenacious of their rights. In the more isolated portions of the F. they remained primitive in their habits. Their life was spent in fishing and fowling, both wild fowl and fish swarming in the rive, and marshes. In severe winter good skating can be had in the F., and many famous speed skaters have come from the dist. It is interesting to know that the old Brit. dye-plant, woad, is still grown in a few of the F. pars.; another but vanishing feature are the little wind-mills that are dotted about the lonely flats, now no longer used. See N. and A. Goodman, *Handbook of Fen Skating*, 1882; C. Marlowe, *The Fen Country*, 1925, and *Legends of the Fenland People*, 1926; W. H. Wheeler, *A History of the Fens of South Lincolnshire*, 1928; Iris Wedgwood, *Fenland Rivers*, 1936. For local colour, C. Kingsley's *Hereward the Wake*, 1866, and G. Manville Fenn, *Dirk o' the Fens*, 1887. For the Norfolk fenland, see G. C. Davies, *Norfolk Broads and Rivers*, 1884; P. H. Emerson, *Pictures of East Anglian Life*, 1888, and *Marsh Leaves from the Norfolk Broadland*, 1898; and C. Marlowe, *People and Places in Marshland*, 1927.

Fenton, or **Great Fenton**, tn. of Staffordshire, England. It is close to Stoke-upon-Trent, and is part of the same par. and municipal bor., and also one of the big pottery centres, most of the people being employed in the manuf. of earthenware and china. It comprises Fenton Culvert and Fenton Vivian, or Little Fenton. Pop. 26,714.

Fenton, **Elijah** (1683-1730), Eng. poet, b. at Shelton, near Newcastle-under-Lyme, Staffordshire. He became private secretary to the earl of Orrery, with whom he went to Flanders, but later he came back to England and was appointed headmaster of the free grammar school at Severnocks. He resigned in 1710, and became tutor to Lord Broghill, the son of his former employer. He worked with Pope at the trans. of the *Odyssey*, the 1-6, 4th, 19th and 20th books being trans. by him. He also ed. Milton and Waller (1725 and 1729) and wrote a tragedy entitled *Mariamne* (1723) and many poems. See W. W. Lloyd, *Elijah Fenton, his Poetry and Friends*, 1894.

Fenton, **Sir Geoffrey** (c. 1539-1608), Eng. writer and politician, son of Henry F. of Nottingham, and brother of Edward F. the navigator. He seems to have travelled a good deal in his early days and wrote *Certain Tropical Discourses written out of Frenche and Latin* (mainly stories from Bandello) while in Paris (1567). He also wrote *Monophylo* (1572), but his most monumental work, pub. in 1579 and dedicated to Queen Elizabeth, was *The History of the Wars of Italy*, trans. from the Fr. of Francesco Guicciardini. In 1580 he was made secretary to the lord deputy of Ireland, and succeeded in so ingratiating himself with the queen that he kept the post until his death.

Fenwick, **Ethel Gordon**, Brit. nurse (1857-1947), daughter of David Davidson Manson, of Spyrie House, Morayshire. Educated privately at Middlethorp Hall, York. She became a nurse in the Children's Hospital, Nottingham, in 1878, and was matron of St. Bartholomew's, 1881-1887. She married Dr. Bedford Fenwick, gynecologist, in 1887. From 1893, hon. editor of *Journal of Nursing*. Founder and first member of Brit. Nurses' Assoc. Largely through her efforts, nursing was made a registered profession in 1919. Founder and hon. president of the International Council of Nurses, 1900.

Fenwick, **Sir John** (1645-97), Brit. soldier. He entered the army and became a major-general in 1688. He was a strong partisan of King James II., conspired against Wm. III., and in 1691 publicly insulted Queen Mary. He was arrested in 1696 for a plot to assassinate the king, and was beheaded.

Fedor I. (Theodore) (b. 1557), Tsar of Russia (1584-98), son of Ivan the Terrible; he was of weak intellect and practically governed by his wife, Irene, and his brother-in-law, Boris Godunov. On his death he left the throne to Irene, who retired to a convent in favour of her brother Boris.

Fedor II. (Theodore) (b. 1589), Tsar of Russia (1605), son of Boris Godunov; a prince of remarkable intelligence. The first map of Russia by a native of the country was drawn by him. The boy prince was foully murdered by the usurper Demetrius I.

Fedor III. (Theodore) (b. 1656), Tsar of Russia (1676-82), eldest son of Tsar Alexius; an intellectual and noble prince, a man of advanced ideas, his life's work was to reform his country. Suffered from an incurable disease which half paralysed him. His consort, Akathia, is said to have been the first to advocate in Russia shaving of the beard.

Feodosia, chief port of the Crimea, standing at the E. tip of the mt. range which lines the coast as far W as Sevastopol. It exports wheat to European Russia and has tobacco factories. In peace time a health resort. F. was sev. times a battlefield in the Second World War.

Feoffment, in feudal times, was the usual mode of conveying a freehold estate in England, and for a long period it was the only mode. This method of conveying required to be accompanied by *livery of seisin*, either *in deed*, or *in law*. In the case of *livery in deed* the feoffer handed a twig or clod of turf to the feoffee on the land to be conveyed; in *livery in law* the feoffer formally gave possession to the feoffee in sight of the land. A F. was usually evidenced by charter or deed, but writing was not necessary before the Statute of Frauds. The Real Property Act of 1845 rendered F. superfluous.

Feræ Nature, term given in Rom. law to wild animals and birds, including game, such as rabbits and pheasants. In Eng., as was the case in Rom. law, they become the property of the first person who takes possession of them, subject of course, to

the game laws. A person keeping wild animals is responsible for any damage they may do.

Ferdausi, or **Ferdusi**, see **FIRDAUSI**.

Ferdinand I. of **Castile** (c. 1000-65), was the second son of Sancho the Great of **Navarre**. He acquired possession of **Castile** in 1028, and was recognised first king of **Castile** in 1033. In 1037 he claimed **Leon** by right of his wife, who was a sister of **Bernudo III.** of **Leon**, and enforced his claim with the sword. He drove back the **Moors**, extended his frontiers from the **Duero** to the **Mondego**, and took the title of Emperor of **Spain** in 1056. He left a reputation for piety.

Ferdinand I. of **Aragon** (c. 1373-1416), surnamed 'The Just,' was the son of **John I.** of **Castile**, but was elected king of **Aragon** in 1412. He proved a strong ruler, and carried on the war against the **Moors**. Though at first a supporter of the anti-pope, **Benedict XIII.**, an **Aragonese**, he afterwards agreed to his deposition in order to end the **Great Schism**.

Ferdinand V. of **Aragon** (1452-1516), son of **John II.**, b. at **Sos** in **Aragon**. At sixteen he married (1469) **Isabella** of **Castile**, and on the death of her brother, **Henry IV.**, in 1474, F. and **Isabella** were proclaimed joint sovereigns, though **Isabella** did not allow her husband much share in the gov. F. succeeded to **Aragon** in 1479 on the death of his father, and the union of these two kingdoms marked the beginnings of Sp. ascendancy in Europe. F., who, on his accession, found faction and disorder rife, reorganised the **Santa Hermandad**, or military police, and suppressed the banditti. The menacing power of the nobles was broken down, and vigorous reforms were carried out, the king and queen being ably seconded in all their undertakings by the celebrated **Cardinal Ximenes**. In the memorable year of 1492, **Granada**, the last kingdom of the **Moors** in **Spain**, was finally conquered after ten years of strenuous conflict. In that year also **Columbus**, supported by the queen, set out on his great voyage of discovery, which made F. and **Isabella** sovereigns of a new world. A less creditable episode of that period was the spoliation and expulsion of the **Jews** in 1492-93. The **Moors**, too, were treacherously treated, a promise of toleration by the 'Catholic kings' being violated. The **Court of Inquisition** had already been instituted at **Seville** (1480). In 1500 F. took part in the conquest of **Naples**, and, outwitting his allies, made himself master of it in 1503. By arranging politic marriages for his children, he gained for himself allies on all sides of France, and in 1512 he seized a favourable opportunity to add the S. part of the coveted kingdom of **Navarre** to his dominions, which thus stretched from the **Pyrenees** to **Gibraltar**. **Isabella** had died in 1504, and F. married **Germaine de Foix**. He died at **Madrigalejo**, and was succeeded by his grandson, the Emperor **Charles V.**, who was already master of **Burgundy**, **Flanders**, **Holland**, and part of **Italy**. F. and **Isabella** were able rulers, but the brilliance of their reign

was marred by acts of gross cruelty and bigotry. F. was a shrewd and clever diplomatist, but was deceitful and despotic. For his expulsion of the **Moors**, the pope conferred on him the title of 'The Catholic.' See **W. H. Prescott**, *History of the Reign of Ferdinand and Isabella*, 1827-38; **W. T. Walsh**, *Isabella the Catholic*, 1936.

Ferdinand I., (Ger. emperor (1503-64), b. at **Alcalá**, in **Spain**, son of **Philip I.** and brother of **Charles V.** He married a sister of **Louis**, the king of **Bohemia** and **Hungary**, and he claimed the two kingdoms on the death of **Louis**, in battle, in 1526. His claim to **Hungary** was contested by **John Zapolya**, supported by the **Turks**, but, after buying off the **Turks**, F. gained the day. When he succeeded **Charles V.** as emperor in 1556, **Pope Paul IV.** refused to acknowledge him, and thenceforward the electors resolved not to ask the consent of the pope. F. tried to conciliate **Rom. Catholics** and **Protestants**, and his reign was marked by wise and enlightened gov.

Ferdinand II., (Ger. emperor (1578-1637), b. at **Graz**. His early training and his education by the **Jesuits** imbued him with a deep hatred against **Protestantism**, and he began early to try to put down **Protestantism** by force, first in his own duchy of **Syria**, and then in **Bohemia** and **Hungary**. When the **Bohemians** saw that F. intended to deprive them of the privileges they had gained under **Rudolf**, they declared that he had forfeited the throne and elected **Frederick Count Palatine** in his stead. This led to the outbreak of the **Thirty Years' war**, which had already begun when F. succeeded **Matthias** as emperor in 1619. F., supported by the **Catholic League**, was at first successful and gained a firm hold of the **Bohemian throne**. His general, **Tilly**, defeated **Christian IV.** of **Denmark** and the **Protestant confederacy** in 1626, but two years later, after **Wallenstein** was checked before **Stralsund**, the **Catholic cause** began to decline. The successes of the **Protestant champion**, **Gustavus Adolphus**, and the assassination of **Wallenstein**, at which F. connived, combined with other causes to bring his fortunes to a very low ebb at the time of his death in 1637. See **F. Hurter**, *Geschichte Kaiser Ferdinands II.*, 1850-1864; **A. Huber** and **O. Redlich**, *Geschichte Österreichs*, vols. v. and vi., 1921.

Ferdinand III., (Ger. emperor (1608-57), b. at **Graz**, the son of **Ferdinand II.** He took part in the **Thirty Years' war** before his accession in 1637, and, though more inclined towards peace than his father, was compelled to continue the war for the first eleven years of his reign. A series of disasters in the summer of 1648 forced him to make peace, and the peace of **Westphalia** was concluded in Oct. of that year. In the Diet of 1653-54, the last over which an emperor presided in person, important changes were made in the administration of justice. See **F. Gallati**, *Die Eidgenossenschaft und der Kaiserhof zur Zeit Ferdinands II und III.*, 1932.

Ferdinand I. (1751-1825), king of the Two Sicilies, was the son of Charles III. of Spain. He succeeded his father on the Neapolitan throne in 1759, ruling over Naples, 1759-1806 and 1815-25, and over Sicily, 1759-1825. He consolidated his dominions as the Two Sicilies in 1816. From 1806 to 1815 Naples was under the domination of Napoleon. F. was a weak ruler, and the gov. was largely controlled by his wife, Marie Caroline of Austria.

Ferdinand II., king of the Two Sicilies (1810-59), grandson of the preceding, was *b.* at Palermo. His reign opened in 1830 with fair promises, but they were unfulfilled, and his despotic rule culminated in insurrection in Sicily (1848). His ferocious bombardment of the chief cities in 1849, which brought the rising to an end, earned for him the nickname of 'Bomba.' His treatment of political suspects was the subject of two notable letters of Gladstone in 1850.

Ferdinand I. (1861-1948) first tsar of Bulgaria, *b.* in Vienna, the youngest son of Prince Augustus of Saxe-Coburg and Princess Clementine of Bourbon-Orléans. He married: (1) 1893, Princess Marie Louise, daughter of the duke of Parma, who died in 1899; and (2) 1908, Princess Eleonore of Reuss, who died in 1916. On the deposition of Prince Alexander of Bulgaria, F. accepted the offer of the succession. He was elected by the Bulgarian parliament on July 7, 1887, but his sovereignty was not recognised by the Porte until 1896. A nimble cunning distinguished his reign, and with much astuteness, he played the politicians and the military against each other. He invested the liberal and patriot Stambulov with almost dictatorial powers and used him to secure the Sultan's recognition; and once this had been obtained, he dismissed Stambulov and used Dr. Stoilov to make terms with Russia. By 1896 his position, both nationally and internationally, had been rendered secure. In 1908 he declared the complete independence of Bulgaria and assumed the title of tsar. This was recognized by the Porte and Powers in 1909. Though at first thwarted at every turn by Russia, F. set himself very successfully to the task of building up and consolidating his kingdom, and the results were seen on the outbreak of the Balkan war in 1912; the result of which was to enlarge the ter. of Bulgaria enormously. But his former allies, Greece and Serbia, dissatisfied with this result, turned against him, and, with the assistance of Rumania, in a war that began at the end of June 1913 (in which Turkey took a hand on its own account), greatly reduced Bulgaria's share of the conquests at their final settlement by the treaty of Bucharest on Aug. 10. This left F. bitter and revengeful against the other Balkan states. He remained neutral in the First World War until Oct. 14, 1915, when he entered it on the side of the Central Powers. He was victorious in Macedonia, Thrace, and Rumania; but his army was defeated by Allied troops at Dobropole, Sept. 1918, and an armistice was signed. On Oct. 4 he abdicated in favour of his son Boris,

and retired to Coburg, where he died thirty years later. See *Bonus III.*

Ferdinand II. of Leon (1136-88), younger son of Alfonso of Castile and Leon, succeeded in 1157. He was constantly at war with the Moors, Castile, and Portugal. His repudiation of his wife led to war with his father-in-law, Alfonso I. of Portugal, whom he defeated and captured at Badajoz. The military order of Alcantara was founded by the pope during his reign.

Ferdinand III. (c. 1200-52), 'The Saint,' son of Alfonso IX. of Leon and Berengaria of Castile; became king of Castile on the death of his wife's brother, Henry I., in 1217, and succeeded his father as king of Leon in 1230. Thenceforward the kingdoms were never separated. F. fought with success against the Moors, capturing Ubeda (1234), Cordova (1236), Jaen (1246), and Seville (1248). He subdued Granada and made Seville his cap. He was responsible for the collection and codification of the Lat. and Gothic laws known as the *Forum Judicum*. He was canonised in 1671 by Clement X., and is commemorated on May 30.

Ferdinand III. (1769-1824), grand duke of Tuscany (1790-99 and 1814-24), younger son of the Emperor Leopold II., *b.* and *d.* at Florence. He succeeded his father as grand duke, and continued his father's reforming policy. He was the first sovereign to acknowledge the Fr. republic, but nevertheless became involved in a quarrel with France, and Florence was occupied by the Fr. in March 1799. He was restored later in the year, but in 1801, by the treaty of Lunéville, Tuscany was formed into the kingdom of Etruria. F. was finally restored in 1814 by the Congress of Vienna. In the meantime he had been successively elector of Salzburg and grand duke of Wurzburg.

Ferdinand VI. of Spain (1713-59), *b.* at Madrid, the second son of Philip V. whom he succeeded in 1746. He helped to terminate the war of the Austrian Succession, and pursued a steady policy of neutrality in the Seven Years' war, in spite of overtures from England and France. He did much to revive literature and the arts in Spain. He was of weak constitution and retiring disposition, and on the death in 1758 of his wife, Barbara, who was greatly attached to him, he fell into deep melancholy, from which he never recovered.

Ferdinand VII. of Spain (1784-1833), eldest son of Charles IV, succeeded in 1790. Discontent with the gov. and the Godoy led to a rising in 1808, which forced Charles to abdicate and placed F. on the throne. F. was almost immediately led by Napoleon to abdicate in turn, and was enticed across the frontier and kept prisoner at Valençay. After the Peninsular war he was reinstated (1814), and promised to maintain the democratic constitution adopted by the gov. of National Defence at Cadiz in 1812. He twice broke a promise of this character, but receiving Fr. support was able to maintain despotic gov. He was succeeded by his daughter, Isabel II., for whose sake he had repealed the Salic law.

Ferdinand of Rumania (1865-1927); b. at Sigmaringen; second son of Prince Leopold of Hohenzollern-Sigmaringen; who was brother to Charles, first king of Rumania. Charles had no son. As F.'s elder brother was to succeed his father in Germany, F. was adopted heir to Charles in March 1889. On Jan. 10, 1893 he married Marie, eldest daughter of the duke of Edinburgh. In 1897 he nearly died of typhoid fever. Troops of the Central Powers overran Rumania on the outbreak of war in 1914; F. and his family retired to Jassy. He succeeded to the throne on Oct. 11, 1914, and immediately sided with the Liberal gov. against the Central Powers. He was obliged to sign an armistice, Dec. 7, 1917; but refused to sign the treaty of Bucharest, May 7, 1918, and denied its validity. In Nov. F. proclaimed expulsion of enemy troops; he re-entered Bucharest, Dec. 1. In Aug. 1919 he sent into Hungary an expedition which led to the downfall of Bela Kun. F. and Marie were crowned king and queen of Greater Rumania, Oct. 15, 1922, at Alba Iulia. Much of his estate was given up to peasants. In 1925 he caused his son Carol (q.v.) to be disinherited in favour of Carol's son Michael; and his last political act was to treat Carol's opponents in power. F. died of a malignant growth, at Sinaia, July 20.

Ferentino, tn. and episcopal see, Italy, 55 m. S.E. of Rome by rail, has remains of aet. limestone walls in the cyclopean style. It is a mkt. for oil and wine. The Church of St. Francis was severely damaged by bombing in 1943, but the twelfth-century mosaic pavement, pulpit, and choir-screen were spared. The church of S. Valentino also sustained damage. Pop. 12,300.

Fergana, or **Ferghanah**, region of Russian Central Asia. All the E. part of F. was added to the autonomous Kirghiz Soviet Republic (alternatively called Kazakhstan) in 1920. W. F. is now included in the Uzbek Socialist Republic (or Uzbekistan), formerly the khanate of Khokand. Nearly the whole of F. belongs to the fertile basin of the Syr Daria, the outlying parts being mountainous. To the E. are the Tien-Shan ranges; to the N. are the Ala-tau Mts., while the Trans-Ala-tau chain encloses the plain on the S. with the Tien-Shan. The richest and most densely populated part of this whole region of Middle Asia is the F. Valley. Sheltered from cold winds by some of the highest mts. in the world, which practically encircle it, it consists of a flat valley floor covered by a thick network of irrigation channels, with poplars and willows growing along their banks. Cotton and sugar beet are the chief crops. The lower hillsides of the valley are treeless, with occasional patches of pistachio, almond tree, iron wood and maple. The new F. canal is 170 m. long and provides water for over 12,000 ac. of grain as well as potatoes, cucumbers and tomatoes in the Uzbek, Tadzhik and Kirghiz Republics. Minerals, such as iron, coal, etc., are plentiful, and rice, maize, grapes, and melons are produced. The pop. is mixed,

the Tajiks, with the nomad Uzbeks and Kara-Kirghiz being the prin. races. In addition to Russian colonists, there are also Kirchaks, Sarts, Persians, Afghans, Hindus, Jews, etc. The chief tns. are Khokand, the cap., and Marghilan, the former cap. The tn. of F. is a centre of the cotton industry and has important cotton mills. Area, 35,446 sq. m.; pop. about 2,000,000.

Fergus Falls, co. tn. of Otter Tail co., Minnesota, U.S.A., on the Red River; has woollen factories and flour mills. Pop. (largely of Scandinavian origin), 10,800.

Ferguson, Adam (1723-1816), Scottish philosopher, b. at Logierait, Porthshire, was for a time chaplain to the Black Watch, and is said to have fought at Fontenoy. He succeeded Hume as keeper of the Advocates' Library, Edinburgh, in 1757; became prof. of natural philosophy in 1759, and of moral philosophy in 1764, at Edinburgh Univ., and afterwards travelled extensively. It was at his house that Scott, when a boy, had his memorable meeting with Burns. Chief works: *Essay on Civil Society* (1766), *Institutes of Moral Philosophy* (1772), and *History of the Progress and Termination of the Roman Republic* (1782).

Ferguson, Robert (c. 1637-1714), 'The Plotter,' a Scotsman by birth, spent most of his life in political intrigues. At first a Presbyterian minister, he became vicar of Godmersham, Kent, but was ousted in 1662 by the Act of Uniformity. He took a leading part in the conspiracies against the last two Stuart kings, accompanied Monmouth's futile invasion, and supported the cause of Wm. of Orange. Chagrined at the scant recognition he received under Wm., he finally transferred his services to the Jacobites. He was a busy pamphleteer, and pub. a *History of the Revolution* (1706).

Ferguson, Sir Samuel (1810-86), Irish poet and antiquary, b. in Belfast, was educated at Trinity College, Dublin, and was called to the Bar in 1838. He gave up his legal practice in 1867, when he was appointed deputy-keeper of the Irish Records. He was conspicuously successful in that capacity, and was knighted for his services in 1878. His antiquarian works include the *Ogham Inscriptions in Ireland*, pub. in the year after his death, and various papers contained in the *Transactions of the Royal Irish Academy* (1831-84), of which he was a notable president. Much of his leisure was devoted to poetry, and the charm of his lyrics and ballads anticipates the modern Celtic Revival. *The Forging of the Anchor* is generally regarded as his masterpiece. His other pubs. in verse include *Lays of the Western Gael*, (1865), and *Congal*, an epic poem (1872).

Fergusson, James (1808-86), 'the historian of architecture,' b. at Ayr. His studies in Bengal resulted in the pub. of *Rock Temples of India* (1843), *Ancient Buddhist Architecture of India* (1848), and *Fire and Serpent Worship* (1869). Also studied the archeological remains of Palestine and surrounding countries. His

monumental work is *A History of Architecture in all Countries from the Earliest Times to the Present Day* (1865-76).

Fergusson, Robert (1750-74), Scottish poet, b. at Edinburgh, his father being a clerk in the British Linen Company. He obtained a good education at Dundee Grammar School and St. Andrews Univ., but, declining to enter the church or to study medicine, he spent his few brief years as a copying-clerk in the commissary clerk's office, Edinburgh. He contributed humorous descriptive poems to *Ruddiman's Weekly Magazine*, and the reputation of these drew him into a convivial society in which he ruined his health. A meeting with John Brown of Haddington turned him to serious thoughts, but an injury to his head turned religious melancholy into insanity, and he died in the city asylum. Robert Burns was greatly influenced by his poems, which were first pub. in 1773.

Fergusson, Sir William (1808-77), eminent Scottish surgeon, b. at Prestonpans, the inventor of many surgical instruments, and prof. of surgery at King's College, London, 1840-70. He was elected president of the Royal College of Surgeons in 1870. *A System of Practical Surgery* (1842), was his most important work. He was elected a fellow of the Royal Society in 1843. See H. Smith, *Biographical Sketch*, 1894.

Feriae, name given to the holy days, or sacred festivals, of the anc. Romans. They were the *dies nefasti*, in contradistinction to the *dies fasti*. They correspond in some respects to the modern Sunday; political and legal business was suspended, and slaves were given a respite from labour. There were forty-five fixed festivals during the year, in addition to such festivals as the *feriae Latinae*, the dates of which were fixed annually, and special festivals at times of danger or victory. In addition to the *feriae publicae*, or public festivals, there were *feriae privatae*, observed by many single families in celebration of some particular event in the family hist.

Feridoun, see **FARDUX**.

Feringhi, or **Feringhee**, name for Europeans, common in the E., and dating from the Crusades, the word being a corruption of Frank. In India it is specially applied to the native-born Portuguese of Bengal. It has come to have a contemptuous implication, and was so used in the Indian Mutiny.

Ferishta, Mohammed Kasim (c. 1550-1612), Persian historian, b. at Astrabad. While still young he went to India and became captain in the bodyguard of the Prince of Ahmednagar. In 1589 he removed to Bijapur, and was commissioned by Ibrahim Adil Shah (1585-1628) to write a hist. of the Muslim dynasties of India. He is one of the most trustworthy of Oriental historians, and his work still maintains a high place as an authority. It has been trans. by Gen. J. Briggs under the title of *The History of the Rise of the Mohammedan Power in India* (1829).

Ferlach, tn. of Austria in Carinthia, close to the border of Yugoslavia. Noted for its industry of shot-gun making, which

originated in 1553, when Belgian craftsmen settled there. The leading *büchsenmeisters* still bear the names of their Belgian forebears. Lock, stock, barrel, engraving and other details have each their special craftsmen and the mechanism of various kinds is completed mostly in the craftsmen's homes. This unique industry is organised in a kind of guild, which is as jealous of its privileges as were the guilds of the middle ages. Recently a school was instituted to teach the craft in F., prior to which apprentices were only trained in the homes of the craftsmen. The Nazis removed the plans and tried to estab. a factory at Suhl, in Germany, but did not succeed in capturing the industry.

Fermanagh, co. of N. Ireland in the prov. of Ulster, with an area of 715 sq. m. The surface is hilly, the highest points being Cullacagh, and Belmore, but the chief feature of the co. is Lough Erne, which, with the R. Erne joining its lower and upper parts, bisects the co. throughout its entire length. The salmon fisheries of the Erne are important, and pike and trout are also caught in most of the loughs. There is an abundance of sandstone and limestone, and iron also occurs. Manufs. are few, the chief being pottery and coarse linen, for the people are chiefly engaged in agric. The only tn. of importance is Enniskillen. F. is in the two dioceses of Clogher and Kilmore. By the Gov. of Ireland Act, 1920, F. was united with Tyrone as a constituency for the return to the N. Ireland Parliament of 2 members. For administrative purposes F. is divided into the urb. dist. of Enniskillen and the rural dists. of Enniskillen, Irvinestown and Lisnaskea; Belleek and Clones were merged in the foregoing rural dists. in 1921. Pop. 55,000 (a decline of nearly 50 per cent through emigration).

Fermat, Pierre de (1601-65), Fr. mathematician, b. at Beaumont-de-Lomagne, near Montauban. He made many discoveries in the properties of numbers, probabilities, and geometry, and is said to have been the first to hit upon the principle of the differential calculus. He also collaborated with his friend Pascal in some of his mathematical researches. His writings include: *Arithmetique of Diophantus*; *Method for the Quadrature of Parabolas*; treatises, *Maxima and Minima*, on *Tangents*, and on *Centres of Gravity*; *Geometric Loci*, or *Spherical Tangencies*, and *Rectification of Curves*. His collected works were pub. at Toulouse in 2 vols., 1670-79, and were re-ed. by Tannery and Henry, 1891-94. F. was also an accomplished general scholar and linguist, and was for a time councillor for the parliament of Toulouse. See A. Gentz, *L'Influence de Fermat sur son siècle*, 1784, and P. Bachmann, *Das Fermatsche Problem in seiner bisherigen Entwicklung*, 1919.

Fermentation, process by which a change is effected in the chemical constitution of many organic substances. It is well known that liquids formed from the juice of fruits gradually alter in character with the evolution of bubbles of gas, that milk cannot be preserved from becoming sour without special treatment,

and that all dead organic matter putrefies or changes its chemical composition in course of time. These changes are brought about by the activity of various minute organisms, which contain substances known as enzymes. The enzymes are the actual agents of the fermentation processes. In many cases they can be extracted from the organisms and work just as effectively, showing that the presence of a living cell or cells is not essential to fermentation. Enzymes induce chemical changes in somewhat the same manner as catalysts hasten certain inorganic reactions. F. normally occurring in the presence of living organisms takes place when the temp. is suitable for their multiplication, where there is abundance of moisture and suitable food, and where there are no substances with a poisonous action on the organism. Perhaps the most important of fermentative processes is that by which the alcoholic liquors of commerce are prepared. This process is due to a member of the fungus group, yeast, which consists of rounded cells about .01 mm. in diameter, usually grouped in chain-like clusters. When introduced into solutions of sugars containing other organic substances which the yeast uses as food, the cells bud and multiply. The temp. must be maintained between 5° and 30° otherwise the cells are unable to multiply, and may eventually be killed. The yeast cells contain enzymes which produce characteristic chemical changes, and the action of each enzyme appears to be restricted to a few media. The chief enzymes present in yeast are *zymase*, which causes the breaking-up of glucose (grape-sugar) and fructose (fruit-sugar); *invertase*, which converts cane-sugar into invert-sugar, a mixture of glucose and fructose; and *maltase*, which converts maltose into glucose. In the manuf. of beer, the action is commenced by another enzyme, *diastase*, which is formed in the grains of barley during malting. The diastase converts the starch in the malt into dextrin and maltose. After the introduction of yeast into the wort, the maltose is converted into glucose by the enzyme *maltase*, and the enzyme *zymase* proceeds to set up alcoholic F. The effect of this F. is to break up the sugar into alcohol and carbon dioxide, thus: $C_6H_{12}O_6$ (glucose) = $2C_2H_5O$ (alcohol) + $2CO_2$. It is uncertain whether the chemical action accomplished is due entirely to the enzymes. The living cells produce a far greater effect than do the enzyme-containing juices obtained by breaking up and pressing the cells, indicating that a 'vital action' operates during F. But possibly harmful enzymes are isolated inside the cells.

Acetic fermentation is brought about by a living ferment, *Mycoderma aceti*, which finds its way into weak alcoholic solutions from the air, and, living upon the nitrogenous matter in the solution, causes the alcohol to combine with the oxygen of the air, thus: $C_2H_5O + O_2 = C_2H_4O_2$ (acetic acid) + H_2O . The formation of acetic acid in this way accounts for the souring of beer and light wines when exposed to

the air, and is the basis of the manuf. of vinegar.

Lactic fermentation is caused by a living organism, the lactic ferment, which has the power of causing milk-sugar, or lactose to combine with water to form lactic acid, thus: $C_{12}H_{22}O_{11}$ (lactose) + $H_2O = 4C_3H_5O_3$ (lactic acid). This acid accounts for the sour taste of milk which has been exposed to the air.

Butyric fermentation is caused by a living organism, the butyric ferment, which is present in decomposing cheese. It often accompanies the lactic ferment in which case the lactic acid is broken up with the production of the foul-smelling butyric acid, thus: $2C_3H_5O_3$ (lactic acid) = $C_4H_7O_2$ (butyric acid) + $CO_2 + 2H_2$.

Glycerin by fermentation. If normal sodium sulphite is added to a sugar solution which is then fermented, the main products are acetaldehyde and glycerin, with little alcohol. Glycerin was manufactured in Germany during the First World War on this principle.

Fermentation in digestion.—The higher animals are also capable of producing enzymes. Thus the cells of the salivary glands produce *ptyalin*, which converts starch into sugar, and the gastric tubules produce *pepsin*, which transforms proteins into peptones. See DIGESTION.

Fermo, tn. of the Marches in the prov. of Ascoli Piceno, Italy, 34 m. from Ancona. It is the anct. Forum Piceum, which was founded as a Lat. colony in 264 B.C. after the conquest of the Picentes, and remnants of a Rom. wall still exist. F. is the seat of an archbishop, and contains a cathedral which dates back to 1227. Pop. 21,000.

Fermoy, mrkt. tn. in co. Cork, Eire, about 20 m. from Cork, on the R. Blackwater. It is an important military station, and the barracks on the N. bank of the riv. are one of the most prominent buildings of the tn., the others being the Protestant church, the Rom. Catholic cathedral, and St. Colman's Rom. Catholic College. It is also the centre for salmon and trout fishing on the Blackwater, and has large flour mills. Pop. 7500.

Fern, Male, or *Aspidium filix mas*, one of the commonest wild Brit. species, and grows in woods and hedgerows. The stem is short and rises but little above the ground, but the leaves or fronds, which are pinnate, are from one to three ft. long. The sori are kidney-shaped.

Fern, Sweet, or *Myrica Comptonia*, species of Myricaceæ which has fern-like foliage. It is a shrub with small dillinous flowers and occurs in N. America.

Fernández, John, Portuguese navigator, and reputed to be the first European to visit the interior of Africa. In 1446 he went with an expedition under Antonio Gonzales to Africa, where, being anxious to glean information for his patron, Prince Henry, he remained in the country for seven months after the departure of his companions. His account of his travels among the Desert tribes and W. Africa bears a remarkable resemblance to that of Mungo Park. The dates of his birth and death are not known.

Fernández, Juan, Sp. navigator, who in 1572, while sailing from Peru to Chile, came upon a small group of is. in the Pacific which now bear his name. In 1574, he left Chile, sailing in a south-westerly direction and came upon an is. which so greatly attracted him and his companions that he formed the intention (apparently never carried out) of revisiting it with a larger expedition. It has been conjectured that this is. was New Zealand.

Fernández de Avellaneda, Alonso, pseudonym of a writer who anticipated Cervantes in publishing *Segundo tomo del ingenioso hidalgo don Quijote de la Mancha* in 1614, as a sequel to *Don Quijote*. It is a work of some merit, and was probably undertaken under the supposition that Cervantes would leave his masterpiece unfinished, but it is marred by an insolent preface, in which Avellaneda taunts Cervantes with his physical defects and his moral infirmities.

Fernandina, city and port of entry of Florida, U.S.A., in Nassau co. It is situated on Amelia Is., at the mouth of St. Mary's R.; its harbour opens on the N. to Cumberland Sound, and may be entered at high tide by vessels drawing 20 ft. of water. The chief manufs. are cotton, cigars, lumber, and palmetto fibres. Pop. 3000.

Fernando (de) Noronha, is. in the S. Atlantic belonging to Brazil. It takes its name from its Portuguese discoverer (1503), the Count of Noronha. It has a rugged surface and healthy climate, and is the seat of a Brazilian penal station. Pop. 1100, all males, consisting mainly of criminals and their guards.

Fernando Po, is. in the bight of Biafra, W. Africa, which belongs to Spain and is considered to be one of the most fertile spots on the W. African coast. Its surface is mountainous, and a great portion of the is. is covered with dense forests of valuable timber. The climate is very hot, and a pestilential wind, the 'harmattan', frequently prevails, but is healthy after the rainy season. The chief products are cotton, cocoa, coffee, sugar, tobacco, vanilla, and palm oil. There is regular communication with Liverpool and with the N. country. The prin. settlement is Port Clarence (1500 inhab.) on the N. coast, and the cap. is Sta. Isabel (pop. 8300). The is.'s affairs are administered by a governor-general and council subject to control of the Colonial Dept. in Madrid. Much has been done to develop the resources of the is. and to improve the social services. Pop. 20,000.

Fernán-Núñez, tn. of Spain in the prov. of Cordova, 15 m. S.E. of that city. Pop. 6000.

Ferney, the anct. name for a tn. of France, which in 1788 was officially called Ferney-Voltaire. It is situated at the base of the Juras, 4 m. N.W. of Geneva, in the dept. of Ain. The vil. was founded by Voltaire, who resided there from 1758 until his death in 1778. Pop. 1200.

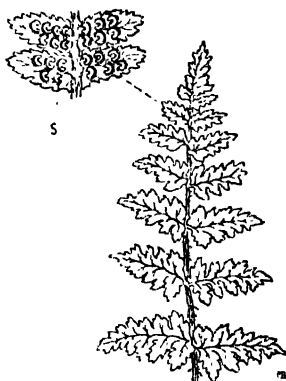

Fernie, city of Brit. Columbia, in the E. Kootenay dist., situated at the junction of Coal Creek with the Elk R. There are

extensive coal-mines in the neighbourhood, and about 480 coke ovens, which supply fuel for the smelting works in southern Brit. Columbia. Almost destroyed by bush fire in 1908. Pop. 4500.

Fernguf, see FERRAGUS.

Fern Isles, or **Ferne Islands**, see FARNE.

Ferns, in the narrower sense of the word, comprise a large number of genera with numerous species, being widely distributed in all parts of the world. They attain their highest development in the tropics. The tree F., characterising the family Cyatheaceae are the largest representatives; they have a woody, unbranched

MALE FERN

S. 501

stem, which bears at the apex a rosette of pinnately compound fronds, which are produced in succession from the terminal bud, and leave, when dead, a large leaf scar on the trunk. The majority of F. are, however, herbaceous and possess a creeping underground stem or rhizome, terminating usually in a rosette of pinnate or deeply divided leaves. A peculiarity common to F. is the coiled position of the young leaves, giving them at the tip the appearance of a crozier, whence their vernation is said to be circinnate, and the leaves continue to grow at the apex until their full size is attained. Peculiar brownish scales, known as paleae orramenta, often fringed, invest the stems, petioles, and sometimes also the leaves of most F. Ferns vary very much as regards their branching; in some, as in the bracken F. (*Pteris aquilina*), the stem forks at the apex; in a few, as in some filmy F., the branching is axillary, like that of flowering plants, while in others, as in some of the tree F., the stem does not branch at all. The roots which are found on a full-grown plant are all adventitious, for the original main root of the embryo dies away very early. The reproduction organs are spores which are produced in cases called sporangia. Each

group of sporangia is known as a sorus which may or may not have a protective covering, the indusium. In most cases the sori are borne on the under surface of the leaves. When ripe the sporangia burst and liberate the spores, which on germination give rise to what is known as a prothallus. The prothallus is a flat, heart-shaped, green body, which leads quite an independent existence, and which produces sexual organs. The male organs (antheridia) and female organs (archegonia) are borne on the under surface of the prothallus. In the antheridia are produced the spermatozoids, which are free-swimming male gametes, and out of these enters an archegonium and fertilises the female gamete contained therein. This process cannot be observed by the naked eye. The fertilised ovum becomes the embryo of the F. plant. Thus the life hist. of a F. presents a true alternation of generations: the F. plant, or sporophyte generation, produces asexual spores, which grow into the gametophyte (prothallus) or sexual generation. This in its turn produces male and female gametes, which after fertilisation grow again into the sporophyte. Occasionally asexual reproduction is effected by budding, as in *Asplenium bulbiferum*.

The form and position of the sori and the presence or absence of an indusium are characters upon which are based the classification of F. Most of the Brit. F. belong to the order Polypodiaceae, which includes *Pteris* (the bracken), *Adiantum* (the maiden-hair), *Asplenium ruta muraria* (the wall rue), *Scolopendrium* (the hart's-tongue), which has entire leaves, *Aspidium*, *Polypodium*, etc., etc. *Osmunda regalis*, the royal fern, belongs to another family; it is peculiar in that the upper pinnae of the leaves are fertile and develop little or no green, so that there is all the appearance of a flower. There are many species of fossil F., which proves them to have formed part of the flora of the geological ages; tree F. are met with in the Devonian period, and many forms were abundant in Carboniferous times.

F. are largely cultivated in gardens and greenhouses for decorative purposes on account of their graceful foliage. Bracken, when dried, can be used for stable purposes and thatching, and its root stock contains starch, which, however, is only used when there is a scarcity of food. The only medicinal F. products are the oil from the male F. and a syrup extracted from the rhizome of an Amer. maiden-hair.

In cultivating F. it is to be remembered that they are shade-loving plants, and like plenty of moisture and soil containing leaf mould. They should be transplanted in early spring or late autumn, and are divided by their rhizomes. This applies to the harder forms. The more tender F. require glass, with uniform temp. and moisture. The soil must be light and well drained, so that the abundance of water which they require will not rot them. They should be repotted before the roots become pot-bound.

Ferns, tn. in co. Wexford, Ire. It has an episcopal palace and was once the seat of a bishop. Pop. 1600.

Ferns, Filmy, see FILMY.

Ferns, Flowering, see OSMUNDA.

Ferozepore, see FIROZPUR.

Ferraboso, Alfonso (1543-88), the Elder, It. musical composer, appears to have settled in England before 1562, but afterwards returned to Italy. He pub. two books of madrigals in 1542 and 1587 respectively, and one of motets in 1541. He was the most important of the It. musicians who lived in England in the sixteenth century.

Ferraboso, Alfonso (c. 1575-1628), the Younger, Eng. musical composer of It. descent, son of Alfonso F. the Elder (q.v.). He was left in England (being probably illegitimate), when his father returned to Italy. It is believed that Queen Elizabeth paid for his musical training; and he became a musician at the court of James I. His works include a number of masques, fancies for the viol, ayres with lute and bass viol, and contributions to Leighton's *Tears or Lamentations*. His three sons Henry (c. 1618-c. 1658), Alfonso (c. 1620-before 1660), and John (1626-1682), were court musicians too, and his daughter Elizabeth (b. 1640) was a singer.

Ferragus, **Ferracute**, **Ferragut**, **Fernguf**, or **Veernagu**, celebrated giant of medieval romance, in which he appears with various attributes. In *Valentine and Orson* he is described as a giant of Portugal who took Bellissant under his care after she had been divorced by Alexander, emperor of Constantinople, and as being in the possession of a brazen head which could answer any question put to it. In Turpin's *Chronicle of Charlemagne* he is a giant 36 ft. high, with the strength of forty men, and invulnerable as regards his skin; while in *Orlando Furioso* he is described as a Saracen, son of Lanfusa. He dropped his helmet in the river, and vowed he would never wear another till he had won that worn by Orlando. Orlando slew him with a wound in the navel, his only vulnerable part.

Ferrandina, tn. of Italy, in Basilicata, situated in the prov. of Potenza, 36 m. S.E. by E. of that place. Pop. 8000.

Ferrar, Nicholas (1592-1637), a theologian, b. in London. He was elected to Parliament in 1621, and took part in the impeachment of the earl of Middlesex. But, foreseeing the outbreak of the struggle between Charles I. and Parliament, he retired to Little Gidding in Huntingdonshire in 1625, where he organised a small religious community. He was visited by Charles I. in 1633, but his 'Arminian nunnery' was broken up by the parliament in 1647. He left in MS. a harmony of the Gospels, and also of the books of Kings and Chronicles.

Ferrara: (1) Prov. of Italy, situated S. of the Po, and W. of the Adriatic. Area, 1019 sq. m. It is a flat surface, and was formerly the main portion of the duchy of F. (formed 1471), and under the house of Este. It was annexed to the Papal States in 1598, and to Sardinia in 1860.

Pop. 381,300. (2) City of Italy on the Po di Volano, 28 m. from Bologna, cap. of the prov. of F., and see of an archbishop. It contains a free univ. (200 students) and was noted for its school of painting in the fifteenth century and as a literary centre in the sixteenth. Besides this, it is interesting as being the former ducal residence of the house of Este, and contains the castle which was built about 1385. There is also the cathedral of San Giorgio, consecrated in 1135; the Gothic Palazzo della Ragione (1315-26), now the law courts; the hospital of St. Anne, where Tasso was confined during his attack of insanity (1579-86); the handsome Renaissance church of San Cristoforo.

W. F. Mansell

FERRARA CATHEDRAL

The tn. was also the asylum of Calvin, Marot, and other reformers, and the bp. of Guarini, Savonarola, and Bentivoglio. In the Second World War widespread damage was suffered by F., which was captured by the Allies on April 24, 1945. Damage was especially heavy near the railway yards but elsewhere, though scattered bombs fell over a wide area, the damage, compared with that suffered by other famous It. cities, was not great or irreparable. But S. Benedetto, a Renaissance church, and sev. minor palazzi were destroyed; others, including the striking Palazzo dei Diamanti, were damaged and the Castello Estense was struck on one draw-bridge tower. In general, however, the complex of houses and palazzi, which give F. its peculiar title to fame and its character received little injury which careful restoration cannot mend. The Chiesa del Gesù was badly blasted inside but the façade is intact; the roof of S. Maria in Vado, one of the oldest churches in F., was shaken but Bononi's elaborate fresco decoration was uninjured. Among the great private palazzi damaged beyond repair were Fracchi, Saraceno, and Strozzi. Pop. 119,300.

Ferrara, Andrea, broadsword-maker of the sixteenth century, was probably a native of Ferrara. He worked with his brother, and in 1585 had acquired a great

reputation as an armourer at Belluno. Many of his swords have been found in Scotland, as well as in the S. and W. of Europe. He is said to have tempered his sword blades by the method employed by the smiths at Damascus.

Ferrari, Gaudenzio (c. 1484-1546), painter and sculptor of the Lombard School, b. at Valuggia, near Novara. He was a pupil of Stefano Scotto at Milan, but made his greatest advance by a minute study of the pictures of Leonardo da Vinci. His works are remarkable for the elevation of their style as well as for the display of difficult and uncommon attitudes. His best are at Varallo, 'The Crucifixion,' a fresco which contains twenty-six life-size figures; 'Scenes in the Life of Christ,' consisting of twenty-one pictures; 'A Glory of Angels,' frescoes at Saronno, near Milan; 'The Martyrdom of St. Catharine,' in the Brera Gallery, Milan; 'Pieta,' in the Royal Gallery, Turin. See B. Berenson, *The North Italian Painters of the Renaissance*, 1907.

Ferrari, Paolo (1822-99), It. dramatist, b. at Modena; he began his literary career at an early age. His works are characterised by their vivacious dialogue and good construction, and fresh, piquant style. Among his works are: *Goldoni e le sue Sedici Commedie* (1852) and *La Satira e Parini* (1858) are critical works. *Il Duello* (1868) and *Gli Uomini Sey* (1869) His *Opere Drammatiche* (1877) have been collected.

Ferraria (in honour of J. B. Ferrari, an It. botanist), the name given to a genus of Iridaceae; they are dwarf plants indigenous to the Cape of Good Hope, and they have glaucous leaves of a dull but sometimes beautiful colour.

Ferrates, salts of ferric acid, H_2FeO_4 . Barium ferrate is obtained as a reddish powder, and is soluble in acetic acid.

Ferreira, Antonio (1528-1569). One of the classic poets of Portugal, b. at Lisbon. He was judge of the supreme court at Lisbon, composing in his leisure the poetry which earned for him the sobriquet of 'the Portuguese Horace,' and gave him a reputation equal to that of Camões. He wrote numerous striking sonnets, elegies and odes, but his poetic fame rests mainly on his epistles. Also wrote dramas, such as *Sophonisba* and *Ines de Castro*, in which he invested with the forms of Gk. tragedy the most poignant and popular events of Portuguese chronicles; and a comedy, *Cinco*. His collected works pub. in Lisbon (1771) and Paris and Rio de Janeiro (1865). He died of the plague. See life by J. de Castilho, 1865.

Ferrel's Law is that everything moving on the earth's surface is subject to a deflecting force owing to the rotation of the earth—in the N. hemisphere the force deflects to the right, and in the S. hemisphere to the left. This is especially applicable to the air when in motion—the winds of the N. hemisphere being deflected to the right and those of the S. to the left.

Ferrer, Francisco (1850-1900), Sp. revolutionary and teacher, b. at Alcala,

near Barcelona. After taking part in an insurrection in Spain, he earned a precarious living in Paris for a time as a teacher. In 1901 he opened a school, the *Escuela Moderna*, in Barcelona. This school was really a propagandist centre, though it did much for educational reform in Spain. After the attempt in 1906 by Mateo Morral on the lives of the king and queen of Spain, F. was arrested and the school closed. F. was, however, acquitted only to be again arrested, in 1909, for taking part in riots in Barcelona. Convicted on hearsay evidence, he was condemned to death by the Council of War and executed. See life by W. Archer, 1911.

Ferrers, Lawrence Shirley, Earl (1720-1760), was the last member of the peerage who was put to death as a criminal in England. In the year 1760, while in a fit of temper, he shot his steward, for which crime he was convicted of murder by his peers and hanged at Tyburn.

Ferret, animal belonging to the family Mustelidae, other species being the badger, weasel, otter, and polecat. The F. is the domesticated albino variety of the latter animal, both of them belonging to the genus *Putorius*. It is very similar to the wild polecat, but a little smaller, being about 14 in. long, has yellowish-white fur and pink eyes. Sometimes, however, F.s. breed with polecats, and the result is a cross-breed having fur tinged with brown. The F. is not altogether tame, and occasionally it becomes quite ferocious, exhibiting no affection whatever. The female F. breeds twice during the year, producing from six to nine young ones each time, and she has been known to devour them. This animal was known among the Romans, who employed it, and it is said that it was brought from Africa to the S. parts of Europe. It is used especially to hunt rabbits, and to kill rats. See N. Everett, *Ferrets*, 1897; W. D. Drury, *Ferrets and Ferreting*, 1927.

Ferriocyanogen, Ferriocyanides, Ferrocyanogen, and Ferrocyanides. *Ferriocyanogen* and *Ferrocyanogen* are two isomeric compound radicals containing cyanogen and iron, whose exact chemical structure has only recently been elucidated. The ferriocyanogen compounds are either prepared from the potassium salt or from the cyanogen compounds obtained as by-products in the coal-gas manuf. or synthetically. *Potassium Ferriocyanide* is produced by heating crude potash in an iron pot closed by a lid having an aperture through which iron filings and certain animal matter, as feathers, horns, and leather, are introduced. The reaction is not well understood, but when the fused mass is lixiviated potassium ferriocyanide ($K_3Fe(CN)_6$) is contained in the solution. It forms quadratic pyramidal crystals of lemon-yellow colour soluble in warm water. It is used in calico-printing and in the preparation of Prussian blue, etc. The *ferrocyanides* of sodium, calcium, zinc, barium, strontium, and many other metals have also been prepared, and sev. insoluble ferriocyanides are made by double decomposition.

Thus copper sulphate and potassium ferriocyanide solutions mixed give soluble potassium sulphate and a brown coloured precipitate of cupric ferriocyanide ($Cu_2Fe(CN)_6$). This is used in the preparation of semi-permeable membranes (see Osmosis). *Ferriocyanic Acid* is obtained by adding pure hydrochloric acid to an equal volume of a saturated solution of potassium ferriocyanide, excluding air as far as possible. It is a white powder crystallising in small needles, is soluble in water and alcohol, and readily oxidises on exposure to air. *Potassium Ferriocyanide*, or red prussiate of potash, $K_3Fe(CN)_6$, is formed when potassium ferriocyanide is oxidised, e.g. by bromine water. It crystallises in dark red prisms and is a powerful oxidising agent. Many insoluble ferriocyanides can be made from a soluble ferriocyanide and a soluble metallic salt. *Hydroferriocyanic Acid* or *ferriocyanic acid* ($H_3Fe(CN)_6$), made by adding three volumes of very strong hydrochloric acid to one of strong potassium ferriocyanide, is a brown-green crystalline body. *Hydrogen Ferrous Ferriocyanide* is a white powder obtained by boiling an aqueous solution of ferriocyanic acid. The potassium salt, when heated with dilute nitric acid, forms Prussian Blue, which exists in sev. varieties, e.g. *soluble Prussian Blue*, *insoluble Prussian Blue*, *Williamson's Blue*, and *Turnbull's Blue*. Prussian Blue itself is hydrated ferric ferriocyanide; the soluble Prussian Blues are hydrates of potassium ferric ferriocyanide, $KFeFe(CN)_6 \cdot nH_2O$. The iron atoms in Prussian Blue are arranged, ferrous and ferric alternately, at the corners of a cubic lattice, and the CN groups lie in the edges of these cubes. The potassium atoms lie at the centres of alternate cubes. Prussian Blue is used as a pigment.

Ferric and Ferrus Salts, see IRON.

Ferrier, Sir David (1813-1928), Scottish physician, b. Jan. 13, at Woodside, Aberdeen, and educated at the univ. there and also at Heidelberg. He became F.R.S. 1876; and was appointed prof. of neuropathology in King's College, London, 1889. He made experimental researches on the functions and diseases of the brain and wrote many medical works—including *Functions of the Brain* (1876), and *Localisation of Cerebral Diseases* (1878, 1890). He was a founder, and for a time editor, of *Brain: a Journal of Neurology*. President of the Medical Soc. of London, 1913.

Ferrier, James Frederick (1808-61), Scottish metaphysician, b. in Edinburgh, and the nephew of Susan F. and of John Wilson ('Christopher North'). Educated at Edinburgh High School and Univ. and at Magdalen College, Oxford, he was called to the Scottish Bar (1832), and appointed professor of civil hist. at Edinburgh (1842), and prof. of moral philosophy and political economy at St. Andrews (1845). After having contributed various metaphysical essays to the *Blackwood*, he pub. *The Crisis of Modern Speculation* (1841), *Berkeley and Idealism* (1842), and *Institutes of Metaphysics* (1854). His *Lectures on Greek Metaphysics*

were ed. in 1866 by Sir A. Grant, who also wrote a life. See also life by E. S. Haldane, 1899.

Ferrier, Paul (1843-1920), Fr. playwright, b. March 29, at Montpellier. His plays include *La Reranche d'Iris* (1868), *Chez l'Avocat* and *Les Incendies de Moussolard* (1873), *Les Mousquetaires au Couvent* (1880), *Habolin* (1884), *Joséphine vendue par ses Sœurs*, a famous opéra-bouffe with music by Victor Rogor (1886), *Le Fétiche* (1890), *Le Carillon* (1896), and certain opéra-libretti, including a collaboration with V. Sardou, *La Fille du Tabarin* (1901).

Ferrier, Susan Edmonstone (1782-1854), Scottish novelist, b. in Edinburgh, the daughter of James F., a clerk of the Court of Session with Sir Walter Scott. Her first work, in which Miss Clavering collaborated for a short time, was *Marriage*, which appeared in 1818, and was followed by *The Inheritance* (1824) and *Destiny, or the Chief's Daughter* (1831). These novels are very lively presentations of Scottish society, and show a rare gift of observation. They were all pub. anonymously, and many conjectures were made as to their authorship; some people attributed them to Scott, who greatly admired her writings and of whom she wrote in her *Recollections of Visits to Ashiestiel and Abbotsford*, pub. with a memoir in Bentley's ed. of her works (6 vols.), 1882. See Sir C. Douglas, *The Blackwood Group*, 1897; and Doyle's memoir in vol. iv. of Lady Margaret Sackville's ed. of *The Works of Susan Ferrier*, 1928.

Ferring, seaside resort, near Worthing, Sussex, England. It is situated between the S. Downs and the sea 1 m. N. of Worthing—with which it is incorporated. There is a prehistoric camp and the site of a Saxon cemetery, which were purchased for the National Trust in 1938 by the W. Sussex Co. Council and the Worthing Corporation.

Ferro, see **HIÉRO**.

Ferro-concrete, another name for 'reinforced concrete,' first used for building purposes in America. See **CONCRETE**.

Ferrol, El, seaport of Spain in the prov. of Corunna, on the N.W. coast of the bay of Belanzos, 12 m. N.E. of the tn. of Corunna. It is strongly fortified and possesses a naval arsenal, dockyard, wharves, quays, etc. There is a wireless station at F. There is a large, safe harbour, but its entrance is narrow and defended by a couple of forts. The manufs. are leather, linen, and cotton goods, naval stores, rope, and sail-cloth; the exports are brandy, vinegar, corn, and fish, old iron and copper. There are sev. fine public buildings, including naval barracks, tn. hall, two hospitals, jail, monastery, and churches. It fell to the insurgents early in the Civil war of 1936. Pop. 62,400.

Ferro-manganese, commercial alloy consisting of: iron, 4 to 6 per cent; manganese, 50 to 80 per cent; carbon, 5 to 6 per cent; and silicon in small and varying amounts. It is used commercially in the manuf. of other alloys, and chemically as a reducing agent.

Ferro-silicon, alloy consisting of: silicon, 10 to 12 per cent; manganese, 2 to 3 per cent; carbon, 6 per cent; and iron 80 per cent. It is used in the formation of other alloys of iron or silicon, and also as a reducing agent.

Ferrottype, or **Energiatype**, photographic process of developing negatives by means of a solution of protosulphate of iron and mucilage of gum-arabic. It was discovered by Robert Hunt in 1844.

Ferry (passage by boat across riv.). This word has the same root as the word 'fare,' and is allied to the Ger. *fahren*, to travel, and to the Lat. *fero*, I bear. F. is the term applied to the place where passengers can be conveyed across either an arm of the sea, as at S. Haven Point to The Sandbank, at the head of Studland Bay, in Dorset, England, or across a riv., as at Twickenham near London. It is also the name given to the boat which holds the passengers. The right to F. is a franchise or royal grant, and has the same legal significance as the right to hold a fair or mkt. It has nothing to do with the ownership of land or water. The possessor of the F. is not entitled to ownership of the stretch of water across which his passengers are ferried. He merely has the right to exact reasonable toll for the service he has rendered in supplying boats for the landing of passengers on the other side. He is, moreover, responsible for the condition of his boats and for the ferrymen he employs. No one is allowed to set up an opposition F. unless authorised by Act of Parliament. Car-ferries or train-ferries are vessels used for trains, and have railway-lines thrown across their decks, enabling the cars to run on and off the vessels on their own wheels. There are many varieties of F. boats, such as rafts, flat-bottomed barges with inclined planes for horses. The flying-bridge is worked by means of a long rope or chain attached to a fixed buoy in the middle of the riv., and is useful in military operations. Proposals for improving 32 Fs. and starting new Fs. were made by the Ferries Committee's report to the minister of transport, June 1948 (*Ferries in Great Britain*, H.M.S.O. 1948). Other recommendations ranged from the provision of additional or larger vessels, to the use of radar or other navigational devices on services liable to interruption by fog. The report also recommended that highway authorities should be empowered to take over Fs. linking trunk or classified roads and that these should be treated as part of the highways and freed from tolls, expenditure being met in part by gov. grants. In Britain 44 vehicular Fs. are normally in use, five of them free from tolls.

Ferry, Jules François Camille (1832-93), Fr. statesman, b. at Saint Dié, Vosges. He studied for the bar, but gave up this profession and devoted himself to politics instead. Elected Republican deputy for Paris in 1869, he strongly urged that peaceful relations should be maintained between France and Germany, but without avail. Created prefect of the Seine in 1870, he had the full responsi-

bility of the siege of Paris, and was forced to resign his prefectship in 1871. He became a member of the Republican ministry formed in 1870, and eventually became minister of education and then minister of Foreign Affairs. He was elected Premier on two occasions, and it was due to his administration that two important measures were carried out, the organisation of public education free from clerical interference, and the colonial expansion of the Fr. empire. A Fr. protectorate was formed in Tunis (1881), and the conquest of Indo-China, and exploration of the Congo and Niger dists. were planned. But his spirited colonial policy involved France in war in Madagascar, and brought about his own downfall in 1885. He performed another service for his country in preparing the terms of the peace with China. He was assassinated by a madman. — See lives by A. N. Rambaud, 1903, and A. Billot, 1904, and A. Israel, *L'École de la République: le grand œuvre de Jules Ferry*, 1931.

Ferryhill, tn. in Durham, co. of England, 6 m. S. of Durham, with iron works. Coal-mining is carried on in the vicinity. Pop. 10,000.

Ferry-Port-on-Craig, see TAYPORT.

Fersen, Hans Axel. Count (1753–1810), Swedish marshal; b. a. Stockholm: son of Fredrik Axel, Count F., of Scottish descent, from McPhersons. Colonel in Royal Swedish regiment of Louis XVI. of France, served in Amer. War of Independence. In flight of Louis and Marie Antoinette to Varennes, June 1791, F. made the preparations and accompanied them. Made marshal of Sweden in 1793, and Chancellor of Upsala Univ. in 1799. Murdered by populace in Stockholm tn.-hall, June 20, on account of a false belief that he had poisoned the crown-prince Charles Augustus.

Ferté-sous-Jouarre, La, tn. and riv.-port of France in the dept. of Seine-et-Marne. It is situated on the Marne, in the arron. of, and 12 m. E. of the tn. of Meaux. Pop. 4600.

Fertilisation, fusion of sexual elements in the reproductive processes of animals and plants. The essential fact of F. is that a gamete or sexual cell from the reproductive tissues of one parent becomes so intimately associated with a gamete from the reproductive tissues of the other parent as to form one cell called a zygote, which becomes the starting point of a new living individual. Where there is no F. in the process of reproduction, the development of the new organism is called *parthenogenesis*. In some of the lower plants and animals the fusing gametes are indistinguishable in form, size, and other characteristics. Such sexual processes are called isogamous, and the term conjugation is to be preferred to F. The term F. now becomes restricted to that process by which a cell derived from the specialised tissues of a parent known as male is united to a cell derived from corresponding specialised tissues in the female parent. It is therefore a process characteristic of the higher animals and plants where sexual organs

are differentiated into male and female. In animals the organs from which the gametes are derived are the testes in the male and the ovaries in the females. The male gamete is the spermatozoon, a small cell of elongated form. The nucleus is situated in the 'head' or thickened part, and the remainder consists of a vibratile tail by which the cell moves freely in a liquid medium. The female gamete is the ovum, a cell usually much larger than the spermatozoon. It is quiescent or non-motile, contains a large nucleus and a large amount of nutritive material enclosed in a protecting membrane. Ova are produced in small quantities, while spermatozoa are relatively far more numerous. The ovum and spermatozoon come into conjunction by the admixture of the seminal fluid in the sexual act. The actual fact of F. consists of the penetration of the envelope of the ovum by the spermatozoon. This is probably brought about by *chemiotaxis*, or attraction of a chemical nature exerted mutually by the male and female elements. What happens is that the nucleus of the spermatozoon enters the ovum and sometimes the centrosome does so. With the formation of the zygote by this fusion of cells, the embryonic hist. of the new organism begins. In plants there are many modes of the sexual process. In certain algae, similar gametes, furnished with cilia, move about in the water and eventually fuse; this process is isogamous. In other plants the male cell is a spermatozoid which visits the female cell. In the mosses, for example, the spermatozooids are developed in large numbers in the *antheridium*, and are set free to move in the water by means of two vibratile cilia. The *archegonium* contains the ovum at the bottom of its flask-shaped structure. When the ovum is ready for F., a passage is opened through the archegonium, through which the spermatozoid reaches the ovum. In the phanerogams, or flowering plants, the male element is contained in the pollen of the stamen, which has to be conveyed in some manner to the female element, the ovule of the stigma. F. in flowers is therefore necessarily preceded by pollination, and the special structure of the flower is adapted to that end. Wind is often an active agent in pollination; in this case the pollen is produced in enormous quantity and the stigmas are often feathery so as to catch the pollen. Insects are, however, the great carriers of pollen, and the colour and scent of the flower serve to guide the appropriate insects to their favourite flowers. When the pollination is effected, the male cell passes from the pollen-tube into the female cell, and a zygote is the result of the fusion. It has been shown that cross F. is the rule even when male and female organs are found on the same individual. In many cases this is ensured by the male and female elements in the same plant ripening at different times. The chemical attraction which effects the fusion is only operative between cells of a certain degree of affinity, that is, it generally means that F. can only take

place between cells of individuals of the same species. In that one phenomenon the potential characteristics of both parents are fused, and may reappear in the new organism when developed (see MENDELISM). See Wilson, *The Cell in Development and Inheritance*, 1902; D. M. Mottier, *Fecundation in Plants*; F. H. A. Marshall, *The Physiology of Reproduction*, 1932; R. Kuczyński, *Fertility and Reproduction*, 1933.

Fertilisers, see MANURES.

Fertility of Soil, see SOIL.

Fertit, Dar (region of Central Sudan), see DAR-FUR.

Fertő-tava, or Neusiedler-See, lake of Hungary, between the counties of Oedenburg and Wieselburg, 19 m. from Pressburg. It has an area of about 120 sq. m., but it is of varying size, and sometimes dries up in part. Eastward it is united with the extensive marsh called the Hanság, through which it is in communication with the R. Raab and with the Danube.

Fescennine Verses (*Fescennina carmina*), early form of popular poetry in Italy. They took the form of a dialogue, usually in the Saturnian metre, and were composed extempore at weddings and other private festivals. They became so licentious that the practice had to be suppressed by law. See Horace, *Epistles*, li. 1, and Virgil, *Georgics*, li.

Fescue grass, name given to a genus of grasses (q.v.); *Festuca pratensis*, the meadow fescue, and *F. rubra*, the red fescue, are common species.

Fess, or Fesse, in heraldry, one of the honourable ordinaries containing a third of the field. It is regarded by some authorities as having been a belt of honour, given as a reward by kings for service in the army. 'Per Fess' is when the field is equally divided by a horizontal line. 'Per Fess and Pale' means that the field is to be divided into thirds, by the F. line and the Pale line, from the F. point to the middle base point.

Fessler, Ignaz Aurelius (1756-1839), Hungarian historian. Educated at Pressburg and Raab. Became a Capuchin monk in 1773. Called to chair of Oriental languages and hermeneutics of O.T. at Lemberg, renounced the monastic state and became a Freemason. Became Protestant; lived in Berlin, from 1809 in St. Petersburg—where he lost his professorship because charged with atheism. In 1833 was made gen. supt. of Lutherans of St. Petersburg. He wrote *Die Geschichte der Ungarn und deren Lausassen* (1815-25), some historical novels, and an autobiography, *Rückblicke auf meine siebenjährige Pilgerschaft* (1824).

Festa, Constanzo (d. 1545), It. composer of madrigals and motets. In 1517 he was appointed singer in the Vatican. F. is chiefly remembered for his very popular madrigal *Down in a Flowery Vale*, which was trans. by Thomas Oliphant.

Festival, see FEAST.

Festoon, in architecture, sculptural wreath or garland, formed of conventional flowers, fruit, and leaves, suspended by ribbons from a knob or an animal's head.

It was used by the Gks. and Romans, probably in imitation of the garlands of flowers that were hung about a sacrificial victim or altar. It may be found as a decorative feature in many Renaissance buildings.

Festubert, Battle of (N. France, 20 m. S.W. Lille). A famous battle in the First World War. On May 9, 1915, Sir Douglas Haig opened an attack on the Gers. just N. of Fromelles and also between Neuve Chapelle and Givenchy, F. being in the latter sector. This attack was undertaken in pursuance of a promise made by Sir J. French to Marshal Joffre to keep the enemy occupied on his front as long as possible. Some ground was gained about Fromelles, but the Ger. machine gunners on the Aubers Ridge held up the advance in that area. Progress was arrested for the next few days by dull and misty weather, rendering artillery observation difficult. On May 15 the attack was resumed between Richebourg-L'Avoué and F., in which the Canadian Div. distinguished itself. On May 16 the 7th Div. made good progress immediately due E. of F., having for its objective the line Rue d'Ouvvert-Canteleux.

By the capture of the orchard at F. on May 20 the Canadians again distinguished themselves. This position had been strongly fortified by the Gers. The preliminary bombardment drove most of the Gers. to cover, and this enabled the 16th Canadian Scottish to clear the wire entanglement at the edge of the orchard by going through a ditch up to their necks in mud and water. When the bombardment lifted to permit the assault to take place, the Gers. streamed back to their trenches, which had only been manned by machine-gun crews during the shelling, but the Canadians were prepared for them and forced them to retreat. The lack of shells generally was a serious handicap to the Brit. commander, as these were necessary to destroy the Ger. machine gunners who worked great havoc among the attackers. It was this circumstance which mainly decided Sir J. French to cease further attacks and to strengthen and consolidate the ground that had been gained. The result of the battle of F. was to deprive the Gers. of a highly entrenched and fortified area on a four-mile front. Their losses in personnel and material also were heavy. The lack of shells, known politically as the 'shell scandal,' led to the creation of the ministry of munitions.

Festus, Porcius, fl. during the reign of Claudius, and succeeded Felix as procurator in Judaea, A.D. 62. In the following year, when St. Paul was brought before him, he admitted the innocence of the apostle.

Festus, Sextus Pompeius, a Rom. grammarian who flourished during the third or fourth century A.D. He compiled a glossary of Lat. words and phrases. *De Verborum Significatione*, part of which is extant. Consult the ed. of C. O. Müller (new ed. 1880).

Fet, or Feth, Afanasi (1820-1892), Russian poet, b. at Novosseiski, in the

gov. of Orel. He took the name of Feth, which was that of the first husband of his mother, although his true name was Chenochine. From 1844 to 1856 he served in the army, finally retiring with the rank of captain in the cavalry of the guard. From 1860 he lived as a country gentleman on his estates. Encouraged by Turgenev he pub. a book of poems in 1856. A new ed. was issued in 1863, which was sharply attacked because Feth as a reactionary opposed the freedom of the serfs. An impressionist in verse, he deals largely with little etelings of his native land and in love poems. At the age of 63 he surprised Russia with one of his best books—*Evening Fires*. He also made excellent trans. of the Lat. poets and of Shakespeare, Goethe, and Schopenhauer. His memoirs were pub. in 1890 and collected poems in 1901.

Fetiales (Lat. *fari*, to speak), Rom. priests who acted on behalf of Rome in international affairs and at time of foreign wars. They made diplomatic negotiations with other countries, decided when it was necessary to declare war, and offered thanksgiving sacrifices when peace was made.

Fétis, François Joseph (1784-1871), Belgian musical critic and composer. b. at Mons, and trained by his father and at Paris. He was appointed organist and prof. of music at Donal (1813); prof. at the Conservatoire, Paris (1821); director of the Conservatoire, Brussels, and chapel-master to Leopold I. (1833). In 1827 he founded the *Revue Musicale*, and wrote a *Biographie universelle des musiciens* (1841), *Esquisse de l'histoire de l'harmonie* (1840), *Histoire générale de la musique* (1869-76), and, in collaboration with Moscheles, *Méthode des Méthodes de Piano* (1837). He also composed sev. operas and oratorios. See W. Gurlitt, *Fétis und seine Rolle in der Musikwissenschaft*, 1930.

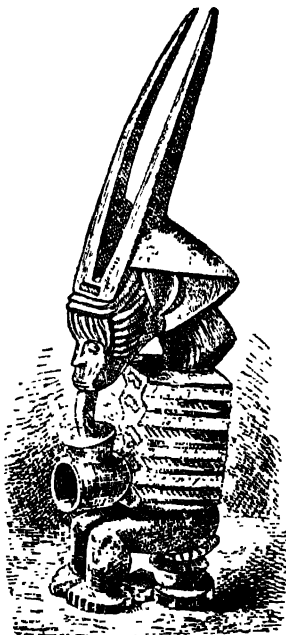

Fetichism, or Fetichism, the worship of inanimate objects which are believed to be possessed with spirits; the word is also used to indicate the use of charms, which, though not the habitation of spirits, are supposed to have a magical influence, derived from spirits, of warding off danger and bad luck. This cult is prevalent among many uncivilised or semi-civilised races, and flourishes especially among W. African tribes. The word is derived from Portuguese *fetico*, a charm, and was first used in its present sense by fifteenth century Portuguese explorers of the stones, wooden figures, beads, etc., worshipped by negroes. See also AMULET. See A. B. Ellis, *Tshi-speaking Peoples of the Gold Coast*, 1887; R. H. Nassau, *Fetichism in West Africa*, 1904; R. E. Denett, *At the Back of the Black Man's Mind*, 1906; R. H. Milligan, *The Fetish Folk of West Africa*, 1912.

The term F. is also used in psychology to describe types of obsessional mental or nervous disorder.

Fettes College, Edinburgh, was founded by Sir Wm. Fettes (d. 1836), who left a large endowment for the purpose of educating orphans and children in unfortunate circumstances. The trust funds

were allowed to accumulate till 1864, when the buildings were begun. The college was opened in 1876, and the administration is similar to that of an ordinary public school.

Feu and Feu-duty. In Scottish law, F. is a mode of land tenure which gives the tenant the right of holding certain property, in return for which he makes an ann. payment in money, cattle, grain, or in kind, called feu-duty. The land is held from the crown, but the crown vassals may give out their land in F. to their vassals, who in turn may F. the land. This process of subinfeudation was prohibited in England by the statute of Quia Emptores in 1290. Consult Rankine's *Law of Landownership in Scotland*.

A NIGER FETISH

Feuchtersleben, Ernst, Freiherr von (1806-49), Austrian poet and physician; b. in Vienna, of an old Saxon family. Secretary to the Society of Physicians. From 1844, delivered lectures on training of psychic physicians. From 1847, vice-director of medico-surgical studies; in 1848 for a little while under-secretary of state for education. Works include: *Die Lehre von den Heilanzeigen* (in Lat.) (1833), *Über das Hippokratische erste Buch von der Diät* (1835), *Gedichte* (containing

'Es ist bestimmt in Gottes Rat,' set to music by Mendelssohn, 1836). *Zur Dittetik der Seele* (1838), *Über die Gewissheit und Würde der Heilkunst* (1839—now ed., entitled *Physician and Public*, 1848), *Beiträge zur Literatur-, Kunst-, und Lebenstheorie* (1837—41), and *Lehrbuch der ärztlichen Seelenkunde* (1845).

Feuchtwanger, Lion, Ger. author; b. 1884, at Munich, of a Jewish family. Studied philosophy in Berlin and Munich. In 1907 he pub. a widely-noticed dissertation on Heine's fragment *Der Rabbi von Bacherach*; also a play, *Der Fetisch*. In 1910 appeared his first novel, *Der tönerne Gott*. In 1916 came a tragedy, *Julia Farnese*; also a refurbishing of the old Ger. play *Vasantasena*. He adapted *The Persæ* of Æschylus in 1917; and the *Acharnians* and *Peace* of Aristophanes in the burlesque *Friede* (1918). Of his dramas, *Warren Hastings* appeared in 1916, and *Jud Suss* and *König und Tänzerin* in 1917. He pub. the novel *Die hässliche Herzogin* (*The Ugly Duchess*) in 1923, and the famous one *Jud Suss* in 1925. The latter was trans. into Eng. as *Jew Suss* in 1926. It is a story of Germany in the eighteenth century, a wonderful combination of Teutonic thoroughness of workmanship and Heb. imagination. Later plays: *Die Petroleuminseln*, with *Kalkutta*, 4 *Mai* and *Wird Hill amnestiert?* (1927). His *Success* (1930) bears a close resemblance to Zweig's famous novel, *The Case of Sergeant Grischka*, being founded on the theme of the unavailing attempts of a determined woman to secure the freedom of a man wrongly condemned to prison. The setting is pre-war Bavaria and the picture presented of political, social, and moral chaos is, as it is intended to be, profoundly disturbing. Like *Jew Suss* it is sketched on a great canvas, comprising scores of characters and all of them intensely vital. His novel *Josephus*, based on the life of the Jewish historian, was pub. in Eng. in 1933. Other works include *The Oppermans* (1933), *The Jew of Rome* (1935), *The False Nero* (1937), *The Devil in France* (1941), *Simone* (novel) (1944), *Proud Destiny* (1947). F. lives in California.

Féud (Middle Eng. *fede*, through the Fr., from Old High Ger. *fehida*. Cf. O.E. *fāh*, foe), a lasting quarrel, often resulting in warfare, between two families, clans, or tribes. See BLOOD, AVENGER OF; VENDETTA.

Feudalism (Late Lat. *feodum*, or *feudum*, a fee or fief), one of the most influential of medieval institutions, gave rise to legal principles and social ideas which are not by any means extinct at the present time. The question of the origin of F. is one of the most difficult in institutional hist.; the main points are now generally settled, though differences of opinion still exist as to points of detail. Institutions have existed in Japan, Africa, and many other places, to which the term 'feudal' might with justice be applied, but when the term F. or 'feudal system' is used without any qualification, the system of medieval W. Europe is always meant. This system came into

existence in the eighth and ninth centuries, owing to the inability of the central gov. to cope with the disorders of the period. Within the limits of this article any detail is impossible, but a few broad principles and tendencies may be pointed out. The two main features of F. are of Rom. origin; one related to land and the tenure by which it is held, and the other to the personal relationship of individuals. The latter was known in the time of the Rom. empire as 'patrocinium', a poor and landless freeman goes to the rich landowner who can afford him protection, states his need, and offers such services as a freeman may perform in exchange for shelter and support. The other institution was the 'precarium'; under this form the owner granted the use of a piece of land to another. The object of this practice was not to obtain income, but to serve a friend, to reward a dependent, or to secure a debt, etc. Its chief characteristic from a legal point of view was that the lessee had no right of any kind against the grantor, as the land was revocable at the will of the owner with no penalty. When a small landowner was in trouble, he made over his land as a gift to a rich landowner near, and received it back as a precarium: this process was known as 'patrocinium fundorum.' These two practices were the foundation of the later feudal system, but they were in their early stages entirely distinct; the personal relation did not connote the precarium, nor did the holding of land involve any obligation of the patrocinium. When the Franks entered Gaul and found these customs prevalent, together with many other Rom. institutions, they not only permitted their continuance, but legalised them. In this they were in all probability influenced by the pre-existence of the institution of the 'comitatus,' which had much in common with the patrocinium. The latter had held no stigma for either of the parties entering into it, but in the case of the comitatus, not only was there no disgrace, but the transaction was considered to confer honour on both the chief and the dependent. All these ideas and customs, such as special ceremonies and oaths of allegiance, passed from the comitatus into the feudal system. The idea of the precarium also would not be totally opposed to Frankish ideas, though the practice was mostly carried on by the great landowners until the beginning of the Carolingian period. The church was the chief agent in carrying over the precarium from the Rom. to the Ger. state; frequently grants of land were made by the Church on this system. The Merovingian period was not distinguished by any great change in the character of feudal institutions; the legalisation of the Rom. practices was the great achievement of that age. The most necessary steps to the formation of the historical feudal system were taken in the Carolingian period; those are the steps by which the two institutions of the patrocinium and precarium became two sides of a single system. Military service had

not previously been connected with the Rom. or Merovingian institutions, and the Carolingian age is remarkable as the period during which military service was estab. as a necessary corollary of F. Such a step was not made in a short time, and the whole epoch is occupied with the development of the change. Charles Martel made use of very extensive church lands to be given to his followers in order that being thus relieved of some expense, they might be able to furnish cavalry to repulse the Arabian attack on Gaul; the method used was called 'precarie verbo regis.' This was the first step towards the unification of the two institutions; about this time the word 'benefice' displaced precarium and 'commendation' was used instead of patrocinium. The judicial functions of the state also passed into private hands during this period. As a result of the extension of the principle of military service, the duty of defending the state changed from a public obligation to a private agreement. So full sovereignty was exercised by the great lords over all residing within their 'fief,' as the benefice was called at this later period. The process by which this change came about is obscure, and many differing views are held on the subject; in the majority of cases the view of M. E. Beaudouin is probably correct, that such power was usurped, owing to the strong local power of the landowner. In the ideal feudal system the fief and the vassal are always connected; the vassal always receives a fief, and a fief is held by none other than a vassal. Estates of allodial land, that is land which the original owner had held in fee-simple, not as a benefice, frequently formed little states of their own; if the pretensions of the owner were made good, they were distinctly recognised by the general gov. as independent states. F. was prevalent over W. Europe from the tenth to the thirteenth century; even where allodial lands were numerous, the real gov. was completely local. At the same time it is noteworthy that the theory of the state, with an almost absolute king at its head, was never totally allowed to lapse even in the palmiest days of the feudal system. The kings themselves never allowed the barons' claim to independence, and thus the decline of F. was simply the conversion of theories into facts once more. The ideal feudal system may be seen in the legal theory (see Blackstone's *Commentaries*), and this theory corresponds generally to the actual facts prevailing. But it must be remembered that such a regular organisation as outlined in the legal theory nowhere existed in practice. A rough system of organisation was what obtained in most places, and no satisfactory idea of wages or details can here be given. The national feudal systems of the different countries of Europe presented many constitutional points of difference, and so exercised a different influence on the history of each country. See ENGLISH LAW and HISTORY, FRANCE, GERMAN, SCOTLAND, etc., for details of these systems. See also FIEF, HIDEN, KNIGHT

SERVICE, SCUTAGE, VASSAL, VILLEINAGE, etc. See Léon Gautier, *La Chevalerie*, 1884 (trans. by H. Frith, 1889); V. Menzel, *Die Entstehung des Lebenswesens*, 1890; E. de Laveleye, *De la propriété et de ses formes primitives*, 1891; J. H. Round, *Feudal England*, 1895, and *Domesday Book and Beyond*, 1897; J. T. Abdy, *Feudalism*, 1896; H. Brunner, *Grundzüge der deutschen Rechtsgeschichte*, 1901; P. Vinogradoff, *English Society in the 11th Century*, 1908; J. Calmette, *La Société féodale*, 1923; W. S. Davis, *Life on a Medieval Barony*, 1923; L. F. Salzman, *English Life in the Middle Ages*, 1926; M. Bloch, *La Société féodale*, 1939-40.

Feu de joie, discharge of musketry given as a salute on occasions of public rejoicings. The guns are let off one after another at quick but regular intervals, thus producing a running fire.

Feuerbach, Ln. of Württemberg-Baden, Germany, 2½ m. N.W. of Stuttgart. Pop. 18,000.

Feuerbach, Anselm (1829-80), Ger. painter, b. at Speyer. His first work of great merit was 'Haiz at the Fountain,' 1852. After a visit to Italy, his subjects were drawn largely from anct. hist. and mythology, and before long he was recognised as the leading painter of the Ger. classic school. His chief works are: 'Iphigenia in Tauris,' 'Orpheus and Eurydice,' 'Plotà,' and 'Dante at Ravenna.' See lives by Allgeyer-Neumann, 2nd ed., 1904; O. Fischer, 1922; and L. Zahn, 1940.

Feuerbach, Ludwig Andreas (1801-72), Ger. philosopher, fourth son of Paul J. A. Feuerbach, b. at Landshut in Bavaria, and educated at Heidelberg, Berlin, and Erlangen. His first work, *Gedanken über Tod und Unsterblichkeit* (1830) an attack on the doctrine of personal immortality, was followed by *Abolard und Heloise*, 1834. In 1837 he married a woman of some means, and was thus enabled to devote his time to study and reading, which resulted in the pub. of *Das Wesen des Christentums* (1841), trans. into Eng. by George Eliot under the title of *The Essence of Religion* (1853). This work is an interesting attempt to prove that God, or the Absolute, is an outward projection of man's inner self, only existing in the human consciousness of the infinite. F. thus denies the existence of God apart from man, and that the highest good is created in man's consciousness as an expression of his human needs. He was made much of by the revolutionary party, who degraded his philosophy into atheism. His complete works appeared in ten vols. (1846-66, new ed. 1903-11). See K. Grün, *Feuerbach in seinem Bruchwechsel und Nachlass*, 1874; M. Meyer, *Ludwig Feuerbachs Moralphilosophie*, 1899; F. Engels, *Feuerbach und der Ausgang der klassischen Philosophie*, 1888, 1903; A. Löwy, *La Philosophie de Feuerbach*, 1904; K. Barth, *Geschichte der protestantischen Theologie, seit Schleiermacher*, 1943.

Feuerbach, Paul Johann Anselm Ritter von (1775-1833), celebrated Ger. writer on criminal law, b. at Frankfurt-on-Main,

and educated at the univ. of Jena. His *Kritik des natürlichen Rechts* (1796), followed by *Anti-Hobbes* (1798), attracted much attention, and in 1801 he was appointed prof. at Jena, and in 1802 accepted a similar position at Kiel. He became second president of the Court of Appeal at Bamberg (1814), and first president of the Court of Appeal at Ansbach (1817). His works include *Merkwürdige Kriminalrechts-fälle* (1808-11), *Betrachtungen über das Geschworenengericht* (1811), and *Kaspar Hauser* (1832). A collection of his *Kleine Schriften* was pub. in 1833. The *Leben und Wirken* were ed. by his son Ludwig (2 vols., 1852). See M. Grünhüt, *Anselm von Feuerbach und das Problem der strafrechtlichen Zurechnung*, 1922.

Feuillants, religious order in France, or reformed branch of the Cistercians, founded in 1577 by Jean de la Barrière, the abbot of a Cistercian monastery in Feuillant near Toulouse. The stricter rules laid down by La Barrière were ultimately confirmed by Pope Sixtus V., and a convent for the new congregation was founded in the Rue St. Honoré, Paris, by Henry III. During the Fr. Revolution the name of F. was given to some moderate Jacobins, including Lafayette, Sleyes, Barnave, Charles de Lameth and Barère, who met in the building in Paris formerly occupied by the religious order. The object of the club (founded 1791) was to unite the old monarchy with the new constitution. The old Jacobins became absolutely republican and contemptuously called the F. the 'Club Monarchique.' The club was dissolved in 1792.

Feuillet, Octave (1821-90), Fr. novelist and playwright, b. at Saint-Lô in La Manche. He was intended for a diplomatic career, and was for a while cut off by his father on declaring his resolution of adopting a literary career. He contributed to the *Revue Nouvelle* and *Revue des Deux Mondes*, but made his first definite success with his novel *Bellah* (1852), reprinted from the latter paper. This was followed by *La Petite Comtesse* and *Dalila* (1857), and *Le Roman d'un jeune homme pauvre* (1858). He also wrote many comedies, which had long runs, but have not retained their popularity. His best work in fiction was done during his later years, and include *Sibylle* (1862), his masterpiece; *Monsieur de Camors* (1867), *Julia de Trécaur* (1872) and *La Mort* (1886). He was elected to the Academy in 1862. See H. Bordeaux, *La Jeunesse de Feuillet* 1922.

Feuilleton (a diminutive of Fr. *feuille*, leaf of a book), supplement of a political newspaper devoted to literary and art criticism, gossip about the fashions, epigrams, and *bons mots*. It was not usually printed on separate paper, but divided from the political part of the newspaper by a line or by smaller print. It was first adopted in the *Journal des Débats* under the editorship of Bertin, and was so popular as treated by the Abbé Geoffroy that it became a permanent feature in Fr. journalism. The same kind of *causerie* may be found in Eng. papers, but the

name F. is used in England exclusively to denote an instalment of a serial story.

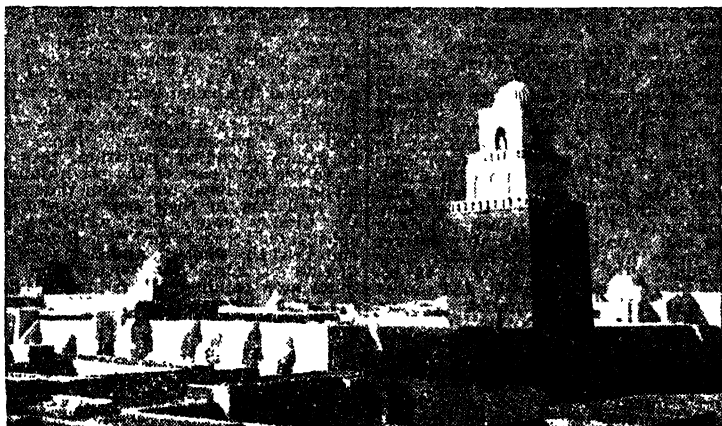

Fever (Lat. *febris*, from *fervere*, to burn), condition of the body characterised by a temp. above the normal, and accompanied by disturbances of normal functions. The feverish condition is symptomatic of a large number of diseases, but the term is particularly applied to those morbid conditions where high temp. is the predominating symptom; that is, where the rise of temp. is practically a measure of the severity of the disease. The normal temp. of the body is between 98° and 99°F. (about 37° C.); when the temp. is above 103° F. the febrile condition (*pyrexia*) is estab.; at 100° the condition is known as *hyperpyrexia*; if the temp. rises above 107°, a fatal termination to the disease may be expected. The cause of rise of temp. may be increase of heat-production owing to stimulated oxidation or a decrease in heat-elimination owing to disturbance of the functional activity of the heat-eliminating organs, notably the skin. The greater factor is probably the latter, as in cases of F. due to the action of micro-organisms it has been found that the increase of combustion due to the struggle between the white corpuscles and the bacteria does not produce much rise of temp. On the other hand, the destructive action of the bacteria and the consequent disintegration of protoplasm are accompanied by a proportionate disability of the cutaneous vessels to effect adequate elimination of heat. The febrile condition is usually ushered in by shivering and alternate phases of cold and heat. Although during the cold fits the skin is clammy and the patient complains of lack of heat, the internal temp. is usually as high as in the hot fits, the sensations felt by the patient being due to nervous disturbance. The pulse is generally rapid and weak, and the secretions are generally disturbed. The digestive secretions are abnormal, leading to loss of appetite and disturbed excretions. There is often constipation, unless diarrhoea is characteristic of the disease, as in dysentery, and the urine is scanty and loaded with sediment. The liver also fails in its functions, and the bile secretion is altered, if not suppressed. The general failure of the nutritive functions leads to wasting and feebleness, the nervous structures are modified and the patient may suffer from delirium. Diseases in which F. occurs may be classified as idiopathic F., where the rise of temp. is a predominating factor; and secondary F., where other symptoms predominate. The diseases more strictly called F. are usually associated with the presence of specific micro-organisms, and are generally infectious. Inflammation of certain organs and tissues is often accompanied by general F., and is called by that name as a secondary or popular title. Thus acute rheumatism is known as rheumatic F., meningitis as brain F. The treatment of F. is usually determined by the cause. As a temporary or soothing measure, the administration of such febrifuges as quinine, antipyrin, and antifebrin is useful, unless contra-indicated

by other symptoms. The application of cold in any form is often resorted to, particularly in the way of sponging, or the application of the cold pack, which consists of wrapping the patient in blankets wrung out of cold water. These measures must, however, be administered with care.

Fever, Breakbone, or Dandy, see DENGUE.

Feydeau, Ernest Aimé (1821-73), Fr. author, b. in Paris. His first pub. was a vol. of poetry, *Les Nationales* (1844), but he was far more successful in writing fiction, for which he showed a genuine talent. In *Fanny* (1858), *Sylvie* (1861),

largest in Africa and is used as a kind of univ. by over a thousand students. The mosque of Muley Edris, built nearly 1100 years ago by the reputed founder of F., is held to be so sacred that any approach by Christian or Jew is forbidden. The interior of the city is not so pleasing. The walls are decayed, and ruined buildings are to be seen on every hand. The streets are narrow and scarcely ever penetrated by the sun. Commercially, Fez is one of the busiest centres of N.W. Africa. The exports are olives, fruits, caraway seeds, citrons, honey, olive oil, hides and leather, tallow, ostrich feathers, ivory, gold, silk scarves, sashes, etc. The fez is also

FEZ: THE GREAT MOSQUE OF KARUEEN

Paul Popper

and *Le Roman d'une jeune Mariée* (1857) he depicts the corrupt manners of an immoral age. His other works include: *Du Luxe des Femmes, des Mœurs, de la Littérature et de la Vertu* (1866), *Histoire générale des usages funèbres et des sépultures des peuples anciens* (1857-61); and *L'Allemagne en 1871* (1872), a caricature of contemporary Ger. life.

Fez, or Faz, sacred city of Morocco, about 85 m. S. of the Mediterranean Sea, and 100 m. E. of the Atlantic Ocean; it is picturesquely situated in the valley of the Sebu, a stream which flows through the centre of the city and falls into the Atlantic 100 m. to the W.; the valley is shaped like a pear, and surrounded by orange groves, olive plantations and fruit orchards. The R. Wad-el-Jubor flows through the neighbourhood, and enters the Wad-el-Sebu, about 6 m. northward of the city. The former stream divides the tn. into two parts, the old part, Fas-el-bali, being on the r. b., and the modern Fas-el-djedid, on the l. b. Viewed from a distance, Fez has a strikingly handsome appearance, and is celebrated as a 'holy city' of Islam, and a seat of learning. The mosque of Karueen is said to be the

manufactured. There is a regular caravan trade with the interior cities of Africa. The native industries are morocco leather goods, pottery, and gold and silver ware. Fez was founded in 808 by Muley Edris, and it became the cap. of the W. African Muslim states. In the tenth century, pilgrimages were made to Fez, instead of to Mecca. It was incorporated with Morocco in 1548. In 1911 the city was besieged by hostile tribesmen, but relieved by the Fr. general Moinier. Pop. 144,200, mostly Moslems, together with some 9000 Jews, and 9500 Europeans, mostly Fr.

Fez, crimson skull-cap, forming the national head-dress of the Turks. It was so called, because the place of its sole manuf. was formerly Fez in Morocco. France, Germany, and Switzerland also make fezes now. They are brimless and are ornamented with a tassel on the centre of the crown. The dye used for them is obtained from small berries which grow in profusion in the neighbourhood of Fez.

Fezzan (anc. Phazania), country situated S. of Tripoli, N. Africa, and transferred to Italy, with the rest of Tripolitania under the treaty of Ouchy (Oct.

1912). It extends 390 m. from N. to S., and 420 m. from E. to W., and has an area of 156,000 sq. m. It consists of a desert, enclosing numerous oases, and bordered by low ranges of hills. The Jebel-es-Soda or Black Mts. and the Haruj-el-Aswad cross the country on the N. The climate is even and healthy on the whole, as it does not lie within the tropical rain zone; rain is not frequent. Water, however, is found plentifully near the surface of the ground. There are five grain harvests annually: wheat, barley, melons, turnips, and cotton are cultivated, while figs, dates, olives, almonds, henna, alfalfa, oranges, and grapes form the chief wealth of the country. Homs (or Khoms) has for ages been the depôt for the produce of the F. The prin. tns. are Murzuk, the cap. (pop. 10,000); and Sokna, Germa, Gatroun, Tejerri, etc. In the Second World War the F. was the theatre of a successful campaign organised by Gen. Leclerc, on the orders of Gen. de Gaulle, in 1941-42 and carried out in 1943. He took the oasis of Kufra in 1941 and, in 1942, made frequent raids into the F. from Fort Lamy in Chad. Having thus acquired a familiarity with all the conditions of terrain and climate, he concentrated at Fort Lamy and Faya forces and supplies considerably greater than those he had used in the raids throughout 1942. By Dec. 22 (1942) his troops had penetrated the F. and routed a motorised lt. detachment S.E. of Gatroun. Oum-el-Araneb was attacked on the 30th and fell on Jan. 4 (1943). El-Gatroun was taken on Jan. 6 and with the capture of Murzuk on the 12th the whole of the F. was conquered and Leclerc's forces went on to take Mizda, entered Tripoli (Jan. 25) and on the next day took Gadamès. This remarkable campaign involved a march of 2500 km. across formidable deserts, without re-victualling, and the scaling of the Tibesti Mts. some 3000 metres in height—altogether an exploit which in peace time would have been remarkable enough, but to have carried on the way bastions fortified for years by an enemy who disposed of motorised and armoured engines of warfare was a feat of arms which surpassed the boldest flights of imagination. (See Capt. Paul Moynet, *Les Campagnes du Fezzan*, 1943.) Pop. 32,000.

Ffestiniog (place of hastening), par. and tn. of Merionethshire, Wales, situated about 20 m. N.W. of Bala, and 8 m. from Portmadoc. It is the centre of a slate-quarrying dist. Pop. 9000.

F.F.I., abbreviation for Forces Françaises de l'Intérieur, Fr. resistance army in the Second World War. See FRANCE—History; and WESTERN FRONT IN SECOND WORLD WAR.

Fiacre, or **Fiacrach**, Saint (Celtic **Fiachra**), (d. c. A.D. 670), Irish anchorite, who was allowed by the bishop of Meaux (in France) to build a little monastery at Breuil. During life he was famed for his miracles, and after death they were long wrought near his shrine. In 1568 his remains were carried for safety to the cathedral of Meaux, where they still rest.

The Hôtel St. Fiacre of Paris, which was named after him, gave its name to a kind of cab (*fiacre*).

Fianna Fail (Soldiers of Destiny), name of the political party in the Irish Free State (later Eire) which followed Eamon de Valera (q.v.). It was returned to office some years after the end of the civil war of 1923, pledged to a policy embracing the abolition of the land annuities to Britain, protection, the abolition of the parl. oath of allegiance to the Crown, the abolition of the right of appeal to the Privy Council and the abolition of Partition. The 'treaty' arrangement whereby S. Ireland was accorded Dominion status was accepted by the moderates under Cosgrave (q.v.) but declined by de Valera and his republican followers, who, however, are not so extremist as the I.R.A., still less, of course, identical with that body. The F.F. party gov. at once proceeded to abolish everything constitutionally binding their ter. to the Brit. Empire and to embark on an economic policy of 'self-sufficiency.' There being no means of ending 'partition,' they had to shelve that part of the programme as an immediate issue, contenting themselves by declaring in their new Constitution that the Erse name 'Eire' which was now substituted by them for 'Irish Free State' embraced the whole is. and that the jurisdiction of Eire 'ran within the Free State area pending the re-integration of the national territory.' See further under DE VALERA; EIRE; IRELAND.

Fians, Anglicised form of *Fiann*, or *Feinne*, of which the Eng. 'Fenians' is a variation. It is rather uncertain exactly what the F. were: what is certain is that the name is derived from Finn MacCool, or Finn MacCumail, who is the central figure of the later heroic or Ossianic cycle of Irish legend. In Scotland Finn MacCool is called Fingal. Finn was a posthumous child, and was at first called Demni. He was the leader of the F., concerning whom the general opinion is that they were a kind of militia or standing army, which was drawn from all quarters of Ireland to assist in the repulsion of enemies, particularly those from over the sea. The headquarters of the F. was at Alton (Allen) in co. Kildare, where Finn himself usually resided with sev. contingents of his followers; the rest were posted at various places throughout the country. The adventures of the F. in war, love, and hunting are the subject of many tales and legends. The admission to this band of warriors was only gained after peculiar and trying ceremonies of initiation. Dr. Skene considers the F. to have been a distinct race, which preceded the Irish and Scottish Gaels and the Germanic people of 'Lochlan' (Scandinavia). The chief figures of the F. were Ossian, the son of Finn MacCumail, Oscar, the grandson, and Diarmait O'Duibne; the latter eloped with the destined bride of Finn, Granne, the daughter of Cormac MacArt (q.v.); the story of this is a well-known legend. The process whereby Finn became associated with the reign of Cormac MacArt is by

no means clear; by the year 1000 he was so associated and has been a popular hero for more than 800 years; primarily he is regarded as one with magical powers, and as a great poet. Finn can be shown to have been originally a figure in the traditions of Leinster and Munster previous to the Viking age; it is impossible that such a band as the F. existed in the second and third centuries, as a number of sages of much earlier date than those which state so have no mention of them. See W. F. Skene, *The Dean of Lismore's Book*, 1862, with introduction; J. F. Campbell, *Leabhar na Feinne*, 1872; J. G. Campbell, *The Franks*, 1891; D. MacRitchie, *Fians, Fairies and Picts*, 1893.

Fiasco (It. word meaning 'bottle') has long been used in connection with the It. stage to draw attention to faults in either singing or acting. Perhaps the modern sense of failure is a metaphorical transference from the bursting of a bottle. The word was early borrowed by other nations of Europe, and in this country it is used indifferently of any event which comes utterly to grief.

Fiat, decree, order, or warrant of a judge, or the attorney-general, or a secretary of State, ending with *fiat ut petitur*, i.e. let it be done as is asked. One of the commonest instances of its application was in the case of a petition of right for redress of an injury at the hands of the crown (*q.v.*); where a subject suffered such injury he could not sue the crown in the ordinary way, by reason of the maxim that the 'king can do no wrong'; he therefore presented a 'Petition of Right' to the home secretary setting out the facts and asking that right be done him in the matter. If the home secretary granted his F. the question was decided by proceedings not dissimilar to those of an ordinary action. By the Crown Proceedings Act, 1947, a subject can now sue the Crown by the ordinary procedure as between subject and subject.

Fiber Zibethicus, see MUSK-RAT.

Fibre and Fibrous Substances (from Lat. *fibra*), slender filaments which compose other bodies, which may be either animal, vegetable, or mineral, and are utilised in manufs. Those used in the arts are either of animal or vegetable origin, with the exception of asbestos, which is mineral. An animal F. of great importance is that of the camel, which is made into excellent cloth, while the hair of the cow makes an inferior woollen cloth. A F. of a silky quality is derived from the byssus of a large shell-fish found in the Mediterranean, and which is used for the making of shawls and gloves. The dicotyledonous plants yield the most important textile F. of vegetable origin, of which flax, hemp, reed, and jute are good examples. The most valuable is the cotton plant, consisting of hairs all round its seeds. Coir F. is obtained from the husk of the nut of the coconut palm.

Fibrin, protein derived from blood. It is thought that it arises from the action of a ferment upon fibrinogen. F. is only a constituent of blood after it has left the

arteries, being formed during the process of coagulation or clotting. Analysis reveals that in 100 parts there are 52.6 parts of carbon, 21.8 oxygen, 17.4 nitrogen, 7 hydrogen, and 1.2 sulphur. It reacts like other proteids, is insoluble in water, highly elastic, tough, and jelly-like. If the blood-plasma of the horse is heated to 55° C., a purer F. is obtained than by beating a blood-clot with twigs. In this latter case globulin and hemoglobin are mixed with the F. which adheres to the wood.

Fibroline, yarn made from flax, jute, and hemp waste. It is used with linen or cotton yarn for the backs of carpets and similar purposes.

Fibula, the splint-bone of the leg, being situated behind the 'tibia,' and extending from the knee to the ankle. It is composed of a slender four-sided shaft and two larger extremities. Ligaments fastened to a roughened surface bind this bone to the tibia. The projecting ankle is formed by the 'external malleolus,' which is a downward projection of the lower end. This extremity articulates with the astragalus, and the upper or head with the upper portion of the tibia. The bone at the back of the astragalus, known as 'os trigonum,' is the lower of the two pressure epiphyses.

Fibula (Lat. word from *figere*, to fasten), a clasp, buckle, or brooch. Fibule or

ANGLO-SAXON FIBULA

Silver set with garnets

safety-pin brooches were known to the Mycenaean age, which is pre-Homeric.

Fichte, Immanuel Hermann von (1797-1879), Ger. philosopher, b. at Jena, lectured on philosophy at the univ. of Bonn from 1836 to 1842, and afterwards was appointed to a chair in Tübingen. In his *System der Ethik* (1850-53) and his *Psychologie* (1864-73) etc., he tries to reconcile Herbert and Hegel. Disliking the pantheism of the latter, he was drawn rather towards the theism of Leibnitz, and strove to realise philosophically the personality of God. See Hildegard Hermann von Fichte's, 1928.

Fichte, Johann Gottlieb (1762-1814), Ger. philosopher of Swedish descent, b. at Rammenau, Upper Lusatia. His early precocity aroused the interest of a local dignitary, Baron von Miltitz, who gave him an excellent education; and after passing through Pforta, where he read Lessing and Goethe, he entered Jena Univ. to study theology. He was now

self-dependent, and the next few years found him occupied in private teaching and writing. In 1788 he became a tutor at Zurich, but this relief was short-lived, and settling at Leipzig he was compelled to turn again to literary hackwork for a livelihood. About this time he first studied Kant—an important event in his mental development, which thoroughly reversed the fatalistic tendencies shown in his early *Aphorisms on Religion* (1790), the result of reading Wolff and Spinoza at Jena. He even commenced a 'popular version' of Kant's *Critique*, but this was left unfinished. Shortly after this, he made Kant's personal acquaintance and submitted a treatise, *A Critique of Revelation*, which Kant approved so highly that he secured its pub. in 1792; and F. was at once acclaimed as a significant philosophical force. This success enabled him, in 1793, to marry Johanna Maria Rahn, to whom he had become engaged at Zurich three or four years before; and for the next few months he remained in Switzerland, studying and developing Kantian ideas and principles. In 1794 he secured the chair of philosophy at Jena, and won immediate recognition and renown for his brilliant lectures. These early lectures formed the nucleus of the Fichtean system, and in the same year he pub. three vols. on the *Theory of Knowledge*. His practical philosophy was given in the *Foundation of the Laws of Nature* (1796), and the *System of Moral Philosophy* (1798), his most important work. Meanwhile, from 1795-98 he had been joint editor of the *Philosophical Journal*, and had incidentally become the friend of Goethe, Schiller, Schelling, the Schlegels, Tieck, and Novalis. But in 1798 trouble arose through a paper pub. in that jour., and the following year F. had to resign from Jena, charged with atheism and disowned by Kant. The rest of his life was mostly passed in Berlin with the Schlegels and Schleiermacher; the chief literary results being the *Vocation of Man* (1800), the *Exclusive Commercial State* (a socialistic thesis, 1800), and *The Way to a Blessed Life* (1806). In 1810 he was appointed rector at the new Berlin Univ.

With the exception of his lectures on transcendental logic (1812), none of his subsequent work covers any important fresh ground; but during the struggle for national independence he earned some distinction as a patriotic lecturer (1813). F.'s philosophy, known as subjective idealism, aimed at a complete exposition of the fundamental laws and principles which govern cognition. He contends that subject and object are absolutely identical and that the individual ego, the human mind, is non-existent apart from the absolute ego, the divine and infinite spirit of all things, God. 'Knowledge is not merely knowledge of itself, but of being, and of the One Being, God, that really is.' All realities, animate, and inanimate, are but sensuous phenomena, material expressions of their essential divine idea, and they have no separate existence, but are the product of the human soul, divinely inspired. The

majority of men live in relation to the superficial appearances of things, ignorant of their divine essence; it is for the philosopher and the man of letters to discover and interpret the fundamental spiritual ideas, of which the appearance is merely a vesture. F.'s influence on philosophy and literature has been enormous; Hegelian idealism and Emersonian transcendentalism are considerably indebted to him, both for idea and for idiom of expression, whilst Schopenhauer's writings are almost wholly evolved from F.'s later works. Besides his more esoteric philosophical works, he wrote sev. of a popular cast, including *The Nature of the Scholar* and *The Characteristics of the Present Age*. He fell a victim to the War of Independence, dying of fever caught through his wife and her nursing of wounded patients in the hospitals. His collected works were pub. by his son I. H. F. (1845-48). See M. Weber, *Fichte's Socialism and sein Verhältnis zur Marx'schen Doktrin*, 1900; G. H. Turnbull, *The Educational Theory of Fichte*, 1926; and life by E. Bergmann, 1928. See also HEGEL; IDEALISM.

Fichtelgebirge (pine mountains), a mt. system of Bavaria, Germany; it forms the nucleus of three mt. ranges, the Erzgebirge, Frankenwald, and Böhmerwald. The highest summits are the Schneeberg, 3161 ft., and the Ochsenkopf, 3334 ft. The mts. were once covered with pines. The geological formation is chiefly granite, slate, gneiss, and basalt; the minerals obtained are iron, sulphur, lead, and copper. Marble and stone are quarried, and the inhab. are engaged in charcoal burning, forges, and blast furnaces. There are extensive tracts of forest land. Alexanderstad is a noted holiday resort.

Ficino, Marsilio (1433-99), It. philosopher, was a true son of the Renaissance. Fortunate in the patronage of Cosimo de' Medici, he secured, in 1463, the presidency of a Florentine college. F. fanned the awakening interest in Gk. philosophy by his trans. of Plato, and unlike the scholars of the succeeding generation was first a Christian and afterwards a Platonist. The incomplete fusion of ecclesiastical doctrine and pagan thought gave a curious flavour to his sermons, when in 1473 he entered the Church.

Ficksburg, tn. of S. Africa, in the Orange Free State, near the Caledon R. In the vicinity are diamond mines and petroleum wells. Petrified fish are found in the fossilised ooze of the Wonderkop. Pop. 3000.

Flouon, Legal, some fact, state of things, or proposition assumed to be true by the law avowedly for the purposes of justice or convenience. Fs. in law though often ridiculous enough, have generally had their origin in some defect in the existing laws or course of procedure, and have in a measure exemplified the desire of judges or other interpreters of law to make the law, in particular cases where some change was necessary, conform to the general and progressive opinion of society. Many Fs. have, far from being

injurious, been highly beneficial, and have paved the way to legislative remedy. Social necessities, says Sir H. S. Maine (*Antient Law*), and social opinion are always in advance of law. Law is static, most societies progressive, and Maine thinks that legal F's. were historically the first agency by which law was brought into harmony with society. But in this sense of the relation of F. to the evolution of law, Maine uses the term to signify any assumption which conceals or affects to conceal the fact that a rule of law has undergone alteration, its letter remaining unchanged, its operation being modified. In this wider signification the term embraces not only F's. in Eng. law, and Rom. law, but the whole of Eng. case-law (Bentham's 'judge-made law'), and the Rom. *responsa prudentum* (answers or opinions of jurists of repute) as resting on a fictitious basis. It is a jurisprudential commonplace that the law is constantly and more or less imperceptibly changed by judicial decisions, although all decisions profess to do no more than apply settled principles to new facts; and similarly with the authoritative answers of the anct. Rom. juriconsults. A good instance of the utility of a legal F. in Rom. law was that of adoption which overcame the narrow caste nature of a legal *familia*, by permitting the family tie to be artificially created by adoption or arrogation. Some instances of F's. in Eng. law are: the proposition that husband and wife are one; the assumptions in such anct. writs as those of *quo minus* by which the Court of Exchequer (q.v.) obtained its common law jurisdiction, and *vi et armis* by which the King's Bench court usurped much of its jurisdiction (see KING'S BENCH DIVISION); the suppositions involved in *fines* and *recoveries* (q.v.); and the assumption of the existence of the two legendary and much ridiculed litigants 'John Doe' and 'Richard Roe,' with the object of applying the real process of an action of ejectment to the trial of questions relating to title to land.

Ficus, genus of Moraceæ, chiefly indigenous to tropical forests, and containing species with widely diverse characteristics. *F. carica*, the fig-tree of commerce, a native of Asia Minor and Syria, is now found in a wild state in the countries bordering on the Mediterranean. The fruit of the wild variety has not the succulence of the cultivated kinds. *F. elastica* is the India-rubber tree, and is frequently cultivated in small pots; *F. religiosa*, the peepul, or sacred tree of the Brahmans and Buddhists, yields a gum resembling caoutchouc; *F. indica*, also called *F. bengalensis*, is the banyan, and yields an inferior rubber, the bark and roots also furnishing a coarse rope-fibre.

Fidææ, anct. tn. of Italy, situated on the Tiber, 6 m. from Rome. In the reign of Tiberius a gladiatorial show took place here, during which the amphitheatre collapsed and destroyed nearly 50,000 people. No ruins of F. now exist, but it is identified with the modern Costello Giubileo.

Fiddle, see VIOLIN.

Fidel-commissum, in civil law (q.v.), denotes a trust. Scots legal writers generally refer the origin of their law of trusts and trustees to the Rom. conception of a F. In Rom. law a F. was an informal bequest or devise made to the heir or legatee (who in such a case was called the *fiduciarius*), with a request attached to it that the *fiduciarius* or trustee should deliver the property to some named person who was incapable of taking directly under the will (the *fidel-commissarius* or beneficiary). At first the rights of the beneficiary were unenforceable and could only be made good by entreaty. The Emperor Augustus, supported by the propaganda of literature and probably under the inspiration of a revival of religion to supplant secret foreign rites, estab. a system which made *fidel-commissa* obligatory on the trustee, and appointed a special magistrate, the *prætor fidel-commissarius*, to compel the trustee to carry out his obligations. For the most part *fidel-commissa* were created by means of codicils (q.v.). Eng. legal historians, generally, are of the opinion that the lord chancellors (q.v.) borrowed the doctrine of the Eng. use (see USES) from the Rom. law of trusts.

Fidel Defensor (Lat. for 'Defender of the Faith'), title conferred upon Henry VIII. by Pope Leo X. in gratitude for a pamphlet in which that sovereign had roundly abused the heretic, Martin Luther. It was granted in 1521, and was subsequently confirmed by parliament and accorded to every Eng. king.

Fidelity Guarantee, form of insurance for the benefit of employers, by which they are guaranteed against fraud, etc., of their employees. The rate of insurance varies, being sometimes 5s. per cent and sometimes 40s. Generally, all the employees of a firm are guaranteed under one policy, and length of service, position, etc., are taken into consideration in fixing the premiums. The F. G. companies are: The Bankers' Guarantee and Trust, General Accident Guarantee Society, Law Accident, Ocean Accident, Provident Clerks' Guarantee and Accident, etc.

Fidenza (anct. Fidentia), walled tn. in the prov. of Parma, Italy, situated on the Stura, a trib. of the Po, 15 m. W. of Parma. It has fine cathed. al built in the fifteenth century in the Lombard style. Hemp and silk-spinning are carried on, and also glass manuf. It was the scene of the martyrdom of St. Doninus in 304, whence its former name, Borgo San Doninus. During the Hohenstaufen dynasty it became an imperial possession, and in 1501 the seat of a bishop. The Canonica of the cathedral suffered serious damage in the Second World War. Pop. 16,000.

Fides, goddess of anct. Rome, the personification of fidelity. Numa Pompilius is said to have instituted the festival of F., and to have built a temple to her on the Capitol. She was represented as a matron wearing a wreath of olive or laurel leaves, and carrying in her hand a basket of fruit.

Fiduciary Issue. In banking language, a fiduciary issue is that part of an issue

of bank notes that is not backed by gold actually held by the bank. As the word fiduciary implies, it is an issue made on the 'faith' of people in the reputation of the bank. In this sense all bills of exchange, cheques, and promissory notes are 'fiduciary' in so far as the assets behind them are undisclosed. From the time when the Bank of England lent its original cap. to the nation, thus commencing the National Debt, the extent of its fiduciary issue has been regulated by the gov.

Fief, or **Fee Law**, first meant an estate held in trust, on condition that the person holding it rendered personal or other service to the lord who granted it. There were three varieties of tenure, free, base, and religious. The first consisted in following the lord of the land to battle; the second were held in virtue of those services which more menial vassals did for their immediate superiors; and the last were held by virtue of masses said by the priests to whom the land was granted. See **ENTAIL** and **FEUDALISM**.

Field, term in heraldry for the ground, which is of a special colour, on which armorial bearings are displayed. See **HERALDRY**.

Field, The, 'the country gentleman's newspaper,' ranks first in the list of sporting papers. It was started about 1843, and was one of the many with which Bradbury and Evans were connected, both as printers and proprietors. Its earliest editor was Mark Lemon, and Leech supplied illustrations of hunting adventure. One of its owners was Benjamin Webster, the actor, who in time acquired the whole property and sold it to Serjeant Cox.

Field, **Cyrus West** (1819-92), founder of the Atlantic cable, b. at Stockbridge, Massachusetts. At fifteen he was a clerk in the store of A. T. Stewart & Co., New York, and in 1840 started a paper business for himself at Westfield, in which he was so successful that he was able to retire in 1853. He then began to think about a trans-Atlantic telegraphic cable, and having enlisted the sympathy of Peter Cooper and other Amer. capitalists, organised the New York, Newfoundland, and London Telegraph Company in 1854, and the Atlantic Company in 1856. The cable was completed by 1858 and was hailed with delight, but it was not in proper working order until 1866. He also interested himself in the New York Elevated Railroad.

Field, **David Dudley** (1805-94), Amer. lawyer, b. in Haddam, Connecticut. He took his degree at Williams College in 1825, and was admitted to the Bar in 1828. After a special study of England's legal system he worked throughout his life for the codification of the common law and procedure of America. His pamphlet on the reorganisation of the judiciary led to his appointment as chairman of a State Commission for the revision of practice and procedure, and the resultant civil code (1857) was adopted in 24 States and the criminal in 18; while the civil code of procedure was adopted in England—though

not until 1873. He became head of a State Commission in 1857 for the ambitious plan of reducing the whole *corpus juris* of the State into a written systematic code; but the codification was only adopted in small part, though it has often served as a model for Amer. codes. His pub. were *The Reorganisation of the Judiciary* (1846) and *Draft Outlines of an International Code* (1872).

Field, **Eugene** (1850-95), Amer. journalist and poet, b. at St. Louis, Missouri. He studied at Williams and Knox Colleges, and the univ. of Missouri. He wrote for various papers, but made his reputation when he became connected with the *Chicago News* in 1883. He is, however, chiefly known by his poems of childhood, of which *Little Boy Blue* is, perhaps, the general favourite. His prin. works are *A Little Book of Western Verse* (1889), *A Second Book of Verse and With Trumpet and Drum* (1892), and *Love Songs of Childhood* (1894).

Field, **Frederick** (1801-85), Eng. divine, b. in London, and was a direct descendant of Oliver Cromwell, of which he was very proud. He was educated at Christ's Hospital and Trinity College, Cambridge, and became a fellow of his college in 1824. In 1839 he ed. Chrysostom's *Homilies on St. Matthew*, and in 1842 he was presented by his college to the rectory of Reepham, in Norfolk. It was here he edited Chrysostom's *Homilies on St. Paul's Epistles* between 1849 and 1862. In 1863 he resigned his living and devoted his time to Origen's *Hexapla*, which was pub. in 1874.

Field, **Sir Frederick Laurence** (b. 1871). Eng. admiral. He was in charge of the torpedo and signal schools of Portsmouth. Flag-captain of H.M.S. *King George V.* and Director of Torpedoes during the First World War. Commodore and Chief of Staff to Admiral Madden. Third Sea Lord, 1920-23. Deputy Chief of the Naval Staff, 1925-27. First Sea Lord and Chief of the Naval Staff in succession to Sir Charles Madden.

Field, **Nathanial** (1587-1633), Eng. actor and dramatist, b. in Cripplegate, London. In 1600 he acted in Ben Jonson's *Cynthia Revels*, in 1601 in the *Poetaster*, and in 1606 played the title rôle in Chapman's *Bussy d'Ambois*. He was the author of two plays: *A Woman is a Weather-cock* (1612), and *Amerinds for Ladies* (1618), which retracts the charge. It is conjectured that he also collaborated with Massinger in the *Fatal Dowry*, and that he had a share in the writing of some of Beaumont and Fletcher's plays. See R. F. Brinkley, *Nathan Field, the Actor-Playwright*, 1928.

Field Research, see **ARCHAEOLOGY**.

Field, **William Ventrils**, first Baron Field of Bakenham (1813-1907), of Bakenham, Eng. judge. From 1830 to 1840, member of a firm of solicitors. Then entered the Inner Temple. Called to the Bar 1850. Took silk, 1864; was made Bench, 1865. In Feb. 1875, appointed judge of the Queen's Bench. On Supreme Court rules coming into force in 1883, F. was appointed by the lord chancellor to sit in chambers continuously for nearly a

year, to estab. a uniform practice. Decided some very important cases—notably *Sharp v. Wakefield*, which laid down the principle of unfettered magisterial discretion in renewal of drink-licences. Resigned, 1890; and on April 10 was raised to the peerage. Thereafter acted as judge in House of Lords and Privy Council.

Field Artillery, see ARTILLERY.

Fielden, John (1784–1849), Eng. politician, b. at Todmorden, Lancashire. As a boy he worked in his father's factory, and in after years remembered the exhaustion caused by his daily toil, and was a keen supporter of the Ten Hours Bill which became law in 1847. He also took an active part in the agitation for parl. reform, and was, like Cobbett, very much against paper money. He pub. *The Mischiefs and Iniquities of Paper Money* (1832), *The Curse of the Factory System* (1836), *A Selection of Facts and Arguments in favour of the Ten Hours Bill* (1845).

Fieldfare, or *Turdus pilaris*, belonging to Turdidae, the thrush family, is a familiar winter visitor to the Brit. Isles and Central Europe. It is gregarious in habit, and finds its summer home in the birch forests of Norway, Sweden, and Russia. The nest of the F. is of long fine grass with an intervening layer of mud; it may be built in birch or fir trees at an elevation of 15 ft., and has occasionally been seen quite near to the ground. This bird feeds on berries in hard weather, but also travels in flocks over the fields in search of slugs and other animal food. The plumage varies from ashy-grey to chestnut-brown, the underparts being a rich ochre, spotted with black.

Field-glass, instrument used for viewing objects at a distance, composed of two telescopes, which are identical in construction, placed parallel to one another. It is easy to use and does not strain the eyes like some telescopes, indeed it has the advantage over that instrument in that it allows the use of both eyes. It is of great value to travellers, soldiers, and sailors, and is almost universally employed by the Navy in place of the long telescope used in Nelson's time. There are two kinds of Fs., the Galilean type and the prismatic. The Galilean, which is the ordinary F., consists of two lenses, an object-lens and an eye-lens, the object-lens is convex, and the eye-lens concave. It was Porro, an It. engineer, who discovered that the usual reversing lenses in a telescope could be replaced by a combination of prisms, but these could not be used until a suitable medium was found, owing to the great absorption of light. The prismatic F. was introduced in 1898, and is now in general use. Of this there are sev. varieties, the special one used by the field naturalists has extending arms which place the object glasses above the head, thus enabling the person using them to keep out of sight; the object lenses, too, can be placed at any angle. The modern glass is made of magnalium with mountings of horn for the eye-pieces, and each eye-piece can be adjusted to suit each eye, and there must

be two prisms in each tube. It is made in four different powers, magnifying three, six, or twelve diameters. The first is used for objects at a short distance, while the last, which does not cover such an area of view, is of great service to soldiers and naturalists.

Fielding, Anthony Vandyke Copley (1787–1855), Eng. water-colour landscape painter, was the pupil of John Varley. In 1810 he became an associate of the Water-Colour Society and contributed largely to its exhibitions. In 1813 he was a full member, and was made president in 1831. His works are clever but slight, his best pictures being sea-pieces and aerial effects. There is a collection of his drawings in the Victoria and Albert Museum, S. Kensington, London.

Fielding, Henry (1707–54), Eng. novelist, b. at Sharpham Park in Somerset. Son of Gen. Edmund F. and a cousin of

HENRY FIELDING

Lady Mary Wortley Montagu. He was educated at Motcombe and Eton, and also studied for a short time at Leyden, where he graduated in 1728. He returned to London in 1728 and for some years led a dissipated life and began a long dramatic career by the pub. of *Love in Several Masques*, which was played at Drury Lane. Several comedies and farces followed, and his burlesque, *Tom Thumb* (1730), is said to have evoked a laugh from Swift, who only laughed twice in his life. In 1735 F. married Charlotte Bradock and bought the little Fr. theatre in the Haymarket, where he produced *Pasquin* (1736) and *The Historical Register* (1737), but the Licensing Act of 1737 put an end to his dramatic labours. All his comedies and farces have long been lost in oblivion. After a brief experience as a theatre lessee, studied law at the Middle Temple and was called to the Bar. Literature, however, was his main preoccupation, and in

1742 he came to the front with *The History of the Adventures of Joseph Andrews and of his friend Mr. Abraham Adams*. This was a parody on Richardson's *Pamela*, and was prompted probably by a feeling of reaction against the morbid tendencies of Richardson's work. The chief character in the book is Parson Adams, who is a 'noble example of primitive goodness and childlike Christian altruism,' and is perhaps F.'s finest and most original conception. In 1743 appeared three vols. of his *Miscellanies*, the third of which contained his strange *History of the Life of the late Mr. Jonathan Wild the Great*, a satirical work which places F. second to Swift in ironic power. After his wife's death he turned again to the law, but in 1745 he was once more engaged in literature as editor of the *True Patriot* and afterwards of *The Jacobite's Journal*. In 1749 his greatest novel, *The History of Tom Jones*, appeared; this was popular from the very first, and was praised by Hazlitt and Coleridge, and by Byron, who calls its author 'our prose Homer.' In 1752 *Amelia* was pub.; the plot of this is inferior to that of *Tom Jones*; but the descriptions and characters are very fine. He founded, conducted, and was the chief contributor to the *Covent-Garden Journal* (1752). Journalism and his duties as a justice of the peace occupied much of his time from 1750-54, when ill-health forced him to go abroad to Lisbon, where he died and was buried. After his death his *Journal of a Voyage to Lisbon* was pub. (1755). Scott styles him 'the father of the English novel,' and one Fr. critic describes *Tom Jones* as 'le premier roman du monde.' In both *Joseph Andrews* and *Tom Jones* F. outlined his ideas on the proper constitution of the novel, pruned of mere didacticism, but informed with a critical spirit and built on a philosophy of life. He conceives the novel as a type of epic, which, like drama, may be either tragic or comic. In associating his comic novel, *Joseph Andrews*, with the epic, it is evident that he was thinking more of the narrative form than the content of epic. There is a less remote analogy between his most typical novel, *Tom Jones*, and drama, not only in structure but in the new prominence given to dialogue—a prominence which was destined to have a most marked influence on the development of the Eng. novel. Again, F.'s realism, unlike that of Defoe, who employs it to give readers the illusion of recorded facts, has for its object to convey rather a general impression of life. Unlike the novels of Richardson there are no emotional crises in the novels of F. Yet in the hist. of the evolution of the modern novel the names of F. and Richardson are inseparable. Both his and Richardson's novels differ not only from those of Defoe (who shares with both the title of 'father of the English novel') but from those of all their predecessors in one essential feature in particular, which is best expressed in F.'s own words: 'It hath been thought a vast commendation of a painter to say his figures seem to breathe; but surely it is a much greater and nobler applause, that they appear to think'—

words which almost seem to herald the coming of the psychological novel. If to Richardson we owe the note of sentiment, dashing and versatile F. may claim to have imported the note of humour. In analytical force and subtlety F. may be inferior to his contemporary but his was the fresher and more vigorous mind. He attempted to paint a true picture of human life as he saw it, and in reproducing the broad features of tn. and country life in the mid-eighteenth century, he is unsurpassed. The complete works were ed. by W. E. Henley and Akers (1903). See Sir W. Scott, *Lives of the Novelists*, 1825; A. Dobson, *Fielding*, 1883, 1925; G. M. Godden, *Henry Fielding: a Memoir*, 1910; H. K. Banerji, *Henry Fielding, Playwright, Journalist, and Master of the Art of Fiction*, 1930; B. M. Jones, *Henry Fielding: Novelist and Magistrate*, 1933; M. P. Willcocks, *A True-Born Englishman*, 1948; Elizabeth Jenkins, *Fielding*, 1948.

Fielding, William Stevens (1848-1929), Canadian statesman, originally a journalist, b. in Halifax, Nova Scotia; He was for twenty years connected with the *Halifax Morning Chronicle*. He resigned his position of managing editor of that paper to engage in the active duties of public life, and rose to be Prime Minister in 1881. In 1896 he resigned and was appointed Minister of Finance in the cabinet of Sir Wilfrid Laurier. In this capacity he was charged with the readjustment of the Canadian tariff. He was a member of the Brit. Royal Commission on trade between Canada and the W. Indies, 1909-10, a governor of Dalhousie Univ. and Canadian delegate to League of Nations Assembly, 1922. P.C., 1923.

Field-marshal, the highest rank in the Brit. Army, was introduced by King George II. in 1736, although the title 'marshal' was in existence much earlier, for Matthew Paris says that in 1214 King John constituted Wm., earl of Salisbury 'marescalcus' of his forces. The 'marescalcus camp' was originally one of a number of officials to whom the name of marshal was given. The marshal was responsible for order in court and camp, and on military expeditions it was the custom for two marshals to precede the army to select a site for the camp, and in time of peace they arranged for the king's lodging.

Field-mouse, name given to sev. species of rodents, which are allied to the ordinary mouse, the vole (q.v.), etc. *Mus sylvaticus*, the wood-mouse, is a great pest in fields and gardens, and boards large quantities of grain; *Mus. minutus*, the smallest of Brit. mammals, makes a curious globular nest among reeds and grasses.

Field-officers, in the army, are those which rank above a captain, but below a general, viz. majors, lieutenant-colonels, and colonels. The captains, lieutenants, and sub-lieutenants are called company officers. See OFFICERS.

Field of the Cloth of Gold was the name given to the place between Guines and Andres where King Henry VIII. met

Francis I. in 1520. Henry meant to make a great impression in Europe, and spared no pains to make the scene as magnificent as possible. He succeeded in his purpose, but the meeting was of little avail politically.

Fields, Gracie (b. 1898), Eng. variety actress, b. at Rochdale, Lancs. Real name Grace Stansfield. She joined a troupe when only seven years of age, went into a cotton mill, and began as a vocalist in a Rochdale cinema, 1906. First London appearance, 1916, at the old Middlesex Music Hall in a revue *Yes, I Think So*, brought from Manchester. A revue *It's a Bargain* with Archie Pitt (whom she married in 1923), ran for nearly three years. Their next revue *Mr. Tower of London*, ran for seven years. Appeared with Sir Gerald du Maurier in *SOS*. Has won great popularity, both through her burlesques and her private generosity.

Field Spaniel, see *under* SPANIEL.

Field Sports, see *TRACK AND FIELD SPORTS*.

Fierabras, name of a prose romance which was very popular in the fifteenth and sixteenth centuries. It was taken from a 'chanson de geste' relating to the Emir Balan, who was conquered by Charlemagne.

Fieri facias, see *EXECUTION*.

Fiery Cross, an anct. summons to arms which was used in Scotland and sent by messengers from place to place. The token was made of wood, generally in the form of a cross, which was first set on fire and then dipped in the blood of a goat. It was employed by the Highland chiefs on special occasions, especially in time of war, to summon the clan as quickly as possible. Roderick Dhu, in Scott's *Lady of the Lake*, used the F. C. to summon his clan to battle.

Fieschi (or **Fiesco**), **Giovanni Luigi**, Count of Lavagna (c. 1523-47), Genoese nobleman who opposed the Republican gov. which Andrea Doria had restored. He formed a plot to establish an oligarchy, and was encouraged by Pope Paul III., the Duke of Parma, Francis I. of France, as well as by his brothers in Genoa. His object was to seize the fleet and hold the gates of the city. This was successfully accomplished, and Andrea put to flight when it was discovered that F. was missing. He had accidentally fallen into the water and was drowned. See *DORIA*, *ANDREA*.

Fieschi, Giuseppe Marco (1790-1836), conspirator, b. at Murato, Corsica. He served as a soldier in Russia in 1812. In 1830 he obtained a gov. appointment, but was dismissed for fraud. He then began to prepare an 'infernal machine' to revenge himself on society. When this was ready he hid it in his lodgings in the Boulevard du Temple, Paris, and when Louis Philippe was passing along to the Bastille exploded it. Louis escaped unhurt, but sev. others were injured, and amongst them F. himself. His life, however, was saved for the stroke of justice, and he was executed with his accomplices Mory and Pèpin.

Fiesco, Sinnibaldo, see *INNOCENT IV.*

Fiesole, small tn. in the prov. of Florence, Italy, and 4 m. from the city of Florence. It is of great historic interest, and contains Etruscan and Rom. remains. It was the anct. *Fesula*, and from 63-62 B.C. was the headquarters of Catiline. There is a well-preserved Rom. theatre, with stairways and entrance arches. The chief building is the cathedral, commenced in 1028. The episcopal palace and the palazzo del pretorio, or tn. hall, date from the thirteenth century. Its decay began in the Middle Ages with the rise of Florence, and it has now only about 3000 inhab., whose chief occupation is straw-plaiting. In the Second World War the church of S. Alessandro was the only monumental building to suffer serious damage, which was sustained by the roof and the apse. Pop. 11,400.

Fiesole, Giovannina, see *ANGELICO, FRA.*
Fife, musical instrument similar to a flute, but which generally has only one key. It has a compass of about two octaves, and is usually pitched in B_♭.

FIFE

or C. Only simple melodies can be executed on it, and it is generally played with the drum. The army drum and fife bands are still popular. See *FLAGEOLET*, *PICCOLO*, *FLUTE*.

Fife, maritime co. of Scotland, forming a peninsula on its E. coast, between the firth of Tay and the firth of Forth. The K. Eden flows through the length of the co. into St. Andrews's Bay, and its highest hills are E. Lomond, 1471 ft., and W. Lomond, 1713 ft. The agric. of the co. is in an advanced state, and there are valuable coal mines at Dysart, W. Wemyss, Leven, Markinch, Dunfermline, Kilty, Lochgelly, Cowdenbeath, and Kirkcaldy; limestone, sandstone, ironstone, and shale are also worked. The chief manuf. is linen, which is carried on chiefly at Kirkcaldy and Dunfermline, but Kirkcaldy is also famous for its olecloth and linoleum. The co. is also noted for its breweries and tanneries as well as for its iron foundries and engineering works; shipbuilding, too, is extensively carried on, and most of the coast tns. take part in fishing. The chief tns. are Cupar, the co. tn. Dunfermline, St. Andrews, Kirkcaldy, etc. For purposes of gov. the co. is divided into two divs., E. Fife and W. Fife, both of which send a member to parliament. Area 504 sq. m. Pop. 278,000.

Fife, Alexander William George Duff, Duke of (1849-1912), son-in-law of King Edward VII. and Queen Alexandra, descended from Alexander Duff of Keithmore, who was b. in 1624. From 1874-79 he represented Elgin and Nairnshire in Parliament, and from 1908 was president of the County of London Territorial Force Association. He succeeded his father as sixth earl of Fife in 1879, and was created duke of Fife in 1889 on his marriage to the Princess Royal, Princess Louise Victoria

Alexandra Dagmar, eldest daughter of the late King Edward VII. He had two daughters: Princess Alexandra, now duchess of Fife in her own right, to whom Queen Victoria stood sponsor, born in 1891; and Princess Maud, countess of Southesk, Queen Alexandra's god-child. On Dec. 13, 1911, he was wrecked in the *Delhi* off the Moroccan coast and rescued only with difficulty. He appears to have caught a chill and died at Assuan, Jan. 29. His body was brought to England and interred at Mar Lodge, Braemar, the seat of the Fife family.

Fifth Column, term that had its origin in the Sp. Civil war, being credited to the Nationalist general, Mola, who said, when he was beleaguering Madrid: 'I have four columns operating against Madrid and a fifth inside composed of my sympathisers.' When the city eventually fell to Franco in the spring of 1939, the Nationalist forces received full co-operation from his supporters within the city. The Gers., in the invasion of Poland, Norway, and the Low Countries (1939-40), had elaborated the use of F. C. activity into an essential part of the technique of invasion. By long and insidious efforts they had weaned elements of these countries to the Nazi political faith and Nazis of Ger. descent had obtained various apparently orthodox posts in the ters. of their intended victims, so that, when the actual invasion was launched, the campaign was already half-won. Thus it is evident that the term may connote, as in the case of the Sp. Civil war, a mere supporter of one particular faction of his own fellow-countrymen, whereas, in the evolution of the Ger. technique, it meant nothing less than a traitor or spy. One of the most infamous traitors in the Second World War, was Vidkun Quisling, the Norwegian betrayer of Oslo, whose name rapidly became a synonym for a fifth columnist in its worst connotation. Quisling was leader of the small Nazi 'party of National Concentration' and was Norwegian Minister of Defence in 1932, but was forced to resign owing to a private scandal. Under this traitor the Ger. invaders set up a puppet gov. after he had thrown open the gates of the cap. to them. During the invasion of the Low Countries in May 1940, the Dutch were betrayed at The Hague by Ger. civilians resident in Holland, who opened fire on Dutch soldiers from the windows of houses, while over a hundred Ger. and Dutch Nazis took possession of strategic points in the centre of the city. In Rotterdam the Gers. succeeded, with the help of the F. C., in occupying the Stock Exchange in the heart of the city and the Marine Barracks, well in advance of the actual invasion of the city. One of the most prominent Dutch fifth columnists was Anton Mussert (1894-1946). By F. C. co-operation the Ger. occupation of the Rotterdam airport was facilitated. In Belgium, the Rexist leader, Léon Degrelle (b. 1907) lent the support of his party to the Gers. Probably F. C. activities played some part in the rapid collapse of Fr. morale in June-July 1940, though the truth was that a large

proportion of the bourgeoisie was in full decay and undermined for many years previously by quasi-Fascist tendencies, not so much through any real sympathy with their hereditary enemies' but out of a fear of the predatory intentions of the Communist elements in France.

Fifth Monarchy Men, religious sect in England in the time of Cromwell, who thought his government was a preparation for the 'fifth monarchy,' during which Christ should reign on earth. They advocated a code of law based on that of Moses, and when they saw their hopes not likely to be fulfilled, turned against Cromwell. Their leaders were arrested, but after the Restoration the sect again gave trouble; the insurrection was suppressed, and Venner and ten others were executed for high treason.

Fig (*Lat. ficus*), name given to the members of a genus of shrubs and trees which belong to the sub-order Urticaceae, included in the natural order Moraceae.

FIG

Fs. are characterised by their pear-shaped receptacles which, by curving inward, form an almost perfect cavity, on the surface of which grow numerous flowers, the sterile and fertile being intermingled. They abound in tropical and sub-tropical regions, occur in about 300 varieties, and range in size from small trailing shrubs to huge trees, like the gigantic *bo* (*Ficus religiosa*) described by Emerson Tonnent as growing near Anarajapoor, in Ceylon, and traditionally said to be one of the oldest trees in the world. The *F. Rumphii* and the *F. religiosa* are deemed sacred by both Buddhists and Brahmans. The latter, called also the 'peepul' or 'bo,' is a large tree with heart-shaped leaves, and is cultivated in S. Asia. (See also BO-TREE). Caoutchouc is obtained in large quantities from the *F. elastica*, or India-rubber tree of the E. Indies—a tree remarkable for its pink buds and its great, shiny, oblong leaves, but, above all, for its gigantic roots, which group themselves snake-wise round the

base. All over India the *F. bengalensis*, popularly known as the banyan, flourishes and covers yearly an ever-increasing area with its vast canopy of foliage and branches. For each branch sends down its own root, which, growing to the surface, becomes in its turn the parent to new growths, and so both roots and branches multiply apace. The dessert fruit of commerce is grown from the *F. Carica*, so called because, according to legend, the famous *F.* trees of Attica were originally imported from Caria in Asia Minor. In this species the leaves are deeply lobed in the cultivated tree, though often almost entire in the wild they grow alternate and are rough and deciduous. Single receptacles spring from the axils of the leaves, the numerous single-seeded pericarps being packed close together inside. In colour the fruit varies from pale yellow to purple and bluish-black. 'Caprification' was long since introduced as an artificial aid to fertilisation. Probably the *F.* is indigenous only in Asia Minor and Syria, spreading thence all along the Mediterranean. Cardinal Pole introduced it into England, where on southern walls it can be cultivated with success; and in the United States it is grown profitably as far N. as Pennsylvania. The *S.* of France, the Spanish peninsula, and Asia Minor supply most of the *Fs.* for Great Britain, the best kinds being shipped from Smyrna. In the warmer climates there are two crops, one from the buds of last summer and the other and more plentiful crop from the spring shoots, which ripen in the autumn. In *S.* Europe and *W.* Asia *Fs.* form an important article of food, being eaten fresh and also in the form of a mashed cake, whilst medicinally they are used for chronic constipation and also for gumboils. *F.* wine is also brewed. Before being shipped abroad the *Fs.* are usually dried in the sun, or in ovens, being pulled and extended by hand during the process, after which they are compressed in wooden cases.

Figaro, famous character of dramatic fiction, who made his first appearance in the *Barber de Séville*, 1785, and the *Mariage de Figaro* of Beaumarchais. The word 'figaro' seems to have meant 'wigmaker' and to have been common to Sp. and It. Since Beaumarchais' time *F.* has become the type of ingenious roguery, intrigue, and cunning, who displays the utmost sang-froid in all his daring deceptions. He appears conspicuously in Mozart's opera, *Marriage of Figaro*, and Rossini's *Barber de Séville* (1816), and is sometimes represented as a barber, sometimes as a valet de chambre.

Figaro, *Le*, popular Fr. newspaper, which was started in 1854 by H. de Villermessant and his colleagues. In the early days its ready sale depended not a little on its light, chatty 'paragaphs,' which were introduced instead of the literary, but often rather ponderous, articles in vogue before. It was not until 1866 that the paper appeared daily. The first jour. of the name, which, of course, was borrowed from Beaumarchais' well-known opera, was pub. in 1826, and was in cir-

ulation till 1833. During its short life it counted George Sand, Paul Lecroix, and Jules Janin among its contributors. The present paper in the early days was aggressive, and at one time was almost wrecked by the revolutionary articles of Rochefort. After the death (1879) of Villemessant, who had given *Le Figaro* a distinctly monarchical bias, the management passed into the hands of François Magnard, Périer, and De Rodays. Its quieter tone, compared with the earlier issues, was largely due to the good offices of Magnard, who died in 1894. In the Second World War, it was pub. from 1940 to 1942 in the unoccupied zone of France, but ceased pub. on the Ger. occupation. In politics the paper is Conservative.

Figéac, Aimé Louis and Jean Jacques Champollion-, see CHAMPOLLION-FIGÉAC.

Figéac, cap. of an arron. in the dept. of Lot, S.W. France. Situated on the banks of the Célé, in a deep valley surrounded by vine-clad, rocky hills, it lies 32 m. E.N.E. of Cahors on the Orleans Railway. Brewing, cloth-weaving, dyeing, and tanning are the chief industries, but the tn. is notable for its picturesque old houses. Pop. 5700.

Figig, or **Figig**, walled oasis in the Sahara, 165 m. E.S.E. of Fez, near the frontier of Algeria in S.E. Morocco. It is an entrepôt for the Timbuktu and Mecca caravans. Pop. 15,000.

Fighter, aeroplanes whose specific purpose is, strictly, the antithesis of that of the bomber (*q.v.*), though there are fighter-bombers, and bombers are armed to defend themselves when attacked. Primarily the function of *F.* planes is to stop hostile bombers, reconnaissance, and photographic aircraft from flying over one's own ter.; another function is to fly in formation over hostile ter., as escorts, and attack hostile formations intending to attack home-based bombers and photographers or reconnaissance aircraft operating over enemy ter.; another duty of the *F.* is to attack enemy aerodromes or carry out, single-handed, specialised raids on selected targets; to this function, somewhat later, was added trench- or ground- striding, i.e., attacking hostile troops in trenches or on roads or railways; while, in the Second World War, another important task was that of 'tank-busting.' The *F.* was evolved from the 'single-seater scouts' of the First World War, the first being the 'Sopwith Tabloid,' predecessor of the Hurricane, and the Bristol Bullet, ancestor of the Blenheim. At first the pilots of scouts were merely armed with revolvers, but soon machine-guns were fixed in single-seaters. A notable development was the Fokker designed with synchronising gear which enabled the machine-gun to be fired between the blades of the airscrew. It seems that the first planes designed as 'fighters' were two-seat 'pushers'—that is, with a real propeller behind and not a tractor screw in front. The De Havilland DH1 was a two-seater biplane with a gun at the nose, and its successor, the DH2, was a single-seater with a swivel gun. About this time (1916), too, the stream-lined

tractor type, fitted with twin synchronised guns in front, ousted most other machines. All these early Fs. were biplanes, excepting the Bristol Bullet, which was a single-seater monoplane.

In the 1930's Brit. aircraft builders produced the famous Hawker series, constructed with steel tubing covered with fabric. Among these were the Fury and the two-seater Demon. The Fs. of this period were officially styled 'interceptors' from the assumption that their main duty was to take to the air and intercept hostile aircraft as soon as the latter were signalled from the coast. This purely defensive function was, however, too limited, and it was not long before a strongly offensive technique was worked out largely through the initiative of Lord Trenchard. The first Spitfire came in 1936, and almost at the same time the first Hurricane. Revolutionary changes were introduced in these famous aircraft. The interruptor and synchronising gear was abolished, with all its weight, complexity and liability to accident and error. The guns—eight fitted in the wings—fired clear of the airscrew and when the Second World War broke out it was soon found that the later Spitfires were far superior in manoeuvrability and fire-power to the much advertised Messerschmitts. The Hurricane was, at that time, a little slower than the Me109 but had the advantage over the latter if it started the duel at a higher level. In 1918 the Lewis and Vickers guns fired at the rate of 600 rounds a minute. Spitfires and Hurricanes, at the opening of the Second World War, flew at more than 350 m.p.h. and fired their eight guns at the rate of 1200 rounds per gun per min. or 160 rounds a sec. The evacuation from Dunkirk could not have been accomplished but for the Fs.—Hurricanes, Spitfires and Defiants—which literally massacred the Ger. bombers and suffered only the lightest losses relatively to the great execution wrought on the enemy. The supreme triumph of the Brit. Fs. in the Battle of Britain (q.v.) is an epic in the hist. of the nation. Here for the first time the Brit. Fs. encountered regular formations of the Messerschmitt 110, the two-seater two-motor F. which was sent to protect the Ger. bombers after these had suffered crushing losses when invading without escort. The Spitfires and Hurricanes, however, in spite of the guns carried aft in the Messerschmitt, found that they were able to break up these formations as easily as they had brought down the Me109 single-seaters. A later development was the night-flying F. which had to fly above the gun barrage or at any altitude over 14,000 ft. The earliest night-fighters of this period were Sopwith Camels, and later, Sopwith Snipe, with 250 h.p. Bentley rotary motors. Another famous F. machine of the early 1930's was the Gloster Gladiator designed by H. P. Folland. With a Mercury motor of 725 h.p. the speed of the Gladiator, though not equal to that of the monoplane Fs., reached 250 m.p.h. and it carried four guns. The early hist. of the defence of Malta in the Second

World War was remarkable for the heroic resistance of the Brit. pilots in their heavily overworked and old model Gladiators. Equally, too, in Norway and in North Africa in the early period of the war, this machine justified its existence.

Among the best-known Fs. in the Second World War were the Vickers-Armstrong Spitfire, Hawker Hurricane, Hawker Typhoon, N. American Mustang, Curtiss Kittyhawk, Curtiss Warhawk, Bell Airacobra, Lockheed Lightning, Bristol Beaufighter, Westland Whirlwind, and De Havilland Mosquito (night fighter). The Vickers Armstrong Spitfire was derived from the Vickers-Supermarine S.6B, which set a world's speed record in Sept. 1931 of 407.5 m.p.h. and won the last of

De Havilland

'VAMPIRE' JET FIGHTER

the Schneider Trophy races for Britain at an average speed of 340.8 m.p.h. The Spitfire V.B. carried two cannon and four machine guns; was fitted with the Rolls Royce Merlin 45 engine and its speed in 1943 was 360 m.p.h. The Hawker Hurricane began, like the Spitfire, with eight machine-guns fitted in the wings; later it was equipped with twelve machine-guns and, finally, with the Bofors size guns. Its speed (without carrying a bomb load) was 322 m.p.h. and, like the Spitfire, it had a Rolls Royce Merlin engine. The Hawker Typhoon was a development of the long line of successful single-seater Fs. produced during the preceding thirty years by the Hawker and Sopwith Companies. Just as the Hurricane was the outcome of many years of experience in the design and construction of high speed types, famous among which were the Woodcock, Fury, Hawfinch, and the Hart, so the Typhoon was the logical development of the Hurricane. The Typhoon

was a single-seater, low-wing cantilever land monoplane with retractable undercarriage and tail-wheel, designed for both day- and night-fighting duties. It was powered by a Napier Sabre liquid-cooled engine, which, with its 2200 h.p., concentrated into a small space more power than that developed by a Royal Scot locomotive. There were two alternative types of armament, consisting either of twelve .303 Browning machine-guns or of four 20 mm. Hispano guns. Its maximum speed in level flight was over 400 m.p.h. and operational pilots obtained readings of well over 500 m.p.h. in the dive. Tactically the Typhoon proved of great value in dealing with tip-and-run raiders—usually Focke-Wulf 190's which repeatedly tried to cause damage to places on the coast in 1942-43. When used like a dive-bomber the Typhoon carried a 500-lb. bomb under each wing in addition to normal armament. The Typhoon was highly effective in 'tank-busting' attacks at the Battle of the Falaise Pocket (see FALAISE). The Lockheed Lightning, though in service with the R.A.F. for 1942, was more generally associated with the U.S. Army Air Forces. It was a twin-engine P. designed in 1937. In its later development it was powered with 1150 h.p. liquid-cooled Allison turbo-supercharged engines and its maximum speed was nearly 400 m.p.h. at 16,000 ft. Its most usual armament, grouped in the nose of the pilot's nacelle, was one 20-mm. cannon, two .5 and two .3 machine-guns. Later types of P. aircraft were jet-propelled or turbine-driven. See C. G. Grey, *British Fighter Planes*, 1941; Maj. O. Stewart (ed.), *The Royal Air Force in Pictures*, 1943.

Fig Marigold, see *MESSEMBRYANTHEMUM*.
Figueira da Foz, seaport, at the mouth of the Mondego, in Coimbra, Portugal. It is the terminus of the Guarda-Figueira and Lisbon-Figueira railways, and was formerly in the prov. of Beira. The exports are wine, olive oil, grain, and fruit. Pop. about 8000.

Figuera, tn. and fortress on the Barcelona-Perpignan railway, 14 m. S. of the Fr. frontier, in Catalonia, Spain. F. is on the fertile plain of El Ampurdan. Ferdinand VI. (1716-59) built its citadel. Pop. 10,000.

Figueroa, Francisco de (1540-1620), Sp. poet, reveals in his pastorals and his blank verse, which he introduced into native literature, the influence of It. literature. It was for his pastorals especially that his contemporary admirers gave him the ambitious title of 'Divine poet.'

Figurate Numbers, succession of series derived from any arithmetical series. The series derived from the natural numbers is obtained as in the following table:

	1, 2, 3, 4, 5, 6, etc.
1st order	1, 3, 6, 10, 15, 21
2nd order	1, 4, 10, 20, 35, 56

Here it is seen that the first order is obtained by adding 1, 2, 3, etc., terms of the natural numbers, the second order is obtained by adding 1, 2, 3, etc., terms of the first order, and so on. The

numbers of the first order in the above case are called triangular, as equilateral triangles are formed with such numbers of points placed equal distances apart,

thus:

etc. Square F. N. are the first order obtained from the series 1, 3, 5, 7, 9 The first order is 1, 4, 9, 16 and

may be represented by

and so on. From the series 1, 4, 7, 10 are obtained pentagonal numbers, 1, 5, 12, 22

Figure, (1) in geometry, a diagram drawn to illustrate a plane or solid shape. (2) in music, short phrase, especially one which assumes a distinctive character in the course of a composition by repetition or thematic use.

Figured Bass, see THOROUGH BASS.

Figurehead, figure, statue, bust, or other device attached to a ship's prow immediately under the bowsprit. Merchant vessels used to have timber volutes or scrolls in place of figures, but the fashion of figureheads had gone out before the introduction of steamers, whose bows, therefore, are usually plain. The huge figurehead of the fighting *Téméraire* and many belonging to other ant. battleships may still be seen at Millwall.

Figwort, name applied to the Brit. species of *Scrophularia*. *S. nodosa* and *S. aquatica* are perennial herbs with brown flowers visited almost exclusively by wasps. They were once used medicinally in accordance with the doctrine of signatures to cure the 'fig' or piles.

Fiji Islands (formerly Feejee or Fidji), island group to the N. of New Zealand, mainly extending between 16° and 19° S. There are some 250 is., of which many are uninhabited islets and rocks, and the gross area of the group, which extends 300 m. from E. to W. and 300 m. N. to S., is 7435 sq. m. The is. are mainly volcanic in origin. Generally speaking, on the S.E. side of the is. are forest and jungle, whilst on the other, or lee-side, is grass land with a less proportion of timber. The climate is cool for the tropics, and though the rainfall varies greatly in the different is., there are no months when some rain does not fall. Meteorological stations have been estab. at Mbau and Delansan. The chief crops are sugar, maize, coconut, tobacco, coffee, arrowroot, a little tea, and cotton, of which the quantity has increased of late years. Most of the natives are engaged in the plantations, but in addition, Indian coolies and labourers from other is. are introduced to work for a period of years: these labourers and the conditions of work are wholly under the control of the gov. Horses and sheep are reared, and there are a few wild cattle. Chief exports are gold, sugar, fruit, coconuts, bananas, cotton, maize, trocas shell, etc. Most of the trade is done with New Zealand, New S. Wales, and Victoria. The trade returns for 1937 showed that the total value of the exports

was £2,213,000 and of imports £1,761,000. The seaports of the is. possess good harbours, protected by coral reefs. The cap. is Suva, on the S.E. shore is Viti Levu; the chief is. are Viti Levu (4250 sq. m.), Vanua Levu, Kandavu, Mango, Vulanga, Yathata, Vatuvata, Mothe, Mbau, Mbalavu, and Rotumah. The constitution of F. is regulated by letters patent of Feb. 9, 1929. There is an Executive Council, consisting of the Governor, the colonial secretary, and other high officials, together with the two unofficial members nominated by the governor; and a legislative council consisting of the Governor and sixteen official members, five European, five native, and five Indian members. The natives retain a large share of self-gov., and their system of vil. and dist. councils has been recognised, and

The F.I. were first seen by Tasman, in 1643, and named by him Prince Wm's Islands. Capt. Bligh, set adrift in an open boat by the mutineers of the *Bounty* passed among the S.W. portion of the group in 1787, being the next European navigator who is known to have sighted the is., Capt. Cook having been only informed of the existence of a large is. named Feejee, three days sail to the N.W. by W. of Tonga-tabu, by the natives of that group. The missionary ship *Duff*, in her passage from Tonga-tabu to China in 1797 got entangled among the smaller is. forming the E. div. of the archipelago, of which her master Wilson made an incorrect plan. More or less regular communication with the people was begun by various masters of vessels plying in the sandalwood trade; but for long European intercourse was very limited owing to the evil reputation of the islanders, who were given over to cannibalism. D'Urville, who paid a short visit to the Fijis in 1827, gave the first authentic account of the is. and their inhabs.; and it was not until 1835 that a Christian mission was attempted by the Wesleyan ministers from Tonga, nor until sev. years later that their efforts met with any success. The want of a regular survey was at length supplied by a United States Exploring expedition which, under Capt. Wilkes, performed that service in 1840. The narrative of this expedition contains a mass of information on the manners, laws, religion, and language of the islanders, and long remained the best, if not the only record of them. But an excellent account of them will also be found in the *Journal* of Captain John Elphinstone Erskine, R.N., who cruised among the is. of the W. Pacific in H.M.S. *Havannah* in 1853. In this *Journal* he gives a graphic account of the very remarkable chief Seru, son of Tanoa, who took the name of Thakombau, meaning 'make-bad Bau' from his having raised an insurrection in Bau which consolidated the authority of his father Tanoa. Thakombau, however, became involved in tribal conflict with Maafu, who had made himself chief of the Windward group of is. Thakombau hoped that by giving up cannibalism and embracing Christianity he would secure the necessary ascendancy; but eventually in 1858 offered the sovereignty of the is. to England to get out of his difficulties, among which was the impossibility of complying with an Amer. demand for a large sum of money for alleged injury to the Amer. consul. Nothing came of the offer; but, in 1871 constitutional gov. was formed by certain Englishmen under Thakombau. This soon led to debt and deadlock among the settlers who by now had considerably increased in numbers from the original body which had gone out from Australia. The Brit. Gov. in the interests of all parties then accepted unconditional cession and F. became a Brit. colony in 1874. The pop. in 1936 was 198,379 (97,651 Fijians, 85,000 Indians, 4028 Europeans, 4574 of European and native descent, and some Polynesians and others). See A. Agassiz,

E.N.A.

A FISHER GIRL OF INBEBU, FIJI ISLANDS

improved, and supplemented by a triennial meeting of chiefs, over whom the Governor presides. The Education Ordinance, 1916, aims at the estab. of a system suitable to the needs of the colony as a whole and of the various races; and a board of education has been created under a director of education. This board has power to establish gov. schools both secondary and primary, and to assist undenominational schools. There are two grammar schools at Suva for Europeans, one for boys and one for girls. There are 68 gov. and assisted schools, 22 for Indians, 33 for Fijians, and 8 for Europeans, other races and half-castes. There are also numerous primary schools conducted by Methodist and Rom. Catholic missions, and vil. schools supervised by native teachers. The natives are a dark-coloured race of a Polynesian type and were formerly notorious cannibals. The spelling of Fijian names varies considerably owing to the peculiar pronunciation.

The Islands and Coral Reefs of Fiji, 1899; B. Thomson, *The Fijians, 1908*, and *Government of Fiji The Colony of Fiji, 1924*; W. A. Chapple, *Fiji: Little India of the Pacific, 1942*.

Filadelfia, tn., 13 m. S. of Nicastro, in the prov. of Catanzaro, Italy. Pop. 6000.

Filament, in botany, is the stalk of the stamen, at the apex of which is borne the anther or pollen case. F. is also used to describe a combination of cells which are connected only by their contiguous ends, as in many algae, hairs etc.

Filangieri, Gaetano (1752-88), Neapolitan jurist and writer, was a barrister of note and a leader of the Liberal cause. For one year before his death he acted as financial minister to Ferdinand IV., but his *Science of Legislation* (1780-85) is his title to fame. In this work he discusses the principles of justice both in theory and practice in such a way as to prove himself an historian of learning and true philosophical insight. The influence of the *Contrat Social* is traceable throughout.

Filariasis, diseased condition due to the presence of the parasite *Filaria sanguinis hominis*, or allied forms. The adult *Filaria* was discovered by Bancroft of Brisbane, and its embryo was discovered in the blood by Dr. Timothy Lewis. The embryo is known as *microfilaria sanguinis hominis nocturna*; it inhabits the lymphatic vessels and makes its appearance in great numbers in the blood at night time. They are about .35 mm. long. Other species are *microfilaria perstans*, which is found in the blood both day and night, and *microfilaria diurna*, which is found in the peripheral circulation only in the day-time. The larvae inhabit certain species of gnats or mosquitoes. The larvae are sucked from the blood by the mosquito and enter the stomach. They afterwards make their way to the base of the piercing apparatus, so that they can once more enter the body of a man when the mosquito bites. The alternative theory to this is that the *filaria* lives in the body of the mosquito until the death of its host, when it may be conveyed by wind to drinking water, by which it again enters the body of man. It has been observed that the blood of men may contain swarms of these parasites without any symptoms of disease being apparent. Under certain circumstances, however, they lead to dilatation of the lymphatics and a general disturbance of their function. The characteristic symptom of F. is the appearance of oedema in the urine. Chyle is the product of the digestion of fat; it is a liquid of milky appearance owing to the presence of small globules of fat, and under ordinary circumstances makes its way to the thoracic duct, ultimately appearing in the blood stream, where it undergoes combustion or is stored up as adipose tissue. When the lymphatics are obstructed by masses of *filaria*, the chyle is diverted from its normal course, and, besides causing hypertrophy of neighbouring tissues, appears in great quantity in the urine. The effect on the general organism is one of malnutrition and inflammation of the lymphatic vessels. In connection with the

hist. of the parasite in its second host, the mosquito, it may be noted that the larvae are not ejected when the mosquito is fed on banana pulp.

Filberts are the fruit of the cultivated *Corylus* or hazel; they are oval, elongated nuts that have a mild, oily taste, which makes them pleasant food. In England they are extensively grown in Kent, some farmers having 100 ac. under cultivation, which in a good year yield as much as 100 tons of fruit. As they weigh heavier unripe they are usually picked in Sept., whilst still green. Compared with the common hazels (*C. Avellana*), which yield cob-nuts, F. trees have a longer, less open cup or involucre, and are more lacerated. The F. is enclosed in the lacinated leafy cups of the female flowers, which look like clusters of coloured styles at the extremities of buds; their kernels are in some varieties surrounded by deep red pellicles. A F. tree, the stem of which rarely exceeds 2 ft., the tree itself being kept from 5 to 7 ft. high, is closely pruned each year, only the finest young wood, and the likeliest to bear blossom being left.

Fildes, Sir Luke (1844-1927), Eng. painter, b. at Liverpool; son of Jas. Fildes of Chester. Studied art at the S. Kensington and Royal Academy schools. He began his artistic life as an illustrator, and became a popular contributor to the *Cornhill* and *Graphic*; and also executed woodcuts for Dickens's last novel, *Edwin Drood*. The subjects of his earliest paintings were often sad in theme and cold in colouring, but his later works, especially the warmer pictures of Venetian men and women, represent the happier side of life. In 1902 he painted a portrait of King Edward VII., and in 1912 of King George V. He became R.A., in 1887, and was knighted in 1906; K.C.V.O. 1918.

File, steel implement, with teeth or serratures on its surface, much used for abrading and shaping metals and other hard surfaces. The art of filing is known to most savage tribes, hard stone or fishes' teeth being generally employed. Single-cut files, which are suitable for soft metals, have only one set of parallel ridges, whilst double-cut files have two courses or series of chisel cuts, the second, which is usually finer, being at an angle with the first. In shape they are various: 'flat' files have a rectangle for their section; rattail files, a circle frequently tapered; three-square files, an equiangular triangle. Most are 'bellied,' that is thicker in the centre, and in length they vary from $\frac{1}{2}$ in. (a watchmaker's) to over 3 ft. (engineers). Blanks are forged from bars of the best crucible steel and after being annealed and straightened are cut either by hand or by machine. The teeth are incised by a small stout chisel inclined at an angle of about 13° from the perpendicular, the chisel being hit sharply for each cut by a hammer. A skilled craftsman can strike as many as eighty blows an hour. The hardening and tempering of a file is a delicate operation, as excess of heat renders the steel brittle, and too little causes the teeth to wear down very rapidly, whilst hasty cooling

often warps the metal and so spoils the tool. The chief difficulty in the way of making thoroughly reliable machinery for file-cutting is that of adjusting the force of the blow to the hardness of the steel. Single-cut and double cut Fs. are graded according to the number of cuts per in., varying from fourteen to 100 or more. The grades, from rough to fine, are known as rough (always single-cut), coarse, bastard, second-cut, smooth, and dead-smooth (always double-cut). The tang or tapered end provided for fitting into a handle, is not included in describing the length of a F.

File (from Lat. *filum*, a thread, through Fr. (*fil*), used in the military sense as the opposite of a 'rank,' that is to say, it refers to an alignment from front to rear, one man being behind another, whilst 'rank' is an alignment abreast or from right to left. Three men now form a F., the Fs. being 'doubled' or 'trebled' if a denser formation is required: the number has been gradually reduced from sixteen, as it was in 1600. The 'rank and F.' of a regiment properly includes non-commissioned officers and men.

File-fish, see BALISTES.

Filelfo, Francesco (1398-1481), It. humanist; b. July 25, at Tolentino; son of a working man. Educated at Padua. In 1417, called to teach eloquence and moral philosophy at Venice. Known as expositor of Virgil and Cicero. Secretary to Venetian consul-general, Constantinople, 1419. Taught Lat. and Gk. at Bologna from 1427, from 1440 at Milan—where duke Filippo Visconti became his patron; to the honour of whose successor, Francesco Sforza, F. dedicated an epic, the *Sforziad*. He went to Rome in 1475; became prof. of Gk. at Florence, 1481, and died there, July 31 in the same year.

Filey, fishing tn. and fashionable summer resort of E. Riding, Yorkshire, situated 8 m. S.E. of Scarborough. The tn. is divided into two parts. The old tn. is just a fishing vil., while the new, which has developed since 1840, consists of two tiers, with pleasure gardens between. F. contains the remains of a Rom. harbour, which proves it to have been a Rom. station of some importance. Pop. 3700.

Filebusters (probably a Sp. form of our word 'freebooter,' derived from Dutch *vrijbuiter*) are pirates and, in general, adventurers who practise illegal warfare for their ends. Thus the Amer. adventurers who took part in the revolutions of Sp. S. America, with the purpose of increasing the anarchy to their own profit, were popularly called Fs., and in the United States the expression is frequently used of politicians whose one purpose is obstruction. Again, the expeditions sent into Spain against the Republicans, by Mussolini and Hitler during the Civil war were frequently and accurately described as filebusting expeditions. In England the word F. is also applied to a small fast-sailing ship. See also BUCCANERS.

Filescala, Vincenzo da (1642-1707), It. lyrical poet, who came of a noble Florentine family. He became famous on ac-

count of a series of odes written in commemoration of the victories of Sobieski. He is also noteworthy for the few very beautiful sonnets he wrote, the most famous of which was *Italia, Italia, O tu cui feo la sorte*. There is a trans. by Borrow in his *Wild Wales*. In 1864 a new ed. of his *Poesie e Lettere* was pub. See life by G. Caponi, 1901.

Filet (from Lat. *filum*, a thread; and *granum*, a grain), delicate jewel and ornamental work made of twisted gold or silver wire. The metal threads are finely interlaced, solder being used to strengthen the points of union, and are wrought into intricate volutes and spirals. In the 'Tara' brooch and other Irish work of the tenth and eleventh centuries, however, the design is skillfully contrived by a single long thread. To-day the best F. work comes from the United and Central Provs. of India, where the art has been practised from time immemorial, from Malta and from Scandinavia, where the daintiest silver buttons and brooches are fashioned, with a further decoration of tiny chains and pendants. F. patterns were often built on to a solid metal ground; in the Middle Ages the Moors of Spain used in this way to embellish croziers and reliquaries. Up to the twelfth century Byzantine goldsmiths lavished a great deal of artistic skill on F. work, and a few illustrations of their handiwork show that the art was well-known both to the Etruscans and the Celts.

Filetque Controversy, controversy on whether the Holy Spirit proceeded from the Father and the Son or from the Father only, the W. Church maintaining the former and the E. the latter.

Filipepi, Alessandro di Mariano dei, see BOTTICELLI, SANDRO.

Filippi, Cav. Filippode, see DE FILIPPI.

Filipino, a native of the Philippine Is., and, more particularly, a member of the Christianised races of Malay stock, generally with an admixture of Sp. blood.

Fillan, Saint, name of two distinct holy men of Scotland, whose festivals are held on June 20 and Jan. 9 respectively. The 'June' St. Fillan is the older of the two. He was called 'an Iobar,' the leper, and a church was dedicated to him at Loch Earn in Perthshire. The other was of Irish origin, being the son of Feredach of Munster and St. Keltigern. He died at Strathfillan in 777, and here as early as 800 an Augustinian priory was built in his honour. Within its grounds was the 'pool of Fillan,' whose waters accomplished miracles of healing. Two relics of this saint, the Quilgrich and a bell, are preserved in the Antiquarian Museum of Edinburgh.

Filet (from Lat. *filum*, a thread), architectural term, applied to the narrow ribbon-like bands, so common both in Gk. and Gothic architecture, to separate mouldings one from the other. Fs. also called 'listels,' are used between the fittings of Ionic and Corinthian pillars.

Fillmore, Millard (1800-74), thirteenth president of the U.S.A., rose, like many others who have held that office, by the sheer force of his own high abilities and

sterling moral character, and might with justice have said that he was handicapped rather than assisted by the accident of birth. In 1820 he broke away from his apprenticeship to a dyer, and having studied in Buffalo was called to the Bar in 1823, and prospered in his law practice. Having served in the state legislature of New York (1828-32) he next sat in Congress for eight years between 1833 and 1843. From 1850-53 he held the chief magistracy, succeeding President Zachary Taylor upon the latter's death, the office coming to him as the elected Vice-President. In policy he allied himself with the Whigs, supported measures framed to mitigate the evils of slavery, advocated protective tariffs, and in 1851 tried to prevent the invasion of Cuba, which the 'filibusters' urged. His active support of the Fugitive Slave Law endangered his popularity.

Filmer, Sir Robert (c. 1589-1653). Eng. writer on politics, matriculated at Trinity College, Cambridge, was knighted by Charles I., and being an ardent Royalist, had his house again and again pillaged by the Roundheads during the Civil war. In his *Patriarcha* (1680) and other pamphlets he develops to a ludicrous extent the theory of the divine right of kings. Yet the fact that Locke took the trouble to expose his fallacies *seriatim* in the *Treatise on Government* shows that at the time at least his theories made a grave impression.

Film Institute, British. Founded in 1933 and reconstituted in 1948 with an ann. grant from the Treasury, the B.F.I. is a semi-official body charged with 'the development of the art of the film, the promotion of its use as a record of contemporary life and manners and the fostering of public appreciation and study of it from these points of view.' In effect, therefore, the Institute acts for the film in the same way as the Arts Council of Great Britain (*q.v.*) does for music, drama, and painting. The Institute's main achievements so far have been the foundation of the National Film Library in which millions of ft. of film of priceless historical value are being preserved for posterity; the estab. of an Information Service on the cinema second to none in the world and the encouragement of the film society movement for the study of film at home and throughout the Commonwealth. The Institute also issues a number of periodicals dealing with various aspects of the film, and has sponsored the pub. of the first authoritative hist. of the Brit. cinema.

Films, see CINEMATOGRAPH.

Filmy Ferns are found native in the moist woods of the tropics, but many species are cultivated in Britain. In many forms the fronds are filamentous, and some have the appearance of Liverworts. They require a great deal of moisture, which is best obtained by growing them in closed cases; a cool greenhouse is sufficient, but they must be kept well guarded from the sun. They should be planted in sphagnum, peat, or fibre; ordinary soil is unsuitable. *Hymeno-*

phyllum and *Trichomanes* are the two genera, including the majority of F. F., of which there are about seventy species; but *Todea superba*, belonging to the Osmundaceae, is often cultivated.

Filters. Solid matter which is suspended, but not dissolved in a liquid, may be separated again by a variety of methods. The commonest is the use of F., by means of which the liquid is made to flow through one or more porous substances, which will not allow the suspended matter to pass. The simplest form of F. is that used in chemical laboratories, where a circular piece of blotting paper is folded into a quadrant and opened into a hollow conical shape. Placed in a glass-funnel this fits closely to the sides, and as the liquid is poured through, the precipitate collects on the paper, and can easily be removed. When liquids are dealt with which attack paper, glass, wool or asbestos fibres may be used instead of paper. One simple method of accelerating filtration is to use a funnel with a long stem. Another more effective method is to employ a Buchner funnel, i.e. a porcelain funnel with a perforated base on which a filter paper is placed. The funnel fits into a bottle with a side tube connected to a F. pump. Difficulties sometimes arise when crystallisation from hot liquids takes place in the funnel stem. To avoid this, double-walled funnels are used, the space between the two surfaces being filled with hot water. Some suspensions are of such a fine nature that the solid particles are not efficiently retained by ordinary F. paper, in which case the remedy is to use special paper with smaller pores. Even this will not suffice to F. colloidal solutions. For the ordinary purpose of filtering water for domestic use, a large number of F. have been devised. They mainly differ in the manner of drawing the dirty water through them. It is usual to use, as the filtering substances, sand and charcoal in some form. A home-made F. is often constructed of two flower-pots placed one inside the other. In the lower one is placed a sponge to plug the hole, then a layer of pebbles, upon which is a layer of sand with powdered charcoal resting upon it, and this in its turn held down by another layer of pebbles. In the upper pot is only a sponge to prevent the water flowing too fast into the F. By this means quite a pure water may be obtained. The F. which are manufactured for use on ship-board, and by soldiers, etc., work on this principle, but are constructed so that the sediment may be removed. So that this may be done, devices are used so that the water may be filtered as it ascends. Thus, if a F. has four compartments, and the water is stored in the top one, and passed by a pipe to the bottom one, then it will ascend through the middle chambers. This is the principle adopted in Leloge's F. When the stored water reaches the lowest chamber, it ascends through a porous filtering stone, to the filtering chamber, from whence it still ascends through a second stone to the chamber from whence it is drawn off. The

sediment can be removed from the lowest chamber by withdrawing a plug.

Another form of F. consists of a cylindrical pot containing the filtering media and with a long tube attached to it. This pot is lowered into the water, and by using the tube as a syphon (q.v.), the water is drawn up through the pot and filtered on its way. This method has been utilised for travellers and others who may have to drink from turbid sources. A porous cylindrical stone consisting of compressed carbon, is fitted on to one end of a flexible tube, to the other end of which is attached a mouthpiece. Then the traveller, lowering the filtering end into the pond, may drink clean water direct from the turbid source. Not only does filtration remove solid matter, but it is well known that charcoal acts upon any soluble organic matter which may be present, so purifying the water. This is of great importance, as very clear water may be highly dangerous to drink on account of the presence of organic matter. The length of time that the charcoal is efficient is, therefore, of the greatest importance. For this same reason charcoal is often placed at the openings from which issue deleterious gases, and so the air is filtered, rendering it inodorous and often innocuous. For filtering on the large scale F. presses are used. The simplest forms consist of a series of chambers connected with each other by a central hole. F. cloths inside the chambers retain the precipitate, and the filtrates are let out through taps at the bottom. See WATER and SEWAGE; and for other processes of clarification (q.v.) see BEER, OIL, SUGAR, SYRUP, WINE, etc. See J. Don and J. Chisholm, *Modern Methods of Water Purification*, 1911; J. A. Pickard, *Filtration and Fillers*, 1929.

In photography a filter is a piece of transparent material of graduated colouring placed between the object and the lens. Its purpose is to control the stream of light and thus to emphasise some special characteristic of the view or to obtain some special effect. A filter is used mainly in the photography of distant views, sunsets, outdoor portraits, and architecture. Where, however, the most up-to-date materials are employed the use of a filter is generally unnecessary. See also PHOTOGRAPHY.

Filurina, see FLORINA.

Fimbria, Gaius Flavius (d. 84 B.C.), Rom. soldier, was an enthusiastic supporter of the demagogue Marius, and was at pains to colour his partisanship by perpetrating needless barbarities against his enemies. Having slain Flaccus, his superior in Asia, at Nicomedia, he worsted Mithridates with Flaccus' army. Finally, he committed suicide rather than fall into the hands of Sulla, whose adherents in Asia he had persistently ill-treated.

Fin, see FINS.

Finale (It., word meaning 'end'), musical term, describing the conclusion of a composition. In instrumental music, that is, in symphonies, concertos, sonatas, quartettes, etc., it is the last movement, which is variously handled by different

musicians, as the recollection of Haydn's sprightly rondos and Beethoven's grand choral F. to his ninth symphony will immediately show. Mozart and other composers bring the sev. acts of their operas to a close by a concerted piece or F. Wagner, however, broke away from this practice.

Finance Acts, in Brit. administration, are formal Acts of Parliament which, after the Budget (q.v.) has been introduced by the chancellor of the exchequer, are necessary in order to give effect to its provisions. The first and more important of these is the Finance Act, which embodies the chief alterations in methods of raising revenue. This is occasionally a very long and involved document, as the utmost precision is necessary when such methods as those relating to Income Tax are revised; but where the changes are few and no fundamental system is affected the Finance Act may be one of the simplest and briefest for the year. The Appropriation Act, which follows, is a formal measure for voting the necessary funds to the various spending depts., and is usually supplemented at the end of the financial year by a similar measure which legalises any additional expenditure that may have become necessary. These Acts, as they deal chiefly with finance, do not require the approval of the House of Lords. When they have been passed by the Commons they are sent to the upper chamber with the Speaker's certificate attached declaring them to be Money Bills.

Finance, National, see BUDGET, TREASURY, PUBLIC DEBT.

Financial News, The, London morning daily paper, founded in 1884. Prior to its appearance the *Financier* (estab. 1866) was the only regular daily which attempted to give detailed news of markets, stocks and shares, prices, and of anything, in fact, which was likely to be of especial interest to business men. Now incorporated with the *Financial Times* (q.v.).

Financial Times, The, London morning daily paper, which first appeared in 1888. With it are incorporated the *Financier* and *Bullionist* and *Financial News* as the Financial Times Ltd. (Chairman, Rt. Hon. Brendan Bracken, M.P.) Offices, 72, Coleman Street, E.C. 2.

Fin-backs, see FIN-WHALES.

Finch, name given to members of the Fringillidae, a family of hard-billed singing birds which inhabit the N. hemisphere. They are almost unknown in Australia. The Fringillidae are divided into sev. sub-families, according to the formation of the skull and beak. The *Coccothraustinae*, or grosbeaks, inhabit the Old and New Worlds, and extend as far S. as India. Their bills are fairly stout and acute, and they have bright-coloured plumage, green and yellow predominating. The species *Ligurinus chloris*, or common green-finch, is often heard in gardens and small plantations. It feeds on the seed of the wild mustard and other weeds, and has plumage of olive yellow, shading to grey. Other members of this group are the *Coccothraustes vulgaris*, or European hawfinch, and the *Hedymeles virginianus*, or

rose-breasted grosbeak, a handsome and sweet-voiced bird. The sub-family *Fringillinae* are distinguished by their softer bills and by their cranial differences. The *Fringilla caelebs*, or common chaffinch, is a general favourite in the Brit. Isles, and may be seen nesting under the eaves of dwelling-houses. The plumage of the male is chestnut-brown, the crown and forehead black or slaty-blue, and the chin and breast pale red. The female is ashy-brown, shading to olive-yellow, the wings being pied with white. To this group also belong *Chrysomitris tristis*, or yellow-bird, a lively, graceful bird common to the United States and to Canada; also its European sister, *C. spinus*. The *Linaria cannabina*, or common linnet, is also a member of the F. tribe, and inhabits most parts of Europe, ranging eastward as far as Central Asia. The *Montifringilla nivalis*, or snow-finch, and the *Erythropsia githaginea*, or desert F., are rarer and even more beautiful varieties. The *Petronia domesticus*, or house sparrow and its allies, are true Fs.; so are the *Serinus hortulanus*, or serin F., and the *S. canarius*, or familiar yellow canary. The *Pyrrhula rubicilla*, or bullfinch, is another inhab. of the Brit. Isles. A further sub-order of the F. family is the *Emberizinae*, or buntings, which inhabit the N. parts of the Old World, and some parts of India.

Finch, Henage, first Earl of Nottingham (1621-82), Eng. jurist, was educated at Westminster School and Christ Church, Oxford, and later joined the Inner Temple. In 1660 he became solicitor-general, and the following year he entered parliament. When Shaftesbury was dismissed he was made lord keeper of the Seals (1673), and next year was promoted to lord chancellor. F. was a zealous churchman, declared in the House that gov. by bishops was inalterable, was vehemently opposed to Charles's Declaration of Indulgence (1663), and eagerly supported the Five Mile Act (1665). Burnet testifies to his forensic powers, and says that he was 'well versed in the law' but mentions also that he was ill-bred and vain. The high repute in which his contemporaries held him is shown by the fact that he framed for the Commons their congratulatory address to Charles on his coming to England.

Finchley, municipal bor. of Middlesex, and a healthy and popular residential dist. of Greater London, England. It lies 7 m. N.W. of St. Paul's Cathedral, in the Hornsey div. of Middlesex, and has three railway-stations, Church End (Finchley), E. Finchley, and Woodside Park (N. Finchley). F. Common is now built over, but it was once notorious because here Dick Turpin and Jack Sheppard waylaid travellers by night. Pop. 47,000.

Finck, Henry Theophilus (1854-1926) musical critic to the *New York Evening Post* and *Nation* 1881-1923; won distinction in philosophy at the univ. of Harvard (1872-76), and, having gained the Harris fellowship, studied psychology at Heidelberg and Berlin (1878-81). Among his many pubs. are *Wagner and his Works* (1893), *Grieg and his Music* (1899), *Mas-*

senet and his Operas (1910), *Richard Strauss* (1917), *Musical Progress* (1923), *Musical Laughs* (1924). He also wrote on gardening and gastronomy.

Finden, William (1787-1852), Eng. engraver, who worked mainly in collaboration with his younger brother and fellow-pupil, Edward Francis Finden (1791-1857). Earlier worked on book illustrations, engraving, e.g. Smirke's drawings for *Don Quixote*. The Findens soon estab. a school of pupils, who worked under their direction, and indeed actually executed most of the engravings which bear their name. The elaborate finish and precision were, however, the work of the Findens. After engraving the Elgin Marbles for the Brit. Museum, and illustrating Murray's *The Arctic Voyages* and Campbell's *Poetical Works*, the Findens pub. at their own private cost in 1833 the illustrations to Moore's *Life and Works of Byron*, a work which made so great a stir that it was followed by other works of a popular nature: *Landseer's Illustrations of the Bible*, after Turner, Calcott and others; *Landscape Illustrations to the Life and Poetical Works of George Crabbe* (1834). But the profits they had derived from these works were squandered in a well-planned and beautifully executed but luckless venture *The Royal Gallery of British Art* (1838), etc. F.'s last engraving on a large scale was that of Hilton's 'Crucifixion'.

Findhorn, riv. of Inverness-shire, Scotland, flowing through Nairn and Moray to the Moray Firth.

Findlay, city and cap. of Hancock co., Ohio, U.S.A., and lies 44 m. S. of Toledo. It stands on the oil and natural gas dists. of Ohio and carries on large manufs. of glass, machinery, pottery, brass, and steel. Pop. 20,200.

Findlay, John Ritchie (1824-98), Scottish newspaper proprietor, b. at Arbroath. He began his career in the office of the *Scotsman*, afterwards becoming owner of most of the property. He gave the Scottish National Portrait Gallery to the nation at a cost of £70,000.

Findon, (1) a fishing vil. of Kincardineshire, Scotland, from which Findon or Finnan haddocks take their name. (2) Vil. in the S. downs, Sussex, England. It is picturesquely situated in a vale and is not far from Clissbury Ring (J.R.).

Fine: (1) Pecuniary penalty payable to the state for an offence against the Criminal Law. It may be super-added to imprisonment or be the sole punishment. At common law a F. was rarely, if ever, imposed on conviction of treason or felony. Its place was taken by the forfeitures which followed on conviction and attainder, abolished in 1870 (33 & 34 Vic. c. 23). The Criminal Law Consolidation Acts of 1861 do not contain any powers to inflict a F. on conviction of felony (except in the case of manslaughter (24 & 25 Vic. c. 100, s. 5), nor is such a F. ever inflicted without statutory authority, e.g. under the Probation of Offenders Act, 1907. But under the Criminal Justice Act, 1948, any Court before which an offender is convicted on indictment of

felony (not being a felony the sentence for which is fixed by law) has power to fine the offender in lieu of or in addition to dealing with him in any other manner in which the Court has power to deal with him. By the same Act the Court may allow time for the payment of the amount of the F., and it may also fix a term of imprisonment which the person liable to pay the F. is to undergo if the sum is not duly paid; but any term of imprisonment so inflicted in default of payment of a F. may not exceed twelve months. As to misdemeanors: at common law the Court may impose as part or the whole of a sentence, a fine or ransom, i.e. a pecuniary penalty, or pecuniary forfeiture. There is no general statutory limit to the amount of such F., except the provisions of Magna Charta and the Bill of Rights, against excessive and unreasonable fines and assessments. (In the Second World War period and after, great Fs. were imposed for various offences against the safety of the realm created by war-time emergency legislation, e.g. failure to disclose receipt of dollar proceeds or possession of American securities; but it was expressly intended that penalties for contravention should be deterrents.) At common law a married woman could not be fined for misdemeanor: *R. v. Thomas* (case heard in King's Bench temp. Hard. reports 278); but since the Married Women's Property Act, 1882, there seems no reason why she should not be fined; and statutes authorising a F. are applied to married women as well as to other persons. In the case of conviction of a person under sixteen years of age powers are given to order the parent or guardian of the child to pay a F. instead of the child, etc. (Children Act, 1908—8 Edw. VII., c. 87, s. 99—re-enacted in later Acts). The parent or guardian may, however, appeal against such order. The Criminal Law Consolidation Acts of 1861 all contain a discretionary power to fine for misdemeanors within the Acts, and so does the Forgery Act, 1913, and the Larceny Act, 1916. In default of payment of the F. imposed being made forthwith the defendant may be committed to prison (see CRIMINAL LAW). Any misdemeanor under the Criminal Consolidation Acts, 1861, may be punished by F. in addition to or in lieu of other punishment. The following offences *inter alia* are punishable by F. in addition to or in lieu of imprisonment: offences against the Foreign Enlistment Act, pound breach (see BREACH), embezzlement (*q.v.*), maintenance (*q.v.*), champerty (*q.v.*), misprision of felony, contempt of court (*q.v.*), riot, rout, unlawful assembly, challenge to fight, common law conspiracy (*q.v.*), indecent conduct, false imprisonment, cheating, and forgery at common law. In the following F. is an alternative only: smuggling; attempting to obtain by false pretences. The punishments are cumulative in the following: seditious libel, blasphemy, and compounding felony. Under the Summary Jurisdiction Act, 1879, a court of summary jurisdiction, in cases where it has power to imprison on a summary conviction,

notwithstanding that it has no express power to impose a fine in any such case, may in its discretion impose a fine not exceeding £25 instead of imprisonment. Under the same Act both an English and a Scottish court of summary jurisdiction may, where it imposes a small fine, i.e. one not exceeding 5s., allocate the F. or any part of it towards the payment of the informant's costs. The mode of enforcing the payment of a F. is by distress and sale of the goods of the person convicted. (2) A collusive action at law (see FINES and RECOVERIES). (3) In the feudal system of land tenure denoted an agreement between a lord and his vassal prescribing the conditions of the latter's tenure; or a sum paid by a villein tenant to his lord for the privilege of giving his child in marriage. (4) A sum paid to the lord of the manor by a person on his admission on the rolls of a manor as owner of a copyhold estate. They were fixed at two years' improved value, e.g. if A. enters as tenant at £50 a year he pays £100; if he improves the land to the value of £100 a year, B., the next admittee, must pay £200. In many cases this archaism of the feudal system ate up practically all the interest of the admittee, and involved a gratuitous hardship in the case of persons who were merely succeeding to the estates of their parents. Copyhold tenure has now been abolished. (5) A sum paid for the renewal of a lease. Under the Settled Land Acts Fs. received on leases made by a tenant for life under his statutory powers must be applied as capital money for the benefit of the reversioners or remaindermen.

Fine Arts may be divided into two groups—the greater arts, which are sculpture, painting, architecture, poetry, and music; and a group of lesser arts, among them acting and dancing. The name F. A., with its Fr. equivalent *beaux arts*, and its It. *belle arti*, is given to these arts by reason of their fostering the love of the beautiful, although they may at the same time be useful—thus there are other minor arts which may be classed as fine if they fulfil the former condition. Among these is the work of the goldsmith, the potter, and the weaver, all of whom produce decorative as well as useful wares. Though in its widest sense the term 'Fine Arts' embraces poetry, music, dancing, and the drama, in its more usual and restricted sense it comprises only the three sister-arts of painting, sculpture, and architecture. 'The work of art,' according to Hegel, is 'a product of human activity and is made for man.' Its primary appeal is to his aesthetic sense; this is, indeed, its actual *raison d'être*, and the fact that it may add to his comfort or convenience, as in the case of an architectural work of art, in no way adds to its artistic importance. While philosophers do not attempt to decry the beauties of nature, they look upon them as being of a lower order than those which are classed under the heading of F. A.; for as Hegel puts it, 'the beauty of art is the beauty that is born of the mind; and by as much as the mind and its products are higher than nature and its appearances, by so much the

beauty of art is higher than the beauty of nature.' The crude beginnings of the arts of painting, sculpture, and even architecture, are found in very early times in the rough sketches scratched on prehistoric caves, in rude stone carvings, and in the erection of mounds of stone. For articles on each of the Fine Arts, *see* under individual headings. A good introductory text-book to the study of this subject is *The Fine Arts*, by G. Baldwin Brown, 1916.

Finedon, vil. in Northamptonshire, England, 3½ m. from Wellingborough, in which it is now incorporated. It has boot and shoe factories, and stone quarries. Pop. 4000.

Fines and Recoveries. These were fictitious or collusive actions at law, which were mainly instrumental in conveying land in spite of certain legal restrictions. Both were notoriously in use as a means of barring the entail (*q.v.*) of estates, thereby enabling the tenant in tail to sell the lands so as to defeat the rights of his own issue and of the remaindermen and reversioners (*see* **DE DONIS, ENTAIL**), while the common recovery was as constantly invoked to elude the Statutes of Mortmain (*see* **CHARITABLE USES**). A fine (*Lat. finis*, end) was formerly a common mode of transferring any freehold. Originally founded on an actual suit, it became later nothing more or less than an amicable compromise of an action, real or fictitious, whereby the lands which formed the subject of the action were acknowledged to be the right of one of the parties. It was so called because it put end and (*finis*) not only to the suit but also to all other suits concerning the same matter. The end of it was to bar issue, but not remainder or reversion, and instead of fee simple it created a 'base fee' lasting only as long as there were issue of tenant in tail, but allowing a remainderman or reversioner to come in upon the extinction of such issue. The effect of the fine was that the right of all strangers to the suit was barred, unless claim was made within five years. The common recovery was an invention of the ecclesiastics designed to enable them to hold land, notwithstanding the prohibition of conveyance to a corporation. It was an action actual or (generally) fictitious, in which the lands were recovered against the tenant of the freehold, the judgment so obtained binding all persons and vesting an absolute fee-simple (*q.v.*) in the plaintiff. In regard to estates tail the common recovery was first employed in Taltarum's historic case, and its effect was to defeat the rights not only of the issue of the tenant in tail, but of remaindermen and reversioners (*q.v.*) as well. Both F. and R. were abolished by the Fines and Recoveries Act, 1833. *See* **ENTAIL**.

Fingal, leader of the Fingallians, *see* **FINN**.

Fingal's Cave, *see* under **STAFFA**.

Finger Prints, patterns formed by the minute ridges on the fingertips differ in each individual; and not only do those which appear on the fingers of the newborn child remain unchanged throughout

its life, but those of no two fingers of the same individual have been found the same. It is this curious physiological fact that led to the idea of a system of identification of persons apprehended by the police by F. P. The system owes its practical application in this country to the ingenuity of Sir Edward Henry, who, when inspector-general of police in the Lower Provs. of India, perfected an effective system of classification of F. P. This system had been successfully adopted for years by the gov. of India before being adopted by the police of England and Wales in 1901. The existing orders of the Brit. Home Office provide for the registration by F. P. of all persons convicted at Quarter Sessions and Assize, and sentenced to a term of not less than one month's imprisonment, or at any petty sessional police or stipendiary magistrate's court of more than one month's imprisonment without the option of a fine, for the commission of any of a number of specified offences. Under the Criminal Justice Act, 1948, where any person not less than fourteen years of age is charged with an offence before a court of summary jurisdiction the court may, on the application of an officer of police not below the rank of inspector, order that the F. P. of that person shall be taken by a constable, who may use such reasonable force as may be necessary for that purpose (this provision is in addition to those of any other enactment under which the F. P. of any person may be taken). But if the person whose F. P. have been taken under this last-mentioned provision of the Act of 1948 is acquitted or discharged under the Indictable Offences Act, 1948, or if the information against him is dismissed, the F. P. and all copies and records of them must be destroyed. Persons coming within the Home Office orders are 'fingerprinted' by the warder staff at the prisons where they are confined, and the slips containing their F. P. are then sent for registration and record by the governors of the prisons to the 'Habitual Criminals' Registry, New Scotland Yard, London. Prison governors or officials are authorised to take F. P. of remanded prisoners, and these officials may use such force as may be necessary for the purpose. But no similar power is conferred on the police, and if a prisoner in the custody of the police declines to be fingerprinted, the police should apply to the governor of the prison to which the prisoner is remanded. Under the Criminal Justice Act, 1948, a previous conviction may be proved against any person in any criminal proceedings by showing that his F. P. and those of the person convicted are the F. P. of the same person. The method of proving a previous conviction under this section of the Act is by a certificate signed by (or on behalf of) the Commissioner of Police of the Metropolis containing particulars from the criminal records kept by him, or by a certificate signed by the governor of a prison or remand centre in which any person was detained certifying that the F. P. exhibited thereto were taken from him while he was so detained.

FINGER PRINT TYPES (ENLARGED)

- 1, Arch; 2, tented arch; 3, loop; 4, composite;
5, whorl; 6, detail of ridge course of 5

F. P. impressions are required in the passports issued by a number of countries, but not by the United Kingdom.

The method of taking what are officially termed 'rolled' impressions of finger patterns is to roll the prisoner's finger on an inked metal plate mounted on a wooden block and then to repeat the rolling operation on a paper form marked into ten spaces for the reception of the impressions of all ten digits. In rolled impressions it is the *delta* or point of divergence of the ridges after running parallel for a certain distance that is of such importance. In taking plain impressions the delta is ignored, but otherwise the detail is essential. After these operations are completed the prisoner signs the slip or form. The object of the 'plain' impressions taken simultaneously is to ensure the printing of the digits in their proper sequence: the plain impressions acting as a simple but completely effective check. Fig. 1 above is an enlargement of the 'arch' type; Figs. 2, 3, 4, and 5 are enlargements of the other three types, 'tented arch', 'loop', 'composite,' and 'whorl.' The 'delta' is marked with an arrow-head in the figs. There are two deltas in whorls and composites, one in a loop, and none in an arch. Where the police find clear impressions in the scene of some crime they are expected to take photographs of the same as quickly as possible and send them to New Scotland Yard, when the photographs will be developed, and, if necessary, enlarged and properly prepared for production in evidence.

Fig. 6 represents the ridge course traced from delta to delta. These deltas are important in comparing F. P. Any two F. P. may display one or two ridge characteristics in common, but the greater the number of characteristics taken the less the probability of mere coincidence. It is easy to establish that the probability of, say, any ten specially noticed characteristics in an impression occurring by chance in the impression of any other digit is $\frac{1}{10} \times \frac{1}{10} \times \dots \times \frac{1}{10}$, i.e. odds against all these similarities being found in two impressions, not those of the same digit, is over a million to one.

In primary classifications arches and composites occurring relatively infrequently are included under loops and composites under whorls. Given an accurate classification number or formula, a card properly located can readily be found in the bureau when wanted for comparison with the impressions of a suspect.

Classification can be simplified by the arithmetical rule for determining primary and secondary or sub-classification and ridge tracing. Secondary classifications are necessary to break up large accumulations of primary classifications into groups of convenient size. Sub-classes are therefore formed by reference to the occurrence of arches, tented arches, and *radial* and *ulnar* loops. A loop is *ulnar* (U) when the downward slope of the ridges about the core is from the direction of the thumb towards that of the little finger; and *radial* (R) when the direction is reversed.

Silver nitrate is often used in developing prints. This method was used in the trial of Hauptmann for the murder of the Lindbergh baby in America, and may be

superior to the old method of powder-dusting, because any light cloth can be treated by it. Theoretically F. P. remain indefinitely unless destroyed by excessive humidity, and as long as they endure they may transform silver nitrate into silver chloride. The system, is not, however, fully developed. See Sir E. Henry, *Classification and Uses of Finger Prints*, 1923; H. Faulds, *Practical Dactylography*, 1923; Vincent's *Police Code* (19th ed., 1931).

Fingers, Deformities of, see MANUS.

Finial, term applied to an ornament in architecture, used specially in the Gothic style. It was carved to represent foliage and terminated pinnacles, gables or spires. Though used earlier it was elaborated by about the twelfth century, and during the next two or three centuries the foliage of the leaves was imitated carefully.

Finiguerra Maso, or Tomaso (c. 1410-75), It. sculptor and goldsmith, b. at Florence, and is supposed to have been taught by Lorenzo Ghiberti. He was especially skilful as an engraver on metal—one piece of his work which still exists being very beautiful, 'The Coronation of the Virgin,' which is now in Paris.

Fining, see BREWING—*Cleansing*.

Finistère (from Lat. *Finis terræ*, end of the land), most W. dept. of France, with an area of 7229 sq. m. It is bounded by the Eng. Channel, Atlantic Ocean, and the depts. of Côtes-du-Nor and Morbihan. The coast is bold and rocky, with lofty cliffs of granite; the Pointe de Raz is the most dangerous headland. The interior has two chains of hills, stretching parallel from E. to W.—the Mt. Arrez, and the Noires; these are clothed with forest trees and heathland, while rich meadows and fertile valleys lie between. The climate is temperate with W., N.W., and S.W. winds. Over a million ac. are under cultivation, and the crops are wheat, rye, barley, oats, potatoes, flax, mangold wurzel, etc.; fruit and vegetables are exported. The grass lands are very extensive, horse and cattle breeding being an important industry. The mineral wealth is not great; coal and iron, lead, bismuth, and zinc are obtained, and granite, marble, and slate are quarried. The arrons. of Brest, Châteaulin, Morlaix, and Quimper are contained in the dept. Quimper is the cap., and Brest, the largest tn., is a military station. The manufs. are woollens and linens, sail-cloth, rope, paper, shipbuilding, etc. Pop. 756,000.

Finisterre, Cape, cape on the N.W. coast of Spain, in lat. 42° 52' 45" N., and long. 9° 15' 32" W. belonging to the prov. of Galicia. It extends into the Atlantic Ocean, and is the projection of a mt. height which rises about 2000 ft. above sea-level. The cape can be seen from vessels fifty m. out; a lighthouse is placed in a conspicuous position. The Eng. gained a naval victory off F. in 1747, when Anson defeated the Fr. adm. Jonquière; twelve Fr. men-of-war and six other vessels were captured by the Brit. In the same year Rear-Adm. Hawke defeated the Fr., and took six men-of-war.

Again, in 1805, Calderan Strahan gained a victory over the Fr. and Spaniards.

Finite, term applied (1) in mathematics to a line or space which is terminated or to a number which is limited; (2) in grammar to the tense of a verb.

Finite Differences, see DIFFERENCE.

Finland (Finnish *Suomi*, or *Suomen maa*, 'the land of fens and lakes'), republic of N. Europe. It is situated between the gulfs of Bothnia and F., and is bounded on the N. by Norway, and on the E. by Russia. Its land area Jan. (1945) was 117,975 sq. m. (excluding inland water area of 12,190 sq. m.). The Åland Archipelago (q.v.) at the entrance to the Gulf of Bothnia (area 560 sq. m. pop. 29,000) forms part of the Finnish Republic.

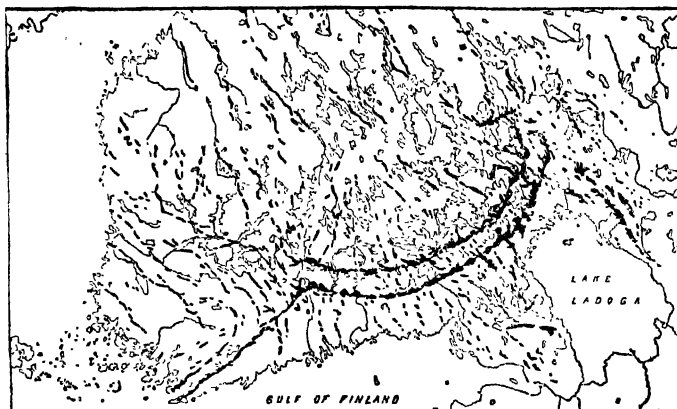

The coast-line of the country is deeply indented, like that of Sweden, and there are clusters of numerous small is. The interior is occupied by a labyrinth of large lakes and rocky basins filled with water, which are divided by low and flat hills and united artificially by means of canals. The chief lakes, prior to the war with Russia, were Lake Saimaa, drained by the Vuoksen over the famous Imatra Falls into Lake Ladoga; Enare, Näsi-Järvi, Pyhäjärvi, Ulea-träsk, and Pajane; but, after that war, F. lost her portion, the N. half, of Lake Ladoga, and further losses were sustained by the terms of the armistice of 1944. The prin. rivs. are Torneå, Kemijoki, Uleå, Tana, and Kymmene. South F. is watered by a number of short rapids, which are of use for working mills, and to some extent for internal navigation. Lake Saimaa is connected with the gulf of F. by a sluiced canal 36 m. in length. The surface of the country is flat, the highest mt. being Haldeifjäll (4126 ft.) in Lapland. In the S. the highest is Turismaa (754 ft.). Three-fifths of the land-surface is covered with forests, which yield valuable timber.

The minerals of F. are very limited. No coal is found, but about 22,000 tons of cast-iron are obtained annually, and there is also a small output of copper and silver. Some gold is found on the Ivalojoeki, in Lapland, and very fine granite is quarried from the Piterlaks mines. The surface of the country consists of such primitive rocks as gneiss, gabbro, and diorite. Cambrian, Silurian, and Carboniferous deposits are found along the coasts of Lake Ladoga and the gulf of F.

Agriculture is the chief industry of most of the pop., though only about 6 per cent of the land is cultivated. Rye is the chief crop, but barley, oats, wheat, hay, and potatoes are also grown. Butter and all kinds of dairy produce are exported in large quantities. The state encourages scientific training and provides instructors for the agric. and horticult. schools. Currants, strawberries, and raspberries are grown with great success, and the apple, pear, and cherry tree are cultivated in the S. Fishing is a prosperous industry, salmon, trout, perch, etc., abound in the lakes and rivs., and a kind of herring is caught off the S.W. coast. The manuf. industries include paper, chemicals, tobacco, cellulose, leather, etc., and there

are many saw mills and wood pulp works. The exports are mainly the output of the saw mills and wood pulp factories: sawn and planed timber, boxboards, and wood for paper-making, hides, pitch, and dairy produce. The many lakes, connected by canals, form an important system of internal communication. The canals are navigable at a length of about 2700 m. and floatable at a length of over 26,000 m. There are only 3000 m. of railway, all but 150 m. belonging to the State. There are 20,000 m. of high roads and 17,000 m. of other public roads. There are over

There are a number of polytechnic, commercial, nautical, and agric. schools. The country is governed by a president, elected for six years, a Council of State, chosen by him, and a House of Representatives consisting of one chamber of 200 members. Women have been enfranchised since 1907 and are eligible for the House of Representatives. Finland was thus the first country to concede women suffrage. Military service is compulsory, and there is also a volunteer organisation of Civic Guards for home defence.

This figure shows part of the Lake district of Finland, which owes most of its physical peculiarities to former ice-work. The whole country has been worn down almost level by the ice-sheet, which has left long moraines running N.W.-S.E., and chains of lake basins following the same general direction. The black lines on the diagram show these moraine deposits. Notice the great festoon of terminal moraines (*asars*) running at right angles to the rest.

28,000 m. of State-owned telegraph wires and over 200,000 m. of telephone wires.

The climate of F. is very severe during the winter, even along the S. coast where it varies in January between 20° and 30° Fahr. However, owing to the S.W. and W. winds, and to the proximity of the sea, the climate is less rigorous than it is farther E. in N. Russia. The winter lasts many months, and frosts have been known to destroy the crops as late as June. The ground is usually covered with snow from the middle of Nov. till late in April. In June, July, and Aug. the days are very long, and the weather dry and sultry. The ann. rainfall at Helsinki is 20 in. and along the S. coast 25½ in. Helsinki, Turku, and Hanko are the only ports open during the winter.

Education in F. is very advanced. There is a univ. at Helsinki, which has over 4000 students, 1000 being women, and two at Turku. Helsinki has also one technical and two commercial schools.

The pop. is 3,993,400. The bulk of the inhabs. are Finns, a people of Ural-Altaic stock. The rest of the pop. is made up of Swedes, Lapps in the N., Russians, and Gers. The vast majority of the pop. is Lutheran, but there is complete religious toleration. Helsinki (formerly Helsingfors), with a pop. of 338,800, is the cap., other important tns. are Tampere (Tammerfors), 87,100; Turku (Åbo), 81,400; Vaasa (Vasa), 36,500; Oulu (Uleåborg), 35,100; Pori (Björneborg), 33,900; Lahti, 32,300; Kuopio, 28,000; Jyväskylä, 22,600 and Kotka, 21,900.

Finnish is an Ural-Altaic tongue; and from 1883 it was placed on an equal footing with Swedish as an official language of the country; but subsequent to the creation of the Finnish Republic after the First World War the use of Swedish declined except in the Åland Is. in literature, too, until the end of the eighteenth century, Swedish was dominant, but there was a Finnish revival in

the first decades of last century, while the formation of an association for the promotion of Finnish literature in 1831 gave a new impetus to the study of the national language and to the collection and publication of popular songs and lyrics. Many of the modern Finnish novelists and poets, writers for the most part of the naturalistic school, enjoy a European reputation. Eemil Sillanpää was awarded the Nobel Prize for Literature in 1939. In music F. can claim Jean Julius Christian Sibelius (*q.v.*), who was born at Tavastehus, 1865, composer of the orchestral piece, *Finlandia*, among many other pieces, and of many symphonies, besides over a hundred songs.

HISTORY.—The Finns are said to have settled in F. during the eighth century, having been expelled from the banks of the Volga. Until the twelfth century they were pagans, when they were conquered by Swedes and adopted Christianity. They remained a dependency of Sweden for 500 years, but enjoyed autonomous gov. Russia repeatedly tried to seize the country from Sweden, and in 1721 by the treaty of Nysad, Peter the Great won that part of F. which forms the prov. of Viborg. In 1743, by the peace of Åbo, Elizabeth extended the Russian frontier to the Kymmene. In 1809 Sweden ceded the rest of the country with the Åland Is. to Alexander I. in the peace of Fredrikshamn. F. preserved its auct. constitution until 1897, when its autonomy was attacked by the Russian Gov. In 1899 Russia declared her right to legislate on Finnish affairs, regardless of the consent of the Finnish Diet, and between 1900 and 1902 the national Finnish forces were incorporated into the Russian army, and Russian was made the official language of the senate and of the more important public depts. There was great discontent in the country, and in 1904 Bobrikof, the governor-general, was assassinated. In 1905, the Constitutionalists and the Social Democrats formed a coalition, and taking advantage of trouble in St. Petersburg, succeeded in winning certain concessions from the governor-general, Prince Obolenski. The popular demands included the freedom of the Press, the deposition of Russian officials, and the reorganisation of the Diet on a basis of universal suffrage. These requests were granted and a single chamber of two hundred members was substituted for the old Diet of four chambers. Trouble was renewed in 1908 when the Russian Gov. again attempted to curtail the powers of the Finnish Diet, and in 1910 the 'Imperial Legislation Law' was passed depriving the Diet of its right to legislate on such questions as the imposition of taxes, police direction, school management, and the control of the Press, which, it declared, affected 'Imperial interests.' In 1911 the Russian Duma passed a Bill 'placing Russians on civil equality with the Finns in the grand duchy.'

In 1917, when the Russian Empire broke down, Finland declared itself independent, but Bolshevik aggression led

for some time to civil strife. Order was restored and matters finally settled between F. and Russia by the treaty of Dorpat, 1920.

Finnish-Russian War, 1939-40.—In the autumn of 1939 Finland was one of the small nations suddenly destined to be a pawn on the international chess-board. The extension of Soviet influence in the Baltic, following the estab. earlier in the same year of military, naval, and air bases in the three Baltic republics of Estonia, Lithuania and Latvia, offered an obvious threat to Finland. There were negotiations in Moscow on political and economic questions, but it was clear that Molotov, the Soviet minister of foreign affairs, was presenting demands incompatible with Finnish independence. Stalin's plain intention was to distort Finland's replies into something provocative to Russia—the technique employed by Hitler against Czechoslovakia and Poland. His real policy was to secure a hold on Finland by way of offsetting Ger. penetration in Scandinavia, and in his attack on Finland he undoubtedly showed considerable acumen in forestalling Germany's coming invasion of Norway of the following year. Soon after the Moscow negotiations had broken down, the Soviet Gov. denounced the non-aggression pact of 1932 on the ground that Finnish troop concentrations in the neighbourhood of Leningrad constituted a hostile act—the fact being that any concentrations must of necessity be close to Leningrad—and diplomatic relations were broken off. On Nov. 30 Soviet bombing planes began hostilities by attacking Helsinki and a number of other Finnish tns., including Viipuri (Viborg) and Enso. The fortress of Hanko was bombarded by Soviet warships and Petsamo seized. At the same time a so-called Finnish People's Gov. was set up at Terijoki by Kuusinen, a former secretary of the Komitea, the avowed object of this puppet gov. of the Soviet being to help the Finnish 'Democratic Republic' of revolutionary peasants and workers. This device, too, followed the familiar technique of Hitler in the case of Austria and Czechoslovakia in the process of dictatorial aggression. Although outnumbered, the Finnish forces at once offered a most determined resistance to the Russian invasion. Heavy casualties were inflicted on the Russians both in the Karelian Isthmus and to the N. of Lake Ladoga (Dec. 1) while on the next day Petsamo was recaptured. The soul of the Finnish defence was Field-Marshal Mannerheim, the 'liberator of Finland' from the Bolsheviks in 1919-20. The Finnish Gov., however, through the Swedish Gov., notified the Soviet of their desire to enter into fresh negotiations, but the offer was rejected. There is no doubt that, despite the bravery of the Finnish troops, the morale of the people was prejudiced by the bombing of the tns., especially as the Finns had but few planes with which to resist or retaliate. Large numbers of Russian tanks were destroyed and heavy casualties inflicted on their infantry in the course of the gradual with-

drawal of the Finns to the Mannerheim Line. The Russians then proclaimed the blockade of the Finnish coast of the gulf of Bothnia down to Hanko and twenty m. out to sea. On Dec. 4, Finland notified the League of Nations of her intention to fortify the Aaland Is. (*q.v.*) and to mine their waters. Very fierce fighting occurred from Dec. 10-16, especially on the Karelian Isthmus and N. of Lake Ladoga and all along the K. frontier, but the Mannerheim Line held firm. The Finnish Gov. then appealed to the world for help and issued a statement setting forth the circumstances leading to the conflict. It was obvious that if the Finnish account of the Moscow negotiations were accurate, she could never have acceded to the Soviet demands, which actually included a thirty-year lease of Hanko, the cession of numerous is., a port on the Karelian Isthmus, and mutual demolition of fortifications on the isthmus.

In the week Dec. 16-23, the Russians made desperate attempts by massed troop attacks to break the Mannerheim Line on the Karelian Isthmus, but were repulsed with very great losses. Man for man the Finns were superior to the Russian soldiers thus far opposed to them, besides being much better able to take advantage of the woody and snow-bound terrain. The cold was so intense on the Arctic front around Petsamo that operations there were brought almost to a standstill. Heavy damage was done on Dec. 18-21 to Helsinki in numerous air raids, as many as two hundred planes taking part in successive attacking waves. Once more President Kallio appealed to the world for assistance. Preparations were made in England to send a force, but the effort was frustrated by the assurance that both Norway and Sweden would resist their passage to Finland. However the Finns continued to offer a staunch resistance, defeating the Russians at Agiljavi, Salla, and elsewhere, and even crossing the Soviet frontier N. of Lake Ladoga; while in the far N., the Russians were also hurried back in retreat. Victories were also won at Lake Kianta and at Suonussalmi. The Soviet command retaliated by raining more bombs on Helsinki, Viipuri, Turku, Lahti, and other open Finnish tns., and these repeated raids undoubtedly told with cumulative effect on Finnish morale, although some 170 planes had been shot down. Between Dec. 1 and Jan. 9, some 234 persons were killed and 400 more or less seriously wounded in air raids and about 400,000 refugees from the tns. were evacuated into rural farm houses, schools, and churches to the dire disruption of the national economy. Yet a third appeal to the world was made by President Kallio, but, while there was some talk of foreign aid, only a few aeroplanes reached Finland, these being sent by Britain. In the penultimate week of Jan. many Soviet attacks were launched N.E. of Lake Ladoga in a new effort to outflank the Mannerheim Line, but the Finns still held firm. Further air raids were carried out by Russian planes on Nurmes, Petsamo

and other tns. Early in Feb., further attacks were made on the Mannerheim Line and near Lake Ladoga, the attacks making some impression at Sammu, but only at great loss to the Russians. Up to Feb. 7, the Soviet losses in material included 300 planes, 560 tanks, 300 machine guns and 200 other guns. The Soviet command now brought up some of their best shock troops in a determined effort to break the stubborn resistance of their adversaries. Massed attacks were made ceaselessly, with especial violence at Sammu, Muolaa and on the Taipale I., and at length the Finns were forced to withdraw from their advanced positions (Feb. 11-17); but they inflicted some 30,000 casualties on their attackers. Finland appealed in vain to the Swedish Gov. for military assistance, and by Feb. 25, the Russian offensive on the Karelian Isthmus had brought their forces close to Viipuri and compelled the Finns to evacuate the important fortress of Kovisto.

The massive Russian attacks were at last wearing down the gallant resistance of the Finns, who had now abandoned the W. part of the Mannerheim Line, and hostilities concluded early in March, the Peace Treaty being signed in Moscow a day or two later. Under it Finland ceded the Rybachy Peninsula in the N., some ter. in the N. centre, the Karelian Isthmus in the S.—including Viipuri, Viipuri Bay, and shores of Lake Ladoga and a 30 yrs. lease of the port of Hanko and neighbouring mainland. The total land and lake area ceded under the treaty being 16,170 sq. m. These terms were far more onerous than those presented by Russia in the Moscow negotiations of Oct.-Nov., 1939, especially as the ceded ter. included the whole Mannerheim Line defences, nor were any concessions made to Finland such as had been previously proposed by the Soviet. But at least Finland retained her independence as a reward for a resistance which will stand high in the epics of war. But for air attack it is possible that their forces might have held out against the Russian armies for a long time. The Russians in this campaign in Finland gave the world the first example of aerial bombardment of a civilian pop. on strictly scientific principles. Their aim was to paralyse the economic life of the country. These tactics were learned from the Gers. In Finland the vital spots for attack were the railway junctions, because the Finnish railway system was poor and easily put out of action. In carrying out these attacks the Russians used certain types of bombs among which were the so-called 'Molotov breadbasket,' a cylinder 7½ ft. long and 3 ft. in diameter, which collapsed in the air and poured out over a wide area upwards of 100 incendiary bombs. But Finland was able to hold out against its powerful enemy for as long as it did owing to the discipline of the people and the absence of any 'Fifth Column' in the country. This absence was due to the elimination of social injustice in Finland and the consequent acceptance by all sections of the pop. of the position that the war was their

war and not merely the war of one economic group or other in the country.

When Hitler invaded Russia in 1941 F. at once allied herself with the Axis (q.v.) and took part in the campaign against the Allies, reoccupying most of the territory ceded under the Treaty of 1940. In 1944 the Russians, who had been counter-attacking throughout 1943-44, at length made a determined effort to eliminate F. from the war. Finnish resistance was overcome, Viipuri falling on June 20. In accordance with conditions required by Russia the Finnish Gov. called upon the Ger. Gov. to withdraw Ger. forces from F. by Sept. 15. Four days after that date the 'cease fire' was sounded in F. and a peace delegation went to Moscow. On Sept. 19 an armistice was signed by Russia, Great Britain and Finland. Territorial concessions were severe. According to this Finnish troops were to be withdrawn behind the frontier fixed by the treaty of March 12, 1940, between the U.S.S.R. and F.: F. agreed to cede the Petsamo area and to lease for 50 years the Porkkala headland, with a considerable stretch of sea and land, for use as a military base. F. also undertook to pay 300 million dollars in reparations within six years. See E. Young, *The Land of the Thousand Lakes*, 1912; A. M. Scott, *Suomi, the Land of the Finns*, 1926; W. E. Hiley, *The Forest Industry of Finland*, 1928; J. W. Archley, *Finland*, 1931; Agnes Rothery, *Finland: the New Nation*, 1936; J. H. Wuorinen, *Finland: An Historical Survey*, 1938; W. N. Bugbee, *The Spirit of Finland*, 1940; J. Langdon-Davies, *Finland: The First Total War, 1940; Armistice with Finland (September 19, 1944)*, Cmd. 6586 (H.M.S.O.). (See further under EASTERN FRONT OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR.)

Finland, Gulf of, the E. arm of the Baltic Sea, having Finland on its N. shores, and Russia and Estonia to the E. and S. Its length is 260 m.: breadth, 25 to 90 m. Into it flow the Neva, draining the great lakes, Onega and Ladoga, and the Narva, draining Lake Peipus. It is connected with the Saimaa Sea, by the Saimaa Canal. The Finnish coast of the gulf is very dangerous, owing to the shoals and is. The water is slightly salt and not very deep, being covered with ice for about twenty weeks in the year.

Finlay, George (1799-1875), historian, was b. at Faversham in Kent, and was the son of Scottish parents. Most of his time was spent in writing the hist. of Greece, the first part of which, *Greece under the Romans*, was pub. in 1844. He wrote also *History of the Byzantine and Greek Empires from 716-1453* (1854), and *History of the Greek Revolution* (1861).

Finn, Fioun, Find, or Fingal, whose name was Find MacCumail, was in Irish legend the leader of the Fiann, Feinne, Fingallans, or Fenians, which was a militia formed of people from all parts of Ireland. Tradition says that he was the son of Cumail who lived in Ireland during the second century A.D. Those who were admitted to this band had to fulfil con-

ditions which were very strict and which inquired into their mode of living with close scrutiny. Among the many heroes of these people were Olsson—generally known as Ossian—who was his son; Oscar his grandson, and Diarmid. Goll and Conan were members of a rival branch of the family, and constant feuds took place between them. After the death of Cormac MacArt, and during the time of his son and successor, Carboy, their power was at its height, and they were eventually totally defeated at the battle of Galra, or Gavra, A.D. 283. It is said by some that Ossian escaped with his life. The stories of the Feinne and of their leaders form the subject of some of the later heroic literature of Ireland. See A. Nutt, *Ossian and the Ossianic Literature*, 1899.

Finnmark, prov. (or fylke) of Norway, in the extreme N., with a rocky, indented coast and a barren mountainous interior. Fishing is the main industry. Alten-gaard is the chief tn. and post. Pop. (chiefly Lapps) 53,700.

Finns, race of people of N. Europe inhabiting various countries, including Finland, Lapland, parts of the Baltic and the banks of the Volga, parts of Russia and W. Siberia. They belong to the Ural-Altaic race, originally inhab. of parts of Asia themselves, and their name is identical with the classic 'Feinne.' From the time of their migration to Europe they have been subject principally to the Swedes and Russians. Most of them now, however, lead a settled life, being engaged in the pursuit of agriculture or fishing, though few prefer a wandering life. They are of strong and robust physique, having rather a low stature, flat features, and fair or reddish hair. They are also brave, straightforward, and hospitable, and most of them have adopted the Christian religion.

Fins are organs extending from the bodies of aquatic animals, which help them to propel themselves through the water. In the case of fish they may be paired F. or median F., the former including pectoral and ventral F., and the latter caudal and dorsal F., these F. being supported by a series of bony rays. The F. in cetaceans are simple extensions of the soft tissue and have no bony rays. The term may also be applied to other aquatic animals, as in the case of the tadpole's tail. Among the invertebrates any expanded part of the body which helps in swimming is termed a F.

Finsbury, metropolitan bor. of London, England, bounded S. by the City of London, W. by Holborn, E. by Shore-ditch, and N. by Islington. Among the numerous places of interest are the Charterhouse, formerly a Carthusian monastery; Bunhill Fields, the burial place of Daniel Defoe, John Bunyan, and other eminent persons, and in the neighbourhood many victims of the plague were interred. S. of Bunhill Fields is the Artillery Ground, which since 1683 has belonged to the Honourable Artillery Company, with barracks and armoury. The prin. industry of the borough is watch-making, and working of precious

metals; there are also large printing works. F. returns one member to parliament. Pop. 90,000.

Finsbury Park, dist. which forms a suburb of N. London, situated 4 m. N. of St. Paul's. It consists of the eccles. pars. of St. Thomas, and St. John. Finsbury Park, from which the dist. derives its name, covers over 121 ac. It is horticulturally well arranged, and affords fine views. It is well planted with trees and shrubs, contains large conservatories, and an artificial lake, which is used for pleasure boats. A small portion of the park is reserved as a gymnasium for children.

the possession of Saxony, and in 1815 of Prussia and is now in the prov. of Brandenburg. There is a Gothic church of 1581, also a chateau and schools. The manufs. are cloth, cigars, and there are iron foundries and flour mills. Pop. 16,400.

Fin-whales or **Rorquals**, also called **Fin-backs** or **Razor-backs**, constitute the *Balaenoptera*, a genus of Cetacea. They are characterised by their elongated shape, short and recurved backfin, and a number of longitudinal folds in the skin of the throat. The F. are the most widely distributed of all whales, being

THE AURLANDS FIORD, ONE OF THE GRANDEST IN NORWAY

Finsen, **Niels Ryberg** (1860-1904), Dan. physician, b. at Thorshaven, Faeroe Islands, took his degree in medicine at Copenhagen, where he lectured on anatomy. It was here that he discovered the effect of light upon certain diseases and made use of his discovery in their treatment. He advocated the exclusion of the chemical rays from people suffering from small-pox, maintaining that this prevented the pustules from suppurating, and used the ultra-violet rays for curing certain diseases of the skin, for example lupus. For this process he invented a lamp which collects the light by means of a quartz lens and also provides for cooling it. In 1903 he was the recipient of the Nobel prize. He wrote *Chemical Rays and Variola* (1891), and *Phototherapy* (trans. from the Ger. by J. H. Sequiera, 1901).

Flinsteraarhorn, highest peak of the Bernese Alps, in the canton of Berne, Switzerland, about 40 m. S.E. of Berne; it attains a height of 14,925 ft., in one of the prin. tourist centres of Switzerland. It was first climbed in 1829.

Finsterwalde, tn. of Saxony, Germany, situated on the Shackebach, 28 m. S.W. of W. of Cottbus. In 1635 it came into

known in all but the extreme Arctic and Antarctic seas; their scarcity of blubber and inferior whalebone has secured them a certain immunity from the whaler. *B. sibaldi* is the largest of all living animals, sometimes attaining a length of 80 or even 85 ft.; it spends the winter in the open sea and approaches the coast of Norway about the end of April. *B. muculus*, the common F., is found in the seas of N. Europe, and occasionally enters the Mediterranean, its length is from 60 to 70 ft. *B. rostrata*, sometimes called the pike-whale, because of its pointed muzzle, is the smallest species, varying from 25 to 30 ft. in length; it frequents the Norwegian fiords in summer, and is by no means rare on the Brit. coast.

Fiord, or **Fjord**, narrow inlet of the sea, having high coasts on either side, and cutting far into the land. These Fs., which are found on mountainous coasts, are exceedingly deep, the deepest part being that nearer to the land, while the bottom shelves up to the shore and the sides are often lined with waterfalls. They may have been formed by the constant wearing away of the rocks, the fissures being filled with sea water, or by the

action of a glacier, the pressure of the ice deepening the valleys. Fs. are found in Norway, Iceland, Greenland, parts of the Amer. coast and New Zealand. Those of Norway are among the most notable; Sogne F., one of the largest, being 100 m. in length, and Hardanger F. only a little more than half that length. Christiania (Oslo), Aurlands, and Trondhjem are also well known, the last being the scene of much naval and air activity in the Second World War in 1939-40, between the Brit. and Ger. forces. See also NORWAY.

Fiorin Grass, see BENT GRASS.

Fir, strictly speaking, is the popular name for *Abies*, a genus of coniferae, but the genus *Picea* and others are often included. The leaves are needle-shaped and in *Abies* have a rounded base; those of *Picea* are decurrent. *Abies* cones are erect, and when ripe the scales fall off leaving the upright axis standing alone; the cones of *Picea* are pendent. *A. pectinata* is the European silver F., *A. nobilis* is the Noble silver F. of America, *A. Nordmannica*, the Crimean silver F., *A. amabilis*, the red silver F. of U.S.A., *A. venusta*, the Monterey silver F., and *A. reticulata*, the Mexican silver F., *P. excelsa*, is the Norway spruce. All these trees are commonly cultivated, but the Norway spruce flourishes in severe exposed situations, and is widely distributed over N. Europe. The timber of this tree constitutes deal, and the trunks are used for masts, etc. There are many valuable products from other members of the order, e.g., gums, resins, pitch, etc., and *A. balsamea* yields Canada balsam.

Firando, see HIRADO.

Fir-bolg, in Irish tradition a race of early inhab. of the pre-Celtic pop.

Firdausi, **Firdousi**, **Firdusi**, **Ferdousi** (c. A.D. 940-c. 1020), Persian poet. He assumed this nom de plume, his real name being Abū'l Kāsim Mansur or Hasan, and is the author of the Persian epic *Shāhnāma*. He was b. at Shadab, near Tus. The source of his work was a hist. of Persia which, unlike other books, was preserved by the Caliph Omar, and Dakiki, the court poet of Mahmud, Sultan of Ghazni, was ordered to put it into verse. On his death the work was taken over by Firdausi. It was agreed by the sultan that he was to have 1000 gold coins for every thousand verses. When the book was finished, the labour taking over thirty years, silver instead of gold was sent to F. owing to the jealousy of the sultan's minister. The poet in anger wrote a satire on the sultan, and was afterwards compelled to flee from place to place. He went to Mazandaran, thence to Bagdad, and finally to Tus, where he died. The chief eds. of the poems are: Turner Macan, 1829; Julius von Mohl, pub. with a trans. into Fr.; J. A. Vailers, and S. Landauer, 1877-83; A. G. and E. Warner, 1905.

Fire (O. E. *fyrr*, Gk. *pur*; ultimate root supposed to be connected with 'purify,' cf. Lat. *purus*). Although the statement has been not infrequently made that tribes totally ignorant of F. have been discovered, the evidence on this point is very weak, and it is questionable whether such

a race is in existence at the present time. There are considerable variations of detail in the primitive methods of producing F., but they are all based on the principle either of concussion or friction. The simplest form of the latter, rubbing a stick along a groove in another stick, is practised among other places in Tahiti, Samoa, and the Sandwich Is. The stick is twirled round in a hole in the other piece of wood in Australia, Kamchatka, Ceylon, S. Africa, the W. Indies, N. and Central America, and as far S. as the straits of Magellan. Concussion has also been known as a means of producing F. from very early times, and such methods as striking two stones together, striking a stone on a piece of wood, or striking two bamboos together, are in use. The employment of a burning-glass is also of great antiquity: Aristophanes mentions one in *The Clouds*. There are many different legends as to the origin of F. In Gk. mythology, Prometheus brings down the torch he had lighted at the sun; Ukko, the Estonian god, strikes his stone with his steel and sends forth F. in the shape of lightning; in N. Amer. legend F. is struck from the hooves of the great buffalo as he gallops over the prairie, and thunder in the Hindu mythology is the clatter of the hooves of the sun's horses on the sky. Primitive man found it convenient to have a F. always burning in a public building hence the pyreaneum gradually became a religious institution, round which centred also all civil and political interests. The principle of an ever-burning F. was observed by the Romans, Egyptians, Gks., Persians, Aztecs, Peruvians, etc. If the F. of Vesta at Rome, for instance, went out, all business was suspended until it had been rekindled with appropriate ceremonies: and no Gk. or Rom. army crossed a frontier without carrying an altar on which F. from the pyreaneum always burned. Because the sun loses force at certain times, the longest day of summer was in many religions an occasion for ceremonious rites connected with F. It was the belief of many anc. philosophers, as the Stoics, that the world would perish by F.: the Scandinavian mythology also mentions this belief, and the Apocrypha (2 Esdras xvi. 15). For further details as to folk-lore, etc., see ORDEAL, PARSEES, and ZOROASTRIANISM; for the physics and chemistry of F. see COMBUSTION, FLAME, and FUELS. See also C. F. Dupuis, *Origine de tous les cultes*, 1794; E. B. Tylor, *Researches in the Early History of Mankind*, 1865; Sir J. G. Frazer, *The Golden Bough*, 1890; J. A. G. Pauschmann, *Das Feuer und die Menschheit*, 1908; W. Hough, *Fire as an Agent in Human Culture*, 1926.

Fire Alarms, see under FIRE BRIGADES.

Firearms. In this article will be considered the varieties of F. known as small-arms, from their inception until their development into the modern sporting gun, rifle, and revolver; the latter are treated of elsewhere, as is also artillery. At the starting-point the gun is not distinguished from the cannon; in the early days of gunpowder portable F. were often

confounded with heavy artillery in Europe. The Flemings anticipated other nations in the use of hand F.; small hand cannons (Ger. *Knallbüschen*) were adopted at Perugia in 1364, and were used at the battle of Rosebecque in 1382. They were generally termed 'sclopo,' from which come 'sclopetto' and 'escopette,' and were used by cavalry as early as the end of the fifteenth century, as we find the expression 'eques scopetarius' used. The hand cannon of the fourteenth century was a rude weapon, made of wrought iron, and fastened to a piece of wood in such a manner that it could not be brought to the shoulder. The touchhole was at first made on the top of the cannon, with a cover to preserve it from damp, later it was placed to the right of the cannon. Two men were generally required to serve one of these hand cannons. The hand cannon capable of being fired from the shoulder, called in France a 'canon à main à épauler,' is of the same design as the former, but has a roughly-made stock; it dates from the end of the fourteenth century. Varieties of hand cannons in which the match was fastened to the weapon itself (hand cannons 'à serpentín' or 'à dragon' and hand culverins or petrials) were invented in the early fifteenth century. Hand cannons lengthened by an iron stock and supported by a kind of fork fixed on the pommel of the saddle were also used by cavalry.

The invention of the arquebus or harquebus marked the next stage in the progress of portable F. The novelty in this weapon was the appearance of a piece of machinery for firing the priming, an operation which had formerly always been carried out by hand. The touch-hole was pierced at the side of the barrel and above a small pan (bassinet). This pan contained the priming, and was covered by another hinged plate (couvre-bassinet). The match was grasped between the jaws of a nipping apparatus (serpentin), and was made to fall on the pan by pressing a trigger. Before the arquebus could be discharged the pan had to be uncovered, the match exactly adjusted, and made to burn more brightly, operations which took some considerable time. The barrel of the arquebus was longer than those of its forerunner, being over 3 ft. in length. The double arquebus was a F. which had two match-holders working in opposite directions; it was from 3 to 7 ft. long, and was generally used in the defence of ramparts. A stand on spikes or wheels, called a 'fourquine' was often used for its support. The wheeled or Ger. arquebus (*Radschloßbushe*) was the first F. fired without a match, and was further distinguished by having a wheel-lock. The match was superseded by the sulphurous pyrites, or marcassite, which was struck by the cogged wheel of the lock and fired the charge. The disk of the lock, which was of steel, was made to revolve rapidly by the pull of the trigger, so striking sparks from the pyrites on to the powder in the pan. This new weapon was not able to oust the arquebus, as its mechanism was much more complicated and liable to

get out of order, and the pyrites was very brittle, and easily broken off.

The construction and mechanism of the musket, which came into use soon after the arquebus, were precisely similar to those of the latter; it differed only in its calibre and charge, which were both double that of the arquebus. It could be used with either a wheel-lock or match, and its greater size necessitated at first the use of a 'fourquine' (see above). The wheel-lock gun continued in general use until about 1640, the pieces which produced the rotary motion being enclosed within cavities in the stock. In the latter half of the sixteenth century, an invention called the 'chenappan' (from Ger. *Schnapphaha*, a cock pecking), or, as it was corrupted, 'the snaphaunce,' proved to be the forerunner of the flint-lock gun. The change which the lock of the F. underwent by the invention of the flint-lock was very important, though not radical. By this contrivance a gun-cock held in its grasp the flint, which in its fall struck against a movable steel pan-cover. This fell back and left the priming powder in the pan exposed to the sparks generated by the impact of the flint on the cover; the main objection to this method was that the sparks from the flint did not always reach the priming powder. Sometimes, therefore, guns were made having both match locks and flint locks, combined in a method said to have been invented by the Frenchman, Marshal Vauban. The caliver, the fusil, and the musketoon were lighter varieties of musket; the carbine was a species of caliver with a short barrel but a large bore, whilst the blunderbuss had a still larger bore with a trumpet mouth, and discharged ten or twelve balls at a shot.

The flint-lock was superseded in the nineteenth century by the percussion-lock. In this lock the fall of a hammer upon a cap causes the ignition of the charge in the barrel of the gun. The cap is a small copper cylinder lined with a fulminating matter. Alexander Forsyth took out a patent for the percussion gun in 1807, but experiments on detonating materials had been carried out as early as 1699. The fulminates in the percussion cap are obtained from gold, silver, platinum, and chloride of potash. The pistol was at first the diminutive of a hand cannon, and as early as 1364 hand cannons of the length of a 'palma' (about 9 in.) were constructed. A little later came the petronal or petrial, a kind of short arquebus, which held a place midway between the arquebus and the pistol proper. The barrels of the early pistols were very short, and the stock was almost at right angles to the barrel. The later developments of F. belong to the articles mentioned below, but it is interesting to note that the principles of breech-loading rifling, and revolving chambers, both in guns and pistols, were discovered at very early times, long before they were utilised as of late years. For further details refer to ARTILLERY, CARTRIDGE, GUN, GUN-POWDER, HOTCHKISS GUN; HOWITZER; LEWIS GUN; MACHINE GUN; REVOLVERS;

RIFLE: etc. See Paul Lacombe, *Arms and Armour in Antiquity and the Middle Ages* (trans. by C. Boutell, 1874); A. Demmin, *Die Kriegswaffen*, 1891; F. Kelly and R. Schwabe, *Short History of Costume and Arms, 1066-1800*, 1931; H. C. Logan, *Hand Cannon to Automatic*, 1944.

Fireball, name of one or two kinds of fireworks, formerly used in war for illuminating or incendiary purposes. Of these the ground F. consisted of a sack filled with some brightly burning composition, and pierced with holes. A parachute F. was constructed in a similar manner, but was timed with a fuse and supported by a parachute. Both were fired from a mortar. They are now superseded by rockets (*q.v.*). The name F. is also applied to a certain class of comet, and also to a variety of globe lightning.

Firebote, term in law used to denote a tenant's right to cut wood for fuel from the land on which he is living. See **ESTOVERS**.

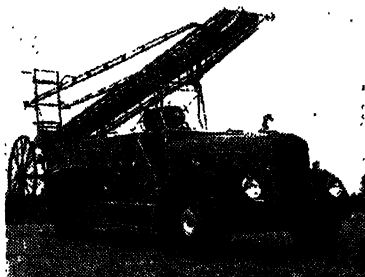

Firebrick, see **FIRECLAYS**.

Fire Brigades and Fire Fighting. Fire brigades are bodies of trained men and their equipment for fighting fires, and for saving life and property from loss and damage from fire, or any other causes. Under this heading will be treated the personnel and fire-fighting appliances throughout the Brit. Isles, but similar precautions for dealing with uncontrolled fire are taken in every tn. of size and importance throughout the world. The first reference to a fire brigade relates to China, c. 4000 B.C. In 2000 B.C. Egypt had an organisation for fighting fires, and the Romans started to form their brigades under a *praefectum vigillum*, or prefect of the watch, about 150 B.C., and by about 40 B.C. theirs was a highly trained and efficient brigade. In England there is no record of very early fire brigades, although legislation in 1189 encouraged the use of building materials of a more fire-resisting nature than hitherto. In 1212 also, it was decreed that new houses were not to be roofed with reeds, rushes, straw or stubble, and that water should be kept for fire-fighting purposes.

The first fire insurance office was founded in London in 1680—The Phoenix (not to be confused with the Phoenix which was founded a century later), and the first body of fire fighters was then organised. These men were drawn from the Thames watermen, and each insurance company dressed their men in distinctive livery. It is not known how they were equipped. In 1825 some of the rival companies realised the desirability of united effort, and later all the more memorable insurance offices merged their fire fighters in the formation of the London Fire Engine Estab. In 1832, later to become, by Act of Parliament in 1865, the Metropolitan Fire Brigade. Money was raised for the maintenance of this brigade by (i.) a halfpenny rate on the rateable property of London, (ii.) a contribution from the insurance companies

of £35 for every million pounds gross insured, and (iii.) a ten thousand pounds grant from the gov. In 1904 the title was changed to the 'London Fire Brigade' which, by 1938, had reached a strength of one chief officer, six senior officers and 2211 other officers and men. There were fifty-nine land fire stations and three R. Thames stations. In other important cities and tns. and throughout the country, most local authorities maintained brigades staffed by professionals or volunteers.

Organisation.—The first Fire Brigade Act for over 40 years was passed by Parliament in 1938. It required, among other things, that certain local authorities should make provision for the extinction of fires and the protection of life and property by providing fire brigades, making efficient arrangements for them to be called, and arrangements for mutual assistance between fire authorities. This Act had not

Dennis

SELF-PROPELLED PUMP, WITH ESCAPE

come into operation, however, before the first Air Raid Precautions Act, 1937, which required air raid precautions and fire schemes to be prepared, such schemes to include an emergency fire brigade service and the recruiting and training of auxiliary firemen. These schemes brought into being the Auxiliary Fire Service which consisted of volunteers from all walks of life who trained in their spare time as auxiliary firemen. At the outbreak of the Second World War in Sept. 1939, many thousands of part-time firemen had completed their initial training, and many of them entered their fire brigades on a full-time basis, while others continued with evening and night duties. The Auxiliary Firemen and their 'Regular' colleagues met and fought the great air raid attacks of 1940 and 1941. Owing to the widespread nature and severity of the Ger. air attack, however, the need for greater mobility and uniformity of practice and equipment was realised, and in Aug. 1941, all local authority fire brigades, 'regular' and 'auxiliary,' were united to form the National Fire Service. The

organisation within the National Fire Service enabled vast numbers of appliances and men to be mobilised at a moment's notice to any part of the country requiring assistance, with the advantage, *inter alia*, that all equipment, appliances, etc., were uniform and interchangeable, and it was this body which successfully met the varying forms of air attack from 1941 until the end of the war. A National Fire Service College was estab. where officers and prospective officers were given extensive training in all aspects of fire fighting and fire prevention. One of the important developments within the National Fire Service was the selection of certain suitable officers for specialised training over a long period in the subjects of fire prevention and fire protection, and these officers were available to give free advice to local authorities, schools, hospitals, factory managers and private householders.

As the result of a promise made by the home secretary that, after the war, local authorities might again control their own fire brigades, the Fire Services Act was passed in 1947 making co. councils and co. bor. councils the 'fire authorities' from April 1, 1948. The 1947 Act provides, that among other things, fire authorities shall secure:

1. Such a fire brigade and such equipment as may be necessary to meet efficiently all normal requirements;
2. The efficient training of members of the fire brigade;
3. Arrangements for dealing with calls;
4. Information, by inspection and otherwise, required for fire-fighting purposes, with respect to the character of buildings and other property;
5. Arrangements for mitigating damage to property resulting from measures taken in dealing with fires (*i.e.* salvage);
6. Arrangements for giving advice on fire prevention, fire protection and means of escape in case of fire.

Joint assistance schemes must be made between adjoining fire authorities' areas, so there is no question whatever of there being any boundaries from a fire point of view. The only boundaries are administrative ones. The secretary of state is the controlling authority, and a staff of H.M. inspectors are responsible for ensuring that effective and efficient fire brigades are maintained. Regulations made under the 1947 Act establish standardised ranks, rank markings, rates of pay, conditions of service, etc., throughout the country. The ranks in the fire brigade are now: Chief Officer, Assistant Chief Officer, Divisional Officer, Assistant Divisional Officer, Station Officer, Sub Officer, Leading Fireman, and Fireman. Training estab. are organised by the larger brigades where members of those brigades having no training centres may also receive initial and supplementary training. The National College gives advanced and specialised training to officers. Financially, the fire authorities bear 75 per cent of the cost of fire brigades, the remaining 25 per cent coming from the Treasury. The estimated cost of the first year of operation is £14,500,000.

Britain's account for fire damage in recent years is given in the following table:

YEAR.	LOSS.	LIVES LOST.
1938	£3,780,000	1563
1939	£9,088,000	1602
1940	£12,640,000	1868
1941	£10,254,000	1806
1942	£12,470,000	1601
1943	£9,092,000	1346
1944	£11,818,000	1332
1945	£12,800,000	1227
1946	£12,047,000	953
1947	£19,814,000	944
1948	£18,851,000	not pub.

These figures relate to material loss only, and take no account of consequential loss. Loss due to enemy action is not included. The growth of tns., the inflammability of certain building materials, and the use in industry of highly inflammable and complex chemicals, together with the increased importance of conserving foodstuffs and timber in co. dists., have rendered adequate fire protection essential. This has been made possible during recent years by the great advances made in the science of fire fighting, in the specialised knowledge of fire engineers, and in the increase in efficiency of mechanically propelled vehicles.

The earliest record of fire appliances is of a pump invented by Ctesibios, a Gk. living in Egypt, about 150 B.C. There is no direct record of it, but Hero of Alexandria described it in the same century. Later buckets, simple pumps, and squirts were used, although inventiveness in this direction seems to have been ignored, for at the time of the Great Fire of London in 1666, there were still only squirts and simple pumps available.

Pumps.—The first known appliance for delivering a *continuous* stream of water was described in 1675 when an air-chamber was coupled to a manual piston type pump. During the latter part of the nineteenth century, the manual type of fire engine was gradually replaced by a combination of horses and steam engines. The horses, specially trained, pulled to the scene of the fire a trolley upon which was a steam engine for pumping purposes. These engines were kept with fires banked down or ready for quick ignition, and were quickly brought to life so that a good head of steam was available by the time the engine had arrived at the fire. At the commencement of the twentieth century, the internal combustion engine began to replace the steam pump and the horses, and the design of the pumps themselves started to change from the reciprocating piston type to the centrifugal pump with its high output for small weight, and very high efficiency—important factors in fire appliances.

Present-day practice is the combination, as one unit, of the internal combustion engine and the centrifugal pump which, instead of working on the principle of displacement by pistons or plungers, makes use of the natural law known as centrifugal force, and consists of a revolving impeller which receives water at its

centre and which discharges it from the outer edge of the blades. The water is converted into the pressure energy required by the general construction of the pump casing. Pumping cannot be commenced until water is within the pump casing, and this is either obtained by introducing water into the pump under pressure (e.g. from a street main supply) or by 'lifting' water from an open supply by 'priming,' i.e. by reducing pressure within the pump and suction hose to below atmospheric pressure (14.7 lb. per sq. in.), thereby causing the atmospheric pressure on the surface of the open water supply to drive the water up the suction hose and into the pump to fill the vacuum created. Under absolute vacuum conditions a maximum 'lift' of 34 ft. is theoretically possible, but under the most favour-

purposes, but as a water tower from the top of which large quantities of water can be pumped on to a high, burning building.

Various other ladders for use in varying circumstances are carried on fire appliances, together with numerous items of 'small gear,' each piece having its own particular use.

Hose.—The original hose used in fire fighting was made of leather, riveted throughout its length. The excessive weight and its inflexibility confined the lengths to short pieces only. The first flexible hose was made in 1672 by J. van de Hyde, Snr., and J. van de Hyde, Jnr., by sewing together the edges of strips of leather. This was a great step forward. Modern hose is made of vegetable fibres woven in such a way as to withstand considerable internal pressures and rough

Merryweather

TURNTABLE LADDER

able working conditions the maximum possible 'lift' is 28-30 ft. See also PUMPS.

Fire 'Escapes' (Ladders).—In residential or factory areas the 'first attendance' to a fire usually includes an escape carrying appliance and the ladders, known as escapes, are designed to be used rapidly for rescue purposes up to a height of about 50 ft. Designs vary, but escapes consist generally of an extending ladder in three sections which are extended by means of steel cables from drums and winch handles, mounted on a sliding carriage enabling the elevation of the ladders to be varied as required. Very rapid and effective use is often made of this piece of equipment. With the increase in height of modern buildings came the need for firemen to get still higher with their apparatus and the escape was developed into the turntable ladder which, although similar in principle to the escape, is constructed normally of steel, power driven, and, as the name implies, is mounted on a turntable on the main vehicle, by which it can be rotated through a complete circle. By the simple operation of levers, the ladders may be manoeuvred into any position required within its range (up to 150 ft.). The turntable ladder is not only used for rescue

abrasions externally. The main fibres used are flax, jute, ramie, cotton, and hemp. Experiments have been made with synthetic fibres (rayon and nylon) though these, for one reason or another, have not yet been found entirely satisfactory. Hose is mainly of two types—'unlined,' which is the ordinary woven fibre, and 'lined,' which contained a very fine layer of rubber or latex covering the whole of the inside of the hose. The latter is the heavier to handle, but the smooth surface of the rubber greatly minimises the friction on the water, and also reduces the amount of water damage within buildings, for this type of hose does not leak as the 'unlined' type does. 'Unlined' hose is usually in 75 ft. or 100 ft. lengths and 'lined' in 50 ft. lengths, each length being capable of being coupled to any other by (usually) brass instantaneous couplings. The diameter of hose varies according to the use to which it will most likely be put, but the most common size for all normal fire fighting purposes is 2½ in. diameter. Fire appliances each carry 1000-2000 ft. of hose according to locality and need.

Fire Alarms (Street).—Most large built-up areas are equipped with an electric fire alarm system, with fire alarm posts situated at convenient positions in

the streets and roads, which connect direct to the fire station. The fire alarm is usually operated by breaking a glass panel and pulling a knob. This immediately makes electrical connection with the fire station where bells are automatically actuated, and the code number of the fire alarm which has been operated is punched out on a tape machine, together with the exact time. There are two main types of fire alarm—'open circuit,' where the actuation of a fire alarm box closes the electrical circuit, and the 'closed circuit' where actuation of a box breaks the electrical circuit, in each case causing the alarms to be given at the station. One disadvantage of most street fire alarm systems is that the person giving the alarm must wait at the post until the arrival of the brigade, and then direct them to the actual address of the fire. Modern development is overcoming this feature by enclosing a telephone in the alarm post so that the caller may speak to the fire station, and give necessary details of the address. It is questionable whether, in highly built-up areas, street fire alarm systems are now so essential as they were, for, with telephones so often readily available, and with emergency facilities, this latter method of calling the brigade is almost as quick as the street fire alarm system, with the advantage also that the full address of the fire can be given.

Fire Alarms (Automatic).—Automatic fire alarms within buildings are devices which automatically respond to any sudden rise in temp. or any gradual rise above a predetermined temp. within a room or compartment, and give an alarm of fire by ringing a bell either outside the building protected to call attention to passers-by, or in a fire station, or both. These automatic alarms work on one of the following principles: (a) thermostatic control, where a rise in temp. will expand a piece of metal situated in small containers fitted at intervals to the ceiling; (b) the expansion of a volatile liquid in a small diameter copper tube running round the walls at ceiling level; or (c) the expansion of lengths of wire situated at intervals on the walls causing a weight to drop. In each case the action causes an electric circuit to be completed for the operation of the alarm bell.

Automatic Sprinklers.—A sprinkler system within a building consists of a range of pipes fitted at ceiling level and connected to a pressure supply of water (e.g. tn. mains, overhead tank, pump from riv., etc.). On the range of pipes are situated at regular intervals sprinkler heads or outlets, having 1-in. diameter, which are sealed in such a manner that they are automatically opened at a predetermined temp. These sprinkler heads are fitted normally one for each 100 sq. ft. (i.e., at 10 ft. intervals) and the seal consists of a seating held in position by a special solder which melts, or by a small quartz bulb containing a volatile spirit which when expanding on being heated, shatters the bulb, thereby releasing the valve seating. The operating temp. may

be varied, and is normally at 155° F. The water issuing from the pipe impinges on a deflector which causes it to 'sprinkle' in umbrella shape over a floor area of approx. 100 sq. ft. In buildings which may become very cold in winter, e.g., riverside warehouses, with the possibility of water in a sprinkler system freezing, a special 'alternate' system may be installed whereby the pipes are charged in winter time with air under pressure, but with an automatic device for rapidly expelling the air and admitting the water in the event of fire. The value of the automatic sprinkler installation lies in its ability not only to detect a fire but also to confine it or extinguish it, and also to give warning by an alarm bell that it is in operation.

Adaptations of the sprinkler system have been made for use on oil fires where water at ordinary pressures would not be suitable for extinguishing burning oil. This adaptation causes water to be ejected on to the surface of the burning oil at high pressure, thereby creating a water-oil emulsion which will not burn readily. Further variations of the sprinkler system may be found outside of buildings which are separated from others only by a short distance. This variation, known as a 'drencher system,' is to create a water curtain down windows and other openings to prevent fire spreading from the nearby buildings. A similar device may be found in many theatres, where the purpose is to provide a cascade of water down the safety curtain to keep it from buckling and falling in the event of a fire on the stage. A system, not unlike the automatic sprinkler system in principle, is the automatic Carbon Dioxide (CO₂) installation which is used to extinguish fires involving oils, spirits, or electrical equipment. On the automatic opening of a valve at a predetermined temp., the room or chamber protected is flooded with carbon dioxide gas. One advantage of this system is that no water damage is caused to delicate electrical apparatus, and on the dispersal of the gas no damage has been caused to any unburned oil or spirits.

Fire Extinguishing Media.—To produce the phenomena of fire three factors are essential to combustion. They are: 1, the presence of a combustible material, or fuel; 2, the presence of air or oxygen to support the combustion; and 3, the attainment and maintenance of a minimum temp., according to the nature involved. If any one of these three essentials are removed then combustion will cease, and fire extinction consists of this action either by 1, removing the burning material (starvation of the fire of fuel); 2, reducing the available air or oxygen (smothering); or 3, reducing the burning material to a temp. below which it will not continue to ignite or re-ignite (cooling). Some methods of extinguishment involve more than one of the above.

Water is the most common extinguishing agent. In the first place, it is the cheapest and most readily available agent, but, secondly, and particularly, it is a

substance which will absorb most heat from a burning material and thereby reduce it below its ignition temp. This is due to the fact that water absorbs 85 calories per gram (153 B.Th.U. per lb.) on being heated from normal temp. to boiling point, but to convert boiling water to steam will absorb 540 calories per gram (973 B.Th.U. per lb.). It will be seen, therefore, that if water is to be used to best advantage it should be converted into steam by the burning material in order that the maximum possible heat is thereby absorbed, for it takes about six times as much heat to convert water to steam as it does to raise it to its boiling point. These figures, compared with those relating to other extinguishing media, show that water has a very much greater capacity of absorbing heat and consequent reduction of the temp. of the burning material to below its ignition temp. *Foam* is a chemically produced solution not unlike thick soap suds in appearance. Is used for the smothering (or excluding oxygen from) burning oils, spirits, fats, etc. Water on this type of fire would have the effect of spreading the burning material. *Carbon Dioxide* and *Methyl Bromide* are inert gases, heavier than air, both of which are used to having a smothering effect on burning materials. They have also some cooling properties, but limited compared with water. These extinguishing agents are particularly suitable for use on electrical apparatus, for they are non-conducting and non-damaging. Certain *dry powders* have been used for fire-fighting purposes. Generally these powders contain a large percentage of sodium bicarbonate, together with chalk, whiting, sand, etc., and for ordinary fires are no more effective than a bucket of water. Various methods are used to eject forcibly the powder on to the fire. Certain classes of fires, however, cannot be extinguished by water or liquid extinguishers, and dry powders of one kind or another only are possible, e.g. for fires involving magnesium, sodium, etc.

Fire Protection.—In recent years considerable emphasis has been placed on the specialised knowledge of fire prevention, and the protection of life and property against fire, as opposed to fire extinction, and there is in every fire brigade at least one specially trained officer who is available to give advice on these subjects. In principle, the aim of these specialists is to reduce the work of the fire fighter by, if possible, preventing fires, or if that is not possible, the danger of loss of life, to lessen and to minimise the spread of fire and thereby reduce the damage. These aims are carried into effect by the inspection of all types of property and the giving of free advice to the occupiers, on matters relating to building construction, means of escape in case of fire, fire prevention, water supplies, access for fire appliances, etc. (See also **FIRE-RESISTING BUILDINGS AND MATERIALS.**) The following is a summary of fire protection legislation concerning chiefly means of escape and public safety:

- 1, Public Health Act, 1936 (sections 59 and 60);
- 2, Factories Act, 1937 (sections 34, 36, and 37);
- 3, Celluloid and Cinematograph Film Act;
- 4, Cinematograph Act, 1909, and Regulations;
- 5, London Building Acts;
- 6, Miscellaneous Factory Orders and Regulations;
- 7, Regulations made under Education Act, 1944;
- 8, Children and Young Persons Act, 1933;
- 9, Theatres Act, 1943;
- 10, Local Acts, Orders, Regulations, and Byelaws;
- 11, Petroleum (Consolidation) Act, 1928, and Regulations;
- 12, Explosive Acts.

S. Hodges, *Electricity and Fire Risk*, 1947; J. W. Kenyon, *The Fourth Arm*, 1948; Sir A. Fibrebrace, *Fire Service Memories*, 1949.

Fireclays, are clays which will withstand a high degree of heat, without excessive shrinking or warping. The varieties of F. differ in their degrees of fusibility owing to the variations in the proportion of free and combined silicon; they are essentially hydrated aluminous silicates with lime and magnesia in the form of carbonates, iron pyrites, free silica, potash, and soda, with a percentage of water. No fixed standard of refractoriness can be given, but in all good F. the fusion point is over 1600° C. Such materials as ganister, sand, sawdust, etc., are mixed up with F. before burning to ensure the 'body' of the brick being sufficiently open in character. Ordinary fireclays are used for making bricks, crucibles, chimney-pipes, etc., but when special properties are required in the bricks, such materials as lime, *bauxite*, etc., are added. Fireclay is found in conjunction with coal at Stourbridge, Glasgow, Newcastle-on-Tyne, and many other places in the British Isles. It is also found in Germany, France, Belgium, the U.S.A., etc.; the beds do not as a rule exceed 2 ft. in thickness. The Stourbridge F. are world-famous, and widely exported.

Firedamp, the name applied by miners to methane (CH₄), *q.v.* It comes from the crevices in the mines, being formed in the coal, and when mixed with the air in a certain proportion is highly explosive, causing many accidents. See **COAL-MINING**.

Fire Engines, Escapes, etc., see under FIRE BRIGADES.

Fire-extinguishing Compounds, see FIRE BRIGADES—*Fire Extinguishing, Media.*

Firefighting, see FIRE BRIGADES and FIREFIGHTING.

Firefly, name given to the luminous beetles belonging to the Lampyridæ and the Elateridæ. The former family include the true glow-worm (*q.v.*), the Eng. species being *Lampyrus noctiluca*. Little is known as to the light given by the Lampyridæ, but most entomologists agree that it has a sexual significance; in the *Luciola*, F. of S. Europe, this brilliance is almost entirely confined to the male. To the Elateridæ belong the genus *Pyrophorus*, tropical Amer. beetles, some of whom possess remarkable luminosity; *P. noctiluca* has a yellowish eye-like lamp on each side of the thorax, and another on the ventral surface of the abdomen. These beetles are used by the natives as lanterns, and the women ornament their hair with them.

Fire Insurance, see under INSURANCE.

Firelock, see FIREARMS.

Firenze, see FLORENCE.

Firenzuola, Agnolo (1493-c. 1545), It. author, b. at Florence. He at first entered the legal profession after having been a student of the law at Perugia and Siena, and practised in Rome, where he was the friend of Aretino. It is said that he joined the order of monks at Vallombrosa, and after the death of Pope Clement VII. he became abbot of Prato. Among his works are: *Discorsi degli animali*; *I Lucidi*; *La Trinzia*; and a *trans.* of the *Golden Ass* of Apuleius. His works were first collected and pub. by P. L. Fantini in 1802. See life by M. Olivieri, 1935.

Fire of London, see GREAT FIRE OF LONDON.

Fire-raising, term used in Scots law for what is known in Eng. law as arson. It applies to the setting fire wilfully to someone else's property, such as burning ships, buildings, growing wood, or corn, coal or articles of that sort. The law with regard to this also forbids setting fire to one's own or other people's property with the intention of defrauding the Insurance Company, and these offences are punished in Scotland with penal servitude.

Fire Resisting Buildings and Materials. The purpose of erecting fire resisting buildings is to give greater safety to life and property by providing safe exit for occupants, reducing outbreaks of fire and minimising fire spread. This is achieved largely by the use of building materials which are not only incombustible but which will not readily transmit heat. They must also withstand rapid cooling during fire fighting. Those building materials which offer the most resistance to fire are solid clay bricks, stone, concrete. Steel is incombustible but, if exposed to heat will (a) expand and cause damage to the structure, and (b) lose much of its structural strength at temps. reached in moderate fires. Cast iron will 'resist' fire but may collapse suddenly on being cooled. These

latter two materials should be well clad with concrete or other non-heat conducting and incombustible material.

Considerable progress has been made in recent years in the classification of building materials and elements of structure into various grades of fire resistance following subjection to comprehensive standard tests. This work is carried out jointly by the Department of Scientific and Industrial Research and the Fire Offices' Committee. As a result, architects, builders and others, having determined the degree of resistance required for their particular purpose, may select materials and forms of construction falling within certain specified grades ranging from $\frac{1}{2}$ hr. to 6 hrs. resistance to fire spread. Wall boards or building boards used for internal work are also graded according to combustibility, but some of these materials, although, in themselves comparatively incombustible, have the character of spreading flame rapidly across their surface. Large buildings sub-divided by internal fire resisting walls must have door and window openings protected to be effective. The Fire Offices' Committee issue rules relating to the construction and fitting of fire resisting doors, etc. These, to be completely effective, should be self closing and held open only by a fusible link which will melt at a predetermined temp.—thus allowing the door to close.

Timber of the hardwood type (*e.g.* oak, teak) 2 in. thick gives a good degree of fire resistance for doors. Other timber with a large cross-sectional area may withstand fire for a considerable time before failing, and may be more reliable than unprotected steelwork. Woodwork may be given treatment by impregnation with certain ammonium salts or painted with a mixture of sodium silicate and china clay. This produces a 'flame retardant' effect rather than make the timber fire-resisting. Fabrics, draperies, etc., used on the stage in theatres are usually required by the Licensing Authorities to be dipped or sprayed with various solutions for the same purpose. These solutions often contain boric acid, borax and sodium phosphate.

The London Co. Council make stringent regulations relating to fire protection in certain classes of buildings.

Fire-ships, vessels filled with combustible materials for the purpose of bringing destruction on the enemy. The 'fire-chamber' was built between the decks from bulkhead to forecabin and filled with various combustible materials, among them gun-powder. These were then set on fire and sent among the enemy, the men escaping in boats. They were employed to defend Antwerp in the siege of 1585, and in 1588 to destroy some of the ships of the Armada. In more modern times Lord Dundonald used them against the Fr. in 1809, but after that they were very little used. Certain kinds of floating fire were, however, used much earlier than any of these, some being mentioned by Livy as being used in the second century B.C.

Fire Tactics have undergone considerable modifications since the first intro-

duction of firearms in warfare; the increased range and efficiency of the arms of infantry and artillery have naturally made many changes. The method of delivering fire which was originally used by the Spaniards for infantry was for each man in succession to fire, and then to fall to the rear of the line to reload. This required a great degree of coolness and individual skill to be successfully carried out. As the handiness of the musket was improved file firing became more and more irregular, and by the middle of the seventeenth century it was the usual custom for the musketeers to fire one or two 'volleys,' or 'salves,' and then charge. Until the Prussian era musketry methods were still half-hearted, and the lack of effectiveness of the infantry, may be put down to the fact that 'fire' and 'movement' were distinct, as their fire was reserved until as near the enemy as possible. The 'linear' system consisted of two long lines of battalions, giving the utmost scope for fire, as it was considered that the maximum weight of controlled fire at short range was a decisive factor. The Prussian system of fire discipline was originated by Leopold of Dessau and Frederick Wm. I., and put into operation by Frederick the Great. Under this system a battalion consisted of eight companies, which fired company volleys as follows. As the company on the extreme right commenced to fire, the second company was at the ready, and so on; the same process was gone through on the left flank, so that by the time the centre companies had fired the end companies were again ready. Since that time rifles have become efficacious at over 1000 yds., and the finding of the range has become a matter of importance. The fire of an infantry company is controlled by the non-commissioned officers and officers, who name the target and give the range. Firing by volleys is the usual method; save at short ranges independent fire and magazine fire are rarely adopted. The most important modification of rifle fire has been the adoption of rapid fire in 'bursts' as the normal method for infantry instead of slow continuous fire. Three rounds per minute is the rate for slow fire, and from eight to twelve rounds for rapid aimed fire. Machine-gun tactics are still somewhat indefinite, but one or two principles of action stand out clearly. It is important that whether they are used in numbers, or as auxiliaries, they should be free to move without being under the necessity of maintaining a relative position to some other unit. Machine-guns must also co-operate with other troops as closely as possible, and must be able to be concealed and evade the enemy's shrapnel. As the result of experience in the First World War, machine-gun companies are now attached to regular infantry battalions. The most favourable range for machine-gun fire is from 600 to 1400 yds. The same principle of firing in bursts is observed. As regards guns which come in the category of artillery, four methods of firing are used. When each gun is fired

separately at a signal from the commander of the battery, this independent fire is used to find the range, etc. When guns fire at stated intervals all along the line of the battery; this is known as battery fire. If the guns of each section are fired at the will of the commander thereof with no reference to the rest of the battery, this is known as section fire. Firing by salvos is when all the guns fire simultaneously; this is only employed very rarely, as sometimes for salutes, etc. These principles, however, have but little relation to massed attacks by tanks, preceded by very mobile troops on motor cycles and parachutists operating well behind the opposing lines and armed with sub-machine guns—co-operating with dive-bombing planes and other low-flying planes armed with machine guns. These tactics were employed by the Gers. with overwhelming success against the armies and powers of Holland, Belgium, and France in May-June 1940 and very speedily resulted in the complete defeat of all three countries. In the later years of the War the Allies developed these tactics by armoured formations and aircraft with devastating results against the Wehrmacht.

Fire-watching, see under AIR-RAID PRECAUTIONS.

Fireworks, see PYROTECHNICS.

Firmament, name applied to the vault of Heaven, the Vulgate trans. *Arma-mentum* being the rendering of the Septuagint *stereoma*, the idea in Heb. being that of something stretched out. The F. was originally looked upon as a solid sphere, which revolved and carried with it the stars which were fixed to it—also forming the div. between the 'waters above the firmament' and those below it. This led later on to the Ptolemaic system of astronomy in which there were supposed to be a number of spheres revolving one outside another.

Firmān, or Firmaun, term applied to a decree issued by the sultan. Any minister can sign such a decree, but a special one has to make it effective by placing on it the name of the sultan in a monogram. The term also signifies a passport which is granted by the sultan or a pasha.

Firmont, De, see EDGEWORTH, HENRY ESSEX.

Firozpur, or Ferozepore, dist. and tn. of the E. Punjab, India. The former has an area of 4302 sq. m., and its surface is level and fertile, wheat, barley, millet, cotton, tobacco, and oil-seeds being produced. The tn. of F. is the civil headquarters, and a military cantonment. It is situated about 3 m. from the l. b. of the R. Sutlej, and contains an arsenal. Pop. of dist. 965,000, and tn. 55,000.

Firozshahr, vil. in the dist. of Firozpur, W. Punjab, Pakistan. It was the scene of a battle which took place in 1845, when the Brit. under Sir Hugh Gough and Sir Henry Hardinge defeated the Sikhs.

First Aid, term used for assistance given immediately in cases of accident or sudden illness before medical advice can be obtained. A knowledge of a few simple rules about stopping bleeding, etc., is often

the means of saving life. Lessons in F. A. methods and principles are given to both men and women by the St. John Ambulance Association (St. John's Gate, Clerkenwell, London, E.C.), the Brit. Red Cross Society (14, Grosvenor Crescent, London, S.W.), and St. Andrew's Ambulance Association (a Scottish organisation), and Boy Scouts and Girl Guides organisations. See ANTIDOTES, BANDAGES, BLEEDING, BRUISES, BURNS AND SCALDS, CHOKING, CONCUSSION OF THE BRAIN, CONVULSIONS, DISLOCATION, DROWNING, EPILEPSY, EYE, FAINTING, FIT, FRACTURE, HYSTERIA, POISON, SHOCK, SPRAIN, SUNSTROKE.

First Empire, that of Napoleon I. who was created Emperor of the Fr. by a decree of the Senate on May 18, 1804. The Empire lasted until the restoration of the Bourbons in 1814.

First-Fruits, first profits of any office, property, etc., as e.g. in feudal tenure, the year's profit of the land after the death of the tenant, which was payable to the king; and in ecclesiastical law, the first year's income of a benefice. When the papal power was dominant, each new incumbent had to remit to the papal treasury the first year's revenues (*primitiæ*) of his benefice. Valuations of annates were made in England in the thirteenth century and probably originated about that time. At the Reformation the F.-F. enacted by Henry VIII. in England were the annates of the bishoprics which he had secured from the Papacy. Their valuation was recorded in the *Liber Regis* in 1535 and became the basis of the valuation of the Eng. clergy thereafter. In Queen Anne's reign, these annates were given up to a fund for augmenting poor livings.

First of June, Battle of the. The name given to the naval victory of Lord Howe over the Fr. which was fought off Ushant and terminated on June 1, 1794. This was the first occasion on which the Fr. naval strength in the Channel had been encountered in the Napoleonic Wars, and the victory was important in its results both in destroying Fr. naval activity in the Channel and in depriving them of a large quantity of grain which was under convoy from America. The number of ships on either side was about equal, and the fight was hotly contested; but though it is always referred to as the 'glorious' First of June, no remarkable evidence of naval skill was given. The result, however, was decisive, for the Fr. admiral lost seven ships, and 3000 men, and was compelled to seek refuge in Brest.

First Offenders Act, 1887. This Act was passed to permit the conditional release of first offenders in certain cases. It gave power to any court before whom a person was convicted of larceny or false pretences or any offence punishable with not more than two years' imprisonment to release the prisoner upon probation of good conduct instead of sentencing him to imprisonment, provided it were shown that there was no previous conviction against him. Not every first offender was entitled to such consideration; the Act expressly limiting its operation to cases

where the youth, character, and antecedents of the offender or the trivial nature of the offence, or other extenuating circumstances, justified the release on probation. This Act was repealed by the Probation of Offenders Act, 1907, because it was thought that the earlier Act gave to a court of record no powers beyond what it already possessed at common law. The Act of 1907 extended probation to the case of any person convicted on indictment and added to the extenuating circumstance those of health and mental condition. Where it released the offender it was only on condition that he entered into a recognisance, with or without sureties, to come up for sentence if called upon within three years and to be of good behaviour. The court might also order him to pay the costs of the proceedings and compensation for any loss sustained. A parent or guardian of an offender under sixteen might also be ordered to pay such compensation and costs. A court of summary jurisdiction had analogous powers under the Act. The Criminal Justices Act, 1925, extended the system adopted by the above Acts, by making provision for the appointment of probation officers and probation committees for petty sessional divs. The Act of 1907 was repealed by the Criminal Justice Act, 1948, which amends the whole law relating to the probation of offenders (for fuller details, see under CRIMINAL LAW).

First Republic, proclaimed in France on Sept. 21, 1792, by the National Gov., following the downfall of the Bourbons in the Fr. Revolution. The Convention was succeeded by the Directory (q.v.) in 1795 and by the Consulate in 1799. The Republic ended with the estab. of the First Empire (q.v.).

Firth (Icelandic *firðir*, Eng. *frith*), Scottish name applied to a narrow arm of the sea, e.g. Firth Bay, a shallow inlet 6 m. from Kirkwall, etc. It is frequently a riv. estuary, as the firth of Forth and the firth of Clyde.

Firth, Sir Charles Harding (1857-1936) Eng. historian, b. at Sheffield. F. was lecturer at Pembroke College, 1887-93; Ford's lecturer in Eng. hist. in the Univ. of Oxford, 1900; fellow of All Souls (1901), of the Brit. Academy (1903), of Oriel (1904). In 1904 he was appointed regius prof. of modern hist. at Oxford. His works include: *Scotland and the Commonwealth* (1895), *Journal of Joachim Hane* (1896), *Scotland and the Protectorate* (1899), *Oliver Cromwell* . . . (1900), *Cromwell's Army* . . . (1901), *Naval Songs and Ballads* (1907), *The House of Lords during the Civil War* (1910), eds. of lives of Col. Hutchinson (1885), and the duke of Newcastle (1886), Ludlow's *Memoirs* (1894), and *The Clarke Papers, 1891-1901*. He also contributed to the *Dict. of Nat. Biog.*

Firth, Mark (1819-80), philanthropist and steel manufacturer, was a native of Sheffield. In 1843 he estab. in Sheffield his own steelworks, which grew rapidly in size and importance, and where eventually most of the steel ordnance came to be manufactured. As a philanthropist he

figures as the donor of a park (opened in 1875), Firth College (founded in 1879), and almshouses, all of which gifts were bestowed on Sheffield.

Fiscal Reform, see **TARIFF REFORM**.

Fischart Johann, known as **Mentzer** (Mainzer) (c. 1545–c. 1591), Ger. satirist, a native either of Strasburg or Mainz, and seems to have been a student at Worms. He took the degree of doctor of the Univ. of Basle about 1572, and after travelling in France and England went to Strasburg about 1576, and in 1581 became advocate to the imperial court at Speyer. After his marriage he became magistrate or bailiff at Forbach, near Saarbrücken (1583). His works, the greater number of which were written between 1575 and 1581, are many of them clever satires directed against the pope, the Jesuits, the aristocracy, and all sorts of folly. They are mainly based on the model of Rabelais, but at the same time are characterised by a true originality. In addition to these satires there are many works which are purely humorous, and which assure to him one of the highest places among Ger. humorists. He was also a master of his own language, which fact is exemplified very clearly in his trans. of the *Gargantua* of Rabelais. He also wrote a number of other works, though the authenticity of some of the works attributed to him has not been estab. Among his satires are: *Aller Praktik Grossmutter* (1572), *Affentuerliche Geschichtschrift von Gargantua und Pantagruel* (1575), *Podagrammisch Trostbüchlein* (1577), and *Bienenkorb des heiligen römischen Imenschwarms* (1579) while *Flöhhalz* (1573) and *Weiber Tratz* (1573) are among his humorous work. He also wrote *Das glückhafte Schiff von Zürich* (1576). See lives by C. H. W. Wacknerhagl, 1870, and A. Hauffen, 1921–22.

Fischer, Emil Hermann (1852–1919), Ger. organic chemist, b. at Euskirchen. Studied at Bonn and Strasburg and, after some years as assistant to von Bayer in Munich, became prof. of chemistry, first at Erlangen and then at Würzburg. Later he succeeded von Hoffmann as prof. of chemistry at Berlin, and during his tenure the school flourished so that students came to it from all parts of the world. He became famous for the preparation in conjunction with Julius Tüfel of synthetic sugars and from these of the ferments and enzymes. His work on proteins was, however, his principal achievement. His other researches included the analysis of the constitution of the rosaniline dyestuffs; investigation of uric acid; and the preparation of purin and its derivatives. The value of his work in organic chemistry was recognised in most countries: in 1890 he was awarded the Davy Medal of the Royal Society; and in 1902 the Nobel prize for chemistry.

Fischer, Ernest Kuno Berthold (1824–1907), Ger. philosopher, b. at Sandewalde, Silesia, and was a student at Leipzig and Halle univs. He became a lecturer at Heidelberg, and in 1856 prof. of phil-

osophy at Jena until 1872, when he succeeded Zeller at Heidelberg. His chief work is *Geschichte der neuern Philosophie* (1854–1910). He also wrote: *System der Logik und Metaphysik oder Wissenschaftslehre* (1852–1909), *Franz Bacon und seine Nachfolger* (later ed., 1875), *Benedikt Spinozas Leben und Charakter* (1865), *Anti-Trendelenburg* (1870) and *Goethe Schriften* (1888–1904). See studies by E. Traumann, 1907 and E. Hoffmann, 1924.

Fischer, Hans (1881–1945), Ger. chemist, b. at Hoechst. He was educated at Lausanne, Marburg, and München, and later held various professional appointments in Vienna, Innsbruck, and Munich. In 1930 he received the Nobel prize in chem. for his work on the red colouring matter in blood.

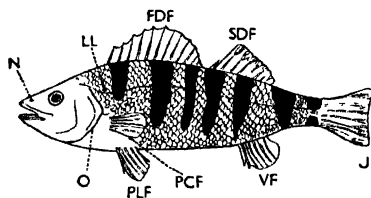

Fischer, Johann Georg von (1816–97), Ger. poet and dramatist, b. at Gross-Sussen, Württemberg. He studied literature and botany at Tübingen, in 1846 being appointed prof. at the Stuttgart Oberrealschule. His first vol. of poems was pub. in 1854, and his last, *Mit Achtzig Jahren*, in 1896. He also wrote some dramas, among the best known being *Saul* (1862), and *Kaiser Marimilian von Mexico* (1868).

Fischer, Otakar (1883–1933), Czech poet and critic, b. in Kohn. He studied Ger. literature at Prague and Berlin, becoming prof. of Ger. literature at Prague Univ. His poetry, expressing the struggle of the soul with fate, is marked by a simplicity of expression, especially in his later work. His poetic trans. combine scholarship and style: his largest work was a fifteen-vol. ed. of Goethe, and in addition he trans. works from Fr., Sp., and Eng. F. was also a literary historian and critic of distinction, producing monographs on Kleist (1912), Nietzsche (1913), and Heine (1924). His critical work is collected in *Duch a Slovo* (1927), and *Staro a svét* (1938). See V. Jirát and others, *Dilo Otakara Fischera*, 1933.

Fischer-Tropsch Process, system of synthesising hydrocarbon waxes and oils from hydrogen and carbon-monoxide. It was invented in Germany by Franz Fischer and Hans Tropsch in 1925 and under the pressure of war preparation was developed intensively to produce liquid fuels. During the Second World War nine plants produced a total ann. output of 500,000 tons of synthetic oil. In this process coal is converted into a gas mixture by high-temp. treatment. After purification it is subjected to a catalytic treatment in which 80 per cent of the gases is converted to the required products, generally the fine hydrocarbons and straight-chain paraffin. The compressed gas may be used as a raw material for chemical production or as a portable fuel. The motor spirit, provided it is reformed or combined with high-grade fuel, is suitable for petrol engines. Diesel oil of very high quality is another product; the wax is suitable for polishes, etc., by further treatment of the primary products, detergents, soap, fats, and lubricating oils may be produced.

Fiscus, or **Fisc** (Lat. *fiscus*, a basket or money-bag), was in the time of the Romans the name applied to the emperor's treasury to distinguish it from the *erarium*, or state treasury, and later on designated the public money which he had by virtue of his office. This is the modern sense of the word, the word *erarium* having been discontinued for a long period.

Fish (O.E. *asc*, Dutch *visch*, Lat. *piscis*), class of vertebrates which live under water, breathe through gills, and whose limbs are modified into fins. There are four orders: the Elasmobranchs, the Ganoids, the Dipnoi, and the Teleosteans. The Elasmobranchs, or cartilaginous F., were very numerous in prehistoric times, but are now only represented by such F. as skates, rays, sharks, and dog-fish. The

EXTERNAL FEATURES OF A TELEOSTEAN, OR BONY FISH (THE PERCH)

N, nostril; LL, lateral line; FDF, first dorsal fin; SDF, second dorsal fin; J, caudal fin; VF, ventral (or anal) fin; PCF, one of the two pectoral fins; PLF, one of the two pelvic fins; O, operculum (gill cover).

Ganoids, or armoured F., are nearly extinct. The members of this order are the sturgeon and bony pike, the Polypterid and the Amla. The Dipnoi, or lung-fish, consist of three groups: the *Protopterus*, the *Lepidosiren*, and the *Ceratodus* (*Epiceratodus forsteri*) found in W. Africa, the Amazon R., and Queensland respectively; related to these are various fossil forms and one present-day genus (*Latimeria*), the latter known from a single specimen discovered off the W. coast of Africa in 1939. The Teleosteans, the newest of the four orders, include nearly all modern F. They possess a bony vertebral column, a brain and dorsal nerve cord, branchial clefts communicating with gills; they are covered with scales and have two paired fins without fin-rays, and unpaired fins and a tail, with fin-rays. The Elasmobranchs have few eggs and are often viviparous, but the majority of other F. have very numerous eggs. The sight of F. is keen, but owing to the nature of the element in which they move, the range of vision is probably very limited. Although their hearing apparatus does not appear to be as complete as that of animals of a higher grade, they possess this sense to a remarkable degree. The sense of smell is also acute and the olfactory nerves are usually of large size; they also possess a

special sensory system located in the lateral line. Although some F. appear to feed upon vegetable substances, by far the largest number are carnivorous, the preying of one species upon another being nature's method of preserving the balance between them. It appears to be almost necessary that this should be so, as, for example, a single cod can lay as many as 4,000,000 or 5,000,000 eggs. The eggs of the fish form the hard roe: two elongated oval lobes, one on each side of the body, placed between the ribs and the intestinal canal; the eggs of the sturgeon are known as caviare. Apparently when the female has deposited her eggs she takes little further interest in them and it is the male who does any tending or guarding that must be done. The testes of the male fish are the soft roe. The air bladder functions as a float or hydrostatic organ. Of recent years much interest has been taken in the F. that inhabit the very deep seas, and some interesting light has been thrown upon them. The long-doubted kraken or octopus of huge dimensions has apparently now taken a settled place in the world of natural hist. It is contended that he is but one of many of the denizens of the ocean able to live at great depths of which we have little knowledge. Below a certain depth the F. appear in many cases to have the power of creating their own light, being equipped with luminous organs. The purpose of this self-made lamp is not clearly known, and whether it constitutes a sex call, or is a warning to enemies, or a lure for prey is still a subject of surmise. The colouring of F. is of remarkable variety, and, in some cases, of great beauty. Generally speaking it seems to be of a protective nature, assisting the F. to camouflage themselves (like 'mimetic' insects), wherever they may be, by close resemblance to their surroundings. Thus along the muddy floors of the sea the flat-fish shows the brown upper surface that is indistinguishable from the ground on which it rests, F. dwelling in the duller waters are brown and dull leaden in hue, while those that float upon the currents or near the surface, have the green and blue markings suggestive of the waves. Very beautiful and rich colours are found in those that move near to the bright vegetation, and strangely enough in some that dwell in the very deep seas, although in the latter cases they resemble autumn hues rather than the gay tints of summer. Many kinds of F. are gregarious and keep together in shoals and schools. A curious variation of this fondness for company lies in the fact that sailing ships at sea are sometimes followed for amazing distances by F. that have picked them up en route.

The fish was a symbol of Christ in early Christianity, for the first letters of the titles of Christ in Gk. (*Ἰησοῦς Χριστός Θεοῦ Υἱός* *Σωτήρ*, i.e. Jesus Christ, Son of God, Saviour) make up the word *ΙΧΘΥΣ* (fish.)

See also **FLAT-FISH**, **FISHERIES**, **PISCICULTURE**. See J. R. Norman, *A History of Fishes* (3rd ed.), 1947.

Fish Curing, term used to describe methods of preserving fish intended for

distant markets or for consumption at a later period. This is usually done by salting, drying, or smoking. Of recent years the improved facilities of carriage and the use of refrigeration have made it unnecessary for fish to be cured for marketing in many cases where it was once essential; but against this, the enterprise of merchants in various parts of the world has built up a demand in remote areas where previously little trade was done. The two chief varieties of fish thus treated are herrings and cod. The latter of these are usually dried, either split or treated whole. The fish curers of Iceland are especially well known for their skill in preserving cod, which enables it to be sent to very remote areas. Herring-curing is usually done by salting, the pickle being little more than the natural salt of the sea brine. A large demand exists for smoked herrings, and great care is taken in selecting the right kind of wood to be used for this purpose, as the flavour is very easily affected by the nature of the smoking. Around the Brit. seaboard many endeavours have been made to deal with the problems arising from the occasional unexpected glut of herrings, and, where suitable warehouse accommodation exists, and a local pop. prepared to join in 'rush jobs' is available as in some places on the Northumberland coast, large quantities of herrings are frequently cured with remarkable speed.

Fish, Royal. In Eng. law, certain fish (whales, sturgeons, porpoises, etc.), when taken in territorial waters, belong to the Crown or its grantees, though caught by another person.

Fisher, Andrew (1862-1928). Australian statesman; b. at Kilmarnock, Ayrshire Scotland; son of Robert F. Worked in a coal-mine, and went to Queensland in 1885. Elected to Queensland legislature in 1893; minister of railways in Dawson administration. In 1901 entered Commonwealth Parliament as Labour member for Wide Bay. Joined Watson Labour Cabinet, 1904, as minister of trade and customs. Leader of party from 1907. In 1908 Prime Minister for six months. In 1910 back in power. Privy Counsellor 1911. Gov. fell, 1913; but he returned to power Aug. 1914. Resigned 1915 and became high commissioner in London; where retiring 1921, he d. Oct. 22.

Fisher, Geoffrey Francis (b. 1887). Eng. schoolmaster and churchman, son of the Rev. H. F. rector of Higham-on-Hill, Nuneaton. Educated Marlborough College, and Exeter College, Oxford. Liddon studentship, 1910. At Wells Theological College, 1911. Assistant master, Marlborough College, 1911-14; headmaster of Repton School, 1914-32, bishop of Chester, 1932-39; of London, 1939-45, dean of the Chapels Royal, 1939-45. Elected archbishop of Canterbury in succession to Wm. Temple, on Jan. 22, 1945, and enthroned April 19.

Fisher, Herbert Albert Laurens (1866-1940), Brit. scholar, parliamentarian, and historian; b. in London, eldest son of H. W. F. Educated at Winchester; New College Oxford; Paris; and Göttingen.

Fellow of Brit. Academy, 1907. Delivered S. African lectures, 1908; Lowell lectures, Boston, Massachusetts, 1909 and 1924; Chichele lecturer in modern hist., Oxford, 1911-12. Member of royal commission on public services of India, 1912-15; of gov. committee on alleged Ger. outrages, 1915; vice-chancellor of Sheffield Univ., 1912-18. His metallurgical and general scientific ability, combined with his academic gifts, brought him to the notice of Mr. Lloyd George and, after being elected Liberal M.P. for the Hallamshire Div. of Sheffield (1916), he was appointed president of the board of education, and in that capacity he served until the fall of Lloyd George's second Coalition Gov. In 1922. From 1918 to 1926 he took his seat in the Commons as National Liberal member for the Eng. Univs. As president of the board of education he was responsible for the far-reaching Education Act of 1918, which was framed 'with a view to the establishment of a national system of public education available for all persons capable of profiting thereby.' The Act embraced nursery schools, elementary, secondary, and continuation schools, and 'further' education and teaching of univ. standard. F. also initiated an admirable scheme of teachers' superannuation, and introduced the block system of grants in elementary education. He left a lasting memorial in his masterly *History of Europe* (3 vols. 1925), a work which gives him a place among the great historians of England. Of his other works the more important are *The Medieval Empire* (1898); *Studies in Napoleonic Statesmanship* (1903), significant for its account of the emperor's reorganisation of Germany; *The Political History of England, 1485-1558* (1906); and *Bonapartism* (1908). Other works: *Life of F. W. Mailland* (1910); *The Republican Tradition in Europe* (1911); *Political Unions* (1911); *Napoleon Bonaparte* (1913); *Studies in History and Politics* (1920); *An International Experiment* (1921); *The Common Weal* (1924); *Life of Lord Bryce* (1926); *Life of Sir Paul Vinogradoff* (1927); *Whig Historians* (1928); *The Bay Colony* (1930); *England and Europe* (1938); and *An Unfinished Autobiography* (1940). F. was great in his conception and wide vision of life and great in the representation of those things for which the people of this country fought in two world wars—the emancipation of the mind and a ceaseless spirit of inquiry.

Fisher, John (c. 1459-1535), bishop of Rochester, a native of Beverley Yorkshire, educated at Cambridge, becoming master of Michaelhouse College in 1497. He was appointed by the countess of Richmond, mother of Henry VII., as her confessor, and in 1504 became chancellor of Cambridge Univ. and bishop of Rochester. He was a staunch supporter of the new learning and also of the authority of the Church, which made him a vigorous opponent of Henry VIII.'s divorce from Catherine of Aragon. For this reason, and on account of the pope making him a cardinal, he was accused of treason and beheaded by the king's orders.

Fisher of Kilverstone, Sir John Arbuthnot Fisher, first Baron (1841-1920), Brit. admiral; b. on the Wavenden estate, Ceylon; son of Capt. Wm. F., 78th Highlanders. Entered the navy in 1854, and served in the Crimean war of 1855, and the China war of 1859-60; took part in capture of Canton and Peh-ho forts. In 1882, as commander of the *Inflexible*, he was present at the bombardment of Alexandria. He became director of naval ordnance, 1886, and served as such until 1891. Thereafter he received steady promotion, holding a number of commands, and was First Sea Lord of Admiralty from 1904 until 1910. He was ennobled in 1909. During his term as First Sea Lord he introduced many reforms, including that of the nucleus crew, which rendered a peacetime navy rapidly available for war; the elimination of obsolete ships; and the substitution of the Dreadnought type. He will go down in hist. as the man who, in 1910, predicted the date of the war with Germany and shaped his policy accordingly. Under many govts. he laboured and planned with extraordinary success to provide an adequate fleet, and when the First World War broke out the Grand Fleet was in readiness to sail to the right location and thwart the enemy, which it did by going, at the psychological moment and without delay, to its different war stations in the mouth of the Elbe and at the entrance of the Channel. The authority for the statement that F. predicted the date of the war is Lord Hankey, who states that it was at Kilverstone that F. foretold the approximate date, and said that Jellicoe would command the fleet when the war came. Regardless of the predilections of others, he made promotions with this end in view.

He retired from the Admiralty in Jan. 1910, after a long quarrel with Adm. Lord Charles Beresford, who had been in charge of the Channel fleet, and who brought charges of parsimony against the Admiralty, which a committee of the Cabinet found to be unsustainable. F. also retired from the navy in 1911. In 1912 he was president of the royal commission on oil fuel and engines, and it was through the researches of this body that in 1913 the Admiralty launched the first oil-fired battleships of the *Queen Elizabeth* class and that the first light Brit. cruisers (*Arethusa* class) to burn oil fuel were on the point of being commissioned when the war commenced. The *Arethusa* class certainly proved its value in the war, notably in the action off the bight of Helligoland. F., however, wanted to go further, and instal the internal combustion engine in ships which should offer a mark of some 33 per cent less area than any 5000-ton vessel theretofore built and be able to circumnavigate the globe without refuelling. But sound as the idea was, the time was not ripe for so great a change in construction. When the war commenced F. had been in retirement since the age of seventy, though after that age he continued to exercise a very real influence on naval policy, and in parti-

cular his advice was sought by the gov. and followed in the handling of the Agadir incident (q.v.). When, through prejudice and popular clamour, the marquess of Milford Haven (q.v.) was driven to resign office, F. succeeded him as First Lord, and at once commissioned some 600 vessels of all classes, and in many cases of new design, to be completed by the early part of 1915. His ambitious plans, however, for the use of these ships were frustrated by the Dardanelles expedition, which was diametrically opposed to his naval policy of striking at the heart of Germany by a landing force, covered by the navy, on the coast of Pomerania. When he saw that ships were being gradually withdrawn from the North Sea forces to supply the needs of the Mediterranean forces, so that (in his opinion) Brit. control of the sea was in jeopardy, he tendered his resignation, and retired immediately after the Coalition Gov. came into office. But this did not mark the actual end of his services, although no adequate sphere for his great energies and amazing prevision was thereafter open to him in naval affairs. But his work in organising the Board of Invention and Research, a purely advisory body, which work he rendered on recall in 1915, was highly effective. He appears to have spoken in the House of Lords on two occasions only, and then only on matters arising out of the Dardanelles expedition. Laconic in the extreme, the first speech, following the resignation of Mr. Churchill from the Cabinet in Nov. 1915, was by way of retort to Mr. Churchill's accusation that the First Sea Lord had not given clear guidance or firm support over the Dardanelles question. Possibly the accusation was justified, for F.'s heart was never in the expedition, but in his reply he said that, having rendered sixty-one years of service, he was content 'to leave his record in the hands of his countrymen,' and that it was not in the national interest to make aspersions when the country was in the midst of a great war. The second speech was in March 1917, and was to much the same effect. Although thus laconic in debate, he was, especially as he grew old, garrulous and flowery in discussion and correspondence. Whatever his faults of impulsiveness and sailor-like bluntness—as exemplified by his famous phrase 'Sack the lot'—he was essentially the great organiser and administrator who created the modern Brit. Fleet and whose uncanny strategic prevision secured its efficiency and readiness for war. In July 1918 his wife d. Thenceforth he resided almost entirely with the duke of Hamilton's family. In 1919 he pub. two very characteristic books—*Records*, and *Memories*. From these the reader gets the impression that Cutcliffe Hyne's Captain Kettle was drawn, in part at least, from F. He d., after undergoing three operations, at 10 St. James's Square, London, July 10, and was buried in Westminster Abbey. His brother, Sir Frederic Wm. F. (1851-1943) was also a naval officer. Served in the Mediterranean, 1887-91; in Australian service from 1894 to 1898. Promoted

admiral 1907. President of the Royal Naval College, Greenwich.

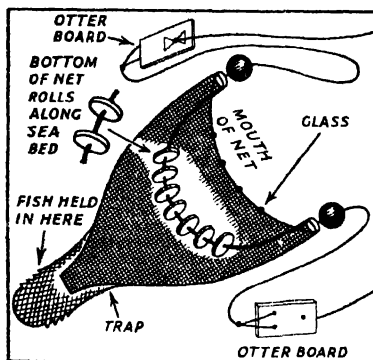

Fisher, Sir (Norman Fenwick) Warren (1879-1948). Brit. civil servant and public administrator, educated at Winchester and Hertford College, Oxford. Entered the civil service by open competition, 1903, and was appointed to the Inland Revenue Dept. He was one of those chosen by Sir Robert Morant to assist in organising the scheme of the National Health Insurance Act, 1911, his marked ability in this work bringing him under the notice of Mr. Lloyd George. In 1913 he was made a commissioner of inland revenue, and in 1914 he was deputy chairman and in 1918 chairman, of the board. On the retirement of Sir John (later Lord) Bradbury, he was appointed to the great office of permanent secretary to the Treasury, being singled out by Mr. Lloyd George as the right man to introduce progressive methods in the organisation of the civil service. F. at once recast the Treasury estab. by placing the three chief branches, finance, supplies, and estab. under separate controllers ranking as heads of first-class gov. depts., with direct access to the chancellor of the Exchequer. The permanent secretary, thus freed from much departmental routine, was formally recognised as 'head of the civil service'—a style that did not pass without a strong challenge in the Commons and outside the House. But as such he was entrusted with the duty of advising the Prime Minister on matters of common interest to the service, including especially the appointment of permanent heads of depts.—a reform which secured for a time an approach to a unified service in the higher ranks. At the same time F. also initiated other important reforms in administration, notably the estab. of the principle that the permanent head of a dept. should himself act as its accounting officer, and answer for his charge to the public accounts committee. The re-constituted Treasury, however, did not endure for more than fifteen years, and the departmental work he had diverted to the sev. controllers returned to the permanent secretary, though F. in that capacity retained the special advisory powers he had originally secured. He retired in 1939, but on the outbreak of war occupied the post of N.W. regional commissioner. In 1940 he became a special commissioner for London, with the duty of supervising the restoration of roads and public utility services after bombing, but retired from public life in 1942.

Fisheries, Ministry of Agriculture and, see FISHERIES.

Fisheries: 1. *River and Lake Fisheries.* are regarded in England as centres of sport and recreation. They are generally the right of the owner of the soil over which the water flows, and in the hands of private owners. It is divided into several and common fishery. A several fishery is the exclusive property of the owner of the soil and can only be transferred by deed; should the right be unclaimed the public acquire no title by right of custom. If

the course of a riv. is diverted, the late owner has no claim to the new channel, though with the encroachment of the riv. he simultaneously becomes entitled to the rights of fishery. The owner has the right to all the fish he can take, and is not restricted in the use of machinery if that machinery does not disturb the navigation. He cannot put up an obstruction to fish above or below the part under his control, neither may he use dynamite or any other explosive, nor pollute the riv. in any way. Common fishery is fishery which all persons may enjoy. The Crown has no right of fishery in non-tidal waters on a subject's property. The control of fresh-water F. is in the hands of dist. boards appointed by co. councils which regulate the by-laws and licences and fix the close time for the protection of fishing. There are special laws for salmon and fresh-water fishing. The prin. fresh-water fish are carp, barbel, tench, roach, bream, trout, salmon, and chub, but they are not considered of nearly so fine a flavour as sea fishes. The most important lake fishery in the world is the Great Lakes fishery in the U.S.A., from which great quantities of food fish are obtained, including whitefish, trout, pike, and perch. Huge quantities of fish are obtained from the Mississippi R. The rivs. of Russia are well stocked with food fish, and carp, bream, lampreys, and sturgeon are extensively caught in the Ural and Volga rivs.

2. *Sea Fisheries.*—The capture of fish as a food for man seems to have been carried on from very early times. Cave remains in W. Europe afford evidence of the use of many different kinds of implements for fishing and of the capture of a considerable variety of species, even including the whale. Dried and salted fish was an important article of commerce among auct. peoples, and many great maritime cities, both auct. and modern, had their origin in fishing vils. A herring fishery is known to have been estab. off the Eng. coast by the eighth century, and a little later the Brit. fishing industry had extended all over the North Sea up to the Arctic regions. The industry was greatly assisted by the growth of Christianity, since the demand for fish for fasts, enjoined by the Church, was considerable. In this country the Reformation dealt a severe blow to the F., and the Brit. supremacy in this direction was not regained till after the Napoleonic wars, having been held in the meantime by the Dutch. During the latter part of the nineteenth century the fishing industry throughout the civilised world received a great impetus from the introduction of steam. This first showed itself in the increased market for fish rendered possible by railway transit, and later spread to the methods of fishing themselves. Steam drifters and trawlers are now largely used, and by these means, and the introduction of ice as a preservative, fresh fish is sold at great distances inland. The regulation of the fishing industry has also been found necessary, as many of the best grounds were becoming worked out owing to indiscriminate methods. A scientific study

Odham's Press

OTTER TRAWL-NET

Fish enter through the wide mouth, and are trapped once they pass through the narrow funnel into the bag.

of the protection and cultivation of various breeds of fish is hoped to do much towards restocking exhausted dists. and keeping up the supply in others.

Methods of Fishing.—The numerous modes in which fish are captured all fall under three main heads: fishing by lines, nets, or traps. Fishing with a hooked line is of three varieties, known as the hand line, the small line, and the long line. Fishing by hand line is largely carried on off the E. and S. coasts of England for cod and whiting. It is only possible in shallow water near land, and the lines are single and bear one or more hooks. As each fish is caught the line is drawn up and the hooks rebaited.

Small-line fishing is the prin. method employed in the Scottish haddock industry. It is carried on by small boats, known as yaws, within 2 or 3 m. of land. The lines range about 2000 fathoms, and are usually baited on land by the wives and children of the fishermen. Mussels form the usual bait, but limpets, scallops, cockles, lugworms, and crabs are also used. The hooks are attached to snoods about 4 ft. apart, and the line, when ready, is coiled into a creel, the baited hooks all lying in the centre, and fresh grass scattered over them to keep the bait fresh. When the fishing ground is reached the lines, all fastened together, end to end, are run out over a metal cylinder. The ends are kept down by large stones, to which are also attached lines reaching to the surface, and there fastened to a buoyed flagstaff, weighted so as to float upright and mark the position. The line is shot across the tide, and is left at the bottom for from half an hour to an hour. Plaice, codlings, whittings, dabs, flounders, and gurnets are also caught by this method, though haddocks form the chief haul.

Long- or great-line fishing, also known

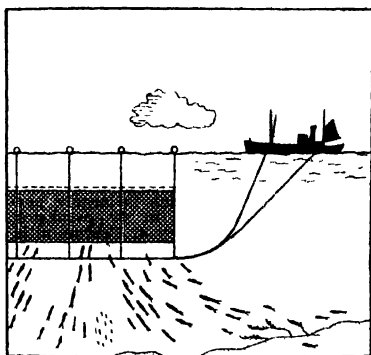

as boulder or trot fishing, follows the same principle as small-line fishing, but employs longer and stronger lines and larger hooks. It is largely used in the North Sea, by both Eng. and Scottish fishermen, at a considerable distance from land for the capture of large fish, such as cod, ling, coalfish, halibut, skate, rays, turbot, conger, and hake. Off the Scottish coast this mode of fishing is generally carried on by the herring boats, and herrings are used as bait. Off the Eng. coast large vessels with a sea-water well are used, in which the fish are kept alive. The Eng. long line is often about 8 m. long when shot, and carries over 4000 hooks; squid, whelks, herrings, and lampreys are used as bait. Steam vessels are now employed in long-line fishing, and are usually provided with an ice-chamber for storage. The Scottish North Sea long-line fishing is carried on mainly from March to July, and extends as far N. as Iceland. It requires deep water of over 200 fathoms. It is also worked during the winter over the Dogger Bank and Cromer Knoll. Boulter ('spiller' in Devonshire and Cornwall) is the term usually applied to the long line used off the S. coast of England, which is not so long as the North Sea type, and is worked from smaller open boats.

Fishing by line has sev. advantages over the use of nets. The fish secured by a line are less bruised and injured, and thus preserve their freshness better. Also, long lines can be shot over rough rocky ground and in mid water, where trawling, etc., is impossible. Many species of fish may be secured by either method, but some, such as congers, seem to be only caught by lines, and others, such as soles, only by nets.

Fishing by nets is of many different varieties. Of these the most important is trawling, by which most of the fish for the Brit. market is secured. Trawling is an industry which has been altogether developed during the last century. First used in the S.W. of England, it was introduced to Ramsgate in 1815, Harwich in 1828, Hull in 1844, and Grimsby in 1858. Steam trawlers made their appearance in 1879, and have largely increased in number, being faster and more seaworthy, and having a much larger fishing capacity than the sailing vessels. Trawlers work for the most part in about 40 ft. of water, though the operation is possible, at a greater labour, in 70 ft., and a smooth and level bottom is essential. The sailing vessels register from 30 to 100 tons, being larger off the E. coast than the S.W., and are either cutter- or ketch-rigged, the latter rig being the safer and more economical. The steam trawlers are about 130 ft. long. The North Sea, off the E. coast of England, is the great trawling ground, and large numbers of boats are owned by Hull, Grimsby, Yarmouth, Lowestoft, and Ramsgate. In winter they work on the Dogger Bank, and each vessel stores its own fish in ice and carries it in; while in summer the fleets work farther afield, off the coasts of Denmark, Holland, and Germany, and deliver up

their hauls to a steam-carrier. The S.W. coast trawlers work independently from Brixham and Plymouth, and fish near those ports in winter and S. of Wolf Rock, or off the N. coast of Cornwall, in summer. Some trawling is done by steam tugs from Falmouth and Cardiff. Another trawling ground lies off the N.W. coast of England, and is worked by boats from Tenby, Whitehaven, Fleetwood, Blackpool, Southport, and Liverpool. The Scottish trawlers are almost all steamboats, and work outside the firth of Forth, off the coast of Aberdeenshire, and in the Moray Firth, the vessels coming from Granton, Leith, and Aberdeen. A large fleet of Irish trawlers, with Dublin as their headquarters, fish between the Irish coast and the Isle of Man. Trawls are of two kinds, the beam and the otter, the latter being the newer and better. The beam trawl is a large conical bag-shaped net, with a wide mouth kept open by a beam of wood, which has iron runners at its ends. The lower edge of the net is weighted, and the whole apparatus is dragged by the boat over the sea bottom, thus enclosing the low-swimming fishes in a kind of bag formed by the hind end of the net. The net is often 80 ft. long and the beam measures from 18 to 50 ft. The net is kept extended by a stout foot-rope, and a ground rope surrs up the fishes. The net is brought on board by means of a warp of strong steel wire attached to the bridle-ropes, and the haul is emptied at the cod end, i.e. that furthest from the beam. In the case of the otter trawl, the single heavy beam is replaced by two boards which automatically come apart when the trawl is let down and come together when it is hauled in, thus rendering the latter operation much easier. The boards are often weighted with iron plates, and only one edge rests on the ground, while a direct pull on the trawl is obtained by the use of from 6 to 12 ft. of chain between them and the bridle. A simpler form of the otter trawl is used by lt. and Sp. fishermen. The labour involved in trawling is very considerable, since the hauling of a heavy trawl on board takes at least an hour, and the expense caused by damage done to the nets by obstacles on the sea-floor is often heavy. Almost every kind of fish is caught in greater or smaller numbers by the trawl, though ground-feeding species predominate. Flat fish always form a large proportion of the haul, which includes sole, plaice, ray, conger, red mullet, dory, mackerel, bass, turbot, brill, halibut, cod, haddock, hake, gurnard, and ling.

The drift-net forms one of the most scientific methods of fishing, depending as it does on knowledge of the habits of certain kinds of fish and observation of their whereabouts at certain times. The net is set up in the water, being kept in a vertical position by weighting the lower end and buoying the upper with cork, wood, or glass floats, and is allowed to drift with the tide or current in such a way that it is at right angles to the direction which it is being taken by a school or shoal of fish. The fish are caught by the gills,

DRIFT-NET

Herring, mackerel, and fish that swim nearer the surface are caught by drifters which drag a series of nets between them. The net is kept close to the surface by floats: the fish are caught by their gills.

which become entangled in the netting. The nets, which are long and straight, may be used at the surface, as is most commonly the case, or at different depths, by means of weights and buoys. Fishing by drift-net is carried on off Cornwall for pilchard, with nets 40 fathoms by 4, having 40 meshes to the yard, for mackerel, with nets 20 fathoms by 16, with 28 meshes to the yard, and for herrings, with nets 40 fathoms by 41, with 36 meshes to the yard; off the E. coast and the Scottish shores for herring, with nets 30 fathoms by 9; and at the E. end of the Channel for mackerel. Ground fish, such as cod and turbot, are also caught by sunk drift nets. The fishing is carried on in Cornwall from about five in the afternoon till eight or nine in the evening, this being the time when shoals of pilchard and such fish spread out, all the fish heading away from the land. Each boat shoots a fleet of nets, numbering from sixteen to twenty for pilchard and herring, and eighty for mackerel, to windward of itself, and boat and net drift together, the former being kept head to wind by a small mizzen sail. A large number of boats can fish on the same ground, drifting parallel, without the nets becoming entangled. When the nets are hauled in, the fish are torn from the meshes and thrown on deck. Trawling and drift-net fishing have been seriously hampered on some parts of the Brit. coast, notably the coast of Devon and Cornwall, by sunken wreckage, resulting from the submarine destruction of shipping during the First World War. Great damage is suffered by the nets, which are frequently torn by projections and wrecks which have spoilt some of the best trawling grounds on the S. coast.

Another method of fishing with nets is by the use of seines or seans. These are long nets, weighted below and buoyed

above, which are dragged around a shoal, the fish being then brought in them either to the shore or the boat. In its simplest form seining is carried on from shore. One end of the net is fixed on the beach, the rest of the net is taken on board a boat and dropped over the stern as the boat makes a semicircle. When the vessel again reaches shore the net is brought in by means of the two ends being drawn together either by man-, horse-, or steam-power. A level bottom is necessary for this operation, which is largely performed on sand-banks, in riv. estuaries, as in the sand-eel fishery at Teignmouth. A more complicated type of seining is that carried on at St. Ives for pilchards during the late summer and autumn. This involves the use of a seine-boat, 32 ft. long, and manned by six rowers, and two men to work the net, two boats with the stop net, and a fourth boat, known as the lurker, from which directions are issued. The seine measures 160 fathoms by 6 or 8 ft., and the stop-net is 70 or 80 fathoms long. The pilchard fishery is protected by very stringent regulations, and has some interesting customs in connection with it, such as the employment of huers, who signal the approach of shoals from look-out stations. A variation of the seine is the purse-seine, used in deep water for mackerel, which has a rope run through the bottom, so that it can be drawn up into a large bag, which encloses the fish. Purse-seines are 900 to 1500 ft. long, and 160 to 180 ft. deep, and are set by large rowing boats accompanying the seine-boat.

The trammel is an ingenious arrangement consisting of three walls of netting, set alongside each other, of which the middle one has a much smaller mesh and is set much more loosely and slackly than the two outer ones. The nets are set up and down the tide, and a fish, striking through the large mesh of one of the outer nets into the small-meshed centre one, carries this with it through the large mesh of the third net, and is thus imprisoned in a bag of the small meshed and slack middle net. A trammel is usually 40 to 50 fathoms long and 1 to 1½ fathoms deep, with the two outer nets of a 12-in. mesh, and the inner one of a 2½-in. mesh. Red mullet, bass, and lobsters are largely caught by this means, particularly off the Cornish coast.

There are numerous minor varieties of nets. The fyke net is a long cylindrical bag kept open by hoops, which terminates in a pocket entered by a funnel-shaped opening, through which the fish will not return. Long straight nets, termed leaders, extend from the mouth to direct the fish towards it. The fyke net is set in fairly deep water, at the bottom. The pound net has a long straight leader, running out from shore to a bag-like net from which the fish cannot escape. Fish swimming along the shore come against the leader, and in attempting to swim round it, follow it down to the enclosure at the end. Pound nets are set in rather shallow water and are supported by stakes. Another type is the Lancashire

stake net, a long straight net 900 ft. long and 3 ft. wide, which is stretched across the tide on stakes. The fish, mostly plaice, are entangled in its meshes, and taken out when the tide goes down. Plaice are also caught in the hedge-baulk, which is a net set between long wicker walls. The stow, or bag net, is used in the Thames estuary, the Solent, the Lynn estuary, Boston Deep, and the frith of Forth. It is a kind of moored beam-trawl, being a large funnel-shaped bag 60 yds. long, and having an opening 20 to 30 ft. square. The fishing is from an anchored boat, and the flowing or ebbing tide carries the fish into the mouth, which is kept open by wooden spars. Sprats, herrings, and other small fish are caught in this way. The ground or set net works on the same principle as the drift net, but is anchored upright on the sea bottom. Herring, cod, turbot, and skate are captured by this means. Oysters are caught by a dredge resembling a beam-trawl, with the netting made of iron rings and the beam of iron also.

Traps are only used for crabs and lobsters. In the most common pattern a framework of wicker or wood is covered with netting. A bait is placed inside, and the opening is so arranged as to prevent the escape of the crab, etc., when once inside.

In recent years experiments have been carried out with a ring-net, in conjunction with an echo-sounder, a device based on radar (*q.v.*). Originally an aid to navigation, the echo-sounder sends an electrical impulse from the ship to the ocean-bed. The time taken for the echo to return to the ship is measured, and the depth of water or configuration of the ocean bed can be recorded as a picture. It was observed that the instrument would record any comparatively solid body between the bottom and the surface, such as a dense grouping of fish. Having located the shoal the boat steams in a circle, paying out the ring-net as it goes. The haul is brought aboard after the fish have been completely ringed. The element of uncertainty which always exists in fishing is thereby likely to be dispelled, as the fisherman will cast his nets where the fish are virtually seen. Another recent contribution of science to fishing has been in the field of stimulating plant growth in the beds of sea lochs in Scotland by means of putting phosphate in the water. Experiment has shown that the quantity of fish inhabiting the waters has increased and thereby the catches.

Regulation of Fisheries.—The control of the F. of Great Britain was, from 1839 to 1903, vested in the F. dept. of the Board of Trade. In 1903 these functions were transferred to the Board of Agriculture and Fisheries, now the Ministry of Agriculture and Fisheries. There is a separate Fishery Board for Scotland, which was instituted in 1882. It may be of interest briefly to consider the hist. of the administration of Brit. sea-F. The first effort to obtain definite and authoritative information on the state of sea F. was made by the royal commission

of 1860, which consisted of Mr. John Caird, Prof. Huxley, and Mr. G. Shaw-Lefevre. This reported in 1866 that the sources of supply gave reason for no uneasiness, and that fishing by all means should be allowed unrestricted freedom. The recommendations of the committee were included in the Sea Fisheries Act of 1868. Another royal commission in 1878 made an inquiry into the effect of the use of beam trawls and ground seines upon fish spawn and fry. A royal commission in 1883 for inquiry into the damage done to line and net fishing by the use of the trawl resulted in the estab. of fishery statistics (1885-87). The foundation in 1884 of the Marine Biological Association of the United Kingdom, which receives a gov. grant, has done much to assist the scientific study of marine biology. The Sea Fisheries Regulation Acts of 1888-1894 provided for the estab. of local committees with powers for the regulation of coast F. In 1899 the control of Irish F. was vested in the Dept. of Agriculture and Technical Instruction for Ireland. Some valuable recommendations were made in 1902 by the committee on ichthyological research, appointed by the Board of Trade, and further suggestions were made by a departmental treasury committee in 1907 all urging the con-

tinuation and extension of scientific research on subjects connected with the F. The regulation of gov. aid to such investigations is now in the hands of the development commission, which was appointed under the Development and Road Improvement Funds Acts of 1909 and 1910, and makes advances for the development of F. as well as agriculture, etc.

The right of fishing in Brit. territorial waters belongs solely to Brit. subjects, and can only be claimed by foreigners by convention. This right strictly belongs to the Crown, but the royal right is only claimed in certain cases, e.g. whales, sturgeons, porpoises, and grampuses are royal fish, and Crown property by whomsoever they are caught, and salmon, oyster, and mussel F. are still held by the Crown. On the high seas, outside territorial waters, the right of fishing is open to all, but may be regulated by custom or convention. Such conventions were made between Great Britain and the U.S.A. in 1818, 1872, and, as a result of the Behring Sea arbitration, in 1892; between Great Britain and France in 1839 and 1867, and between the countries having a North Sea seaboard in 1882.

Statistics of British Fisheries.—During 1937 the quantities of sea-fish landed in Great Britain, excluding salmon, were:

TONNAGE AND VALUE OF FISH LANDED OF BRITISH TAKING, 1938

Kind of Fish	England and Wales		Scotland		Total	
	Tons	Value (£)	Tons	Value (£)	Tons	Value (£)
Cod	322,320	4,239,308	27,387	506,998	349,707	4,746,306
Haddock	91,661	1,696,184	51,258	1,035,244	142,919	2,731,428

Whiting	13,470	202,499	16,037	272,592	29,507	475,091
Herrings	129,330	804,082	140,031	1,062,981	269,361	1,867,063
Mackerel	6,893	84,732	3,164	19,306	10,057	104,038
Other	140,735	2,420,343	21,702	624,234	162,437	3,044,577
Total	776,635	12,233,209	269,028	3,826,671	1,045,663	16,059,880
Shell-fish	—	408,637	—	79,853	—	488,490
Grand total . . .	—	12,641,846	—	3,906,524	—	16,548,370

In 1947 the quantity of fish of Brit. taking landed in England and Wales was 694,687 tons, valued at £31,004,924, against 776,635 tons, valued at £12,233,209 in 1938.

The number of fishermen (1931) in England and Wales was 26,945, with 18,472 in Scotland. In 1946 there were, in Great Britain, 36,801 regular and 4215 occasional fishermen: total 41,016.

In addition to this harvest of Brit. taking, the United Kingdom imports large quantities of fish. The figures for 1937 were as follows:

From Deep Sea F.	1,275,000 cwt. valued at £1,000,000
„ Brit. countries (chiefly Eire, Canada, and Newfoundland)	480,000 „ „ „ £1,900,000
„ Foreign countries	3,500,000 „ „ „ £10,000,000

Re-exports were:

To Brit. countries (chiefly Eire, Canada, and Newfoundland)	281,000 cwt. valued at £800,000
Foreign countries	220,000 „ „ „ £860,000

The statistics show that there was a great decline of imports in 1938, and that while in 1945-46 there were large increases the average totals did not equal those of 1937. From deep-sea F. the monthly average in 1938 was 31,000 cwt., valued at £25,500; in 1945 the average was 225,000 cwt. at £276,000, and for 1946 227,000 cwt. at £283,000. From Brit. countries overseas the monthly average in 1938 was 9500 cwt. at £44,000; in 1945 38,200 cwt. valued at £185,100; and in 1946 17,145 cwt., valued at £97,400. In 1938 imports of herrings, salmon, and migratory trout, cod, haddocks, plaice, etc., averaged 136,000 cwt., valued at £232,000; in 1945 the average was over 300,000 cwt., valued at £1,091,000; in 1946 the average dropped again being 215,000 cwt. at £770,000. Imports of salmon from Canada, U.S.A., Russia, and other foreign countries averaged 96,000 cwt. a month in 1938, valued at £385,000; in 1945 the

average was about 36,400 cwt., valued at £269,500; and in 1946 76,000 cwt. at £573,000. Statistics, in fact, will be found to show violent fluctuations (see Accounts relating to Trade and Navigation of the United Kingdom. H.M.S.O. (issued monthly)).

Detailed statistics of imports and exports of fish into and from the United Kingdom for the years 1938 and 1948 are subjoined.

QUANTITIES AND VALUE OF EXPORTS OF FISH FROM THE UNITED KINGDOM

	Quantities		Value	
	1938	1948	1938	1948
	Cwt.	Cwt.	£	£
Fish, fresh or frozen:				
Herrings	796,911	587,065	382,486	993,881
All other sorts	279,097	21,748	460,933	114,290
Fish, cured or salted, not canned:				
Herrings:				
To Brit. countries	60,712	87,224	94,290	337,081
Poland	864,695	38,355	556,846	98,313
Germany	969,988	584,366	704,299	1,218,356
Other foreign countries	838,207	269,602	670,996	871,070
Tota.	2,733,602	979,547	2,026,431	2,525,420
All other sorts	468,443	110,945	603,338	620,531
Fish (including shell-fish) canned:				
Herrings	59,152	87,733	166,900	574,552
Other sorts (including fish paste)	38,665	18,586	221,241	304,826

The British Fishing Fleet.—In 1937 the Brit. fishing fleet consisted of 13,352 vessels, with a tonnage of 273,855 (3,954 sailing, 11,482 tons; 9398 steam and motor, 262,373 tons).

The estimated number of men and boys employed in sea fishing in that year was 64,776, of whom 48,690 were regular fishermen, and the remainder persons occasionally employed in sea fishing.

Of Eng. F., the trawl F. for cod, haddock, and flat fish yield about three-fourths of the total amount landed, the remaining quarter being mainly supplied by drift-net F. for herring and mackerel. In Scotland net-F. for herring, etc., yield rather more than half of the total, trawling nearly three-eighths, and line F. an eighth. In Ireland three-fourths of the total is provided by mackerel and herring F., and the remaining quarter by trawling. The fishing industry of the Brit. Isles far exceeds that of any other European country in all respects. Returns as to steam trawlers show that while Brit. vessels are more and more leaving the North Sea and going farther afield, their place is taken by continental vessels. Great Britain is responsible for more than a third of the total haul of the F. of Europe.

Fish thrown back.—From time to time the public is shocked by reports of quantities of fish being deliberately thrown back into the sea. Is such action to be denounced as wicked, or excused as inevitable? The process by which supply is adjusted to demand is in general ruled

by self-interest and the price mechanism—a smaller supply tending to raise price and a bigger supply to reduce it. But the price mechanism does not work smoothly and promptly enough to cope with the day-to-day variations in supply in the fishing industry, and a bumper catch may reduce the price to ruinous levels. Storage is often at least part of the answer to irregularities of supply, but fish is pre-eminently a perishable commodity, and storage has to be combined with methods of preservation—curing, canning, freezing. Even so the fishing industry often finds itself faced with the alternative of assisting the price mechanism by reducing the effective supply, or of selling at a figure which leaves less than no profit—and the fisherman is not able to indulge in altruism.

While we may perhaps excuse the fisherman who jettisons his fish in the case of unexpected glut we can only regard such frustration of the bounty of nature as a *pis aller* not to be tolerated outside the strictest limits. In these days the price mechanism is giving ground to planning, and planning certainly offers possibilities for the beneficial disposal of surpluses.

American Fisheries.—United States.—The F. of the U.S.A. are very important and increasing in prosperity year by year. They employ 190,000 men; in vessels and boats valued at over \$300,000,000, of which 26 per cent consists of steam trawlers; and land 1,300,000 tons of fish a year valued at over \$100,000,000.

Though many Amer. boats fish in the waters off Canada, Newfoundland, etc., by far the larger part of the total catch comes from Amer. waters. The Atlantic F., particularly those of the middle Atlantic states, are considerably more profitable than those carried on off the Pacific seaboard. The most valuable product is the oyster, nearly half of the yield coming from cultivated oyster farms. Virginia is the leading state in this industry. Salmon are largely caught in the Pacific, and cod, haddock, hake, halibut, mackerel, herring, shad, clam, and lobsters in the Atlantic. The whale fishery of the U.S.A., formerly carried on to a large extent in the N. Pacific and the Arctic Oceans, has very much diminished of late years.

Canada.—The Canadian F. are very extensive, though still exceeded by those of the U.S.A., and they are continuing to increase under careful gov. supervision and assistance. The fish caught are, in order of value, salmon, cod, lobsters, herring, and mackerel. The canning of salmon (from the Pacific coast) and lobsters is an important industry, and the finished product is largely exported. The provs. engaged in the fishing industry are, in order of the value of their produce, Brit. Columbia, Nova Scotia, New Brunswick, Ontario, Quebec, and Prince Edward Is. There is also a large seal fishery in the Behring Sea (see CANADA).

The S. F., mainly for cod, herring, and salmon, on the Newfoundland Banks form the prin. occupation of the people of Newfoundland. The cod F. are the most important, and are carried on on the Banks and off the shores of Newfoundland and Labrador, and the catch also includes seal, herring, lobster, salmon, trout, smelt, and grand turbot. The inshore cod F. is the branch in which the great majority of the fishery pop. is engaged. In 1937-38 between 16,000 and 19,000 men were engaged in the inshore cod fishery, and the total catch was 515,000 quintals in 1938. The Bank cod fishery employed in that year 2200 men, and the catch was 233,000 quintals; and the Labrador cod fishery 2400 men had a catch of 400,000 quintals. Altogether in the cod fishery there were some 10,000 small sailing vessels, motor boats, etc. Lobster-canning for export is an important industry. Cod is largely dried, and exported to Brazil, Spain, Portugal, the U.S.A., and the W. Indies (see NEWFOUNDLAND).

European Fisheries.—**Belgium.**—The Belgian North Sea fishery is carried on from Ostend, Blankenbergh, Heyst, La Panne, and Nieuwpoort. Ostend in 1938 had 360 vessels employing 1500 men. The total quantity of fish landed at Belgian ports in 1944 was 50,000 metric tons. The total fleet tonnage was then under 2000.

Denmark.—There are important Dan. F. in the Baltic, for plaice, flounders, eels, herrings, cod, and garfish; in the North Sea for plaice, haddock, lobsters, and cod; off Iceland and the Faroes for cod and herring, and off Greenland for seals,

whales, salmon, trout, halibut, and cod. In 1938 Denmark had 8000 fishing vessels of all sizes, and 20,000 men were employed in fishing. In 1943-44 the total value of fish caught was 150,000,000 kroner (about 28,000,000 sterling), and in 1946 about 170,000,000 kroner.

France.—The Fr. fishing industry is very important, and before the Second World War received much gov. aid. The great fishery for cod is carried on off Newfoundland, off Iceland, and in the North Sea. The Fr. fishing fleet consisted (1938) of upwards of 18,000 boats and vessels, and gave employment to 70,600 men. The statistics for 1939 show that the Fr. fishing fleet then numbered over 10,000 sailing-boats, over 300 steamers, and 11,250 motor boats; that the industry employed over 130,000 persons, and the value of fish caught was about 1½ billion francs.

Germany.—The Ger. fishing industry, particularly in the North Sea, developed to a considerable extent in the inter-war years. Steam trawling took place from Gessemünde, Bremen, and Bremerhaven, and a deep-sea herring fishery, on the Dutch model, was estab. at Emden. In 1948 the number of vessels of the Ger. fishing fleet was fixed at 287. In 1930 175,000 men and 14,000 boats were employed in F., landing 6,320,000 cwt. of fish valued at 44,274,000. In 1937 the yield of the North Sea fleet was 620,000,000 kilos of fish, valued at 90,000,000 Rm., and of the Baltic F., 51,750,000 kilos, valued at 12,500,000 Rm.

Greece.—Sardines, anchovies, tunny fish, mullet, eels, and mackerel, are caught, but the chief fishery is for sponges.

Holland.—The Dutch fishery products include herring (mainly off the E. coast of England), cod, ling, anchovies, smelts, eels, flounders, shrimps, and oysters. There are exports of fresh and salted fish. In 1938 some 3300 vessels of all kinds were employed in the Dutch F. The produce of the herring fishery in the North Sea was valued at 8,000,000 guilders, and 96,600 tons of herrings were caught.

Iceland.—About 1500 boats and vessels are employed in the F. of Iceland, which gives occupation to 3900 men.

Italy.—Tunny fish is the chief product of It. F., but sardines, anchovies, hake, swordfish, lobsters, cuttlefish, oysters, sea urchins, turtles, and sharks are also caught, and there are valuable F. for sponges and coral. (Trade statistics have been suppressed since 1939.)

Norway.—The chief Norwegian F. in 1930 employed 102,600 men, and yielded produce of the value of 44,720,000. In 1943 38,850 persons were employed in cod F., and 15,600 in winter herring F.; while the total number of persons employed in the F. was 114,000 (of whom nearly 40,000 had a second chief occupation). The output of the sea F. in tons totalled in 1943 642,700, of which herring yielded 306,000 tons and cod 111,500 tons. Herring, cod, and mackerel are the chief fish caught; other kinds are salmon, sea-trout, lobsters, ling, coalfish, torsk, and oysters.

Poland.—The Polish F. were chiefly those taken over in consequence of the political changes following the First World War; these were small and gave employment to about 1280 men. No current statistics are available.

Portugal.—The F. of Portugal employ about 42,000 men, with 15,600 boats. The most profitable part of the industry is sardine fishing, which accounts for nearly half the employment. In 1944 the sardine catch was 128,200 metric tons, valued at 259½ million escudos. Tunny fish are also caught, and whales off the Azores.

Russia.—Fishing in Russia is almost entirely carried on inland; the S. F. of the Baltic, White and Black Seas, the Bothnian Gulf, etc., only providing a small percentage of the total amount. These produce cod, herring, and whales. Cod and herring are imported. Owing to political events statistics are few and unreliable.

People, 1945; and J. W. Kempster, Our Rivers, 1948.

Fisher Marten, see PEKAN.

Fisher's Hill, precipitous bluff in the Shenandoah valley, Frederick co., Virginia, U.S.A., 30 m. S.W. of Winchester. It is noted for a battle fought there in 1864, when the Federal troops under Sheridan gained a victory over the Confederates under Gen. Early. The former lost about 1300 men, while the latter lost 530.

Fisher's Island, is. in Long Is. Sound, New York, U.S.A. It belongs to Suffolk co., and is 8 m. long, with an average of 1 m. in width, and an area of 4000 ac. It is separated from Connecticut by F. I. Sound, a narrow channel. The surface is hilly. Pop. 300.

Fishery Board for Scotland was instituted in 1882 to take the place of the Board of Brit. White Herrings, which was simultaneously dissolved. Investigations had been made and plans had been

FISHGUARD HARBOUR

British Industries

Spain.—The most important products of the Sp. F. are sardines, tunny fish, and cod. Eels, lampreys, hake, bream, and salmon are also caught. The preservation of sardines and tunnies forms an important industry, employing thousands of workers in great numbers of trades in the tinning of sardines. The value of the fishing industry in 1943 was 1,055,000,000 pesetas, representing some 445,000 tons of fish. There are large imports of dried cod, etc.

Sweden.—Swedish F., for long regarded as unimportant, show signs of improvement. In 1937 over 20,000 men were employed. Deep-sea line-fishing is carried on at the Kattegat and in the North Sea. Much of the fish is salted. The total value of the Göteborg and Bohus fishing industry in 1943 was estimated at 61,282,000 kronor.

See W. Brabazon, *Deep Sea and Coast Fishing of Ireland*, 1848; J. B. Karr, *La Pêche*, 1878; N. Wood, *North Sea Fishers*, 1911; P. F. Anson, *Fishing Boats and Fisher Folk of the East Coast of Scotland*, 1930, and *Mariners of Brittany*, 1931; G. L. Alward, *Sea Fisheries of Great Britain*, 1932; A. Stanford, *North Atlantic Fishermen*, 1939; F. Fraser Darling, *The Seasons and the Fisherman*, 1941; A. Hamilton Jenkin, *Cornwall and its*

brought forward to prevent the destruction of the spawn of sea fish, and the F. B. for S. was entrusted with the task of improvement. Experiments were made, and with the assistance of a gov. grant of £3000 a steam yacht was purchased, the fifth of Firth closed, and a laboratory and sea-fish hatchery estab. A comprehensive programme of investigations has since been carried on successfully with international co-operation. The important regulations of the Salmon and Fresh Waters Fisheries Act of 1923 do not apply to Scotland.

Fishguard, or Aberavon, seaport tn. of Pembroke, Wales, situated at the mouth of the Gwaen in F. Bay, 25 m. N. of Pembroke, and 258 m. from London. It is one of the seven Pembroke bors., and is divided into two parts; the upper portion stands high up on the cliffs, overlooking the harbour, and contains the par. church, market-place, etc., while the lower tn., joining the quay, is occupied by the fishermen. The bay affords good shelter and anchorage. The depth of its fine natural harbour at the entrance is 14 ft. at high water and 8 ft. at quayside. F. is a port of call for Cunard liners from New York and Booth liners from S. America, and there is a service of passenger and freight steamers to Rosslare, Waterford, and

Cork, the first of which is the shortest sea passage from England to Ireland. Pop. with Goodwick 5100.

Fish-hawk, see OSPREY.

Fish-hooks. These were, in very early times, made of stone, bronze, copper, and sometimes shell, as relics belonging to a prehistoric era have been discovered. In spite of their antiquity, however, some of them resemble very closely those of modern times, though some seem to have been quite original in idea, as those made of the spine of a cactus and used by Indians. The place in England where F. are principally made to-day is Redditch. They are usually composed of soft steel wire, afterwards hardened and polished, and may be manufactured either by hand or machinery. Their shapes differ, and the number of designs which are executed is considerable. The one most generally in use has the point parallel to the shaft, although some anglers prefer it bent in another direction. The ends also may be ringed, flattened, or simply plain.

Fishing-eagle, see OSPREY.

Fish-lice, name generally applied to any of the copepod crustaceans which are parasitic on fishes; there are many genera and species, which are ectoparasitic, as *Caligus* or epizootic. See EPIZOOTIC.

Fish-oils are esters of glycerol, with highly unsaturated fatty acids containing twenty or more carbon atoms. Many of them, e.g. cod-liver oil, sardine oil, seal oil, and whale oil are of medicinal, nutritional, or industrial importance; thus whale oil is used in the manuf. of margarine and soap.

Fish River, see GREAT FISH RIVER.

Fish River Caves, see BLUE MOUNTAINS and JENOLAN CAVES.

Fiske, John (1842-1901), Amer. writer and philosopher. In 1869 he was appointed lecturer on philosophy at Harvard, and in 1881 at St. Louis Univ. His first philosophical work in literature was *Outlines of Cosmic Philosophy* (1874). Other works include *The Unseen World* (1876); *The Origin of Evil* (1899); and historical works such as *The Discovery of America* (1892); *Old Virginia and her Neighbours* (1897); and *New France and New England* (1902).

Fission, in atomic science, the splitting of the nucleus of an atom. Thus the nuclei of plutonium, uranium, and other elements undergo F. with the release of vast quantities of energy. The nuclei of heavy elements are more susceptible to F. than those of light elements. The products of F. are usually radioactive.

Fistularia (Lat. *fistula*, a pipe), generic name of a fish belonging to the family of Aulostomatidae, or flute-mouths. It is characterised by a long tubular muzzle, terminating in a small mouth, and by the pelvic fins consisting of six soft rays. The body is naked and the forked caudal fin has one or two of its middle rays produced into a long whip-like filament. This genus inhabits the tropical Atlantic and Indian Oceans, and the family is closely allied to that of the sticklebacks (q.v.).

Fistulina, genus of hymenomycetous fungi, of which one species, *F. hepatica*, is common to Britain. It grows prin-

cipally on old oak-trees, and is liver-like in appearance. It is used in some countries for edible purposes, and when cooked is said to resemble grilled meat.

Fitch, Ralph (fl. 1583-1608), traveller, and is remembered as the pioneer among Englishmen who took the overland route to India. He set out in 1583 and returned in 1591. The account of this journey was pub. by Hakluyt in 1599. See J. H. Itley, *Ralph Fitch, England's Pioneer to India and Burma*, 1899.

Fitch, William Clyde (1865-1909), Amer. playwright, b. and educated in New York, where his first play was produced in 1890. He wrote a large number of dramas, among them being *Beau Brummel* (1890); *The Moth and the Flame* and *Nathan Hale* (1899); *The Cowboy and the Lady* and *Barbara Frietchie* (1900); *The Climbers* (1901); *The Girl with the Green Eyes* (1902); and *The Truth* (1906), with which he gained an international reputation.

Fitchburg, city of Massachusetts, U.S.A. in Worcester co. It is situated 50 m. N.W. of Boston on a branch of the Nashua R. The prin. manufs. are pulp, cotton, and woollen goods. There are granite quarries. Pop. about 41,800.

Fitoles, or **Fare**, see VETCH.

Fittig, Rudolf (1835-1910), Ger. chemist; b. at Hamburg. Studied chem. at Göttingen. He assisted Wöhler, the organic chemist, in 1858, and taught in Göttingen, 1860-70. Prof. of chem. at Tübingen, 1870-76; thenceforward prof. at Strassburg. He discovered the lactones, or anhydrides of oxyacids, and synthesised sev. hydrocarbons. He was the discoverer of phenanthrene. F. re-ed. Wöhler's works, and wrote *Über Aceton* (1858); *Das Wesen und die Ziele der chemischen Forschung und des chemischen Studiums* (1870); and *Grundriss der unorganischen Chemie* (1872). Received the Davy medal of the Royal Society, 1906.

Fittou, Mary (fl. 1600), daughter of Sir Edward F., a native of the co. of Cheshire, England. She was a maid of honour at the court of Queen Elizabeth, and was one of the performers in the masque at the wedding of Lord Herbert in 1600, shortly afterwards becoming his mistress. Some people have identified her with the 'dark lady' of Shakespeare's sonnets.

Fitz, from the Norman-Fr. word *fitz* (Lat. *filius*), meaning son. It was and is used as a prefix to a surname to show descent—as the Scottish prefix *Mac* and the Irish *O'*—appearing in such words as Fitzwilliam and Fitzhamilton. It was also used as the surname of illegitimate children of kings or princes, as in Fitzjames and Fitzclarence.

Fitzalan of Derwent, Sir Edmund Bernard Fitz-Alan Howard, first Viscount (1855-1947), Eng. viceroy and politician, third son of Henry Granville, earl of Arundel, and later duke of Norfolk. Commissioned in the 11th Hussars, 1875. Saw service in the S. African war, being promoted lieutenant-colonel, 1900. Conservative member for Chichester, 1894-1921. Junior lord of the Treasury, 1905. Unionist chief whip 1913, and joint pers. secretary to the Treasury, 1916. Privy

Councillor, 1918. G.C.V.O., 1919. Succeeded Lord French as the first viceroy of Ireland under the Act of 1920, being raised to the peerage in the next year, and made lord lieutenant. K.G., 1925. President of the Catholic Union of Great Britain. He will be remembered as a man of wide social and political influence, and as a man whose advice on questions of procedure was highly valued by the authorities of the Rom. Catholic Church.

Fitzalan, Edmund Henry, and Richard (2), see ARUNDEL, EARLS OF.

Fitzgerald, Lord Edward (1763-98), son of the first duke of Leinster; served in the Brit. Army until 1792, when he was cashiered for being present at a revolutionary meeting at Paris. He was described by Cobbett, who served under him in the 54th Regiment, as the only really honest officer he had ever known. He now threw in his lot with the United Irishmen, and began to prepare schemes for a rising in that country. It was impossible for the gov. to ignore his action, and after he had been given an opportunity to escape to France he was taken prisoner. A wound that he had received in the struggle mortified, and he d. in Newgate on June 4. There is a biography by Thomas Moore.

Fitzgerald, Edward (1809-83), poet, went to Trinity College, Cambridge, in 1826, and there made lifelong friendships with the Tennysons, Thackeray, Spedding, Donne, W. H. Thompson, and the rest of the coterie. When he came down from the univ. he settled at Woodbridge. He found pleasure in letter-writing and in boating, but his prin. interest was in books. In 1851 he pub. anonymously *Euphranor, a Dialogue on Youth*, and in the following year *Polonius, a Collection of Wise Sayings and Modern Instances*. He issued in 1853 a free trans. of *Six Dramas of Calderon*, and six years later gave to the world his rendering of the *Rubáiyát* of Omar Khayyám, which has made him famous in all the Eng.-speaking countries and has passed through innumerable eds. But Quaritch, who first pub. the poem (he pub. 250 copies in 1859), met no success with it, and it was only after Rossetti found a copy in the 'fourpenny box' outside Quaritch's shop that the work began its road to fame. Other and more faithful trans. have been produced, but none approaching that of F. for glow and atmosphere. His complete works and correspondence were ed. in 1902 by Aldis Wright, and there are biographies by Groome (1895), Thomas Wright (1904), A. C. Benson (1905), and A. M. Terhune (1947). See also essay by L. Housman and biography by G. F. Maine in Collins's ed. of *The Rubáiyát*, 1947.

Fitzgerald, Francis Scott Key (1896-1940), Amer. novelist, b. at St. Paul, Minneapolis, U.S.A. Educated at Princeton Univ. (1913-17). Wrote *This Side of Paradise* (1920); *The Beautiful and Damned* (1921); *The Great Gatsby* (1925); and *Taps at Reville* (1935).

Fitzgerald, small tn. of Georgia, U.S.A., situated in Irwin co., 25 m. N.E. of Tifton. Pop. 7300.

Fitzgibbon, John, see CLARE, EARL OF. Fitzherbert, Maria Anne (née Smythe) (1756-1837), was a Rom. Catholic and the wife of George IV., though not openly acknowledged as such. She had been twice married before meeting George—then Prince of Wales—to whom she was married in 1785—the marriage not being valid, as it had taken place without the king's consent. On marrying Princess Caroline he, for a time, broke off his consortium with Mrs. F., but it was not finally ended until 1803. See S. Leslie, *Mrs. Fitzherbert*, 1939.

FitzJames, see BERWICK, JAMES FITZJAMES, DUKE OF.

Fitzmaurice, Edmond George Fitzmaurice, Baron (1846-1935), son of the fourth marquess of Lansdowne, was educated at Eton and Cambridge. In 1869 he became an M.P., representing Calne until 1885, and the Cricklade div. of Wiltshire (1898-1905). Raised to peerage Jan. 1906. Held minor ministerial posts in the Foreign Office, but is remembered more for his biographies, particularly his lives of Granville and Shelburne. Among his literary works are *The Life of William, Earl of Shelburne* (1875-77); *Sir William Petty, the Political Economist* (1895); *Lettres de l'abbé Morellet* (1898); *Charles William Ferdinand, Duke of Brunswick* (1901); and *The Life of George Leveson-Gower, second Earl Granville* (1905).

Fitzmaurice, Sir Maurice (1861-1924), chief engineer of London Co. Council (1901-1912), graduated as M.A. and M.E. from Trinity College, Dublin. Among his engineering works are the Rotherhithe tunnel, the subway for electric trams below Kingsway; and the electric tramways, and the duplication of the main drainage system of London.

Fitzmaurice-Kelly, James (1858-1923), was in 1900 examiner in Sp. at the univ. of Oxford, and Taylorian lecturer at the same univ. in 1902. His literary work, which is chiefly on the literature of Spain, includes *The Life of Miguel de Cervantes Saavedra* (1892); *Un Hispandito inglés del Siglo XVII.* (1899); *History of Spanish Literature* (1898); *Lope de Vega and the Spanish Drama* (1902); *Chapters on Spanish Literature* (1908); *Miguel de Cervantes: a Memoir* (1913); *Cervantes and Shakespeare* (1916); and ed. Cervantes's complete works, 1901, etc.

Fitzroy, Augustus Henry, see GRAFTON, DUKE OF.

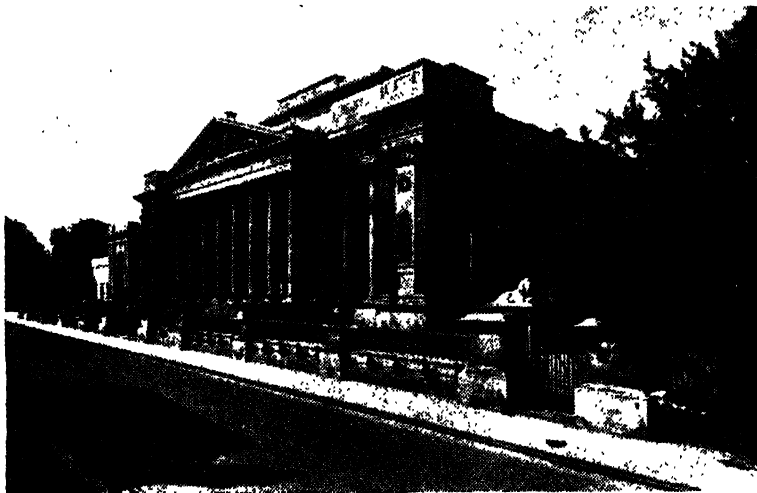

Fitzroy, Robert (1805-65), Eng. admiral, hydrographer, and meteorologist. From 1828 to 1830 he captained the *Beagle*, then employed in a survey of the coast of Patagonia, Tierra del Fuego, Chile, and Peru. It was during this voyage that he discovered the inland sea called Otway Water, and its connection with the salt Skyring Water by means of what came to be known as Fitzroy Channel. During a circumnavigating voyage in the *Beagle* in 1831-36, when Charles Darwin accompanied him, F. not only ran a chronometric line round the world, but recorded a number of invaluable meteorological observations, the most famous of which are his storm warnings. These were all

gathered together in his *Weather Book* of 1863.

Fitzroy: 1. City of Victoria, Australia, in Bourke co. It is 2 m. N.E. of Melbourne, and it forms a suburb of that place. Pop. 35,000. 2. Riv. of Queensland, formed by the junction of the Dawson and Mackenzie Rs. It flows eastward into the Pacific, near the tropic of Capricorn, at Keppel Bay, and is navigable from its mouth for 35 m. to Rockhampton. 3. Largest riv. of W. Australia, whose source is in King Leopold Mts. It has a westerly course, flowing through beautiful well-watered plains.

of London. F. was a devoted adherent of Becket, dining at his board and serving as remembrancer in his chancery and sub-deacon in his chapel, and was, moreover, one of the few who loyally stood by his master at his death.

Fitzurse, Reginald (fl. 1170), enjoys an evil notoriety as one of Becket's murderers. With his three confederates he determined to fulfil the prayer uttered by the king in a momentary passion, and after the deed was done suffered excommunication, and with his fellow knights was exiled, it is said, to Palestine, where he *d.* within three years of his crime.

Reproduced by courtesy of the Director

FITZWILLIAM MUSEUM

and finally enters King Sound. Steamers navigate the riv., 100 m. from its estuary. The source of the F. was discovered in 1842 by Stokes, although the riv. itself was not explored until 1897.

Fitzsimmons, Robert (1862-1917), Eng. prizefighter, *b.* at Helston, Cornwall; taken to New Zealand, 1871; became amateur boxing champion there. In 1890 he went to the U.S.A.; won middleweight championship in New Orleans, 1891; won heavyweight world championship from Corbett (*q.v.*) at Carson City, 1897. Beaten in Coney Is., 1899 by Jeffries. Beaten by Jack Johnson in 1907.

Fitzstephen, William (*d. c.* 1191), biographer of Thomas à Becket, wrote in 1174 his valuable if biased *Life and Passion of Archbishop Becket*, which he pub. together with his *Description of the City of London*. A trans. of the latter, which, except for the Domesday Book, gives the earliest topography of the metropolis, is appended to Stow's *Survey*

Fitzwilliam, William Wentworth, second Earl Fitzwilliam in the peerage of the United Kingdom (1748-1833), succeeded in 1782 to the estates of his uncle, Lord Rockingham, and was thenceforth one of the richest peers of his day. An enthusiastic Whig, he was one of the duke of Portland's party who coalesced with Pitt in 1794, and was later in the year appointed lord lieutenant of Ireland. He held this office only for a few months, being recalled for supporting the Rom. Catholics' claims in defiance of his instructions. He was president of the Council in 1806 under Grenville, but after this did not again take office.

Fitzwilliam Museum, which is at Cambridge, possesses an excellent collection of engravings, MSS., and books left by its founder, Richard, Viscount Fitzwilliam of Merpton, to the univ. on his death in 1816. The building itself is a beautiful example of Gk. architecture, standing not far from Peterhouse College. The Marlay

galleries were added in 1924, and the Courtauld galleries in 1931. The Marlay court includes coins, pottery, porcelain, and majolica, and these galleries rank with the finest in the world. In the founder's collection are a splendid Rembrandt, paintings by Veronese, Titian and Palma Vecchio; 130 medieval MSS., unique prints, and early Eng. music. In 1893 a series of It. primitives was added. The lighting of the galleries has served as a standard for later building of this description, and the unpolished wood background for the pictures is accepted as a model. Sir Sydney Cockerell, director 1908-37, was succeeded by Mr. L. C. G. Clark (during the Second World War), and Mr. Carl Winter. The Fitzwilliam is vastly indebted to private benefactions. In 1948 Lord Fairhaven gave the museum £30,000 to purchase Brit. drawings and paintings.

Fiume, or Rijeka, seaport of Croatia, Yugoslavia, 70 m. S.E. of Trieste; situated at the mouth of the Fiumara, and at the head of the gulf of Quarnero, in the Adriatic. It is divided into two portions: the anct. tn. is built on the hill slope or Karst ridge, and contains a triumphal arch, supposed to have been erected in honour of Claudius II. The newer parts are crowded into the amphitheatre between the Karst and the shore. Among its historic churches are those of the Ascension, with a front in the Rom. Pantheon style, and St. Velt, an imitation of Sta. Maria della Salute in Venice. It has two harbours, the main harbour being formed within a long breakwater and having a deep entrance, with 30 ft. of water at the quays. The other harbour is Porto Baros. Coastwise vessels use Porto Canale. There are petroleum refineries, distilleries, and tobacco factories, chemical works, and a torpedo factory. Wood, sugar, rice, and petroleum are exported. Connected by rail with Trieste, Ljubljana, and Zagreb. Few places have been more often contested throughout their hist. It is first mentioned in the thirteenth century, since when it has successively been the property of Austria, Croatia, France, Austria, Hungary, Croatia again, and Italy. The pop. of Fiume is distributed somewhat as follows: Its., 30,000; Magyars, 7000; Croats, 17,000. The preponderance of Its. was a vital factor in settling the question of its disposal after the First World War. It owes its importance to being the terminus of a railway from Budapest and to the fact that it is one of the very few ports on the E. Adriatic. For about fifty years before the First World War the Its. and Magyars united in opposing any scheme to extend the political and municipal franchise to the suburb of Sušak, which was mainly Slav. F. (without Sušak) gradually became an It.-Magyar city in appearance, while Austria spent much money on the shipping which was owned by Croats.

By the secret treaty of London (1915), under which Italy entered the First World War, F. was given to the Croats, but after the war It. political writers claimed it for

Italy on the ground that their nationals were predominant. To put matters beyond doubt Gabriele D'Annunzio (q.v.), the poet and novelist, took matters into his own hands by collecting a small force, with which he raided and occupied the place in Sept. 1919. Although this venture was not officially noticed to any serious extent, it was approved by many influential Its., and it undoubtedly influenced Mussolini (q.v.) and Farinacci (q.v.) in the 'march' on Rome. Various attempts were made to eject him which, however, did not at first succeed. Eventually F. was ceded to Italy in 1924 in spite of the protests of other nations concerned, especially Yugoslavia. Under the treaty, signed in Rome, Jan. 27, 1924, the free state of F. came to an end. Yugoslavia's sovereignty over Port Baros and the delta was estab., while Italy acquired the tn. and harbour works of F., together with a narrow strip of hinterland. After the Second World War Yugoslavia's peace treaty with Italy (Feb. 10, 1947) gave F. to the former, together with the greater part of the prov. of Venezia Giulia. See S. Gigante, *Storia del comune di Fiume*, 1929.

Five Members, The, of Parliament, were John Pym, Denzil Holles, Sir Arthur Haselrig, Wm. Strode, and John Hampden. In violation of all constitutional liberties, Charles I. tried to arrest them on Jan. 4, 1642, so as to prevent Henrietta Maria's impeachment. This foolish endeavour undoubtedly hastened the Civil war.

Five Mile Act, The, passed in the reign of Elizabeth, penalised Rom. Catholics, who had been convicted of non-attendance at the Protestant church, for going a greater distance than five miles from their homes. A more famous and less stringent Act of the same name was passed in 1665, whereby no nonconformist preacher or teacher could come within 5 m. of any tn. or bor. corporate or any place whatever where he had preached or taught since the Act of Oblivion (1660) unless he first took the oath of non-resistance and pledged himself not to interfere either with the Church or State. This law remained in force till 1689.

Fives, game of handball, played by two or four players in a court enclosed on three or four sides. It is at least as old as the fourteenth century, and is almost certainly derived, like racquets, from the Fr. *Jeu de paume*, which became known in England as hand-tennis. Various explanations of the name have been offered, the most common being that it refers to the five fingers, but the origin is obscure. To-day it is not played much outside schools and colleges, but it retains a deserved popularity with schoolboys, the Etonians especially being fond of the game. In America it is called handball, and the courts are sometimes 60 ft. long compared with 34 ft., which is the normal length in this country. F. is a very healthy form of sport, as it is played in the open air and exercises every limb of the body. In winter, indeed, it is one of the pleasantest means of promoting a good circulation in

a small space of time. There are many varieties of courts, and the codes of rules will be found to differ fairly extensively in different public schools, but a brief description of Rugby F. and of the points in which Eton F. is at variance will give the reader some notion of the nature and objects of the sport.

To begin with, no apparatus is necessary except the ball, which is commonly made of white leather, stretched over a firm cork foundation, and, if the player chooses, a pair of padded gloves. The court consists of a front and two side walls, these latter usually sloping towards the back, often from 12 to 20 ft. It may be roofed or otherwise, and sometimes has at the back a dwarf wall or projection. It is invariably divided into a fore and back court, technically known as on and off wall, and in a double, when there are two partners a side, these stand diagonally to one another. Thus the server or hand-in stands in the fore court nearer the left wall, one of his opponents standing opposite to him in the same court. The other two players guard the off wall. Hand-in serves, and must hit the ball with his hand against the front wall above a line, marked with a board or other device at least 3 ft. above the ground level, in such a way as to cause it to rebound from the right-hand side wall on to the ground on the off wall. Hand-out, that is his opponent in the fore court, may refuse the serve if he likes, but the game cannot proceed till he has returned one of the server's strokes. After his first-cut, or return, the ball is kept flying by either side alternately, there being no restriction as to which of the two partners hits the ball at any time. The winning side is that which first scores fifteen points; the server only can score, and wins a point when the opposing side misses a point, that is, fails to keep the ball going. If he loses a stroke, his partner becomes hand-in until he too fails; when the other side has its innings. In any return the ball may be volleyed and may be made to touch one or both of the side walls beside the front, which all the players face, and which must invariably be hit above the horizontal line or plank already referred to. At Eton the game was first played against the chapel walls, buttresses serving as side walls and the steps projecting from the side. The steps in the proper F. courts became the famous pepper-box, which juts out from the left side wall, making the game considerably more intricate, whilst the platform or dais leading to the flight of chapel steps gave rise to the hole, that is, the space between the pepper-box and the step which was introduced to break the level of the F. court floor. F. is also played at Winchester and Rugby. See books by J. Marshall and others, 1890, and J. A. Tait, 1890.

Five Towns. The name applied erroneously (for there are six) to the Eng. and N. Staffordshire pottery tns. of Tunstall, Burslem, Hanley, Stoke, Fenton, and Longton. See A. Bennett, *The Grim Smile of the Five Towns*, 1907.

Five Year Plan, name given to the plan

of the Soviet Gov. so to increase their industrial and agric. output during the period 1928-33, as to overtake all other nations. To effect this ambitious object the country was supplied with factories, railways, motor vehicles and tractors, and other equipment; while houses were to be built and land cultivated and amenities given to the whole people. The political aim of the plan was to enhance the power of the Soviet in every direction—economical, political, and industrial—but in fact the people were sacrificed to the plan, for the food raised was exported in exchange for secondary imports required for industrial development. The chief industries developed under this plan were manganese production at Chisturi, asbestos at Asbest, steel at Magnitogorsk, wheat at Gigant and Verblud, petroleum and crude oil at Baku, tractors at Cheliabinsk, Kharkov, and Stalingrad, and tea at Chakwa. Electrical energy is provided by installations at Dnieprostroy erected under the supervision of Amer. engineers. The plan was certainly ahead of the scheduled time in its political development, and by 1931 such good progress had been made that the State Planning Commission stated that the gov. had decided to begin work on a new F. Y. P. for 1933-38. By 1937 this plan had been completed and a new period embarked on. The Second World War interrupted the progress of this third plan, but a fourth, announced for 1946-50, was devoted to the building up again of heavy industry. See further under RUSSIA.

Godless Five Year Plan.—The name given to a plan embodied in a decree issued by the Council of People's Commissaries in Oct. 1932 with the object 'not to leave a single house of prayer on the territory of the Union of Soviet Socialist Republics, and to extinguish in the minds of the people the very notion of God.' See B. Brutzkus, *Economic Planning in Soviet Russia*, 1935.

Fixed Stars, see STARS.

Fixed Trusts, or Fixed Unit Investment Trusts, are investment companies, which purport to open up to the investor of small means a wider field, so as to enable him to spread his risks, with relative safety. Some of these trusts are general, their investments being made over a variety of industries; others are specialised, i.e. they restrict their operations to one industry or field; and yet others are cumulative as opposed to those which distribute in cash any capital bonuses received, as well as dividends. The life of a trust is fixed by deed, with, in some cases, the option of conversion to a trust company at the end of the period. The first Brit. Unit Investment Trust was formed in 1931, immediately before the Brit. Gov. went off the gold standard, and the movement was much favoured by the ensuing steep rise in ordinary share values which followed the boom in gold shares in 1932-1933 and thereafter. The bulk of the holdings of the F. T. are in the ordinary shares of well-established companies, and, by the end of 1938, the movement in Great

Britain had taken such a hold that there were over eighty trusts in the country. Most of them were affiliated to the Unit Trusts Association. Promotion and management rest with a number of distinct groups, operating through private companies. In the U.S.A., during the period of the rise and development of F. T. in Britain, there was a corresponding collapse of F. T. following on the crash in Wall Street in 1929. The majority of trusts formed in the first four or five years of the movement were operated on a fixed small panel of no more than a score or so of selected securities or equities; but later trusts acquired powers to operate from considerably larger fields of securities, including also trustee securities, thereby tending to wide flexibility and partial reversion to the old managed type of investment company. These latter are known as flexible unit investment trusts, in contradistinction to F. T. In consequence of the growth of the F. T. movement in Britain a gov. bill for the prevention of share-pushing—the Prevention of Fraud (Investments) Bill—was introduced in 1938, and passed its third reading in the following year.

Fixtures. Generally speaking, the term F. denotes anything in the nature of personal property (chattel) has become annexed to the freehold so as to become part and parcel of it. More popularly F. may be defined as things of an accessory nature annexed to houses or lands. The justification for the old common law doctrine of the irremovability of F. was that if any limited owner, e.g., a tenant for life or for years, removed the F., he necessarily committed waste, i.e. an act of destruction which injures or diminishes the value of the inheritance; and, further, that the mere fact of annexation indicated an intention to abandon his ownership in the F. From early times the common law rule was relaxed in favour of the principle that the circumstances of the annexation might show an intention in the parties to the contrary of the common law presumption. The degree and object of the annexation became all-important, and the rule became estab. that whatever chattel was annexed, merely for its more complete enjoyment and use as such, could be removed, but that where the purpose of the annexation was the improvement of the freehold, the chattel was irremovable. This obviously did not go far enough. However much a tenant for life under a marriage settlement may desire to improve the freehold, no thought could be further from the mind of a trade tenant, or, indeed, any tenant having no sort of relation other than contractual with the freeholder. Consequently the law in its relaxation of the old doctrine, on grounds of public policy, in favour of ornamental F., F. for convenience, trade F., and F. for business purposes, proceeded rather on the principle that what could be removed without material injury to the freehold was removable by the lessee or tenant in the absence of special stipulation to the contrary. Much greater indulgence, however, is and has always

been extended to the case of trade than to merely ornamental F., and that greater indulgence is expressed in the orthodox rule that to take away the right to remove, the probable damage to the freehold must be so great as practically to destroy it. In the case of ornamental and domestic F., the rule appears to be that removal will only be allowed if little or no damage be thereby caused to the freehold or to the fixture itself. The common law doctrine has also been relaxed by a number of statutes in the case of agric. F., but this was a much more belated concession to the claims of natural justice. In connection with these relaxations, it is to be noted that the above exceptions are construed more or less strictly according as the dispute is between (a) heirs and executors of the same owner; (b) executors of the tenant for life or tenant in tail (see *ENTAIL*), and the remainder man or reversioner; and (c) between landlord and tenant. The law is strictly construed in favour of the inheritance in class (a), but it is relaxed in class (b) in favour of the limited owners, while in (c) the greatest indulgence is extended to tenants.

A more detailed reference may now be made to the law of F. as between landlord and tenant. A tenant may only remove his F. during the subsistence of his term unless expressly allowed to do so subsequently. Landlords' F. include those put up, not only by the landlord himself, but by any person other than the tenant, and such as have been put up but may not be removed by the tenant. It is usual, however, in leases to specify in a schedule not only the F. already on the premises or land, but such additions by the tenant as he may not remove even if he does hereafter make them. There is not a little confusion in the law as to landlords' and tenants' F. It is by no means clear what, in the absence of express stipulation, is the test of removability. As stated in the accepted text-books, the rule is that, however large the structure or thing may be, however solid or substantial it is removable if it is so constructed as not in fact to be fastened to or let into the freehold. From one point of view this principle of the degree of physical annexation may be looked upon as no more than a test of the probable damage resulting from the removal. This reversion to the root principle of the law of F. involves, in effect, the abandonment of all the concessions so painfully won at the expense of the freeholder. This conflict of principle, however, works less confusion than may be imagined, and for two reasons: (1) Contracts are generally so drawn as to provide for all eventualities; and (2) a great number of empirical exceptions to the ant. doctrine enable one in a moment to refer to one or other of them the great majority of chattels annexed to land or buildings; e.g. barns, mills, sheds, etc. Erections on blocks, rollers, patterns or plates, the whole resting upon brickwork, but not united to the land or building by mortar or nails, are removable by the tenant. The decided cases also show that even if the structure

is erected on a brickwork foundation let into the soil with uprights rising out of the brickwork, it is removable provided there be no actual fastening. Consistently with these decisions, stills set in brickwork have been held irremovable, but not vats merely supported by and resting on brickwork and timber. *Inter alia*, the following things of ornament or convenience are removable by the tenant: Cornices, beds fastened to the walls or ceilings, furnaces and coppers, cupboards fixed with holdfasts, bookcases screwed to the walls, clock cases, hangings, tapestry, marble chimney-pieces, wash-tubs and fixed water-tubs, grates, stoves and ranges, ovens, pier glasses nailed to the walls, window-blinds, wainscot fixed by screws, and iron backs to chimneys. The following have been held irremovable: Verandas the lower part of which is attached to posts embedded in the soil; conservatories erected on brick foundations affixed to or communicating with rooms in a dwelling-house; and green-houses fixed with mortar or nailed to foundation walls of brickwork. It is to be noted, however, that some of these latter structures would be removable, despite the degree of their physical annexation, if they were erected for trade or business purposes. In regard to a tenant's trade F., the cases show that the following, *inter alia*, may be removed: salt pans, vats, chimneys, machinery, tables, steam and fire-engines. It is clear that the removal of some of these trade F. would result in not a little damage, but the difficulty in point of principle is got rid of by creating the exceptions in spite of it. In a contract between landlord and tenant it is desirable, especially from the tenant's point of view, to insert clauses in his lease expressly limiting the effect of the *pro forma* clause to 'deliver up the premises at the end of the term together with all fixtures.' The effect of a covenant (q.v.) to deliver up premises and all F. belonging thereto, without further explanatory words, has been construed to mean that the tenant's F. are to be delivered to the landlord as well as other F. Consequently, to guard his own interests, the tenant should always put in a proviso expressly excepting his own F. The right of a tenant to remove F. does not extend beyond the subsistence of his term, unless power be expressly given him to enter and remove them after the expiration of the lease.

Agric. tenants were not allowed to remove their F. until 1851, when such F. as were erected with the landlord's written consent were allowed to be removed, provided no injury were done to the freehold, and a month's notice to the landlord of intention to remove were given, and provided also the landlord did not elect to buy the F. The Agricultural Holdings Acts, 1875-83, went further and allowed removal, even though the erection was without the landlord's consent. The right of a tenant to remove agric. F., for which he is not by statute or otherwise entitled to compensation, and which have not been erected in place of some F. belonging

to the landlord or in pursuance of some obligation to the latter, is subject to these conditions: (a) Before removal all arrears of rent must be paid and all other obligations to the landlord fulfilled; (b) no avoidable damage to any other building or part of the agric. holding must be done; (c) such damage as has been unavoidably occasioned must be made good; (d) one month's notice must be given; and (e) any dispute as to the value where the landlord elects to purchase is to be settled by arbitration. Under the Agricultural Holdings Act, 1923, the tenant may, within a reasonable time after the expiration of his term, remove F. which he has erected, unless the landlord chooses to take them over at a valuation. See LANDLORD AND TENANT.

For a full list of chattels held to be removable by a tenant, see Woodfall on *Landlord and Tenant*. See also EXECUTOR; CONTINGENT REMAINDER; REVERSION.

Fjord, see FIORD.

Flabellifera, or Fan-bearer, name given to a certain order of isopods. These particular isopods have tail-fans at their extremities, formed by the end-piece or telson and the last pair of appendages. Within this tribe there are many varieties or families, and one classification is into parasitic and non-parasitic F. In the former div. come *Carolina* and *Conilera*, whilst the gribble or *Limnoria lignorum* is one of the most important in the latter. See also GRIBBLE.

Flabellum, or Fan, used in the W. Church from the fourth to the fourteenth century to keep flies from the sacred vessels. Formed in Rome of peacocks' feathers, and, in other places, of metal. The ministry of the F. was primarily confided to the deacon, though afterwards, in the Lat. Church, it might be exercised by any person who had received the tonsure. The Gks. and the Armenians were, later, the only Christians who made use of the F.

Flaccus, Gaius Valerius (d. A.D. 88), Rom. poet who wrote *Argonautica*, a poem discovered by Poggio Bracciolini in 1416, and first printed in Bologna in 1472. F. lived in the reign of Vespasian, and was known to Martial, who urges him in one epigram to give up poetry for the more lucrative profession of law. The poem has many purple patches, but is disconnected, sometimes obscure, and not infrequently spoilt by the pedantry of the writer. Eight cantos only have come down to us. See trans. by J. H. Mozley, 1934.

Flaccus, Lucius Valerius, Rom. warrior and statesman, was consul in 100 B.C., the remarkable Marius being his colleague. Throughout his career he allied himself with Marius, and consequently assisted in the quelling of Saturninus' revolt. In 86 he was again elected consul, but his own soldiers put him to death before he could proceed against the formidable invader, Mithridates.

Flaccus, Marcus Fulvius (d. 121 B.C.), Rom. democrat, belonged to an illustrious patrician family, but identified himself with the Gracchan or popular party. On

the death of Tiberius Gracchus, he was appointed one of the three commissioners to carry out the agrarian reforms. His proposal during his consulate of 125 that all allies should have the Rom. citizenship led indirectly to the plebeian revolt known as the Social war. The senate, after making two unsuccessful attempts to banish him from Rome, was finally relieved of its hot-headed opponent during the riots which followed its organised opposition to Gracchus in 121. Both F. and his greater leader were slain.

Flaccus, Quintus Horatius, see HORACE.
Flacius (or **Flach**), **Matthias** (1520-75) (whose proper name was Vlacich ('known in Croatian literature as Matija Vlačić Ilir'), and who was surnamed Illyricus), b. at Albona, Istria, a follower of Luther, led so stormy a life that the volume and merit of his literary output are truly remarkable. He studied successively in Venice, Basle, and Tübingen, and in 1541 gained a small livelihood by teaching Gk. and Heb. in Wittenberg. He was the victim of spiritual depression and despair. Luther, however, drove away his melancholy and doubts and converted him into an enthusiastic Protestant reformer. The siege of Wittenberg forced him to leave the city (1547), and on his return he was soon banished once more. This time because of his vehement opposition to Melancthon, who henceforth made Wittenberg a stronghold. His enforced wanderings carried F. in turn to Magdeburg, Jena (1557-61), Regensburg, Antwerp, Strasburg, and Frankfurt, where he d. in extreme poverty. His *Magdeburg Centuries* is the first great hist. of Protestantism, whilst in his *Catalogus Testium Veritatis* (1556); *Clavis Scripturæ Sacre* (1567); and *Glossa Compendiaria in Novum Testamentum* (1570) he proves himself the first exponent of scriptural hermeneutics. See life by W. Preger, 1859-61, and W. Nigg, *Kirchengeschichtsschreibung*, 1934.

Flag, piece of cloth attached to the end of a staff, serving as a national or local emblem, or used for naval and military purposes, or for signalling. It originated from the representations of various animals and other objects that ant. nations were wont to use for similar purposes. Thus the Romans first used the manipulus, a wisp of straw or fern attached to a pole, which served as the rallying-point of the soldiers. This was succeeded by the figure of animals, such as the eagle, wolf, horse, etc., of which the eagle alone survived until the days of the empire. The first Rom. flag was apparently the vexillum, the standard of the cavalry, a square piece of cloth attached to a cross-bar on the end of a gilt staff. The labarum was a Rom. military standard bearing at first the head of the emperor, but from Constantine's time the Gk. letters XP, signifying Christ, when it was made the imperial standard. One of the earliest forms of Fs. was the gonfalon or gonfalon (from Middle High Ger. *gund*, battle; and *fano*, flag), a square or oblong piece of cloth, sometimes with streamers, attached to a cross-bar or fixed in a frame in which it could turn. The

gonfalon of William the Conqueror bore a gold cross on a white ground with a blue bordure.

The pennon (Lat. *penna*, a wing) was the ensign of the medieval knight bachelor and was a tapering F. forked at the fly, exhibiting the arms or badge of its owner. The pennoncel or pencil was a small streamer, triangular in form, wide at the staff, and pointed at the fly, carried by the esquires and bearing the cognisance of their leaders.

The banner was a rectangular F. borne by nobles of the rank of knight banneret and upwards, and displaying the owner's coat of arms. The standard was a large, long F. tapering towards the fly and slit at the end. It varied in size according to the owner's rank and displayed his badge. In addition, the various trades and guilds also had special Fs., which when necessary were borne to battle.

The diversity of Fs. carried in medieval armies had necessarily to be replaced by greater uniformity when standing armies were introduced. At first each company of the regiment had its distinctive colour, but in the reign of William and Mary the number of Fs. in the regiment was reduced to three, and later by Queen Anne to two, the royal and regimental colours, which number is still maintained. The foot guards have, however, remained unaffected by these innovations, and still retain a separate colour for each company. The regiments of household cavalry have each three regimental colours besides the royal standards, the dragoons have the usual two colours, while the lancers and hussars have no colours.

The use of Fs. is far more extensive on sea than on land. Formerly ships sailed under the individual Fs. of their captain, or the port of origin, but now they sail under the national colours. Usually the ruler of a country has a F. personal to himself known as the royal standard, though it is generally rectangular like the banner. The royal standard of the Brit. Isles bears the quartered arms of England and Scotland, and formerly Ireland. It is flown at the place where the king resides and on certain occasions of national celebration. The union F. was introduced in 1606 after the union of England and Scotland, and at first bore the crosses of St. George and St. Andrew. It was ordered by James I. to be borne at the maintop of all Brit. ships, except ships of war, which bore it upon their jack-staff at the end of the bowsprit, whence it is erroneously termed Union Jack. With this F. was afterwards merged, at the union with Ireland in 1801, the cross of St. Patrick, a red saltire on a white ground, and the F. thus formed has become the national F. It is still used as the man-o'-war's jack, and is also flown at the maintop of the admiral's vessel. It also appears on all ensigns. The ensign is the F. flown upon the ensign staff of every vessel indicating its nationality. Formerly the Brit. red, white, and blue ensigns were distinctive of the red, white, and blue divs. of the fleet, but in 1864 these divs. were done away with and new

uses allocated to the three ensigns. The white ensign, a white F. bearing the cross of St. George and with the upper corner near the staff occupied by the union device, is the exclusive F. of the Royal Navy and the Royal Yacht Squadron, and may be flown by no other vessel. The red ensign is a red F. with the union device in the upper quarter near the staff and is flown by Brit. merchant vessels and ships not belonging to the navy. The blue ensign is a plain blue F. with the union device in the upper quarter next the staff, and is flown by the Royal Naval Reserve, and by certain yacht clubs. The union F. and the blue ensign are also used with various additions to denote various officials or depts. Thus dominion war vessels fly the blue ensign with the dominion badge in the fly, while the F. for the colonies is the union F. with a white escutcheon in the centre, which bears the arms of the respective colony. The F. of the Lord High Admiral is red with a golden anchor and cable, the admiral's F. a cross of St. George, red upon white ground, flown at the main-mast. The vice-admiral flies at the fore-mast a similar F., but with one red ball in the upper quarter near the staff, and the rear-admiral flies at the mizzen-mast the same F. with a red ball in each of the quarters near the staff. A commodore flies a broad pennant, a swallow-tailed F. tapering towards the fly, and bearing the St. George's cross, while other officers commanding ships of war fly the long pennant, a very long, narrow, and tapering F. bearing a red cross on white ground.

The Eire national F. has three stripes, green, white, and orange, of equal width, the green being nearest the pole.

The F. of the union of S. Africa was altered from the Union Jack and defined by an Act of the Union Parliament in 1927. It now comprises both the Union Jack, to denote the association of the union with the other members of the group of nations constituting the Brit. Commonwealth, and the national F. the design of which is three horizontal stripes of equal width from top to bottom, orange, white, blue. In the centre of the white stripe the old Orange Free State F. hangs vertically, spread in full, with the Union Jack adjoining horizontally, spread in full towards the pole, and the old Transvaal Vierkleur adjoining horizontally spread in full away from the pole, equidistant from the margins of the white stripe. The Australian national F. is blue with the stars of the S. Cross in white, and the union F. in the top corner nearest the pole. The Canadian national F. is red with the dominion emblem in the centre and the union F. in the top corner nearest the pole. The New Zealand (Merchant) F. is red with the S. Cross stars in white and the union F. in the top corner nearest the staff. The national F. of the dominion of India is a horizontal tricolour with bands of deep saffron, white, and dark green in equal proportions; on the centre of the white band is an Asoka wheel in navy blue. The national F. of Pakistan is dark green, with a white vertical bar at

the mast, the green portion bearing a white crescent in the centre and a five-pointed heraldic star.

The Fr. F. is the tricolour of blue, white, and red in vertical bars adopted during the revolution, and is used both in the navy and the mercantile marine. Before the revolution the royal standard was a blue F. bearing three *fleurs-de-lis*. During the two empires the imperial standard was the tricolour, powdered with golden bees, and having the imperial eagle upon the white bar.

The Ger. imperial standard had a black iron cross with broadening arms, known as the cross patée, upon a gold field, each quarter of which was charged with a black crown and three black eagles, while the centre of the F. bore a gold shield, surmounted by a cross and surrounded by a collar of the black eagle. Within the shield were the imperial arms. The naval F. had a white ground bearing a black, white-edged cross, in the centre of which was the Prussian eagle in black on a white circular ground. The upper canton next the staff was divided into three horizontal bars of black, white, and red, upon which rested the black, white-bordered iron cross. This standard during the Nazi regime of Hitler was replaced by a black swastika within a white circle placed in a red ground.

The old Austrian imperial standard had a golden field, bearing the double-headed eagle of the empire with an indented border of gold, silver, blue, and black. After the union with Hungary the combined F. of Austro-Hungary consisted of three horizontal bars of red, white, and a bar divided vertically into two half bars of red and green, with two shields over the centre white bar, containing the arms of Austria and Hungary respectively. After the First World War the Austrian F. design was changed to three horizontal bars of red, white, and red.

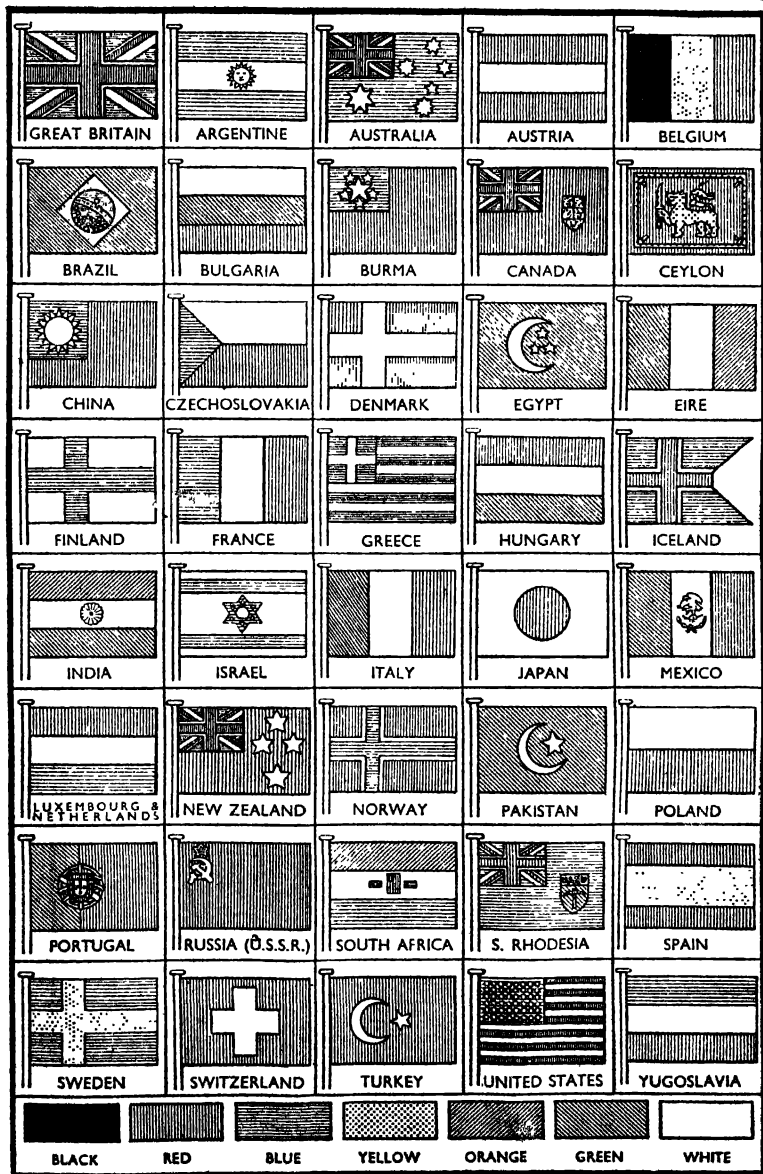

The old Russian imperial standard was yellow, bearing the arms of the empire, and the naval F. was simply a blue diagonal cross, or saltire, on a white ground. The Russian or Soviet F. is red with a yellow sickle crossing a yellow hammer, surmounted by a five-pointed star.

The Hungarian F. now has three horizontal bars, red, white, and green, with the Hungarian arms, without supporters, in the centre.

The It. royal standard until the country's adoption of a republican form of gov. was a white F. with blue border, bearing the arms of the king of Italy. The national F. has three vertical bars of green, white, and red.

The old Sp. standard bore the royal arms and the naval F. had red, yellow, and red horizontal bars; the middle bar bearing, near the staff, a circular shield with the arms of Leon and Castile surmounted by a crown. The mercantile F. is yellow with two narrow horizontal red bars. The republican F. in the Civil war had three equal bands—red, yellow, and violet.

The Portuguese F. (since 1910) is of

SOME NATIONAL FLAGS

dark green (next pole) and bright red in the proportion of five green to eight of red. On the red and green ground, half in each, is a shield, and on it representations of spheres and castles.

The Norwegian F. is red, with a blue cross bordered with white, the Swedish F. is blue, with a yellow cross. Both Fs. are square for mercantile vessels, but swallow-tailed for standard and navy, with the arm of the cross projecting between the tails and pointed.

The Belgian naval and mercantile F. has three vertical bars, black, yellow, and red. The standard is the same, with the royal arms in the centre.

The Dutch naval and mercantile F. has three horizontal bars, red, white, and blue. The standard is the same, with the royal arms in the centre.

Luxembourg's F. is red, white, and blue. The Dan. F. is red, with a white cross, swallow-tailed for the navy, and rectangular for the mercantile service. The standard bears a square in the middle with the royal arms.

The F. of Iceland is blue, with white-bordered red cross.

The Turkish naval F. is red with a white crescent and an eight-pointed star near the staff. The mercantile F. is green with a white crescent upon a red circle in the centre.

The Gk. standard has nine horizontal blue and white stripes, while the upper quarter near the staff is blue, with a white cross, in the centre of which is a crown. The mercantile F. is identical without the crown.

The Rumanian F. has three vertical bars of blue, yellow, and red.

San Marino, two horizontal bands, white and blue, with the republican arms in centre.

The Finnish F. is white with blue horizontal cross extending to the width and length of the F.

The Polish F. consists of two horizontal stripes, white and red, of equal width, with the white uppermost.

The Swiss F. is red, with white cross in the centre.

The Czechoslovak F. has a blue triangle within the square extending from the pole, with an apex in the centre of the F., the top portion of which is white and the remainder red.

The Yugoslav F. has three horizontal stripes of equal width, blue, white, and red, with blue uppermost.

The Bulgarian F. has three horizontal stripes of equal width, white, green, and red, with the white uppermost.

The Albanian national F. is red, with a black double-headed eagle. The mercantile F. is red, black, red in horizontal stripes.

The U.S. F. consists of thirteen red and white stripes, representing the original number of states, with the upper inner quarter blue, bearing one star for every state actually in the union. The number of stars is now forty-eight. Two stars were added in 1912 for Arizona and New Mexico.

Cuban national, oblong with red tri-

angle next to staff extending one-third of F., containing a five-pointed star in centre, the rest of the design being five horizontal stripes of equal width, blue and white alternately with blue uppermost.

The Mexican F. is a tricolour with green, white, and red vertical bars, bearing the Mexican arms in the central bar. Costa Rica: five horizontal bands, blue, white, red, white, blue (the red band twice the width of the others). Dominican republic: red and blue, with white cross. Guatemalan: three vertical bands, blue, white, blue. Haitian: two horizontal bands, blue and red. Nicaraguan: three horizontal bands, blue, white, blue with the republican arms on the white, displaying five volcanoes, surmounted by cap of liberty under a rainbow. Salvador: three vertical bands, blue, yellow, red. Panama: four diagonal squares—two white, one blue, and one red, with the five-pointed blue star in the middle of one white square and a red star in the other white square.

The Brazilian F. is a green F. bearing a yellow rhombus. In the rhombus is a blue circle dotted with stars and bearing the motto 'Ordem e progresso.'

The Argentine F. has three horizontal bars, blue, white, and blue, for the mercantile service, and a sun upon the white bar for the navy.

The Chilean F. consists of two horizontal halves, white and red. Near the staff in the upper bar is a five-pointed white star on a blue ground. Peruvian: three vertical bands, red, white, red. Colombian: three horizontal bands, yellow (twice the width of the others), blue, red. Bolivian: three horizontal bands, red, yellow, green. Venezuelan: three horizontal bands, yellow, blue, red (with seven white stars on blue band). Paraguayan: three horizontal bands, red, white, blue (with the republican arms on white band). Uruguayan: four blue and five white squares (surcharged with rising sun, next flagstaff). Ecuadorian: three horizontal bands, yellow, blue, and red (yellow twice the width of the others). The Jap. F. is a red central disk, representing the sun, with red spreading rays on a white ground. The Chinese F. is red, with a blue first quarter bearing a white sun with spreading rays.

Other Fs. are: Persian (man-of-war): white, bordered with green (top) and red (bottom), with arms—lion and sun—in centre. Siamese: five horizontal stripes, red, white, blue, white, and red, of equal width, with an elephant as centre emblem. Egyptian: green, with one white crescent, and three five-pointed white stars, arranged as an equilateral triangle, between the horns. Ethiopian: three horizontal bands, green, yellow, red. Afghanistan: green, red, and black, with white device in centre. Saudi-Arabian: green oblong, white device in centre: 'There is no God but God, Mahommed is the Prophet of God,' and a white scimitar beneath the lettering. Moroccan sultan's F. is red, with green pentagram (the seal of Solomon). Syrian: black, white, and green, with white stars. Lebanon F.

is blue, white, and red, with a cedar of Lebanon on white stripe.

A white F. is the 'E' of truce, a yellow F. denotes quarantine, a red F. mutiny, and a black F. piracy. For the use of Fs. for signalling see SIGNALLING.

See G. C. Housell, *Flags of all Nations* 1874; H. H. Horner, *American Flags* 1810; W. J. Gordon, *Flags of the World*, 1928; G. Perreux, *L'Origine du drapeau rouge en France*, 1930; and E. H. Baxter, *National Flags*, 1934.

Flag, in botany, the popular name of two species of Iridaceae found in Great Britain. *Iris pseudacorus*, the yellow or water F., grows in marshes and ditches. *I. foetidissima*, the stinking iris, grows in hedges and is of a purple colour. This name is also given to the tall blue irises of the U.S.A., *I. versicolor*, *I. prismatica*, etc.; and with a qualifying adjective to sev. other similar plants, *Gladiolus segetum*, the corn F., *Acorus calamus*, the sweet F., etc.

Flag-captain, captain of the admiral's ship in any squadron or detachment of the navy and is commonly the admiral's nominee.

Flagellants, **The**, is the name given to groups of religious fanatics who during the thirteenth and fifteenth centuries urged and exaggerated the efficacy of self-inflicted scourging by way of atonement for sin. This doctrine had been moderately put forward by many ascetics when suddenly in 1260 there sprang into public notice a certain monk of Perugia, Ranieri by name, who by his feverish enthusiasm prevailed on numbers of men and women to band themselves together and to march from vil. to vil. singing violently denunciatory hymns and halting at every square or crossways to flagellate themselves, so as often to draw blood and cause grave bodily hurt with a heavy knotted scourge, not infrequently loaded with iron or lead. Condemned in 1261 by the pope, this group died out, but later flagellation visited Europe in waves, usually after some great upheaval or crisis. Thus the outburst of 1260 was the result of the chaos produced in Italy by the unceasing struggles between Guelph and Ghibelline, whilst that of 1349 was directly traceable to the panic and despair which took hold of men's minds after the Black Death. The last formidable wave was that of 1414 which subsided in the burning of the leader, Conrad Schmidt, and in the punishment of his followers by the intemperate inquisition.

Flageolet, musical wind instrument of the recorder family, resembling the flûte à bec, beak flute, or ripple flute, but with two of the six holes of that instrument at the back and closed with the thumbs. In shape it is a small pipe with a mouth-piece inserted in a bulb, and produces a shrill sound similar to, but much softer than, that produced from the flauto piccolo. Various said to have been invented in France and England, but it was certainly in vogue in England from the late seventeenth to the early nineteenth century. The obbligate in the song 'O, ruddier than the cherry' in Handel's *Acis*

and *Galatea* is for a F. Mozart wrote a part for the F. in G in his *Entführung aus dem Serail*, but as the instrument is obsolete in the orchestra this part is now played on the piccolo. The ordinary six-holed tin whistle, which is a popular form of F., gives a good idea of the appearance and tone of its orchestral prototype. The F. is also an organ stop of 2 ft. scale, and wood pipes. F. tones are produced upon instruments of the violin type by drawing the bow very lightly over the strings.

FRENCH OR TRUE FLAGEOLET
back and front views

Flag-lieutenant naval officer who transmits by signal or word of mouth the admiral's commands to the various ships. He is attached to his admiral exactly as in the army the aide-de-camp is to his general.

Flag-officer ranks above a captain in the Brit. Navy, and is usually a rear-admiral, vice-admiral, or admiral. He is so called because he is privileged to hoist a flag at his mast-head instead of a pennon, the flag being invariably a red St. George's cross on a white ground. A rear-admiral carries it at the mizzen, a vice-admiral at the fore, and an admiral at the main. To Fs. are given the commands of naval stations at home, and of fleets at home or abroad, whilst they may be entrusted with the surveillance of any important dockyard. They are appointed by the Admiralty at the king's pleasure.

Flagship, so-called because it flies the admiral's colours. In any naval engagement other members of the squadron naturally look to the F. for orders.

Flag-signalling, or **Flagging**, see SIGNALLING and SEMAPHORE.

Flagstaff, pole or staff upon which a flag is hung; a F. on land is more often a tall mast, permanently fixed, while that on board ship is generally the mainmast, or at the stern.

Flagstaff, tn. of Arizona, U.S.A., the cap. of Coconino co., situated 84 m. E. of Prescott junction. Large stock raising dist. There are lumber mills, excellent yellow pine being produced. In the city are the Lowell Observatory and the headquarters of the Coconino Forestry Service. Pop. 5000.

Flagstones (geology), thin beds of sandstone which lend themselves to quarrying in slabs suitable for paving stones or rough slating. In the N. of England a flagstone quarry is synonymous with a slate quarry. The best F. are quarried from the Orcaidian or Middle Old Red sandstone of Caithness and Orkney. Other good F. are the Carboniferous F.

of the N. and midland cos. of England; while certain Jurassic rocks also yield good F.

Flahaut de la Billarderie, Auguste Charles Joseph, Comte de (1785-1870), Fr. general and diplomatist, the son of Mme de Souza, took the name of her first husband, Flahaut de la Billarderie, who was executed in the Reign of Terror (1793), although it is generally believed that Talleyrand was his father. From 1800 till Waterloo he was continually in active service, fighting at Landbach (1805), Friedland and Leipzig (1813), and having served with distinction in the Russian campaign (1812). His liaison with Hortense de Beauharnais, queen of Holland, was the result of a devoted attachment. Having taken part in an unsuccessful attempt to put Napoleon II. on the throne, he finally retired to England, where he married Margaret Elphinstone, afterwards Baroness Keith in her own right.

Flambard, Ranulf (Ralph) (d. 1128), chief justiciar in the reign of Wm. Rufus; was a Norman of obscure birth, who began life by being at the same time priest and lawyer. After Lanfranc's death, in 1089, he insinuated himself into his place as the king's chief adviser, and soon made himself odious to clergy and laity alike by his infamous, though ingenious, devices for enriching his master's exchequer. A favourite means was arbitrarily to keep a see vacant that the king might pocket the revenues. In 1099 he became bishop of Durham, but when Henry I. came to the throne he was imprisoned in the tower. Having made good his escape he took part in Robert's rebellion of 1101. Notwithstanding this treachery he regained his bishopric, and was honoured as a founder of the cathedral.

Flambé, form of lustre ware, generally yellow or red, with flame-like splashes of blue, mauve, or other colours, giving changing tints from different viewpoints. It originated in blemishes in red glaze, and was first made by Chinese potters.

Flamborough Head (A.-S. *Flamburg*). Domesday Book *Flaneburg*; derivative from *Flein's burg*, headland on the coast of Yorkshire, England, situated 2 m. E. of Flamborough. It is composed of limestone cliffs, and extends a considerable distance into the sea, rising in places to a height of 400 ft. Formerly beacons were lighted on the summit, and now a lighthouse, the light of which is visible at a distance of 25 m., stands 214 ft. above high-water mark.

Flamboyant, adjective used to describe the last phase of Gothic architecture in France during the fifteenth and sixteenth centuries. It corresponds to the Perpendicular style in England, and the name refers to the flame-like curves and flowing lines which characterise the window tracery of the period. Generally speaking, F. work is *snick* and beautiful in detail rather than in the whole effect, and is related to the finest Gothic architecture just as later Gk. statuary is to the masterpieces of Phidias. Broad surfaces are left bare, minute ornamentation being

crowded into insignificant corners and spaces. Interpenetration, that is, the interlacing of base mouldings, is an ingenious and intricate rather than a beautiful feature of this style.

Flame (Lat. *flamma*, from root *flag*; cf. *flagrare* and *φλέγειν*) can be defined as a gas which is temporarily luminous as a consequence of chemical action. The common distinction which is drawn between luminous and non-luminous Fs. is not scientific, and can only be taken as representing a rough estimate of the degree of luminosity. Fs. can also be induced by the medium of electricity; rapidly alternating high-tension discharges in air will produce an oxygen-nitrogen F., which cannot be distinguished from a F. produced by ordinary means.

Structure of Flames.—The term structure, as applied to Fs., is somewhat vague, and different accounts are given as to the number of differentiated parts in various Fs. The shape of Fs. as a rule is that of a hollow cone. The gas which is unburnt forms the interior of the cone and the other gas surrounds it in the case of Fs. produced simply by the reaction of two gases. The Fs. of the compounds of carbon, and especially of hydrocarbons, have received more attention and been more studied than other kinds, as is natural, owing to their extensive use and application. The cone of F. is simple when such elementary gases as oxygen and hydrogen only unite, but consists of two or more parts in more complex cases. At the base of a candle F. is a blue portion which forms the rudiment of an inner cone of combustion. When no air is mixed with the gas before coming out of the burner, no clear differentiation of the structure can be observed in a carbon-monoxide F. Hydrogen, when burnt in air at ordinary pressure, has very little luminosity or colour. The F. of cyanogen is peculiar in structure, consisting of a shell, almost crimson in colour, surrounded by a margin of bright blue. These two colours mark two stages in the process of combustion, as the carbon of the gas is oxidised first to carbon monoxide and then to carbon dioxide. If the gas of a hydrocarbon is supplied with sufficient air before leaving the burner, as in the case of the blast blow-pipe, the result is a sheet of undifferentiated F., blue in colour.

Luminosity of flames is caused by various reasons, of which the presence of solid incandescent matter in the F. is one. In some cases the solid is put into non-luminous F., which it renders luminous, as in the case of the incandescent gas mantle and the limelight. In the candle, oil, and coal-gas Fs., small particles of carbon, set free by the decomposition of the hydrocarbons form the chief cause of luminosity. In many Fs., however, solids are absent, and the luminosity is still great. Such are the Fs. of oxygen and hydrogen under pressure, carbon disulphide, nitric oxide, etc. With an ordinary hydrogen F. luminosity is diminished as the purity of the hydrogen is increased and as the air is freed from dust. High temp. may increase the luminosity of Fs., in which

are no solids, as in the case of coal-gas in a regenerative burner, or the same result may be obtained by increasing the density of the F. gases by pressure, as in the case of a hydrogen and oxygen F. The Bunsen burner is an illustration of the converse of the above process. Combustion in this case is rendered more complete by the addition of air to the inside of the F., but the pressure is reduced by the consequent admixture of nitrogen and oxygen, and the luminosity is thus lessened. So in the case of an ordinary gas F., if instead of air, nitrogen, or carbon dioxide is admitted to the interior of the F., the latter can be rendered practically non-luminous. The chemical energy required for the production of F. may be liberated in the process of either decomposition or combination of the component gases; the latter is the more usual, but gun-cotton is an instance of the former, as it gives off a F. in the process of decomposition. F. temps. have been measured in many ways, one of the best being the use of a platinum and platinum-rhodium thermocouple. The normal Bunsen F. is about 1870° C., the oxyhydrogen blowpipe 2420° C., the acetylene F. 2550° C., and the oxyacetylene blowpipe 3500° C. These may be compared with the temp. of the electric arc, which is about 3750° C.

Flame-Flower, or **Red-hot Poker**, popular name of the various species of *Kniphofia*, a genus of Liliaceae. They are hardy plants, suitable for cultivation in a light soil, and bear vivid scarlet flowers. Originally they came from S. and E. Africa.

Flamen (from Lat. *flare*, to blow up the altar fire), in anct. Rome the title of sacrificial priests. The chief or majores were the F. Dialis (priest of Jupiter), F. Martialis, and F. Quirinalis, who were always patricians, whilst the other twelve were chosen from the plebeians and were consequently known as minores. Their supreme function was daily sacrifice, and on Oct. 1 the majores invariably offered oblations on the Capitol to Fides Publica. A woollen mantle, called the *lena*, a white conical hat, the apex, and a laurel wreath or olive branch were their distinctive dress. Like the pope the F. Dialis was hedged round by many restrictions; e.g., he might never leave the city for a night or look at an army, nor mount a horse. His wife, known as the *flaminica* Dialis, helped him to dispense his religious duties.

Flame-thrower, military weapon, used in Byzantium, mainly as a siege and naval weapon, by special troops known as *σφοδισταί* (see GREEK FIRE). In the First World War the weapon was first introduced by the Gers., notably at Verdun (*Flammenwerfer*). Brit. and Fr. portable (infantry) and static copies were developed. The charge is a mixture of inflammable oils, the propellant compressed air or gas. Flame-throwing tanks employed by the Ita. In the Abyssinian campaign of 1935 consisted of a trailer-mounted F., towed by a light tank, but some flame-throwing tanks were used by the Gers. (converted *Panzer-*

kraftwagen II.) and Brit. in the Second World War.

Flamingo (from Lat. *flamma*, flame), name given to a genus of beautiful birds belonging to the family Phoenicopteridae, of the order Odontoglossi. They inhabit the most of the countries bordering on the Mediterranean, a few individuals occasionally travelling as far as the Brit. Isles and N. Germany. By its long neck and legs, as well as by its internal anatomy, the F. gives evidence of an ancestral connection with the storks. There are nine existing species of the *Phoenicopterus*, and these constitute the true F. *Ph. roseus*, the European F., common in the S. of France and in Spain, has plumage of a pinkish-white, with scarlet wing coverts; the beak is rosy-red at the base and black

FLAMINGO

at the tip; and the legs and feet are light vermillion. *Ph. ruber*, the Amer. F., has an entire plumage of vermillion. Large flights of these birds, travelling, as they do, over the lakes, present a most beautiful spectacle. The F., though essentially a wader, is also a powerful swimmer. It feeds on small aquatic animals and water-plants. See E. Gallie, *The Flamingoes of the Camaguey*, 1948.

Flaminian Way, or **Via Flaminia**, was the great trunk road which in Rom. times led for 222 m. northward from the metropolis to Ariminum on the Adriatic. Literature is full of allusion to it, which is not surprising, as it was a famous thoroughfare alike for travel and for commerce. A wayfarer leaving Rome would pass in turn through Oricoll, Narnia, Sangemini, Carsulae, Mevania, and Forum Flaminii. In time he would reach Nuceris and after ascending the pass over the Apennines would descend to Caes. Here his road bore round in a N.-easterly direction, and he would finally reach Forum Fortunae on the coast, whence he would turn N.-westward through Pisaurum on to the busy port of Ariminum. Some of the paving stone and the bridges or, at least,

their pliers still remain *in situ*. It was built during the censorship of Flamininus (220 B.C.), whence the name.

Flamininus, Titus Quinctius (c. 228–174 B.C.), Rom. statesman and general, secured the faithful support of the Gks. against Philip V. of Macedon, from whose oppressive yoke he rescued them, his victory at Cynoscephalæ in 197 being the decisive engagement. His somewhat hollow gift of independence and liberty to his allies gained him the title of 'deliverer and father of Greece.'

Flamininus, Gaius, Rom. democratic leader and general, granted during his tribunate of 232 B.C. a stretch of newly acquired land, 'ager Gallicus Picenus,' to the plebeians in direct opposition to the senators' wishes, and later built for them the Circus Flamininus on the Campus Martius. In 223 he gained a notable victory over the Insubres on the banks of the Addua, but in 217 he was slain during the Punic wars in the battle of Trasimene Lake into which he had foolishly allowed the astute Hannibal to entrap him. See also FLAMINIUS WAY.

Flammarion, Camille (1842–1925), Fr. astronomer, b. at Montigny-le-Roi, was entered in 1858 at the Paris Observatory as an astronomical student and worked for four years in the Bureau des longitudes, where he assisted in the compilation of a scientific nautical almanac. For some time he ed. the scientific columns of the *Siècle*, and soon became known as a popular lecturer on astronomy. In 1868 he made sev. ascents in a balloon in order to investigate aerial currents and the hygrometry of the atmosphere. Two years later he pub. an important work on the movements of celestial bodies, and in 1880 was awarded the Montyon prize of the Fr. Academy for his *Astronomie populaire*. One of his most important discoveries is that the rotatory movements of the planets are governed by the effect of gravity upon their various densities. *Pluralité des mondes habités* (1862), *Les Merveilles célestes* (1865), *Voyages aériens* (1868), *Dans l'infini* (1872), *Atlas céleste* (1877), *Les Comètes, les étoiles et les planètes* (1880), and *La Planète Mars et ses conditions d'habitabilité* (1893) are some of his many pub. Towards the end of his life he became much interested in the question of immortality and pub. sev. curious books dealing with it.

Flamsteed, John (1646–1719), b. at Denby, near Derby, first astronomer royal of England, showed a lively interest in the heavens whilst still a boy, and was delighted to find himself installed in 1676 in the Royal Observatory at Greenwich, then just completed. Largely self-taught, he left school before he was sixteen, and laboured with single-minded devotion for forty-four years at Greenwich Observatory from its foundation. At first he was harassed by lack of funds, and gladly supplemented his £100 a year by teaching and by taking holy orders, which enabled him to obtain the small living of Burstow, near Horley, in Surrey. The three vols. of his *Historia celestis Britannica*, which did not appear till 1725, contained a

record of all his astronomical observations and also the *British Catalogue* of nearly 3000 stars. Unfortunate bickerings with Sir Isaac Newton, who depended on F. for data in support of his lunar theory, cast a heavy shadow over the worthy astronomer's later years. F.'s name will always be honoured as the first great Brit. observer who estab. precise astronomy on secure foundations. The great tasks that F. undertook were, first, the construction of a catalogue of the fixed stars more extensive and more precise than any then existing; secondly, the systematic observation of the sun, moon, and planets with a view to revising the theories of their apparent motions and to constructing tables from which their positions could be computed with the desired accuracy. Those tasks were far beyond the capacity of one man, but as no assistance was provided by the gov. F. had to defray the cost of it out of his own pocket. He introduced new methods into practical astronomy, many of them still in use to-day. In accuracy his observations far exceeded those of his predecessors or contemporaries; they were, in fact, the earliest observations from which the phenomenon of aberration (q.v.) was clearly deducible. The task which he did not live to finish was completed by the labours of Crosthwait and Shart, who had been his private assistants.

Flanders (Flem. *Vlaanderen*, Fr. *Flandre*), former name of a co. of Europe, which in the seventh century was applied only to Bruges and its surroundings, but it later extended along the North Sea from the Scheldt to the straits of Dover and Calais. It comprised the N.W. part of present Belgium, with a S. portion of the Netherlands, and a N. portion of France.

History.—The country was originally inhabited by Celtic tribes, the Morini and Menapii, who were subjugated by Cæsar's forces, and the land became incorporated with Rom. Gaul. In the early centuries A.D. F. was overrun by invaders, many of the Franks taking up their abode permanently. By the treaty of Verdun in 843 F. was assigned to Neustria, or W. Francia, under Charles the Bald. F., though virtually a suzerainty of France, was politically autonomous, being governed by the counts of F. The first count whose name is recorded in hist. is Baldwin I., *Bras-de-fer* (840–79), the son-in-law of Charles the Bald. The early counts were very much occupied in guarding their lands from the attacks of predatory northmen, and in extending their own dominions. Baldwin III. (d. 962) laid the foundations of F.'s future commercial and industrial prosperity by establishing the first weavers and fullers at Ghent, and by patronising the ann. fairs in the chief Flemish cities. Baldwin IV. (988–1035) obtained Valenciennes in 1006 from Emperor Henry II., thus becoming a feudatory of the empire as well as of the Fr. crown. During the rule of Baldwin V. (1035–67) the cos. of Alost (Aalst), Tournai, and Hainaut were added to the principality. The counts of the

eleventh and twelfth centuries were zealous in promoting the industrial interests of the country. Count Philip (d. 1191) encouraged the development of the free towns, and conferred certain municipal privileges on a number of seaports. On his death the countships of F. and Hainault, which had been separated during the rule of Baldwin VI., were now reunited. Baldwin IX. (1194-1205), the founder of the 12th empire of Constantinople, was succeeded by his two daughters, Johanna and Margaret. It was during this reign that France began to exercise undue influence in the country, and attempted to deprive the people of many of their rights. Philip the Fair invaded the country during the reign of Margaret's son, Guy of Dampierre. Together with his two sons and his nobles Guy was taken prisoner, and F. established as a Fr. dependency. The sturdy Flemish burghers rose in insurrection, and under the leadership of Peter de Conynne, a master cloth-weaver of Bruges, routed the Fr. army at Courtrai (1302). The cities increased in power and wealth, and many of them were governed locally on democratic principles. The internal struggle for superiority between the chief cities often disturbed the country with civil war. In the middle of the fourteenth century Jacob van Artevelde was the virtual ruler of F., and persuaded his countrymen to make an alliance with Edward III. of England in defiance of their count. In a plot Jacob was murdered (1345), and the count of F. Louis van Male came to power. The last resistance of the cities was broke at Ghent in 1349. Under Philip van Artevelde, Jacob's son, Ghent rebelled again, until he, too, was slain at Rosbroeke (1382). By the marriage in 1369 of Margaret, the heiress to the countship, and of Philip the Bold, of Burgundy, the hist. of F. became intimately connected with that of Burgundy, until in 1477 F. became part of the Austrian Netherlands. The Flemish cons. still attempted to assert their rights in defiance of their rulers, but the Burgundian dukes, while promoting Flemish industry and trade, sternly repressed any revolts against their authority. In 1526 France was obliged to yield her right of suzerainty in favour of Austria, and in 1633 F. reverted to Sp. rule. From 1659 to 1713, by the treaties of the Pyrenees (1659), Aix-la-Chapelle (1668), Nijmegen (1678), and Utrecht (1713), S. portions of the country were assigned to France, under the name of Fr. F. By the treaty of Vienna in 1815 it was incorporated in the Netherlands. In 1830 the new kingdom of Belgium was formed, and the old name of F. was retained in the two provs., E. and W. F.

E. F. lies to the N.W. of Belgium, extending to the neighbourhood of Antwerp. It has rich and fertile soil, being well watered by the Scheldt and the Lys. The chief tns. are Ghent (the cap.), Dendermonde, Oudenaarde, Eecloo, St. Nicolas. The prov. is famous for its flax, and the inhab. manuf. cloth, paper, leather, etc. Market-gardening is carried on under excellent conditions. Area 1147 sq. m. Pop. (1947) 1,212,103.

W. F. borders the North Sea for about 40 m. Like its neighbouring prov., the country is flat and the soil very productive. Agriculture and cattle breeding are the chief occupations of the inhab., Flax, hops, and tobacco are cultivated. The pop. is also engaged in fishing and in weaving, spinning, lace-making, bleaching, etc. The chief tns. are Bruges (q.v.) (the cap.), Ostend (q.v.), Ypres (q.v.), Courtrai, and Furnes. Area 1249 sq. m. Pop. (1947) 990,873. See also BELGIUM; EAST FLANDERS; WEST FLANDERS.

Flemish Language and Literature.—Flemish belongs to the Teutonic group of the Indo-Germanic or Indo-European family. It is thus closely connected with Ger. and with Eng., all having grown out of the same Teutonic stock. Together with the Dutch tongue it is generally called Netherlandish. There is very little documentary evidence of Old Netherlandish apart from an interesting trans. of the Psalms. The literature of Middle Netherlandish, which developed about the eleventh or twelfth century, is particularly rich in romances and fables, among the former being *Karel ende Elegast* and *Floris en Blanceflor*, the chief among the latter *Reinart*. Among the mystics of the fourteenth century Ruysbroek was the most important. New Netherlandish, or Dutch, dates from the early fifteenth century. The love of literature and pride in the national tongue were promoted by the formation of *Kamers* or literary clubs. One of the oldest, the *Violier*, at Antwerp still exists. During the seventeenth and eighteenth centuries, owing to historical reasons, the literary activity was nearly completely concentrated in the Dutch provs. But at the beginning of the nineteenth century, after the separation of Belgium from the Netherlands, there was a great revival of letters. The Flemish language had been largely superseded by Fr., and was regarded almost as a patois. The pioneer of the new movement was Willems (1793-1846), who aroused interest in Flemish literature by editing the old classics, and by founding in 1834 a literary organ for Flemish writers. The novelist Hendrik Conscience (1812-83) and the poet, Guido Gezelle (1830-99) were the outstanding figures of this period. They prepared a new and most fertile literary activity. Among the poets of the modern school should be noted A. Rodenbach (1856-80), Pol de Mont (1857-1931), P. van Langendonck (1862-1920), K. van den Woestijne (1878-1929), P. van Ostayen (1896-1929), and M. Gijzen (b. 1899), and among the novelists are numbered C. Buysse (1859-1932), S. Streuvels (b. 1871), A. Vermeylen (1872-1945), M. Sabbe (1873-1938), H. Teirlinck (b. 1879), A. de Ridder (W. Elschot) (b. 1882), F. Timmermans (b. 1886), M. Roelants (b. 1896), and G. Walschap (b. 1898).

Goris (ed.), *Belgium*, 1945; and H. Smith (ed.), *A Dictionary of Modern European Literature*, 1947.

Flanders, Battle of (1940), fought between May 10 and June 2, 1940, and begun with a simultaneous attack by the Gers. on Holland, Belgium, and France. During these fateful weeks the Brit. Expeditionary Force, under Lord Gort, advanced into Belgium, and fell back again when the Gers. pierced the Fr. armies and the Belgians capitulated, and finally fought its historic retreat to Dunkirk, where 211,532 fit men, 13,053 casualties, and 112,546 allied troops were embarked. Lord Gort, who was under the immediate orders of Gen. Georges, commanding the Fr. front of the N.E., had no responsibility for the plan to meet a Ger. invasion of the Low Countries. There were strong arguments in favour of that which was adopted, the wheel to the Meuse-Dyle line (the so-called Dyle plan) as against a shorter wheel to the Escaut, or remaining on the frontier with mobile troops thrown out to the Escaut. But its advantages depended on other conditions, such as the capabilities of the Belgian Army and the mobility of the Fr. reserves, conditions which were not fulfilled.

When the Ger. attack was launched on May 10 the advance through Belgium was carried out successfully, but the comparatively slight interference attempted by the Ger. Air Force was in itself a warning. Danger loomed nearer on May 15, when the Dutch Army capitulated. The excellent Fr. troops of the Seventh Fr. Army, who had rushed up to Holland, had to retire hurriedly on Antwerp. Sev. divs. of them were ordered to pass right across the communications of the B.E.F., and of their own First Army, and try to secure the disintegrating Ninth Army. This complicated move was successfully carried out on May 18; but official dispatches record that it was too late. The divs. disappeared into the enemy maelstrom, and their fiery leader, Gen. Giraud, arrived only to be captured. As for the B.E.F., which was not seriously attacked up to the night of May 15, it was still conforming to the Dyle plan. But the enemy was moving ahead of schedule, and May 16 was the turning-point. The Gers. had broken through on the Meuse and the Fr. S. flank was imperilled. Gort therefore asked for and obtained orders from Gen. Billotte, commanding the army group, to withdraw by stages to the Escaut. The withdrawal involved the abandonment by the Allies of both Brussels and Antwerp. On the day May 17-18 began a phase of improvisation—for there was

confusion in high places, and co-ordination had too often failed—during which, while the main body of the B.E.F. was holding off the enemy in the N., desperate efforts were being made by detached and improvised forces first to hold the panzer thrusts through the rearward areas, and then to form a defensive flank to the S. But on May 18 the enemy reached Amiens, and cut the lines of communication with ports S. of the Somme, and his strength of five armoured divs. made it certain that he would reach the Channel ports. The loss of the line of the Somme also cut off the arriving armoured div. (Brit.), which thus never came under Gort's effective command, and also five battalions of the 12th and 46th Divs. (lines of communication troops), together with the 51st Div., which was rushing back from the Saar. The gap in the allied line ought to have been closed by counter-attacks from N. and S., but the Fr. had not sufficient reserves at their disposal, and the so-called Weygand plan—for a counter-offensive on a large scale from the N., while the Fr. First Army and the B.E.F. were to attack S.W. at the earliest moment with eight divs., and with the Belgian Cavalry Corps in support—existed only in theory, and the attack from the S. never materialised on any substantial scale. On May 20 orders were given to Gort to fight his way back S. to Amiens, carrying with him, if possible, the Fr. and Belgian Armies from the N. Lord Gort was obliged to point out that this course was impracticable, as he would have simultaneously to fight a rearguard action against a superior enemy, and to break through a superior enemy. He knew that the Fr. and Belgian Armies could not have conformed even if they would, and the B.E.F. no longer had the supplies for protracted operations. Probably the idea never would have been practicable. But a most gallant sortie on a smaller scale was made by two Brit. divs. in co-operation with Gen. Prioux and the Fr. Cavalry Corps (May 21). All through May 22 this force held on, hoping for further Fr. support which never came, and it was finally withdrawn. But if the attack could not develop at least it imposed a delay on the enemy which greatly contributed to the success of the evacuation from Dunkirk. On May 23 Calais was isolated. Its defence for over four days by the Royal Tank Regiment and the 30th Brigade under Brig. C. Nicholson, was a most gallant action, which held off effectively this claw of the Ger. attack from Dunkirk. (See also under CALAIS.) The Weygand plan was still in the air, and Weygand reported that the Fr. Seventh Army was advancing successfully, and that it had captured Péronne, Albert, and Amiens; but these reports of successful advances were, in fact, untrue. The Weygand plan, in so far as it existed at all, was quite impracticable. Nevertheless, plans for a counter-attack towards the S. were prepared to begin on May 26. But already on the 24th the enemy had driven in the Belgian line on the Lys, and the projected counter-attack never took

place. On May 26 plans were agreed for withdrawal by stages to the Dunkirk perimeter. During that day it was evident that the Belgian Army could not retire on the Yser, and that a gap would open between it and the H.V.F. Thereafter the plans for the final withdrawal from Dunkirk were put in hand. See further WESTERN FRONT IN SECOND WORLD WAR. Consult E. Keble Chatterton, *The Epic of Dunkirk*, 1940, and Lord Gort's Dispatches, *London Gazette*, Oct. 10, 1941.

Flanders, East, see EAST FLANDERS.

Flandrin, Jean Hippolyte (1809-64), Fr. historical and portrait painter, b. at Lyons. His fame rests chiefly on his monumental decorative work, of which the church of St. Germain-des-Prés offers fine illustration. For here hang in the sanctuary his great frescoes, 'Christ entering Jerusalem' and 'Christ going up to Calvary' (1842-44), and in the choir his figures of many saints and virtues (1846-1848). The cathedral of Nantes possesses his 'St. Clair healing the Blind,' and his pictures may also be seen in the churches of St. Paul at Nîmes, St. Vincent de Paul at Paris, and St. Martin d'Alnay at Lyons. He was much influenced by Ingres.

Flange, projecting rim or edge, used in engineering, machinery, building, etc., either to strengthen an object, or to afford means of fixing it to another object, or to serve as a means of guidance. The variety of Fs. is too great to be fully detailed here. A girder consists of a vertical web connecting horizontal parts called the Fs., which are necessary to its strength, and iron joists are a similar combination of web and Fs. The use of a F. for jolting purposes is seen in cast-iron pipes, the ends of which are joined by bolts passing through the F., while iron plates are also made with Fs. at all four sides to enable them to be bolted together. Such plates are used in the construction of the tubular tunnels for underground railways, the Fs. serving as ribs and strengthening the structure. The most frequent use of the F. for guiding purposes is to be seen in the tyres of tramcar or railway carriage wheels, where the Fs. prevent the vehicle from leaving the rail. A back F. is the plate placed over the end of a cylinder in order partly to close the aperture.

Flannan Islands, or Seven Hunters, uninhabited is. group of Scotland, in the par. of Uig, Ross-shire, situated 20 m. N.W. of Gallion Head, and consisting of seven is. and twenty rocks, the highest point reaching 282 ft. The group contains some interesting Caledonian ruins, which are estimated as dating from the early eighth century. Cragsmen frequent the is. in June to obtain the eggs of the elder ducks, gannets, and other sea fowl, which breed there.

Flannel, soft woollen textile, made usually from loosely spun yarn. The origin of the word is probably Welsh, as F. made from the short staple wool of the mt. sheep was a well-known production in Wales early in the sixteenth century. A material known as balze, which is a sort of coarse F., was introduced into England

by the Fr. refugees about 1578. In Rochdale, which is the historic seat of the industry, the manufacturers favoured a wool of fine texture from the Southdown sheep, and also the wool from a Norfolk breed. In Ireland the wool from the Wicklow variety of the Cottagh breed is used. F. is now made largely from Australian, New Zealand, and S. Amer. wools. The manuf. of F. in Rochdale alone employs over 2000 people, and a considerable export trade (5,500,000 yds. in 1927), is carried on by Great Britain. The increase of flannelettes on the markets has undoubtedly checked the progress of the F. trade, but the Merchandise Marks Act has done much to ensure for purchasers the genuineness of the article.

Flash Point, temp. at which an oil will give off a vapour which can be ignited. This temp. varies with the pressure on the surface of the oil, and is higher when the oil is heated in an open apparatus than when a closed one is used. To obtain an exact ratio a standard apparatus must be used. In England the one used is Abel's closed oil tester. It consists of a closed receptacle surrounded by a water jacket. The temp. is taken by means of a thermometer in the water. The oil receptacle is fitted with a sliding lid. From time to time this is slipped back and a light applied to the opening. The lowest temp. at which a flame appears is taken as the F. P. of the particular oil that is being tested. In most countries there are special regulations with regard to the storage of oils with low F. Ps. In England the minimum legal F. P. (determined in a closed apparatus) is 73° F.

Flat (C.E. *flat*, floor), applied in modern language to the story or floor of a building, fitted up as a self-contained residence, sev. of such dwellings being approached by a common staircase. The term flattened house is still used in Scots law. This tenement system is more common in Scotland and on the Continent than in England, but of late years it has been widely adopted in large tns. of this country, not only in congested dists., but in London suburbs.

Flat (b), character in musical notation which indicates that a note is to be sung or played a semitone lower than its natural pitch. The F. signature always occurs before the note to be flattened, in the case of an accidental, for example, where the F. comes in temporarily in the course of a piece of music, and the effect does not extend farther than the bar in which the F. is put. A double F. (bb) is a sign placed before a natural note, to show that the pitch is to be lowered by two semitones.

Flatbush, formerly a township of Long Is., near Prospect Park, Brooklyn. It has a lunatic asylum, and is now part of the bor. of Brooklyn.

Flat-coated Retriever, see RETRIEVER.

Flateyjarbók, or the Book of Flatey, collection of Icelandic legends and true stories, which was compiled in the fourteenth century, and which deals chiefly with the tenth and eleventh centuries A.D. One story tells how certain Norsemen

actually reached America some four centuries before Columbus. The MS. is now preserved in Copenhagen.

Flat-fish. The family Pleuronectidae, to which all F. belong, is distinguished by the unsymmetrical conformation of the head and anterior region of the body, in consequence of which both eyes are situated on the same side, in some cases the right and in others the left. The family Pleuronectidae embraces the dextral F. (halibut, etc.), with eyes on the right side; Bothidae, the sinistral F. (turbot, etc.); Soleidae (the soles), eyes right; Cynoglossidae (tongue soles, tropical species), eyes left. The body is greatly compressed and flattened, the side on which the eyes are situated being, as a rule, dark, and the under or eyeless side being colourless. Young F., which are met with in the open sea, are transparent and perfectly symmetrical, having one eye on each side of the head, and it is evident from individual metamorphosis that the order was originally normal in shape, though there is some difference of opinion as to the process of their evolution. The F. is exclusively carnivorous, and inhabits all seas except those of polar regions or off rocky coasts. Many species, such as flounders, ascend rivs., and some have become inured to a fresh-water existence. The pigment-bearing elements in the coloration of the dark side of the skin are known as chromatophores. When lying on the sandy bottom of the sea, which it chooses in preference to a muddy bed, the F. is hardly to be distinguished from its surroundings, as the bright spots on the skin harmonise exactly with the sand and pebbles. The least specialised or most primitive species is *Psettolodes erumei*, which ranges from the Red Sea through the Indian Ocean to China, and is also found on the W. coast of Africa; it has the dorsal fin commencing at the nape of the neck, whereas in all others it commences above or in front of the eyes. *Hippoglossus hippoglossus*, the halibut, has both eyes on the right side. The genus typified by *Rhombus maximus* (or *Psetta maxima*), the turbot, contains also *Rh. levis* (or *Bothus rhombus*), the brill. *Pleuronectes platessa*, the plaice, and *P. flesus* (or *Flesus flesus*), the flounder, are characterised by the narrow mouth aperture. Another group includes *Solea vulgaris*, the common sole; *S. auranziaca* (or *S. lascaris*), the lemon sole; *S. variegata*, the banded sole; *S. minula*, the dwarf sole, and other allied species.

Flat-foot. acquired deformity of the foot, in which both arches of the foot are impaired, more especially the lateral arch. It is caused generally by long periods of standing, and is therefore commonly seen in policemen, domestic servants, hospital nurses, etc. The tendency to F. is increased by any constitutional weakness, by lack of proper food, and by general debility. It is especially liable to occur after Pott's fracture of the ankle. In its earlier stages the condition is accompanied by pain along the upper and outer part of the foot.

Treatment.—It is important that the

condition should be treated early. Excellent results may then be obtained by rest, massage, and suitable exercises. The most useful exercises are standing and walking on tiptoe, rising on tiptoe and falling back on the heels; balancing on the outer edge of the feet; and walking on the outer edge of the feet. Many patent supports are made for this condition, and are very generally used. They are not to be recommended, as they tend to stretch further the tendons and ligaments of the sole of the foot which are already lax, and so, too, increase the F. High heels should be especially avoided. In the later stages of F., attempts have been made to improve the condition by setting the foot in the correct position in plaster of Paris splints. Some surgeons operate for the condition, removing a wedge of bone from the inner side of the foot. If, however, the condition has been allowed to go far, it becomes extremely intractable, and the results of operation are often disappointing.

Flatford, beauty spot in the par. of E. Bergholt, on the R. Stour, Suffolk, England. Flatford Mill, the property of the National Trust, and Dedham Mill figure in famous paintings by Constable.

Flatheads, name given to a tribe of N. Amer. Salish Indians, who formerly occupied the country round the mts. of N.W. Montana, between the Cascade range and the Rocky Mts. The name F. owes its origin to an anct. custom, once prevalent among Peruvian tribes, of flattening the skulls of children during infancy. The term is incorrectly applied to the Salishes, but the practice still continues among modern Chinooks and among other Indian tribes dwelling by the Pacific coast of N. America. The F. used formerly to offer human sacrifices to the sun. In 1841 Father P. J. de Smet founded among them a very successful mission, and they have developed into able and industrious farmers. They are brave fighters, but prefer peace, and have always maintained friendly relations with white races. They now dwell in reservations in Brit. Columbia and Washington, and their number is estimated at about 17,500.

Flatman, Thomas (1637–88), poet and miniature painter, was educated at Winchester and New College, Oxford, being a fellow of the latter in 1676. He painted excellent miniatures and wrote much poetry. Granger says: 'One of his heads is worth a realm of his Pindarics.' Saintsbury, on the other hand, says his 'unlucky name by no means expresses his poetic quality.'

Flat-racing, see under HORSE-RACING.

Flattery, Cape, headland of Washington state, U.S.A., washed on the N.E. by the strait of Juan de Fuca, and on the S.W. by the Pacific.

Flatulence, condition characterised by the presence of gas (*flatus*) in the stomach or intestines. It is usually accompanied by a feeling of oppression, and the accumulation can often be felt as an elastic swelling which has in some cases given rise to suspicion of a tumour. The

commonest cause of F. is digestive trouble. In normal digestion the food-material is broken up by the enzymes elaborated by the body itself, and the liquid products find their way into various channels for the nutriment of the body. Digestion may be accompanied by bacterial action which, to a certain extent, aids the activity of the digestive ferments. Bacterial fermentation is, however, accompanied by evolution of gaseous products, which exert pressure upon the walls of the alimentary tract and give rise to the symptoms of F. The condition may also be caused by chemical action between food material occasioning effervescence, or, as is often the case with infants, an accumulation of air ingurgitated with the food. In hysterical patients F. is often caused by evolution of carbon dioxide from the blood. The treatment depends mainly upon the cause. Infants suffering from wind are usually eased by the administration of dill-water, prepared from the aromatic fruit of *Peucedanum graveolens*, or fluid magnesia. The great absorptive properties of charcoal are utilised in preparations known as charcoal biscuits. Massage of the abdominal regions is often helpful. Among carminatives may be mentioned cloves, chillies, or cayenne pepper, ginger, peppermint, aniseed, etc. Where the F. is intestinal and obstinate an enema of asafoetida usually has a good effect.

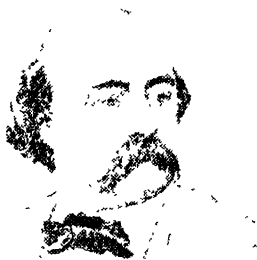

Flat Worms, see PLATYHELMINTHES.

Flaubert, Gustave (1821-80), Fr. novelist, b. at Rouen. He was the son of a surgeon, and did not leave his native place till 1840, when he went up to Paris to study law. His mother having been left alone through the death of his father and sister, he abandoned the idea of a legal profession, and made a home for her at Croisset, on the Seine, not far from Rouen, where he lived till his death. At this time he became an intimate friend of M. Maxime du Camp, with whom he travelled in Brittany in 1847, and Greece and Asia Minor from 1849 to 1851. From 1846 to 1854 he had an *affaire de cœur* with Mlle Louise Colet, apparently the only one of his life. He never married.

He began to write about 1846, and started with poetry, which he soon abandoned for prose. On his return from Greece he set to work on his great novel, *Madame Bovary*, which took many years to prepare, and finally appeared in serial form in the *Revue de Paris* (1857). It is the story of a girl of culture and high aspirations, married to a well-meaning but stupid doctor. Her various lapses into vice and her ultimate suicide are related with startling vividness. The pub. caused a great deal of scandal, and the author and publisher were prosecuted on a charge of violating morals, but were acquitted. In the following year F. paid a visit to Carthage and began a serious archaeological and historical study of its surroundings, which he made use of in his second work, *Salammô*, which was finished in 1862, a romance of the struggle between Rome and Carthage.

In 1866 he was decorated with the

Legion of Honour. Three years later he pub. a realistic novel of contemporary manners of the type of *Madame Bovary*, called *L'Éducation sentimentale*. It was followed in 1874 by *La Tentation de Saint Antoine*, a fantastic romance, worked up from fragments which he had written as early as 1857. He was now a distinguished member of a small literary set, which included Turgenev, Zola, Daudet, and the Goncourts. He was moreover, a personal friend of George Sand, his correspondence with whom was pub. posthumously. By temperament he was shy and morose, and wrote with great intensity, labouring over every word and never satisfied with what he had written.

GUSTAVE FLAUBERT

In 1877 he pub. *Trois Contes*, including *Un Cœur simple*, *La Légende de Saint Julien l'Hospitalier*, and *Hérodias*. His last work, *Bouvard et Pécuchet*, was unfinished, and was pub. posthumously in 1881. He d. of apoplexy, and was buried in the family vault at Rouen.

F.'s style is a model of purity and strength. His work is tinged with satiric melancholy. He loathed everything mediocre, and his hatred for the *bourgeois* amounted almost to monomania. He wrote with an extraordinary knowledge and insight of the manner of his time, and as a literary artist must be placed between the realistic and romantic schools, belonging to neither and yet having much in common with both. His undoubted preference was for romanticism, and it was rather in spite of himself that he achieved so great a triumph with his realistic novel, *Madame Bovary*, and so much so, that he is regarded as the true inspiration of all modern realist fiction.

His *Œuvres complètes* were pub. in 8 vols. in 1885. Of his works not already mentioned should be noticed two plays, *Le Candidat* (1874), and *Le Château des oiseaux* (1877); and *Par les champs et par les grèves* (1885). See Maxime du Camp, *Souvenirs littéraires*, 1889-93; E. Zola, *Les Romanciers naturalistes*, 1881; lives by E. Faguet (*Grands Écrivains français*), 1899; L. Bertrand, 1912; and A. Thiaudet, 1935; also R. Dumesnil, *Gustave*

Flaubert, l'homme et l'œuvre (with bibliography), 1932; H. Guillemin, *Flaubert devant la vie et devant Dieu*, 1939; and F. Steegmüller, *Flaubert and Madame Bovary*, 1947.

Flavigny-sur-Ozerain, com. of the dept. of Côte d'Or, France, noted for its culture of aniseed. Pop. 700.

Flavius, Julius, see CONSTANTIUS II.

Flavius Porphyrogenitus, see CONSTANTINE VII.

Flavius Valerius, see CONSTANTIUS I.

Flavones, Flavonols, colouring matters of plants. They may be divided into the following prin. classes: photosynthetic pigments—chlorophyll (q.v.); carotenoids—carotene; anthocyanins, and anthoxanthins. Most of these pigments occur as glycosides, with glucose or rhamnose; while a few occur free.

Flawil, small tn., 8½ m. W. of St. Gall, with which it is connected by rail, between the lakes Constance and Zürich in the N.E. of Switzerland. Pop. 5500.

Flax (*Linum usitatissimum*), dicotyledonous plant of the order Linaceæ. It is an ann., growing from 20 to 40 in. in height, bearing a corymb of bright blue flowers. The seed of the plant (commonly known as linseed) is of great value commercially and medicinally. The stem is also of great value in yielding a fibre which is used to make linen. The soil best adapted to the growth of F. is a deep rich loam in which there is much humus or vegetable mould. It thrives well in the rich alluvial land of Zealand and the polders. It is also raised with great success in the light sands of Flanders, but much more careful tillage and manuring are required. The land on which F. is sown must be very free from weeds, the weeding of this crop being a very important part of the expense of cultivation.

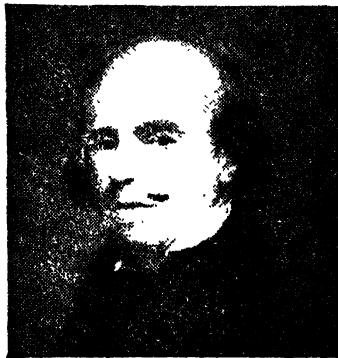

F. was used in the very earliest periods of civilisation. It is mentioned in the book of Exodus, and the lake-dwellers of the Stone Period are known to have used it to make ropes, lines, and fishing-nets. In anct. Egypt the cultivation and preparation of F. were very successful, and down to the fourteenth century Egyptian F. was famous throughout the civilised world.

The preparation of F. is done in six stages, which are (1) *Pulling*.—This should be done in dry weather, and the plant should be pulled up by the roots. (2) *Rippling*.—That is separating the seeds from the stalks. (3) *Retting or rotting*.—This is done either by soaking in soft water (*water-retting*), or by exposing to the dew (*dew-retting*). Schneek's method is now generally used. In this the fibres are soaked for a shorter time in warm water. (4) *Drying*.—Often called grassing, as the fibre is spread out on short grass to dry. (5) *Breaking*.—Preparatory to scutching. (6) *Scutching*.—The separation of the fibres from the woody part of the stalk. This can be done by hand, though of late scutching machines have been chiefly used.

The F. industry of Great Britain has been steadily decreasing since the middle of the last century. Ireland is the only

part now in which any considerable crop is grown. Russia now grows the largest crop of any European country. The F. industry of the U.S.A. is also very considerable.

Flax, New Zealand (*Phormium tenax*), also called Flax-lily, Flaxbush, monocotyledonous plant belonging to the Liliaceæ order. It grows wild in New Zealand, but is half hardy in this country, where it is generally grown in cool greenhouses. Its leaves are from 2 to 6 ft. long, and 2 or 3 in. broad. Their fibres are very strong and fine, and in New Zealand are used to make clothes, dresses, mats, etc. In England the N. Z. F. is used chiefly for ropes and sailcloth. It is obtained by cutting the leaves from a plant, and macerating them, after which the fibres are easily extracted. The New Zealanders obtained more perfect F. by a laborious process of manual separation without maceration. Intensive research work is (1931) being carried out in New Zealand at Massey College on the breeding and selection of improved strains of *Phormium* with a view to raising the general standards of strength and productivity, and encouraging results have already been obtained by the college.

JOHN FLAXMAN

Engraving after the painting by John Jackson.

Flaxman, John (1755–1826), Eng. sculptor, b. at York. He was the son of John F., a moulder of plaster figures and casts in Covent Garden, London. He was a sickly, slightly deformed boy, and spent his childhood mostly indoors, drawing and playing with moulds. He exhibited models at the Free Society of Artists in 1767 and 1769, and won the silver medal of the Royal Academy in 1770. During 1775–87 he earned a livelihood by his beautiful designs for the china ware of Messrs. Wedgwood. In 1787 he married and settled in a studio in Wardour Street, where he executed monumental sculpture for the dead. His work of this class includes monuments of Chatterton in St. Mary Redcliffe, Bristol; of Collins,

and of the Rev. T. and Mrs. Ball in Chichester Cathedral; and of Mrs. Morley in Gloucester Cathedral. For seven years (1787-94) he lived in Italy, studying and perfecting his art, and while there, executed his famous designs for Homer (pub. 1793), Æschylus (1795), and Dante's *Divina Commedia* (1797), as well as a marble group of 'The Fury of Athamas,' and a 'Cephalus and Aurora,' from the stories in Ovid's *Metamorphoses*.

He was elected R.A. in 1800; appointed prof. of sculpture to the Royal Academy in 1810. His work is pure and simple in style, and is executed in the true classic spirit, but occasionally shows weakness in portraying the stronger emotions. The most notable of his later works are monuments of Nelson, Howe, and Sir Joshua Reynolds in St. Paul's, Lord Mansfield and Capt. Montague in Westminster Abbey, and 'St. Michael' at Petworth. The F. gallery in Univ. College, London, was founded by his wife's sister. His *Lectures* were ed., with a 'Brief Memoir' in 1829. See A. Cunningham, *Lives of the Most Eminent British Painters, Sculptors, and Architects* (vol. iii.), 1830; S. Colvin, *The Drawings of Flaxman*, 1876; and W. G. Constable, *Flaxman*, 1927.

Fleabane, popular name for plants of the genera *Conyza* and *Erigeron*, both of the order Compositæ; from the former a volatile oil is prepared, which keeps away insects, and the scent of the *Erigeron acris* serves the same purpose.

Fleas are parasites of the *Pulex* genus. There are about 500 varieties known, many of which are specific to some particular bird or mammal. The word is commonly used to refer to the variety that chiefly infests man, the *Pulex irritans*.

The flea is a wingless insect, with a laterally compressed body strongly cased in chitin to withstand pressure, small head, and six long powerful legs. It lives on the blood of warm-blooded animals, though it can evidently live for long periods without such food. The piercing organ is the mandible, and not the maxilla, while the upper lip forms the sucking tube. The flea is justly famous for its jumping powers, which are equal to those of the locust, that is, it can jump 200 times its own length.

The eggs are not very numerous as a rule. They hatch in from six to twelve days, when wormlike bristly larvæ emerge. These live for about a fortnight feeding on decaying organic matter before forming cocoons. Thus *Pulex irritans* takes about a month to reach maturity. The Indian rat-flea, *Xenopsylla cheopis*, transmits the plague.

The chigoe or jigger of S. America and W. Africa is another famous member of the family. See CHIGOE.

Flèche, term in Fr. architecture used generally for a spire and especially for a slender spire of timber covered with lead, rising from the intersection of the nave and transepts of large churches.

Flèche, La, tn. of France in the dept. of La Sarthe, manufacturing paper, oil, and leather. It has also a timber trade.

Since 1764 it has been the seat of a famous military school for the sons of officers. Here also are the heart and a statue of Henry IV. Pop. 11,200.

Flecker, James Elroy (1884-1915), Eng. poet and playwright; b. Lewisham, London; elder son of Rev. Wm. Herman F., headmaster of Dean Close School, Canterbury, where he was educated before going to Trinity College, Oxford. James was his substitution for Herman, his baptismal first name. Prepared for consular service by two years at Cambridge, where he studied oriental tongues. He served in Constantinople in 1910 and 1911, and transferred to Beirut, where he was vice-consul till 1913. He d. of consumption at Davos Platz. Works, including poems: *The Bridge of Fire* (1907); *Forty-two Poems* (1911); *The Golden Journey to Samarkand* (1913); *The Old Ships*, a collection of seventeen poems pub. posthumously (1915); a novel, *The King of Alexander* (1914); two plays—*Hassan* and *Don Juan*—both pub. posthumously. F. follows the objective methods of the modern Fr. poets of the Parnassian school—eschewing the personal and emotional. Except in *Hassan* he rarely got beyond the stage of experimentation in verse. *Hassan* is notable more for its lyrics than for any dramatic qualities. It was produced at the Haymarket in 1923. See J. C. Squire's introduction to *The Collected Poems of James Elroy Flecker*, 1916.

Flecknoe, Richard (c. 1620-78?), Irish Rom. Catholic priest and playwright, who travelled between 1640 and 1650 in Europe, Asia, Africa, and Brazil. He afterwards settled in London, where he wrote sev. now forgotten plays. His name is remembered in connection with the poet Dryden, who gave his merciless satire against Shadwell the title of *Mac-Flecknoe, or a Satyr upon the True-Blew Protestant Poet, T. S.* Marvell also wrote a satire on him.

Fleet (O.E. *fleotan*, to float; cf. Ger. *fließen*), word denoting a collection of ships, and particularly a collection of warships belonging to the navy of one nation, and under the supreme command of a single officer. In Great Britain it should consist of at least ten ships, to each of which are attached torpedo-boats, cruisers, etc. Little difference is made between a F. and a squadron, the words being used indiscriminately of a div. of the R.N. The word is also applied to a number of vessels for fishing or other commercial purposes.

Fleet Air Arm consists of those aircraft, and the men who fly and tend them, that are embarked in H.M. ships; it is a part of the R.N., and not of the R.A.F. In the Second World War it did not fly from H.M. ships alone, if the needs of the moment required otherwise. Naval squadrons at home operated as units of one or other command of the R.A.F.—coastal (q.v.) or fighter (q.v.)—for operations in the Channel or in other seas. In the battle of Britain (q.v.) more than forty naval pilots, few of whom survived, joined the fighter command and fought alongside their brethren of the R.A.F.

Among the many operations in which the F. A. A. greatly distinguished themselves were those at Taranto, when many It. warships were sunk or damaged (see WORLD WAR, SECOND, *Naval Operations*), the battle of Matapan (q.v.), the sinking of the *Bismarck* (see 'BISMARCK, THE'), and the Malta convoys. Some six old Swordfish planes of the F. A. A. made a most heroic if abortive attempt to stop the escaping Ger. warships *Scharnhorst*, *Gneisenau*, and *Prinz Eugen* in the Eng. Channel on Feb. 12, 1942. Lt.-Cdr. Esmonde, who led these aircraft on that occasion, receiving a posthumous V.O. Aircraft carriers are the moving airfields of the F. A. A. See *The Fleet Air Arm* (pub. by the Admiralty H.M.S.O.), 1943, and J. Moore, *The Fleet Air Arm*, 1943; and *Escort Carrier*, 1944.

Fleet Prison, famous London jail, which was situated on the E. side of Farringdon Street, on what was formerly known as Fleet Market. It took its name from the Fleet stream, and is supposed to have dated from Norman times. During the reigns of Mary and Elizabeth it was the scene of imprisonment of Catholic and Protestant martyrs, and later of those who were condemned under the Star Chamber and court of chancery. In 1640 the Star Chamber was abolished, when F. P. came to be used as the prison for debtors and bankrupts. The prison had many times to be rebuilt. It was destroyed in the reign of Richard II. by the followers of Wat Tyler; in 1666 it was burnt down during the Great Fire of London; and in 1780 it was destroyed during the Gordon riots, but again rebuilt in 1781-82. Among its celebrated prisoners were Bishop Hooper, Prynne, Wycherley, and Penn, the colonist of Pennsylvania. Its keeper was called the warden of the Fleet. During the seventeenth, eighteenth, and part of the nineteenth centuries it was notorious for the clandestine marriages contracted within its walls, the first notice of which is in 1613. They were at first celebrated in the Fleet Chapel, but on marriages without banns being prohibited in chapels, the precincts of the Fleet were employed for the performance of these marriages. Such unlicensed marriages were declared to be void by Act of Parliament in 1753, which came into force in March of the following year. See J. Ashton, *The Fleet, its River, Prison, and Marriages*, 1888.

Fleet Street, newspaper centre of London, England, running from the end of the Strand at Temple Bar to Ludgate Circus. It takes its name from the R. Fleet, and (together with the nearby Bouverie Street and Tudor Street) has the offices and printing establs. of many of the leading Brit. newspapers and news agencies, and London offices of foreign newspapers.

Fleetwood, Charles (d. 1692). Eng. commonwealth soldier; third son of Sir Miles F., of Aldwinkle, Northamptonshire. His eldest brother was a royalist; the second went to Sweden; and Charles, studying law in Gray's Inn when civil war began, joined the parl. army as

trooper. He was colonel of horse at Naseby; M.P. for Marlborough, 1646; governor of Isle of Wight, 1649, and fought with Cromwell at Dunbar, 1650. He became a member of the council of state, and lieutenant-general in 1651. He led cavalry at Worcester. F. married (second of three wives) Bridget, daughter of Cromwell and widow of Ireton, 1652. In Ireland as commander-in-chief till 1655—for last year lord-deputy. He was one of the major-generals of 1655; and one of 'Oliver's lords.' Always for the army as against Parliament, he was popular with religious extremists. On Oliver's death commander-in-chief of army, 1659, till deprived by the Rump Parliament. Included in indemnity at Restoration. F. was buried in Bunhill Fields.

Fleetwood, bor. and port at the mouth of the R. Wyre, Lancashire, England, 9 m. N.E. of Blackpool. It has steamship services to Belfast, the Isle of Man, and Scotland. The chief industry is steam-trawler fishing. Pop. 24,000.

Flegel, Eduard Robert (1855-86), Ger. traveller in W. Africa, b. of Ger. parentage at Vilna in Russia. After a commercial education he devoted his life to acquiring for Germany the major share of the trade of the Niger. He ascended this riv. first in 1879 in the London Missionary Society's steamer, and a year later in his second ascent reached Sokoto. In 1883 he discovered the sources of the Benue to the S. of Adamawa. He wrote *Loose Blätter aus dem Tagebuche meiner Hausa-freunde* (1885) and *Vom Niger-Benue* (ed. by K. Flegel, 1890).

Fleischer, Heinrich Leberecht (1801-88), Ger. orientalist, b. at Schandau, Saxony. He ed. Abulfeda's *Historia ante-Islamica* (1831-34) and Beldhawi's *Commentary on the Koran*, and trans. Ali's *Hundred Sayings* into Ger. (1837).

Fleming, Sir Alexander (b. 1882), Brit. bacteriologist, b. at Lochfield, Darvel, Scotland. Educated at Kilmarnock Academy and St. Mary's Hospital Medical School, London. M.B., B.S. (London), and the univ. gold medal, 1908; F.R.S., 1943; F.R.C.P., 1944. Prof. of bacteriology at St. Mary's Hospital till 1948. He is best known for his discovery (in 1928) of the anti-bacterial substance penicillin (q.v.), extracted by him from a green mould, *Penicillium*, which contaminated a culture of bacteria on which he was working. His early extracts proved unstable, and it was not until the Second World War that a stable product was prepared on a large scale, and was the means of saving countless lives. For this work F. was knighted in 1944, and received the Nobel prize in 1945. His earlier discovery of lysozyme (1922), an antiseptic present in tears and preserving the eyes from infection, was also important. He has pub. many papers on bacteriological subjects, and gained numerous distinctions besides those here detailed.

Fleming, David Hay (1849-1931), Scottish historian. He was educated at Madras College, St. Andrews. Retired from business, 1883, to devote himself to

Scottish hist. Puba.: *Martyrs and Confessors of St. Andrews* (1887); *Scotland after the Union of the Crowns* (1890); *Mary Queen of Scots* (1897); *Three Sections of Scottish History and Life* (1902); *The Story of the Scottish Covenants in Outline* (1904); *The Reformation in Scotland* (1910); and *Critical Reviews relating chiefly to Scotland* (1912).

Fleming, Sir John Ambrose (1849-1945), Eng. electrical engineer, b. at Lancaster. He entered St. John's College, Cambridge, in 1877, and after a brilliant career was appointed univ. demonstrator in applied mechanics; first prof. of mathematics and physics at Univ. College, Nottingham; electrical engineer to the Edison Electric Lighting Company (1881), in which capacity he superintended the introduction of incandescent electric lighting in England. In 1885 he became prof. of electrical engineering in Univ. College, London, and obtained the erection of its engineering and electrical laboratories. He made the first thermionic valve in 1904. Chief puba.: *Short Lectures to Electrical Artisans* (2nd ed.) (1885); *Magnets and Electric Currents* (1897); *Wireless Telegraphy* (1905); *Radio-telegraphy and Radio-telephony* (1908); *Propagation of Electric Currents in Telephone and Telegraph Conductors* (1911); *The Wonders of Wireless Telegraphy* (1913); *The Thermionic Valve in Radio-telegraphy* (1919); *Fifty Years of Electricity* (1921); *Electrons, Electric Waves, and Wireless Telephony* (1923); and *The Interaction of Scientific Research and Electrical Engineering* (1927). He was knighted in 1929.

Fleming, Sir Sandford (1827-1915), Canadian engineer, b. at Kirkcaldy, Scotland. He became chief engineer for the dominion gov. (1867-80), when he superintended the construction of the intercolonial railway. Author of *The Intercolonial: a History* (1876); *England and Canada* (1884); and *The New Time Reckoning* (1889). See L. J. Burpee, *Sandford Fleming, Empire Builder*, 1915.

Flemings, see FLANDERS.

Flemings in England. Flemish settlers probably first came to England in the reign of Henry I., who expelled the Welsh from Lower and S. Dyfed (Pembrokeshire) in favour of Teutonic settlers. These colonists soon became anglicised, but, up to the present day, have retained many of their Teutonic characteristics and have shown little inclination to intermarry with the Celts. During the reign of Stephen, Flemish weavers estab. themselves in the E. cos. and made Norwich famous as the centre of the cloth industry. The close commercial relations between England and Flanders, estab. by the *Magnum Intercursus*, 1496, encouraged emigration. During the Reformation many Flemish Protestants sought refuge in this country.

Flemish Art. The chief names in the Flemish school of painting, prior to the time of Mabuse, are the van Eyck brothers and sister of whom Hubert (c. 1370-1426) and John (c. 1390-1440) are supposed to have invented painting in

oils. John van Eyck is notable for brilliant and rich colouring. A polyptych by the brothers was stolen by Gers. from the cathedral of St. Bavon in Ghent (see also EYCK). Dirk or Dierick Bouts (q.v.) (d. 1475), a Dutch landscape or historical painter, who settled in Louvain and whose work has affinities with that of Rogier van der Weyden or de la Pasture (q.v.) (1400-64). The architectural background and floating angels of Mabuse's celebrated 'The Adoration of the Kings' owe something to the influence of van der Weyden. Hans Memling (or Memlinc) (q.v.) (c. 1430-94), a native of the Rhineland who settled in Bruges, is famous for his panels of religious subjects. Rogier van der Weyden, too, exerted an important influence on Memling. Memling's art is essentially classical, in so far as for him what was accidental or abnormal did not exist, his concern being only with the general or universal; he is also notable on account of his regard for unity, composition, and finish. He was equally celebrated as a portrait painter. Most of his portraits are inspired by a religious emotion; thus he portrayed the donors of his altar-pieces praying under the protection of their patron saints. It is generally believed that Memling painted in oils. In the old chapter-house of the Hôpital Saint-Jean, Bruges, before the Second World War, were to be found sev. of his masterpieces: 'The Mystic Marriage,' 'The Adoration of the Wise Men,' 'The Shrine of Saint Ursula,' 'The Descent from the Cross,' and others. Of this period, too, are Gerard David (q.v.) (c. 1450-52) of the Bruges school, who was famous for altar-pieces, and Quentin Matsys (q.v.) (1466-1530), who also painted religious subjects. Jan Gossaert, called Jan of Mabuse (q.v.) (b. c. 1470 at Mauberge and d. at Antwerp 1541 or, according to some, in 1532), changed the whole spirit of antecedent F. A. by Italianising it under the influence of the work of Leonardo and Michelangelo. Critics still ask themselves whether Mabuse did any service to his own creative art or to his own country generally by visiting Italy; for the Flemish native soul has nothing in sympathy with the cold and polished works of the school of Leonardo. Mabuse is at his best in mingling the study of architecture with the gaudy system of colouring peculiar to artists of stone. His magnificent altar-piece, 'The Adoration of the Kings,' in the National Gallery, London, is essentially Flemish in outlook and is one of the glories of European art. Of equal importance is the fact that the remarkably minute finish of every part of the picture faithfully reflects the conscientious methods that inform the subtle work of the famous Flemish illuminators of MSS. His later work—perhaps it may be called artistic degeneration—may be seen in the 'Adam and Eve' at Hampton Court, and in the 'Neptune and Amphitrite' (1516), formerly in Berlin, the figures of which lack the sublimity and dignity of those of his pre-It. period. One fruit of his It. contact was that he chose to sign himself 'Mabodius.' Contemporary with

Mabuse was Joachim da Patinir (c. 1490-1524), the artist who first painted landscape for its own sake, i.e. not merely as a background or irrespective of its inherently exciting or dramatic qualities or of its subtle charm. His 'Repose in Egypt', at Brussels, is a good example of his method. Henri de Bles (q.v.) (1480-c. 1550) is believed to have been a pupil of Patinir. His *Virgins and Holy Families*, influenced by his long stay in Italy, show a further departure from the original spirit of F. A.. Other sixteenth-century painters were Bernard van Orley (q.v.) (c. 1493-1560), who was famous for tapestry designs; Michael Coxie (q.v.) (1494-1592), a pupil of van Orley, whose work shows the influence of Raphael; Lambert Lombard (q.v.) (or Susterman) (1506-60), who was also an engraver; Antonio Moro (q.v.) (or Sir Anthony More) (c. 1525-81), painter to Queen Mary of England; and Pieter Brueghel (c. 1520-69 or 1570), founder of the celebrated family of Flemish painters of that name. Flemish painting reached its golden age in the seventeenth century—the century of Rubens, van Dyck, and the Teniers. Peter Paul Rubens (q.v.) (1577-1640), the most eminent representative of F. A. and one of the greatest painters of any school, has been called the great model for chiaroscuro. He is correct in design and magnificent in his drapery. Though the beauty of his female types is generally most pleasing, it does not aim at it. refinement or airy grace, but then neither does his work generally reflect the stiffness of Italianate imitators; rather is it Flemish in warmth and life throughout, and indeed it was Rubens who, reacting from the school of Mabuse, brought F. A. back to its true spirit and to nature. Some critics have charged him with historical improprieties or anachronisms; but he is too good a classical scholar not to be fully aware of what he is doing, and in this he followed the example of Titian, Paul Veronese, and others. For nearly a century the Flemish school of art may be said to have been but a reflection of the principles of Rubens, and neither in name nor in fact did that school ever find a second Rubens; and his paintings (at least before the Second World War) were to be found in all the prin. galleries of Europe. Sir Anthony van Dyck (q.v.) (1599-1641) early in life worked with Rubens. At the outset of his career his power of conception was greatly superior to his refined taste as a portrait painter. One of the most brilliant figures in the hist. of art, he yet cannot be said to have formed a school. It was hardly possible for him to reach an equal degree of expression when choosing the same subjects as Rubens; but in applying the same principles of bold and comprehensive imagination to portrait painting he was no less successful; nor indeed are Titian, Raphael, Rembrandt, or Velasquez superior to him in this branch. The harmony of figure with background seems to have been with him a guiding principle, whether in light and shade or colour, while his physiognomical interpretation

gives an enduring character to all his portraits because it is so closely related to picturesque necessity. Sometimes he may be thought to be deficient in solidity or to be rather prone to unnecessary fluidity in attitude, but these defects, if defects they be, are outweighed by his sense of proportion, elegance of outline, and altogether admirable technique. David Teniers the Elder (q.v.) (1582-1649) and David Teniers the Younger (q.v.) (1610-94), though Flemish by birth and education, belong more closely to the Dutch school. The younger Teniers was a pupil of Rubens. In style he followed

W. F. Mansell
VAN DYCK'S 'PORTRAIT OF A LADY'

his father, but with a much superior power of conception. He shows also the influence of Adrian Brauer (q.v.) (1608-1640) early in his career. Truth in physiognomy and beautiful effect of light and shade, frankness in expression, and freedom of attitude characterise his famous 'Jubilee Meeting of the Civic Guards,' which went to St. Petersburg. Few artists worked with greater ease, and hundreds of his pictures are or were to be found in European museums or in private collections. While many of his interiors are masterpieces, they do not often equal his open-air scenes, which are alive with carefree joyousness and everlasting sunshine. Some of his tavern scenes are characteristic of this genre, though Brauer was better acquainted with this milieu than was Teniers; while his cottage interiors are less realistic than those of Ostade and, as an etcher, Teniers compares unfavourably with both Ostade and Cornelius. Other seventeenth-century

painters are Frans Snyders (*q.v.*) (1579-1657), painter of animals and of battle-pieces; Casper de Crayer (*q.v.*) (1582-1669), whose chief works are altar-pieces; Jakob Jordaens (*q.v.*) (1593-1678) who, after Rubens's death was the acknowledged leader of the Antwerp school; Gonzales Coques (or Cox) (*q.v.*) (1618-84), a pupil of Pieter Brueghel, who excelled in cabinet portraiture taking van Dyck as his model; Pieter van der Pae (or Sir Peter Lely) (*q.v.*) (1671-80), whose *chef-d'œuvre*, a series of portraits of women of the court of Charles II. of England, is at Hampton Court; Lucas van Uden (1595-1672) and Jan Fyt (1609-61). A large number of Flemish painters, many of them pupils of Rubens, lived in the seventeenth century, but they are of no importance. Among eighteenth-century painters are Cornelis Huysmans (1648-1727) and Jan van Bloemen (1662-1740).

Evidently one cannot speak of a contemporary Belgian school of art, whether Flemish or Walloon, or of any tendency to grouping artists of to-day under the inspiration of a common ideal. This might have been possible twenty or more years ago in the epoch of Expressionism. Of Belgian expressionist painters Fritz van der Berhe has sunk into oblivion and the reputation of Gustave de Smet has not survived a temporary popularity. Permeke and Tytgat are still living (1949), but both now paint without caring whether they be expressionists or not. Tytgat, the most refined of to-day's Belgian painters, is difficult to classify, for his method is always changing in the effort to avoid 'stylisation'. No coherent movement has succeeded Expressionism. Wolvens, Dasnoy, Stobbaerts, and the sculptor Grand have nothing in common but their aversion from the efforts of their predecessors, whether cubists, expressionists, or surrealists. Wolvens is perhaps the most richly gifted of all modern Belgian painters, with his luxuriant colouring and heavily laid-on paint, but even his best pictures lack composition; they are magnificent slabs of painting without more. 'With the example before him of many Flemish painters,' says M. Arnold de Kerchove, 'Wolvens abandons himself to his instinct and is content to be only an eye. To say that is at once to praise him while indicating the limitations of his art.' The admirers of Paul Delvaux do not hesitate to acclaim him the foremost contemporary Belgian painter; but others say that this would only be true if he were judged by the yardstick of his excellent intentions, and that in the effort to realise his dreams or obsessions he employs an academic technique which is the very negation of painting. *The Last Flowering of the Middle Ages*, by J. van der Elst (1945), collates all the essential things that should be known in order to understand Flemish painting of the fifteenth century. See also H. Fierens-Gevaert, *Études sur l'art flamand: La Renaissance septentrionale*, 1903; R. Oldenburg, *Die Flämischen Malereien im sechzehnten Jahrhundert*, 1922; and L. van Puyvelde, *The Flemish Primitives*, 1948.

Flemish Bond, see BRICKWORK.

Flemish Language and Literature, see FLANDERS, *Flemish Language and Literature*; and BELGIUM, *Literature*.

Flensburg, tn., 19 m. N. of Schleswig in Schleswig-Holstein, at the end of Flensburg fjord, an inlet of the Baltic. There are iron and machine works, copper and zinc factories, shipbuilding yards, brick, cement, and lime works, and breweries. Fishing and fish-curing are also carried on. The tn. passed from Denmark to Prussia in 1864. F., in the closing days of the Second World War, was the headquarters of the stop-gap gov. of Adm. Doenitz (*q.v.*). Here and at Kiel and Copenhagen the Gers. had concentrated what remained of the Ger. Navy. The Doenitz Gov. seems to have contemplated yet another redoubt in Norway; but this shadow gov. had only a precarious hold on Radio F. and the adjacent area; and a few days after the foreign secretary, Count Schwerin von Krosigk, had broadcast a farweld message to the Ger. people, the Doenitz Gov. in F. was dissolved and arrested, and Doenitz was placed on the list of war criminals. Pop. 70,900.

Flers, manufacturing tn. in the dept. of Orne, France. A linen and cotton manufacturing dist. There are also drug, chemical, brick, tile, and dye works. Pop. 12,300.

Flesh (*A.-S. fleesc*), the softer tissues of the body, the muscles, adipose tissue, and generally those parts of an animal commonly used as food. The term is applied also to the body, and its capacity for receiving sense-impressions from phenomena in the world of matter as opposed to spirit, consequently F. stands for the basic parts of human nature. According to Ger. physiologists, F. is substance in the human body whose constitution approximates to that of muscle.

Flesh-fly, see HOUSE-FLY.

Fleishy School, name given by Robert Buchanan to the 'realist' school of poets, which includes, among others, D. G. Rossetti, Swinburne, and Wm. Morris.

Fleta, early Lat. treatise on the common law of England, with the sub-title *Seu Commentarius juris Anglicani*. It is supposed to have been written during the reign of Edward I., about the year 1290. The author is unknown, but wrote it during his confinement in the Fleet prison; hence the name. The work is divided into six books, the author having adopted the plan of Bracton, and in many instances transcribed whole pages from him. F. was originally pub. by J. Selden from an MS. in the Cottonian Library in 1647, a second ed. appearing in 1685. It is also printed in Honard's collection.

Fletcher, Andrew, of Saltoun (1655-1716), Scottish politician. He so vehemently opposed the measures of the duke of York (subsequently James II.) that he was obliged to flee to Holland. In 1685 he accompanied Monmouth on his expedition to the W. of England. He returned to Scotland at the revolution of 1688 and his estates were restored to him. On the passing of the Act of Union, F. retired from public life. See *The Political Works*

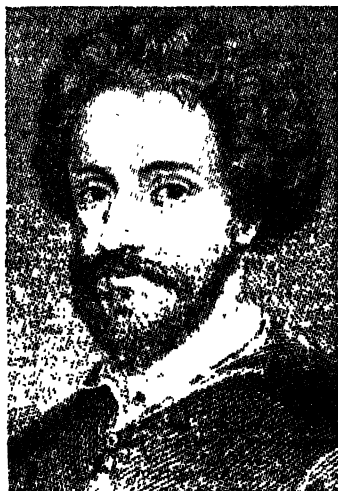

of Andrew Fletcher, 1737, and Earl of Buchan, *Essay on the Lives of Fletcher of Saltoun and the Poet Thomson*. 1792.

Fletcher, Sir Banister Flight (b. 1866), eldest son of Prof. Banister F. Educated at Univ. College, London, and Royal Academy. For some time lecturer and assistant prof. at King's College, London, and examiner to the City and Guilds of London Institute and, later, was univ. staff lecturer on architecture at London Univ., and sole partner in the firm of Banister F. & Sons. Has a keen sense of the value of old styles of architecture as an integral part of the evolution of modern styles, and emphasises the importance of a study of old buildings in architectural education and training. He has written, among other works, *The Influence of Material on Architecture* (1897); *The Architecture of the Twentieth Century from the Point of View of Public Health* (1901); *Andrea Palladio, his Life and Work* (1902); *The English Home* (1911); and *A History of Architecture on the Comparative Method* (1921). See W. Hanneford-Smith, *The Architectural Work of Sir Banister Fletcher*, 1935.

Fletcher, Giles (c. 1588–1623), Eng. poet, son of Dr. Giles F., a poet, and cousin of John F. the dramatist. He was b. in London, and educated at Westminster School and Trinity College, Cambridge, where he became reader in Gk. grammar (1615) and in Gk. language (1618). He took holy orders and received the rectory of Alderton, Suffolk. His chief work is *Christ's Victorie and Triumph, in Heaven, in Earth, over and after Death* (1610), a poem in the epic style, divided into four cantos. It is written in eight-line stanzas, the first five rhyming a, b, a, b, b, the stanza ending with a rhyming triplet, the last line being an Alexandrine. The poem owes much to Spenser and in turn influenced Milton. Eds. of his collected works are those of A. B. Grosart in the Fuller Worthies Library (1868) and in the early Eng. Poets (1876), and of F. and Phineas F. by F. S. Boas (1908–9). Giles F. also contributed to *Sorrow's Joy* on the death of Elizabeth, and wrote *The Reward of the Faithful* (1623). See *Fuller's Worthies of England* (vol. II.), ed. 1811, and H. E. Cory, *Spenser, the School of the Fletchers, and Milton*, 1912.

Fletcher, John (1679–1625), dramatist, was a son of Dr. Richard F., bishop of London. B. in Dec. at the picturesque vill. of Rye in Sussex, of which par. his father was then the officiating priest, tradition has it that at the age of twelve he was sent to Bene't (Corpus) College, Cambridge, where he remained until the summer of 1596. The bishop dying then and leaving behind him little property beyond a library, it behoved the young man forthwith to begin to earn his own livelihood. Like many another thrown penniless upon the world without any special qualifications, he looked to his pen for support, and, as all the world now knows, with more of success than even he can then have anticipated. It is said that he at once began to write for Henslowe, a theatrical manager and perhaps became

the stock-dramatist for that personage. Of these early writings and adaptations of the plays of others nothing is known. His hist. only becomes definite after he made the acquaintance of Francis Beaumont (1584–1616) in, or perhaps somewhat earlier than, 1607. The two men became great friends, lived together near the Globe Theatre, and wrote plays in collaboration. The first fruits of their literary partnership was *The Woman Hater* (1607). This was the first of their twenty plays, the best of which perhaps are *Phylaster* (1620); *The Maides Tragedy* (1619); *A King and No King* (1619); *The Knight of Malta* (1618); *The Knight of the*

JOHN FLETCHER

Burning Pestle (1613); and *The Double Marriage* (c. 1620). Beaumont wrote only one masque by himself; F. no fewer than twenty-four plays without assistance, and sev., after Beaumont's death, with other collaborators. The literary partnership of Beaumont and F. has attracted much attention, scholars being curious as to the share of each in the plays written jointly. The fact that Beaumont's name comes first is not supposed to indicate that he was the predominant partner, but that when they came together he had already a reputation as an author. It is generally conceded that Beaumont wrote better and had more of the true poetic fervour in him, and that F. had the sprittier wit and a more vivacious fancy. As against this, it may be put that in *The Faithfull Shepheardesse*, the most beautiful of pastoral plays in the language, F., who was entirely responsible for it, showed himself a very true poet. Unfortunately the plays are nearly all so gross that it is impossible to represent them to-day, and

this is the great pity because, apart from this defect, they contain so much that is splendid, such beautiful thought, and such admirable poetry. The first collected ed. of the plays of Beaumont and F. appeared in 1647, containing thirty-four plays never before printed. The Variorum ed. of 1904-12 were ed. by various editors under the general direction of A. H. Bullen. A. Glover and A. R. Waller ed. a reprint of the ed. of 1679, with collation of all the previously printed texts (1905-12), and G. P. Baker a selection of plays in Kerman's Library (1911). See J. Monck Mason, *Comments on the Plays of Beaumont and Fletcher*, 1798; O. L. Hatcher, *John Fletcher, a Study in Dramatic Method*, 1905; E. H. C. Oliphant, *The Plays of Beaumont and Fletcher*, 1927; J. H. Wilson, *The Influence of Beaumont and Fletcher on Restoration Drama*, 1928; and U. M. Ellis-Fermor, *The Jacobean Drama*, 1936.

Fletcher, John Gould (b. 1886), Amer. poet, b. at Little Rock, Arkansas, Jan. 3, son of John Gould F. Educated at Phillips Academy, Andover, Massachusetts, and Harvard. He has used his travelling experiences in his verse to good purpose. His sojourns in various parts of Europe and in the W. states of America, together with steamboat trips down the Mississippi, extended from 1903 to 1916, when he settled in London, England. His vols. of verse include *Fire and Wine* (1913); *The Dominant City* (1913); *Irradiations—Sand and Spray* (1915); *Goblins and Pagodas* (1916); *The Tree of Life* (1918); *Japanese Prints* (1918); *Breakers and Granite* (1921); *Parables* (1925); *Branches of Adam* (1926); *The Black Rock* (1928); *XXIV. Elegies* (1935); *The Epic of Arkansas* (1936); *Life is my Song* (1937); *Selected Poems* (1938); *South Star* (1941); *The Burning Mountain* (1946); and *Arkansas* (1947). Awarded Pulitzer prize in poetry, 1939. Trans.: *The Dance over Fire and Water* (by Elío Faure) (1926); *The Reveries of a Solitary* (Rousseau) (1927). His critical works are *Paul Gauguin, His Life and Art* (1921); *John Smith—also Pocahontas* (1928); and *The Two Frontiers* (1930).

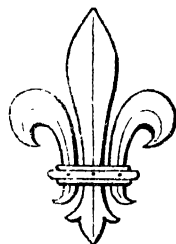

Fletcher, Phineas (c. 1582-1650). Eng. poet, elder son of Dr. Giles F. He was b. at Cranbrook, Kent, and educated at Eton and King's College, Cambridge. With his brother Giles he contributed to *Sorrowes Joy* (1603). His pastoral drama, *Sicelides, A Piscatory* (1614), was written for performance before James I. He took holy orders, and ultimately became rector of Hilgay, Norfolk, where he remained for the rest of his life. His prin. work is *The Purple Island: or the Isle of Man* (1633), written in twelve cantos of seven-line stanzas. It is an allegory of the human body, written in the manner of Spenser. There are many passages of great beauty, but much of the poem is marred by far-fetched conceits. F.'s other works include two prose treatises, *The Way to Blessedness and Joy in Tribulation* (both 1632), and a poem called *The Locusts, or Apollyonists* (1637), attacking the Jesuits. His complete poetical works were ed. by A. B. Grosart in the Fuller Worthies

Library (1869), and those of F. and his brother Giles by F. S. Boas (1908-9). See H. E. Cory, *Spenser, the School of the Fletchers, and Milton*, 1912, and A. B. Langdale, *Phineas Fletcher*, 1937.

Fletton, par. of Huntingdonshire, England, close to Peterborough. Noted for its brickfields. Pop. 8000.

Fleurance, tn. of France in the dept. of Gers and the arron. of Lectoure, 25 m. S. of Agon. It manufs. gloves and liqueurs. Pop. 3400.

Fleur-de-lis, heraldic device in armorial bearings of many countries, but it is especially associated with the royal house of France. The design is based on the white lily, and shows three flowers joined together, the central one erect and the

FLEUR-DE-LIS

other two bending outward. In India and Egypt it was the symbol of the life and resurrection of the god Horus. Some people think it represents the white iris, the 'flower de luce' of Shakespeare. In Rom. and Gothic architecture it is a favourite ornament.

Fleurus, mkt. tn. of Belgium in Hainaut, situated 15 m. W. of Namur and 7 m. N.E. of Charleroi. It is noted for three important battles. In 1622 the Gers., under the duke of Brunswick and Count Ernst von Mansfeld, gained a victory over the Spaniards. In 1690 the Fr. under Luxembourg defeated the allied Dutch and Ger. forces, who were led by the prince of Waldeck. In 1794 the Fr. under Jourdan defeated the Austrians under the duke of Coburg. Pop. 6500.

Fleury, André Hercule de (1653-1743), Fr. cardinal and statesman, b. at Lodève. In 1679 he obtained the post of chaplain to Queen Maria Theresia, wife of Louis XIV., and in 1698 he became bishop of Fréjus. He was made a cardinal in 1726. He was over seventy when he became first minister for Louis XV., though he refused the title. His financial administration was such that the usual deficit was turned into a surplus of 15,000,000 livres. His foreign policy was always peaceful. His severe economies found him unprepared for the war of the Polish Succession (1733), though through it Louis XV. gained Lorraine. In 1741 F. was again forced into a war with which he had no sympathy, that of the Austrian Succession. He d. soon after the evacuation of Prague.

Fleury, Claude (1640-1723), Fr. eccles. historian, b. at Paris. In 1689 he was appointed sub-preceptor to the dukes of Anjou, Burgundy, and Berry. He was then presented with the rich priory of Argenteuil. In 1691 he commenced his great work, the *Histoire ecclésiastique*, pub. in 20 vols., and continued by J. C. Fabre and Goujet. He wrote many other works, among them *Histoire du droit français* (1674) and *Mœurs des chrétiens* (1682).

Fleury, Flory, or Flowery, in heraldry, indicates that the object is decorated with the fleur-de-lis. The cross flory is a cross of the fleur-de-lis. The flowers at the termination turn downwards. The F. differs from the cross flory by its having a line between the ends of the cross and the flowers.

Flexile Collodion, see COLLODION.

Flies. All insects which belong to the Diptera (q.v.) are commonly called F. This order comprises many families, and is widely distributed over the earth's surface, though certain species are limited to particular dists., as *Glossina morsitans*, the tsetse-fly, to equatorial Africa. *Musca domestica* is the specific name for the common house-fly; *Calliphora erythrocephala*, the blue-bottle; Culicidae, the gnat family, etc., may be found under their respective headings.

Flight, see FLYING.

Flight-lieutenant, commissioned officer in the R.A.F., holding rank equivalent to a naval lieutenant or an army captain.

Flight, Theory of, see under AERONAUTICS.

Flinders, Matthew (1774-1814), Eng. hydrographer, navigator, and explorer. He was b. at Donington, Lincolnshire; entered the navy in 1789, and served in the *Bellerophon* at the battle of the "glorious first of June." In 1795 he went as midshipman in the *Reliance* to New S. Wales, and spent his time studying the outlines and bearings of the Australian coast with George Bass, the surgeon of the *Reliance*. He explored the George R., and later much of the then unknown coast S. of Port Jackson. In 1798 he made a survey of the Furneaux Is., N. of Tasmania. In 1801 he sailed for Australia with sev. well-known scientific men in the sloop *Investigator*, and thoroughly explored the coast. On his return in H.M.S. *Porpoise* he was wrecked on a coral reef; on his rescue in the schooner *Cumberland* he was taken prisoner by the Fr. at Mauritius. His captivity lasted six years and ruined his health. He wrote many scientific and interesting works, among them *A Voyage to Terra Australis*, with a vol. of maps (1814). See life by E. Scott, 1914.

Flinders Petrie, see PETRIE, WILLIAM MATTHEW FLINDERS.

Flindersia, genus of Australian hardwood trees, of the Meliaceae family. *F. australis*, of New S. Wales and Queensland, is regarded as one of Australia's finest hardwoods. It weighs over 50 lb. per cub. ft., and its greasy quality makes it more or less impervious to damp. Hence

it is much used in dock works, flooring, shipbuilding, etc. It is yellow in colour, with brown and white streaks, thus being suitable for cabinet work.

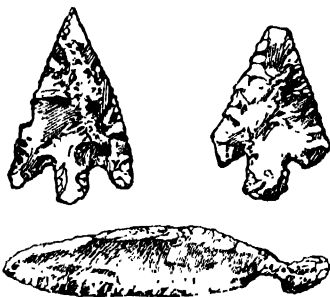

Flinders Range, range of mts. in S. Australia. It extends from the N. of Spencer Gulf, diagonally across the lake dist. of the S., for about 150 m. The heights are not lofty, the chief summits reaching from 1000 to 3100 ft. Mts. Remarkable, Eyre, Serle, Arden, and McKinley are the most important.

Flint, Robert (1838-1910), Scottish philosopher and theologian. In 1864 he became prof. of moral philosophy at St. Andrews Univ., and in 1876 prof. of divinity at Edinburgh Univ. He was also Stone lecturer in 1880, and Craill lecturer in 1887-88. Among his works may be mentioned *Christ's Kingdom on Earth* (1865); *The Philosophy of History in France and Germany* (1874); *Theism* (1877); *Sermons and Addresses* (1899); and *On Theological, Biblical, and other Subjects* (1905).

Flint, hard brown mineral, consisting mainly of silica, found in chalk deposits. It has a specific gravity of 2.6, is frequently harder than quartz, is brittle and breaks with a conchoidal or shell-like fracture. In colour it ranges from dark brown to light yellow or grey. It occurs usually in nodular masses, but under the microscope exhibits a crystalline structure. Its composition resembles that of quartz; it is almost pure silica with traces of lime, iron, and organic matter. When received from the chalk the outer surface is opaque, rough, and greyish. On being broken it has a glassy lustre with cloudy, opaline, and speckled effects in its colouring. Fs. are found usually in bands or layers in chalk, but are sometimes scattered. Layers of F. pebbles are common in riverbeds and beaches in the E. of England, and concretions of the same nature are found under the name of chert in beds of limestone. The origin of F. is, to an extent, a matter of conjecture. The silica composing it was obtained from the skeletons of sponges and radiolaria. It evidently passed into solution, diffused through the porous mass of the chalk, and was precipitated in concretionary masses where the conditions of pressure, etc., were suitable. It appears to have taken the place of chalk, and fossils situated in the area of precipitation were outlined in silica. The uses of F. arise from its hardness, durability, and its abundance in certain dists. It is used for buildings and road making. When used for mending the surface of roads, some disadvantage results from its breaking up in angular fragments with sharp edges. Before the days of the lucifer match, flakes of F. were used for lighting tinder by striking them with a steel edge. They were also used for discharging guns before the introduction of percussion caps; and earlier still, tools and weapons were fashioned out of F. by dexterously breaking off flat or curve-flakes by successive blows. At the present time Fs. are ground down for use in the manuf. of earthenware of a superior kind. See also FLINT IMPLEMENTS.

Flint: 1. Parl. bor. and cap. of Flintshire, N. Wales. It is situated on the Dee estuary, 12 m. from Chester and 173 m. from London. There are important chemical works, smelting and iron foundries, paper mills, etc., and an export trade in potash, soda, coal, and copper. F. Castle was begun in the reign of Henry II. and completed by Edward I. It was here that Richard II. was betrayed to Bolingbroke in 1399. In 1643 the Roundheads captured it. Pop. 7600. 2. Tn. of Michigan, U.S.A., and the cap. of the Genesee co., 68 m. N.W. of Detroit. It is situated on the R. F., and is served by the Grand Trunk and the F. and Pere Marquette railways. There is a deaf and dumb institution here. The lumbering trade is very extensively carried on, and there are large saw mills, etc. Pop. 151,500.

Flint Glass, see GLASS.

FLINT ARROW HEADS AND KNIFE

The arrow heads were found at Mooreock and Wreton, Yorkshire, England; the knife, 4½ in. long, at Pickering, Yorkshire.

Flint Implements, weapons and tools fashioned out of flint, the discovery and study of which form an important branch of archaeological research. Before 1860 it was generally accepted that the hist. of the earth involved a series of catastrophes which marked the end of geological periods, and that man only came into existence in the Alluvial period. The appearance of human remains in the midst of animals of the Drift period was attributed to deep burial until Boucher de Perthes demonstrated, by his account of discoveries in the Drift beds at Abbeville in the Somme valley, that man existed in that period capable of making well-fashioned stone implements. The discovery of these implements has given the name of Stone Age to the period when they were deposited. These found in the Drift beds are simple in form and rudely finished; these belong to the *Paleolithic* or Early Stone Age. Flints found in more recent formations are more specialised in form and highly finished by grinding or polishing; these belong to the *Neolithic* or later Stone Age. *Paleolithic* F. I. are found over a wide area. They occur in the beds of rivs. and lakes and in riv.

gravels in the S. and middle parts of Europe and in S. England. They are not found in Norway, Sweden, and Denmark, nor in Scotland, nor England N. of the Ouse. Three typical forms of the implements can be recognised: the spear-head form from 6 to 8 in. long, the oval form with a sharp edge all round obtained by chipping the stone, and the knife-like form, trimmed or pointed at one end only. It is obvious that at this stage of development the different forms were made to serve for a great variety of purposes. The Neolithic implements discovered in peat-bogs and recent alluvium are differentiated to a high degree. Flints have been discovered plainly indicating special functions, as chisels, scrapers, saws, axes, daggers, etc. See Sir J. Evans, *Ancient Stone Implements of Great Britain*, 1897 and Lord Avebury, *Prehistoric Times*, 1914.

Flint River. Riv. in W. Georgia, U.S.A. with a length of 400 m. It joins the Chattahoochee at the S.W. extremity of the state, and together they form the Appalachicola. It is navigable as far as Albany.

Flints, Liquor of, solution of flint or silica in potash (silicate of potash). This has the property of being soluble in water.

Flintshire, maritime co. of N. Wales, with an area of 264 sq. m. It is the smallest Welsh co., and consists of a main portion with a detached dist. The former is bounded by the Irish Sea, the Dee estuary, Denbighshire, and Cheshire, while the separated part is situated on the r. b. of the Dee, and bounded by Cheshire and Shropshire. The chief streams are the Dee, Clwyd, and the Alyn. The soil is fertile and the co. is an agric. one, about three-fourths being under cultivation; stock-raising and dairy-farming are flourishing industries. There are some thirty coal-mines, but not all are now being worked, and the pre-1914 output of 850,000 tons has declined through the loss of foreign markets. Iron, lead, copper, and limestones are obtained, and there are smelting works and potteries. The prin. tns. are Flint (the cap., pop. 13,500), St. Asaph, Mold, Holywell, etc. Rhyl is a popular seaside resort. Pop. 135,000.

Flintwood, section of the Australian *Eucalypti*, yielding a hard, heavy, and durable timber, much used for railway sleepers, piles, and flooring.

Flinty Slate, siliceous stone, usually black or of a very dark colour. It is employed for testing gold and other precious metals, and has been named on that account 'Touchstone.' The variety originally used was that found in Lydia, Asia Minor.

Flitch, see under DUNMOW.

Flitter-mouse, see BAT.

Floating Battery, vessel which is fully armed with cannon and used as a defence from or attack on an enemy. In the siege of Gibraltar (1779-83) the Fr. and Spaniards used them but without success. They were used again in 1854 by the Eng. and Fr. against Russia.

Floating Beacons, see LIGHTHOUSE.

Floating Bridge may be a permanent

construction used for ordinary traffic across a riv., or temporary, as used in military operations. The former is built of pontoons or boxes of iron, on which is supported a roadway raised considerably above the water, the bridge being securely connected at each end with the shore. In the temporary constructions the pontoons, which may be boats or rafts, are planked over to allow the men to cross the stream. Until it was replaced by a suspension bridge, a good example of a F. B. was that at Calcutta: it was over 1500 ft. long, 48 ft. wide, and was carried on 28 iron pontoons. It was constructed over the Hugli R., the bed of which is too loose and the current too rapid for permanent bridge foundations.

Floating Debt, see under PUBLIC DEBT.

Floating Docks, see DOCK.

Floating Kidney, see KIDNEYS, Diseases.

Flodden, Battle of, was fought on Sept. 9, 1513, about the base of the hill of F. in Northumberland, near Branxton, and 10 m. N.W. of Wooler between the Scots and the Eng. The Scots were under James IV. and the Eng. were commanded by the earl of Surrey. Henry VIII. was before Tournai prosecuting his war against the Fr. in connection with the 'Holy League.' James IV. of Scotland declared himself the active ally of France, crossed the border with an invading army of 30,000 men and took up a position on F. Hill, facing S. Surrey executed a very daring move, which should it fall would cause the Brit. Army to be entrapped and its position rendered hopeless. He crossed the Till and drew up in the rear of the enemy, between it and Scotland. The Scots then took up a fresh position, facing N., on Branxton Hill. Each army was in four distinct bodies. After a devastating attack from the Eng. archery and cannon, the Scots rushed down the hill and came into close quarters. The earls of Huntly and Home got the better of the Eng. right, under Sir Edmund Howard, but only for a time; it soon rallied with the help of Lord Dacre's reserve corps. The Scots right, under Lennox and Argyle, was completely routed by Sir Edward Stanley. James, fighting bravely among his soldiers, attacked Surrey, but Stanley, turning about, attacked the king's corps in the rear. This corps fought to the last man, but the battle was decided—the Scots were most grievously defeated. They had lost their king, 10,000 men, and the flower of all the noble families of Scotland. The Eng. loss was 5000 men. See Scott's *Marmion*, where the battle is described with some accuracy and some imagination, and P. Hume Brown, *History of Scotland*, 1919.

Flogging, or Whipping, is now practically only a statutory punishment, and the statute prescribing such punishment also fixes the number of strokes. Under various statutes F. or W. of males of any age is authorised in the case of robbery with violence, robbery or assault with intent to rob by a person armed with a weapon, conviction as an incorrigible rogue, discharging firearms at or using any substance with intent to injure or alarm

the sovereign; and, as to males under sixteen, for larcenies, malicious damage, and under the Criminal Law Amendment Act, for having or attempting to have carnal knowledge of a girl under thirteen. Women may not be flogged or whipped. F. of male children over seven and under fourteen by order of a magistrate on summary conviction for an indictable offence is inflicted privately by a police constable in the presence of a superior officer and of the parent (if he desires it), and only twelve strokes or less may be given if the offender's age does not exceed fourteen, and only six if he is under twelve. F. may also be inflicted on convicts in prison for mutiny or gross personal violence to a prison officer or servant; but an inquiry must be held before the sentence of F. is carried out. In the navy F. is authorised by the Naval Discipline Act, 1866. Commissioned officers may not be flogged, but a maximum F. of forty-eight strokes may be inflicted on petty officers for mutiny. F. for breaches of discipline in the army was prohibited by the Army Act of 1881, but may be inflicted on persons subject to military law when in prison. A commission appointed to investigate the matter reported in 1938 in favour of its abolition, except in cases of assault by a convicted prisoner upon a prison officer. The sentence of F. or W. was abolished by the Criminal Justice Act, 1918. See further under CRIMINAL LAW.

'Floire et Blanchefleur.' At the time of the Crusades the Franks and the Gks. came into direct contact, and *F. et B.* with sev. other romances of Byzantine origin were put into Fr. without passing through Lat.—probably by oral transmission. Writers in most of the European countries, including Boccaccio in Italy, told the tale from the Fr. version. It is the story of two children who loved each other, were separated, and who came together again happily after passing through many difficulties and dangers. Gaston Paris says that the *châlefabule*, *Aucassin et Nicolette* is another form, though greatly altered, of this story. See the poem in Eng. ed. by A. Lang, 1910 (Early Eng. Text Society).

Flood, Henry (1732-91), statesman, entered the Irish parliament in 1759, and in 1773 held office as vice-treasurer of Ireland. At one time he joined forces with Grattan in order to endeavour to translate into reality their dream of an independent Irish Parliament; but, differing on other matters, especially on Catholic emancipation, they quarrelled, and in 1783 were within an ace of fighting a duel. In that year, though still an Irish member, he was returned to the Eng. House of Commons, but there he was less successful, and made little or no mark in that assembly. He was an able parliamentarian, and one of the greatest orators that Ireland has ever produced. There is a biography by Warden F. (1838).

Floods and Inundations, due most commonly to excessive rains or melting snows, which cause rivs. to rise and overflow their banks. Some rivs. present this

phenomenon annually. The rising and falling of the Nile in this way is no disaster, but has been made by man the basis of Egyptian agriculture. The Mississippi, the Missouri, and the Ohio valleys are liable to F., and these can be predicted with comparative accuracy; great inundations occurred in 1897, in 1927, and in 1937, the last being the most serious since records of the riv. and of its tribs. have been kept, over 1,000,000 persons being made homeless. In China the Hwang-ho R. is especially liable to become swollen after leaving its mountainous region and entering upon its long, low delta course. Levees 70 ft. high proved ineffectual in the disaster of 1887, when 1,000,000 people were drowned and tens of thousands perished by disease and famine ensuing. In 1938 breaches in the bank of the Hwang-ho (or Yellow R.) caused either by the Chinese themselves or by Jap. gunfire flooded thousands of sq. m. of land, killed many thousands of people and held up the Jap. advance in the prov. The breaking up of ice and glacier dams cause inundations in the valleys of the tribs. of the Indus. Riv. F. less catastrophic in nature, but sufficiently disastrous, occurred in France in Jan. 1910, and in England in the summer of 1912. In France heavy rains caused the waters of the Marne, Loire, Yonne, and other rivs. to flood their valleys: this swelled the Seine and Paris was inundated. In England, following a rainfall unprecedented in the records of the meteorological office, many of the E. and midland cos. suffered, especially Norfolk. England suffered disastrous F. in March 1947 through prolonged snow storms and rain. Flood waters spread in the Thames valley, the record levels of 1894 being passed, and below Chertsey the riv. was 3 m. wide. There was an unbroken stretch of water from Windsor to Weybridge and the F. were 6 ft. deep in places. Troops and prisoners of war were drafted into the Fen country for anti-flood work, where there were sev. breaches in the banks of the Great Ouse. The Severn valley was flooded for over 40 m. from Caersws to Shrewsbury. There was extensive flooding in the E. Riding of Yorkshire when the Derwent overflowed its banks from Malton to where it joins the Ouse, a distance of 50 m. Altogether there were F. in some parts at least of thirty cos. and the area mainly affected covered almost the whole of central England roughly in a square with its four corners in mid Wales, Lincolnshire, Somerset, and Essex. 'Tidal waves,' occurring when high winds drive the waters of the sea on to the land at periods of high tides, are a less frequent cause of inundation. Notable F. of this nature occurred in the Netherlands in 1421, but the construction of more and more invulnerable dikes have made the country decreasingly subject to these disasters. Inundation by the sea may cause serious F. as in Bengal in 1876, when 200,000 lives were lost. The W. Indies, the Gulf Coast, the Middle Atlantic States, etc., are liable to inundation at the periods of tropical hurricanes.

Earthquake shocks disturbing the sea may cause inundation of the adjoining land; the catastrophe in which Lisbon was destroyed in 1775 was of this nature. Devastating F. have been caused by the bursting of reservoirs, that of the Bradfield reservoir, Sheffield (1861), is an instance. For the Noachian flood see DELUGE. See also FENS. See C. E. Brooks and J. Glasspoole, *British Floods*, 1928; Institution of Civil Engineers, *Interim Report of the Committee on Floods in Relation to Reservoir Practice*, 1933; and B. D. Richards, *Flood Estimation and Control*, 1944.

Floorcloth, term applied to a number of materials used as substitutes for carpet. These include oilcloth, linoleum (*q.v.*), kamptulicon, corticine, cork carpet, etc. Oilcloth consists of coarse canvas (bur-laps), made of jute or flax, to which a coating of size and sev. coatings of thick oil paint are applied. It is then often ornamented with patterns. This hard and cold F. was partly superseded (1844) by kamptulicon, made of ground cork and indiarubber; it was expensive and is now little used. Cork carpet is the F. now most extensively employed; it is warmer than the others and deadens the sound of the footsteps. It is made of a preparation of ground cork and oxidised linseed oil reduced to a pulp and pressed in a machine; it has a canvas backing. There is more cork in this than in linoleum and the particles are larger.

Floors, name applied to the upper storeys of houses, those above the ground floor. Technically the floor is the surface on which people walk. F. are generally constructed of wood, but in large buildings they are often 'fireproof,' and then flat bricks and iron girders are used. In a single floor, constructed when the span is not more than 15 ft., the joists pass from side to side of the house. A double floor has two sets of joists crossing each other, one for the F. and the other for the ceiling. A framed floor has girders in addition to the two sets of joists.

Floquet, Charles Thomas (1828-96), Fr. statesman, was b. at St. Jean Pie 1-de-Port. In 1876 became a member of the Chamber of Deputies, of which he was president from 1885 to 1888, and Prime Minister in the latter year. In 1888 he wounded Gen. Boulanger in a duel, and in the next year resigned from his office. He was compelled to give up public life, however, a year or two later, owing to his connection with the Panama case.

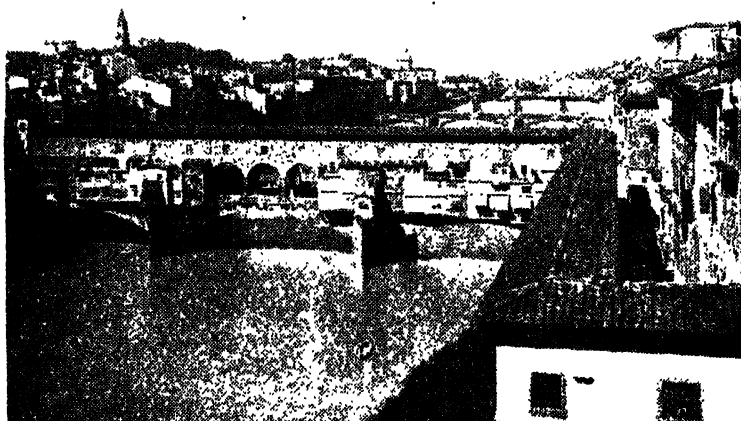

Flora, anct. Rom. goddess of the spring, of flowers, and of the 'flower of youth.' The *Floralia*, a theatrical festival in her honour, lasted from April 28 to May 3, and was characterised by licentiousness and unrestrained merriment.

Flora, term which denotes collectively all the species of plants which are native to a certain dist. or country. Linnaeus was the first to use the word in this sense. It may also be applied to denote the plants of a certain epoch in time, so that we speak of the Miocene flora.

Floral Decoration, see FLOWER DECORATION.

Florence (It. Firenze, Lat. Florentia), city of central Italy, the cap. of a prov. of the same name, and formerly cap. of the duchy of Tuscany. It is situated at the foot of the Fiesole Hills in the fertile valley of the Arno on both banks of the riv. It is about 180 ft. above the sea level, 194 m. N.W. of Rome. F. is well called *la città dei fiori*, for flowers grow in luxuriance in its gardens and fields, and the surrounding plain and sloping hills yield an abundance of wheat, Indian corn, vines, olives, fruit trees, the pine, ilex, poplar, etc. The great portion of the city is on the N. bank of the riv., which

dral, Santa Maria del Fiore, is its chief building. It was begun by Arnolfo di Cambio in 1296, and consecrated in 1436, when it was called del Fiore (of the flower) either after the name of the city or in reference to the municipal arms, a red lily on a white ground. Its detached campanile was begun by Giotto, and Brunelleschi designed its dome. In front of the *duomo* is the octagonal baptistery of San Giovanni, the old cathedral of F. Of its three splendid bronze gates one is the work of Andrea Pisano (1330), and the other two, called by Michelangelo in admiration 'The Gates of Paradise,' are

FLORENCE: THE PONTE VECCHIO

The bridges in the background were destroyed in 1944

W. I. Mansell

before 1944 was spanned by four imposing bridges. Many suburbs have sprung up beyond the ant. walls of which a few towers only remain. Extensions of the city took place during 1864-72, when F. was for one year the seat of the It. Gov., and for eight years the cap. of Italy; further growth came about from immigration from 1881. The city with its suburbs, riv., bridges, cupolas, towers, market-places and fine squares, its streets and encircling boulevards constitute a marvellous panorama well seen from the Piazza Michel Angiolo, the highest point of the Viale dei Colli, a magnificent 'drive' of modern construction, but many of the famous monuments of the city have gone as a result of the fighting in 1944, particularly on the N. bank of the riv. round the Ponte Vecchio, a fourteenth-century bridge which has a covered passage built over a row of goldsmiths' shops, linking the Palazzo Vecchio with the Pitti Palace. The *duomo* or cathe-

Lorenzo Ghiberti's masterpiece (1403-47). Other famous churches are Santa Maria Novella, Santa Croce (F.'s pantheon, with frescoes by Giotto), (the roof was pierced by a shell, but a recent survey disclosed that the roof timbers are in a dangerous condition throughout, due to extreme old age), Santo Spirito (roof was pierced by shell-fire in sev. places), and San Marco, whose convent has frescoes by Fra Angelico and was the home of Bartolomeo and Savonarola. F. possesses four important libraries containing many rare MSS., illuminated missals, and Bibles, etc.; they are the Biblioteca Nazionale, the Marciana, the Laurentiana, and the Riccardiana. Rich collections of medieval artistic and historical treasures are stored in its galleries and museums, the chief among which are the Uffizi Gallery and the Pitti Palace (the Uffizi Gallery suffered much damage from blast and the corridor linking it with the Pitti Palace was badly wrecked). Here are masterpieces by

Raphael, Andrea del Sarto, Perugino, Ghirlandajo, Botticelli, the Lippis, etc., with some fine sculpture. Priceless archaeological collections are to be seen in the museum of the *duomo*, the Accademia, and the Casa Buonarroti. The streets of F. are unique for their splendid medieval palaces, the old residences of the Florentine noble families; the Palazzo Vecchio, now the tn. hall, once the seat of gov. of the republic of F., and the Palazzo Riccardi, now the prefecture, once the residence of the Medici, are among the most celebrated. Many of the old palaces have been restored as far as possible to their pristine grandeur, but some were destroyed in the Second World War. The prin. industrial occupations of the Florentines are those connected with vintaging and oil-making, together with certain artistic handicrafts such as jewel, mosaic, majolica and porcelain making, straw-plaiting and the fabrication of silk and woollen textures. The univ. of F. is one of the first in Italy, and there are many trade and professional schools with some important learned societies, such as the Accademia della Crusca, for the study of the It. language, and the Società Danteica. There is an agric. institute, a high school of forestry, and a women's training college. The Brit. Institute, founded in 1818, occupies the famous palace of the Antinori. Pop. 322,000.

History.—Florentia, an old Rom. colony, was rebuilt by Julius Cæsar, 59 B.C., to serve as a military post at the ford of the Arno. It rose into some importance under the Carolingian emperors, who included it in the Tuscan margravate. It was bequeathed in feudal legacy to Pope Gregory VII. by the celebrated Countess Mathilda (1115), and became, in consequence, the scene of conflicts between the popes and the emperors. F. stood for the papacy, but early began to develop a spirit of local patriotism and of freedom, and soon became bold and strong enough to close her gates against Frederick Barbarossa. The Florentines were already great traders, and they now formed themselves into *arti* or trade guilds, and in order to hold public office it was necessary to belong to one of these guilds. They waged war against the feudal lords whose castles were in the neighbourhood, and who had interfered with their trade, forcing them to become citizens and to live in F. at least three months in the year. They gradually threw off the rule of the emperors, and after the death of Frederick II. in 1250 F. was proclaimed a republic. In the twelfth and thirteenth centuries F. was involved in the struggles between the Guelfs and the Ghibellines, the former the democratic-republican-papist party, the latter favourable to the aristocrats and the emperor. F., which was chiefly Guelf, formed the 'Tuscan League' with other cities, and fought against Pisa, Siena, and other Ghibelline tns. The rich burghers with their guilds now governed F., taking the power from the nobles by the 'Ordinances of Justice.' The executive power, formerly invested in the *podestà*

and captain of the people, was now transferred to the *priori* (eight members) and the *gonfaloniere* of justice. And now F. was torn by the feuds of the Nerl and Bianchi ('blacks' and 'whites'), two factions born of the opposition of the nobles to the new constitution. Dante was one of the *Priori*, and was banished with the whites in 1302. In spite of the constant fighting entailed by these feuds, F. grew in splendour and prosperity—fine churches, palaces, and libraries were built, Florentine cloth merchants, jewellers and goldsmiths visited all the foreign markets and estab. banks everywhere, about 400,000 gold florins were minted every year, and the city was a centre of art and letters. All this was made possible by the solidarity of the trade guilds. In 1348 the city was decimated by plague, the Black Death, described by Boccaccio. From 1434 to 1527 the Medici held sway, and under them F. attained the summit of its magnificence. Cosimo, the first of the name, a princely merchant, was very popular, and rose to a position of great power. Lorenzo de' Medici, called the Magnificent, was the most famous and powerful of the family. They were seven times banished for aiming at sovereign power, and were many times recalled. They patronised art and letters, and a school of painters came into being, represented by Cimabue, Leonardo, Giotto, the Lippis, Del Sarto, and others. F. was the centre of the Renaissance. But the succeeding members of the Medici family degenerated in character, and with them to some extent, the Florentines. The work of Savonarola, who tried to reform the manners and morals of the citizens, and to re-establish a democratic gov. after the city had been delivered from the Medici, took place in the latter part of the fifteenth century. He was abandoned by the people and burnt at the stake. F. ceased to be an independent republic in 1532 to become the cap. of the grand-duchy of Tuscany. In 1808 Tuscany, and F. with it, was annexed to the Fr. Empire, and in 1865 the city became the cap. of the kingdom of Italy and remained the cap. until 1871. F. is the bp. of Dante (1265), Donatello, the sculptor (1383), Ghiberti (1378), of Machiavelli (1469), and of Florence Nightingale.

In the Second World War, S. African troops reached the outskirts of the city on Aug. 4, 1944, and on the 11th the Allies took F. The allied forces had been provided with booklets listing all buildings in Italy which, by reason of historic associations or artistic value, were exempt from military use and had to be protected against avoidable damage. Under F. might be read: 'The whole city must rank as a work of art of the first importance.' Such was the allied armies' estimate of a city which the Gers. chose to violate. The great monuments, most of which lie N. of the R. Arno, escaped undamaged because, though the Gers. held the N. bank, no Brit. troops deliberately abstained from firing upon them. No damage of any significance is attributable to allied action. But to the historic

tn. of F. the damage was very heavy. On the N. bank the heart of the old city round the famous Ponte Vecchio, with all its associations, is gone. The bridge itself escaped serious damage, but the old houses on it suffered severely from blast, and most of the old houses on the S. bank were totally destroyed. The Gers. blew up all the other five bridges, though some of the sculpture from the Ponte S. Trinita was recovered by divers. As early as March 1944 the Gers. had made a photographic survey of the area they subsequently mined and ruined, including the narrow approaches. On the S. side of the riv. the whole of the Via de' Guicciardini, from the Pitti Palace to the riv., was destroyed, and the whole of the famous view looking up the riv. to the Ponte Vecchio, with the medieval houses reflected in the water, is lost for ever, together with three of the old Florentine towers, and the sixteenth Bagno del Medici. Twelve palaces were either completely destroyed or ruined beyond repair, amongst them the Casa Macchiavelli and the Casa del Giambologna. The Casa del Torre de' Bardi collapsed, and with it the Columbaria library and its MSS., though half these latter and most of the anc. library were saved by the prompt action of the Allied Monuments, Fine Arts, and Archives officers. On the N. side of the riv. other old towers were destroyed, including the Torre degli Amidei, the best-preserved of all the Florentine towers. Among palazzi destroyed or damaged were the Acciaiuoli, de' Angelis, and Buondelmonte. A great loss was that of the old houses—the Piazza del Pesce, right up to the church of S. Stefano, which itself was damaged, the Via Por S. Maria, and with these have disappeared all the most characteristic remains of medieval F. By contrast the area which the Gers. held against allied attack was relatively immune, and, apart from the Columbaria, the libraries and archives did not suffer. From the galleries of F. all the more important pictures had been removed to places of safety outside the city limits. Of the villas round F. many suffered damage, but the most important fared best on the whole. It may be mentioned that it will be possible to make an accurate reconstruction of the original bridge of Santa Trinita. Some of the famous towers were repaired or reconstructed. The Uffizi-Pitti corridor was re-roofed. There was widespread damage to sev. churches, particularly to roofs and windows, and some frescoes. S. Stefano al Ponte was heavily damaged by Ger. mines, but the facade was completely rebuilt with the original stones. Santa Trinita's roof was holed, and the frescoes shaken, but those by Ghirlandajo and Lorenzo Monaco were unharmed. Considerable damage was done to the roof and windows of the Pitti Palace by shell fire and explosions. The Uffizi Gallery was severely damaged throughout by explosions, and almost all the windows were smashed and decorative frescoes badly damaged. See *Works of Art in Italy: Losses and Survivals in the War*. Two parts. H.M.S.O., 1945, 1946.

Florence: 1. Prov. of Central Italy, cap. F. It embraces part of the basin of the Arno, is traversed by the Apennines, has an area of 2265 sq. m. and a pop. of 1,000,000. It produces wine, oil, the olive, and flowers, and carries on silk weaving and sheep breeding. 2. City of Alabama, U.S.A., co. seat of Lauderdale co., situated on a plateau 200 ft. above the Tennessee R., on its N. bank. Its industries are connected with lumber, coal, and iron-mining. Pop. 15,000. 3. Co. seat of F. co., S. Carolina, U.S.A. Its industries include tobacco and cotton growing. Pop. 16,000.

Florence of Worcester (d. 1118), O.E. chronicler. He was a monk of Worcester. He appears to have lived most of his life, and certainly d., in the Benedictine monastery at Worcester. We know nothing else about him. He wrote the *Chronicon ex Chronicis*, beginning with the creation and ending in 1117. A certain John of Worcester continued the work up to 1141. It is interesting to compare the work with other Eng. chronicles till his independent work from 1108; the main part appears to have been taken from the chronicle of Marianus, an Irish monk who lived at Fulda. It was trans. by B. Thorpe in 1848, and by T. Forester in 1854, for Bohn's Antiquarian Library.

Florentia, see FLORENCE.

Florentinus, Rom. jurist, was the writer of *Institutiones* in sev. books. There is no other work by which he is known, but many extracts from his book are still preserved.

Flores, Juan José (1800-64), Sp.-Amer. soldier, b. at Puerto Cabello, Venezuela, who became first president of Ecuador, and fought under Bolívar in the War of Independence. He was commander-in-chief in the campaign against Peru, and when Ecuador became independent (1830) he framed her constitution and was elected president.

Flores: 1. Is. of the E. Indies, belonging to the Dutch. It has an area of about 5850 sq. m., the interior being but very little known. Rice and maize are grown here, while sandal wood and cinnamon are among the exports. Pop. 1500. 2. Is. in the Atlantic Ocean belonging to the Azores group. It is one of the most westerly of the group, and is very fertile. The cap. is Santa Cruz. Sir Richard Grenville's defence off Azores in 1591 is commemorated in Tennyson's *Revenge*. Pop. 7300. 3. Dept. of Uruguay, S.

America. Its chief tn. is Trinidad. Area 1744 sq. m. Pop. 36,100.

Florez, Enrique (1701-73). Sp. historian, was b. at Valladolid, and joined a religious order when quite young. He afterwards devoted all his time to the writing of hist., his chief works being *España Sagrada* (1747-73) and *Memorias de las Reynas Catolicas* (1770).

Florian, Jean Pierre Claris de (1755-94), Fr. poet and writer of romance. He was b. at the château of Florian, near Sauve. His uncle, the marquis of Florian, introduced him to Voltaire, who greatly influenced his ideas on literature. He obtained a commission in a dragoon regiment, but at the beginning of the revolution he retired to Sceaux, where he was captured and imprisoned. He only lived a few months after his release. One of his first literary works was an eclogue entitled *Ruth*, crowned by the Fr. Academy in 1784. He wrote many poems and comedies; among them are *Le Bon Ménage*, *Numa Pompilius*, and *Galatée*. In 1792 he wrote his famous *Fables*, and trans. *Don Quixote* into Fr. His style was sentimental, and his comedies are delicately expressed with a certain amount of charm and piquancy. He was elected to the Fr. Academy in 1788.

Florianopolis (formerly Desterro), city and seaport of Brazil, which is named after Marshal Florian Poixoto, president of Brazil (1891-94). It is situated on the W. side of the is. of Santa Catharina off the coast of the state of Santa Catharina, of which it is the cap. Agriculture is the prin. industry and dairy produce is largely exported. The port affords good accommodation for smaller vessels. A suspension bridge, called the F. suspension bridge, which adjoins the city, was completed in 1926. Pop. 49,000.

Florida (Land of Flowers), 'peninsula' or 'everglade' state, the most S. of the states of U.S.A. Its length is 400 m., its average width 95 m., and its area 58,560 sq. m., about 4298 of which is lake and riv. area. Its surface seldom rises more than 200 ft. above the sea level; lakes, swamps, and savannah lands are frequent in the centre, while the S. is characterised by submerged saw-grass plains called everglades, whose pure water, about 1 ft. deep, abounds in fish. To these everglades F.'s largest lake, Okeechobee (1200 sq. m.), contributes a subterranean supply. The prin. rivs. are St. John's, the Withacochee, and the Caloosahatchee. The climate of F. is so equable and healthful that the state has been called the Amer. Riviera, and has become a favourite health resort; immense mineral springs enhance its value. The leading industries are those connected with agriculture (cereals, the peanut, potato, tomato, beans, tobacco, celery, etc., are cultivated), cigar-making, lumber (the yellow pine, cypress, red cedar, oak, and catalpa grow abundantly), phosphate rock, and fruit-growing (orange, pineapple, grapefruit, etc.). The pop. (1940) was 1,897,400, and (1946) 2,310,300. Of the first total the foreign-born white numbered 70,000, and one-third of the

whole are coloured. The chief tns. are Tallahassee (cap.), 12,000; Jacksonville, 206,400; Miami, 192,100; Tampa, 124,400; St. Petersburg, 85,100; Orlando, 50,100; Pensacola, 43,300; West Palm Beach, 40,500. The state provides higher education in a univ. of the state of F. at Gainesville (founded 1905), with 3000 students, a state college for women, founded at Tallahassee in 1905 (2000 students), and a college for Negroes at Tallahassee (800 students). F. was discovered in 1512 by Ponce de Leon, was ceded by Spain to England in 1763, became an Amer. possession in 1821, a ter. of U.S.A. in 1822, and was admitted to statehood in 1845. Miami and Palm Beach, the two chief resorts for residents and visitors, have greatly increased in popularity of recent years and the trade of F. has thereby received a very helpful stimulus. See C. H. Brevard, *A History of Florida from the Treaty of 1763 to Our Own Times*, 1924-25; F. W. Dau, *Florida, Old and New*, 1934; and Kathryn T. Abbey, *Florida: Land of Change*, 1941.

Florida, cattle-rearing dept. of Uruguay, whose cap. of the same name is about 70 m. N. of Montevideo. Area 4763 sq. m. Pop. 106,400.

Florida Reefs, or Keys, bow-shaped chain of small is. and sand reefs (or keys), extending S.W. for 220 m. from Cape Florida. They parallel the E. coast of F. and enclose an inland waterway. The ports Fernandina, Jacksonville, and Key West are on the keys. There is an active sponge industry.

Florin (Fr. *florin*, from It. *fioreno*, a florin, the word being derived from *fiore*, a flower, because the coin bore a lily on the obverse), name first given to a gold coin struck in Florence in the eleventh century. It was called also a 'fioreno' in Europe, and was much used in commerce, other countries issuing similar coins. In England Edward III. ordered every pound of gold to be coined into fifty fiorences (value six shillings each); and the 'gulden' and 'guilders' of Germany and Holland came into being. Edward's fiorences were soon discontinued, but in 1849 Queen Victoria issued a silver F. (two shillings), which became known as the 'godless' or 'graceless' F., because the words *Dei Gratia* were omitted; this omission was rectified in 1852. The double F. of 1887 was discontinued in 1890.

Florina (Flurina), dept. of Gk. Macedonia. Pop. 152,800. Cap. F. (10,500).

Florio, John (c. 1553-1625), Eng. author and translator, was the son of It. Protestants, and was b. in London, where his parents had taken refuge. He became a prof. of languages at Oxford, and in 1603 was appointed to read It. with Queen Anne, being made groom of the chamber in the following year. He also taught Prince Henry, son of James I. He is best known by his trans. of Montaigne's essays (1603). Among his other works are *Florio, his first fruites which yield familiar speech, merie proverbes, wittie sentences and golden sayings, also a perfect Introduction to the Italian and English Tongues* (1578) and *A Worlde of Wordes or most Copious*

and *Exact Dictionarie in Italian and English* (1598).

Floris, Frans (1516-70), Flemish painter whose real name was de Vrienat, b. at Antwerp. He began as a sculptor under his father, and later went to Liège, where he studied painting under Lambert Lombard. He then visited Italy, and while in Rome made a careful study of the work of Michelangelo, and his work shows very plainly the influence of that great master. In 1540 he opened a school of painting in Antwerp. Among his best works are 'The Last Judgment' (in Brussels); 'The Fall of Rebellious Angels' (in Antwerp). His brother Cornelis (1514-75) was an architect and sculptor, whose chief work was the tn. hall at Antwerp.

Florists' **Flowers**, see FLOWERS, FLORISTS'.

Florus, historian of Rome, who wrote during the reign of Hadrian (A.D. 117-38). Very few definite facts of his life are known, but his work was a hist. of Rome from the foundation of the city to the time of Augustus. It is founded principally on Livy's work, and although its arrangement is good it leaves much to be desired in other ways. One of the best known eds. is that by Halm (Leipzig, 1879).

Flory (in heraldry), see FLEURY.

Flotation, study of the conditions under which bodies float. If the weight of a body be greater than the weight of the fluid displaced, the body will tend to sink; if the weight of the body be equal to that of the displaced fluid, it will rest anywhere in the fluid; if the weight of the fluid displaced be greater than the weight of the body, the body will be forced upwards to the surface, so that it floats partly immersed. As the pressure upwards upon a floating body must be equal to the pressure downwards due to the weight of the body, it follows that the weight of the fluid displaced is equal to the total weight of the body. It also follows that the pressure upwards shall act in the same straight line as the pressure downwards, so that the centre of gravity of a floating body is in the same vertical line as the centre of buoyancy, or the centre of gravity of the displaced fluid. If the body be slightly displaced, the moment of the two forces tends to restore it to its original position if the centre of gravity be below the centre of buoyancy, but tends to overturn it if the centre of gravity be above the centre of buoyancy; in the former case the floating body is in stable equilibrium, in the latter it is in unstable equilibrium. Hence the necessity for keeping the centre of gravity of a ship as low as possible. A certain amount of displacement is inevitable, and if the centre of gravity be raised by heavy deck loads there is risk of capsizing, while the lowering of the centre of gravity by ballasting tends to ensure stability.

Flotow, Friedrich, Baron von (1812-1883), Ger. composer, b. at Teutendorf in Mecklenburg. His first great success was *Le Naufrage de la Méduse*, an opera produced in 1839, *Alessandro Stradella*, in 1844, and *Martha*, in 1847, being equally popular. Among his later operas may be

mentioned *Indra* (1853); *La Veuve Grapin* (1859); and *L'Ombre* (1869). The characteristics of his works are liveliness and grace, combined with pleasing melodies.

Flotsam, **Jetsam**, and **Ligan**, names given in Eng. law to goods lost at sea as distinguished from *wreck* or goods which come to land. *Flotsam* 'is where goods continue swimming on the surface of the waves' (Blackstone). *Jetsam* or *jettison* connotes goods cast into the sea which remain under water; *ligan* are goods which are attached to a cork or buoy in order that they may be found again. F., J., and L. are adjudged to the Crown if no owner appears within a year and a day, while *wreck* belongs to the Crown in any case.

Flounder, or *Pleuronectes flesus*, flat fish (q.v.). It is common to the N. temperate and Arctic seas of both hemispheres, and is almost as much a fresh-water fish as a sea fish. The F. rarely exceeds a length of 12 in., or a weight of 1½ lb., but those caught in America are larger and heavier. Nearly all Fs. are excellent eating.

Flour (the word is a variant of *flower*), in general language the powdered grain of wheat. When the word is used to denote the powdered grain of other cereals, a qualifying term is added—rye F., barley F., etc. Wheat F. is used for making bread in preference to the F. of other grains, not on account of any superiority in its nutritive properties, but because of the presence in it of a special gluten, a highly tenacious, sticky substance which enables the dough to retain the carbonic acid gas introduced into it in the form of yeast or baking powder. This makes the bread light and spongy. Dough made with the F. of other grains is granular, and this allows the gas to escape. The following comparison shows that in essential nutritive constituents other grains equal or surpass wheat:

	Protein	Sugar.
	starch, etc.	
Wheat	11.9	71.9
Oats	11.8	59.7
Barley	12.4	69.8

The best wheat (the richest in gluten) comes from Minnesota, Manitoba, Hungary, and Russia. Great Britain imports F. from Canada in rapidly increasing quantities. The most recent statistics of the values of different kinds of cereals imported into Great Britain from Canada and Australia are as follows: Wheat (1948) £23,602,364. Barley—Australia (1948) £2,414,000. Oats—Canada (1947) £1,997,268. Meal and flour—(including semolina) (1948) Canada £17,939,556; Australia £7,585,188. Statistics, however, show considerable fluctuations. In 1938 wheat imports from all countries were £38,627,554. In 1948 £26,574,678; oats £537,520 in 1938 and £9,431,417 in 1948. The total imports of grain and F. from Canada in 1938 were 44,379,178 cwt., valued at £18,592,293; in 1948 79,369,482 cwt., valued at £85,639,121; from Australia (1938) 35,994,636 cwt., valued at £14,392,095; (1948) 24,094,247 cwt.,

valued at £40,266,251. From the Argentine republic the import figures are: 1938, 24,262.313 cwt., valued at £8,190,189; 1948, 30,833,458 cwt., valued at £43,301,517.

Flourens, Marie Jean Pierre (1794-1867), Fr. physiologist, b. at Maureilhan, Hérault. He began his career by assisting Cuvier in 1828, and later received an appointment at the Jardin du Roi. He afterwards held a professorship of the Collège de France, became perpetual secretary of the Academy of Sciences, in 1840 a member of the Fr. Academy, and in 1846 was made a peer of France. He wrote many works on physiology and anatomy, among them *Anatomie générale de la peau et des membranes muqueuses* (1843) and *Théorie expérimentale de la formation des os* (1847).

Flourish, literally in O.E. a fanfare but in modern musical terminology a short figure used as an embellishment rather than as a theme.

Flour-milling. *Ancient method.*—More than 6000 years ago people ceased to eat grain in its wild state and began to break it up with a rude kind of pestle and mortar. Later a primitive hand mill came into use. This consisted of two stones with roughened surfaces between which the grain was ground. The next mill evolved was the *quern*, formed of two circular stones, the upper revolving on the lower, to which it was attached by a metal or wooden pin. The corn was introduced between the stones by means of a funnel in the upper stone which had also a small hole near its edge into which a stick was inserted to serve as a handle. The quern is still used by semi-civilised peoples, and in remote parts of Ireland, the Hebrides, and the Shetlands. Down to 1874 the grindstone remained the basis of the flour-mill, but the 'power' was supplied by animal labour, by wind, and by water. Grindstones are still used in the smaller mills. They are made of *buhr*, a very hard silicate. They are from 4 to 6 ft. in diameter, and their surfaces are grooved or furrowed from centre to circumference. The 'hopper' supplies the grain through the centre of the upper stone; the wheat is pushed along the grooves and broken upon the ridges.

Modern method.—In modern F. iron or steel rollers worked by steam have taken the place of grindstones. The first successful steam mill was erected in London in 1784, and iron rollers were first used in 1840, following their introduction in Budapest. Hungary became the world centre for F. on account of this improvement. Minneapolis soon adopted it, becoming in her turn the world centre, and remaining so to the present day. From 1880 the system of roller-milling has been in operation in all large mills.

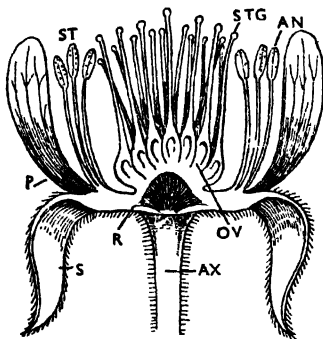

The first operation consists in removing the husk (*bran*) from the grain. That this may be successfully done, that is, without particles of bran becoming incorporated with the flour, the grain is 'tempered' (damped) after being thoroughly cleaned in revolving cylinders. Then it is passed through sev. pairs of grooved iron rollers, each pair having finer grooves than the

last as well as a different angle of grooving and a different rate of movement. Two products result: bran and 'middlings' or 'semolina.' Next the semolina is 'purified,' i.e. the finer and coarser particles are assorted, and any 'offal' or extraneous particles of tissue and fibre carried off in revolving, gauze-covered cylinders. Flour-making proper is the object of the next operation. The semolina is passed through various pairs of smooth rollers and 'flour' results, but as the particles are not even now of uniform size, it is further treated in a 'dresser,' or revolving cylinder covered with fine Swiss silk. The product alone which is able to pass through the meshes (12,100 to the sq. in.) is accepted as flour, the remainder, a fluffy tissue, is used as food for cattle. See R. Bennett and J. Elton, *History of Corn Milling*, 1898.

Flower, Sir William Henry (1831-99), Eng. anatomist and zoologist. He held the curatorship of the Hunterian Museum of the Royal College of Surgeons in 1861; and, in 1884, the directorship of the Brit. Museum of Natural Hist. He wrote *An Introduction to the Osteology of the Mammalia* (1870); *Fashion in Deformity as illustrated in the Customs of Barbarous and Civilised Races* (1881); *The Horse* (1891); and *Essays on Museums and other subjects connected with Natural History* (1898).

Flower, shoot bearing a number of leaves modified for the purpose of reproduction, and frequently with other leaves forming an outer investment. A typical F. consists of four whorls of floral leaves, the carpels, constituting the pistil, stamens, petals, and sepals, but there are many and varied modifications from this type. The pistil and the stamens are the essential organs of a plant, because seeds cannot be formed if these are absent. The petals collectively form the corolla, and the sepals constitute the calyx. When sepals and petals are indistinguishable from one another, as in daffodil and many monocotyledons, etc., a perianth occurs. In dicotyledons the calyx, when present, is usually green as in primrose, and of a protective nature, but it may be yellow as in marsh marigold, or blue as in larkspur. The corolla is usually brightly coloured, or white; sometimes it is absent altogether, as in *Thalictrum*, the rue. A typical stamen consists of a stalk, or filament, bearing a terminal anther which contains the pollen. The pollen is the male element in the sexual process. The pistil is the female organ and consists usually of three parts, the ovary or seed bag, made up of carpels, above which is a shaft-like tube, the style, at the apex of which is the stigma, the receptive organ for the pollen grains. A F. is said to be complete when both calyx and corolla are present; it is incomplete if one or both of these envelopes are absent. If both stamens and pistil occur together, the F. is said to be perfect or hermaphrodite; it is imperfect or unisexual when only one class of essential organs is present, and the Fs. are then either staminate (male) or pistillate (female). Where the floral leaves in each whorl are similar in size and shape, the F. can be divided symmetrically

in sev. directions, and is said to be regular, as in buttercups; otherwise it is irregular, as in pears, orchids, etc. Much of the classification of plants is based upon the characters of the F., thus dicotyledons are subdivided into polypetalæ and gamopetalæ. The Fs. of the former have petals free from one another, as in buttercup; those of the latter have their petals joined to one another, so forming a tube, cylinder, etc., as in primrose. In dicotyledonous plants the parts of the F. are usually in fours or fives or their multiples; thus a primrose has five sepals, five petals, five stamens, and a pistil made up of five carpels; members of the pink family (Caryophyllaceæ) usually have ten sta-

STRUCTURE OF A FLOWER

AX, axis; R, receptacle; S, sepal; P, petal; ST, stamen; AN, anther; OV, ovary; STG, stigma.

mens. Monocotyledons, on the other hand, have their parts in threes or multiples; thus in the lily there are six perianth leaves, six stamens, and three carpels. Mention must be made of the receptacle, a very important structure in the classification of flowering plants, as upon it depends the insertion as it is called, of the floral leaves. Thus if sepals, petals, stamens, and carpels spring one beneath the other from a more or less conical receptacle, such as occurs in the buttercup, the F. is said to be hypogynous and the ovary is superior. It is perigynous when the stamens spring from the same level as the ovary, as in rose, blackberry, etc.; and it is epigynous when the petals and stamens are inserted above the ovary, as in the lily, and members of Umbelliferae and others; in this case the ovary is said to be inferior.

In order that a F. may produce seed, fertilisation is necessary, and pollination is a preliminary step to this end. By pollination is meant the bringing of the pollen into contact with the stigma of the pistil, and there are all sorts of wonderful devices in plants to effect this end. There are two chief ways by which this is brought about, one is by the agency of insects, and sometimes by birds, and the

other is by wind. Entomophilous plants, as they are called in the first case, are attractive either by their colour or smell or both, and the insect visits the F. for booty of pollen or honey, and incidentally causes the pollen of one F. to fall upon the stigma of another. The ways in which certain Fs. are specially adapted for visits from certain insects, and the relative positions of stamens and pistil so as to be used to the best advantage, is a subject in itself. Fs. which open in the evening are usually of a pale colour and have a strong smell—they are pollinated by moths and evening insects. Anemophilous plants, those which are wind-pollinated, often bloom before the leaves are developed, their Fs. are usually inconspicuous, they produce no honey, they have no smell, and pollen is produced in large quantities to atone for waste; grasses and many trees belong to this type. It has been proved by experiment that cross-fertilisation, i.e. when the pollen contents of one F. are brought into contact with the pistil contents of another F., whether on the same or on a different plant (but always of the same species), is more beneficial than self-fertilisation, but often if cross-pollination does not take place, the plant becomes self-pollinated. In some cases, however, self-pollination is impossible, for various reasons: (1) The anthers and stigma are in such relative positions to one another that pollen cannot possibly reach the stigma of the same F., e.g. aristolochia. (2) The stigma and anthers of the same F. mature at different times; Fs. in which this occurs are either protandrous, when the anthers are first developed and have already shed their pollen when the stigma of the same F. is capable of receiving it; or they are protogynous, when the stigma is withered before the pollen is shed; this is the more uncommon of the two forms, but occurs in arum and in the figwort, etc. Most composites, campanulas, etc., are protandrous. (3) When the Fs. are unisexual, as in willow, etc. When pollination has once been effected, the pollen grain germinates on the stigma and sends out a tube which forces its way down the style until it reaches the micropyle of an ovule. The contents of the pollen grain then travel down the tube and fuse with the contents of the ovule. This act of fusion is fertilisation, the most direct result of which is the development of the embryo, and the conversion of ovule into seed. See also BOTANY. See K. T. Hinkson and F. Maitland, *A Book of Flowers*, 1909; W. O. James and A. R. Clapham, *Botany of Flowers*, 1935; W. J. Stokoe, *Observer's Book of British Wild Flowers*, 1937; and M. Hadfield, *Everyman's Wild Flowers and Trees*, 1938; M. C. Carey and Dorothy Fitchew, *Wild Flowers at a Glance*, 1949.

Flower Decoration as we know it now, that is to say, flowers placed in containers filled with water for the decoration of a room, was unknown until the middle of the last century. For hundreds of years people have loved flowers for their beauty and particularly for their perfume, but they scattered them about on the floors of

their rooms, on the tables where their meals were taken, and even on their beds, for the fleeting pleasure which they gave. In mid-Victorian times the arrangement of flowers was as formal as the planning of their gardens; only hothouse flowers were thought good enough for the adornment of the dinner table, and these were festooned across the white damask cloths. Wire was much used then for buttonholes and bouquets to give a stiff effect. It was Queen Alexandra who started a new vogue by having large vases of leaves placed in her drawing-room at Marlborough House, and from that time the use of flowers in the house became gradually more popular and the formality of Victorian days gave place to more natural and artistic arrangements.

At the present time all types of blooms are used—wild flowers, perennials, annuals, branches of flowering shrubs and trees, and even the leaves of certain vegetables. A good effect can be obtained in winter by placing fine twigs in a vase against a light background; in the early spring, too, branches of winter jasmine, forsythia, japonica, etc., and even of non-flowering bushes, can be picked when the buds are just formed, and will soon open out into full bloom in a warm room. The choice of flowers is almost entirely a matter of individual preference, the season, and what one can afford or grow; bunches of mixed flowers of all colours and varieties suit certain types of room, or a mixture of different blossoms in one colour; from the vegetable garden one can take the leaves of curly kale, and carrot tops to use as fern; all white flowers of different types are much more pleasing than would be thought in a vase. The modern method is to strip off the leaves before placing the flowers in the bowl, instead of adding foliage as was a former practice, the idea being that the green detracts from the colour effect of the blossoms. Much of the effect of good flower display depends on the vase or bowl used. The glass and silver specimen vases of the Victorians, together with the brass fern and aspidistra pots, have been replaced by rather large pottery jugs, bowls, and vases. In fact anything can be used to hold flowers if it is watertight and happens to appeal to its owner or harmonise with her room. Glass containers should not be used for thick-stemmed flowers, or where the stem is likely to discolour the water.

The care of the flowers themselves is of importance: those who have gardens should pick the flowers overnight, and place them in a tall jug of water in a cool place. If roses or blossoms with woody stems have been picked, hammer the tips, or slip back the bark and split the stalk. In the case of poppies or hollyhocks the tips of the stalks should be plunged in boiling water to seal them, and they will not drop. Vases need not be emptied every day to snip the stems; instead they may be filled up with slightly warm water; in this way disarrangement of the decorations is avoided. Some types of flowers absorb much water in the first hours, and vases will need refilling. Above all flowers

should be kept away from draughts. Everlasting flowers should be picked when not fully out, and hung in small bunches in a cool, dry place; if the bunches are too thick the flowers in the centre will turn mouldy.

There are various types of supports on the market; many people prefer a heavy glass block; others use a piece of wire netting, loosely rolled and jammed tightly into the bowl; again there is a wire stand, sometimes obtainable, which has looped branches of wire, each of which will hold one blossom; both these and the wire-netting are very economical when flowers have to be bought. Flower-rings, introduced recently, look beautiful when filled with short-stemmed flowers, such as pansies or primroses, or wild roses in summer, and form attractive wreaths of flowers for the table. Wall vases with high flowers are good in a hall. Vases placed in front of a mirror are effective. See Constance Spry, *Flower Decoration*, 1934, and *Flowers in House and Garden*, 1938.

Flower-de-luce, see FLEUR-DE-LIS; IRIS. Flower Gardens have from earliest times been cultivated for pleasure and profit. Especially in the E., where the confinement of a building is so oppressive, we have records of gardens of surpassing beauty. The first mention of them is the description of Solomon's gardens, which were, however, overshadowed by the hanging gardens of Babylon, one of the seven wonders of the world. They were irrigated by water from the Euphrates, and contained a wonderful variety of effects. Persian gardens supplied the type which the Gk. gardeners followed, though the latter introduced glass in the construction of conservatories. To come down to comparatively modern gardens, the Fr. style is one of characteristic elegance. Le Nôtre, a gardener of the seventeenth century, obtained fame in the reign of Louis XIV. by laying out the gardens of Versailles. In 1742 Richard, Viscount Ranelagh, threw open the fine gardens which he had built to his mansion at Ranelagh, and they remained a favourite public resort till 1803. In 1661 Vauxhall Gardens also became famous. Landscape gardening reaches a state of highest perfection in Japan, where they attain the most successful results by following a picturesque irregularity. F. G. have always been a source of pleasure to Eng. people. Bacon's essay 'Of Gardens' is a fine description of one of the Elizabethan period. As in other things garden flowers have their period of popularity and chance for newer varieties, and the foxglove, lavender, marigold, lobelia, calceolaria, and pansy are superseded by geranium, hyacinth, tulip, and chrysanthemum. See also GARDEN ART.

See T. Hammer, *The Garden Book*, 1659; F. Watson, *Flowers and Gardens*, 1901; E. S. Rohde, *Scented Garden*, 1931, and *Gardens of Delight*, 1934; M. Hadfield (ed.), *The Gardener's Companion*, 1936; and S. B. Wootthead, *In Your Flower Garden*, 1948.

Flowering Ferns, see OSMUNDA. Flower Painting. In Europe figure-painting has always been the form of art

most studied, landscape-painting being a later development. Flowers, although used often in a conventionalised form to decorate illuminated MSS. (see ILLUMINATION OF MSS.), did not themselves form the subject of pictures in the earlier centuries of the Christian era. In the seventeenth and eighteenth centuries the Flemish painters developed the art of F. P. to a high degree. Jan Brueghel (1568-1625), the portrait painter, exquisitely reproduced living flowers. Frans Snyder (1579-1657) frequently collaborated with Rubens by supplying the still life in the master's paintings. Fairy-like in his treatment of blossoms was Jan Davidsz van de Heem (1606-83), whose son Cornelis inherited his father's gift to a lesser degree. Daniel Seghers (1590-1661) was, however, the supreme painter of flowers, refusing to blend his subject with any other forms of still life, although he used his floral decorations to embellish his devotional subjects. Among the Fr. artists F. P. became an important study in the nineteenth century, when Edouard Manet (1832-83), Henri Fantin-Latour (1836-1904), and Claude Monet (1840-1926) were regarded as masters of this delicate art. In the E. it has been a cult for many centuries. 'Before a masterpiece of Fantin-Latour we feel that the flowers have been taken from a field or garden to be grouped before us, a feast for the eye,' says Laurence Binyon in *Painting in the Far East*, 'but the Chinese artist brings us to the flower, that we may contemplate it and take from it into our souls something of the beauty of life which neither sows nor spins.' The plum blossom and lotus flower provided a sufficient theme for the oriental artists without need of human figures, and among the most famous flower painters of the Sung period are Hsu Hsi (tenth century), Chao Ch'ang (eleventh century), and Li Ti (twelfth century). See CHINA, *Chinese Art*. See E. Haig, *Floral Symbolism of the Great Masters*, 1916; E. W. Earp, *Flower Painting*, 1928; and I. Nishikawa, *Floral Art in Japan*, 1936.

Flowers, in chem., substances which are sublimated as the result of chemical action. The chief are F. of sulphur, the fine powder which is obtained when crude sulphur is heated to vaporisation and condensed in a cooling chamber; F. of phosphorus, a flocculent powder consisting of phosphorus pentoxide, formed when phosphorus is burned in excess of air or oxygen; F. of tin (*flores stanni*), a mixture of powdered metal and stannic oxide formed by fusing the metal in excess of air; F. of zinc, antimony, arsenic, etc.

Flowers, Artificial, imitations of natural flowers used for various purposes of ornamentation, including millinery, dresses, and decorations in the house. The Fr. make most of these A. F., though some are made in England and other countries. The materials most commonly employed are sarcenet, cambric, velvet, gauze, threads, and wire, and in some cases paper. The petals and sepals are first stamped out and then gauffered, the

same process being pursued with regard to the leaves, which are made of green taffeta, the stems being made of wire. The flowers made for tombs are of pottery or enamelled iron, and sometimes of wax. The Chinese make A. F. from rice-paper, and in the Bahama Is. they are made of shells.

Flowers, Florists', are plants with horticult. varieties, whose parent species are unknown or not cultivated, as the dahlia or gladiolus. Dahlias have only been introduced into England in comparatively modern times, but their beautiful colours, and the fact that they are easily grown and require no especially rich soil, has made them very popular. *Gladiolus*, a genus of the order Iridaceae, bears brilliant flowers, blossoming in mid summer. In America F. P. is the term applied to any flowers raised to be cut for ornamental purposes, as rose, carnation, violet. They are brought to a high state of perfection and elaborate establs. are maintained for their rearing, transportation, and disposal, giving employment to thousands of people, the increase of wealth in the cities being responsible for their demand.

Flower Shows were originated by the Royal Horticultural Society of London, which was founded by Thomas Andrew Knight in 1804 and received its charter in 1808. The object of the society is to encourage and promote the cultivation of plants, flowers, fruits, and vegetables. One of the most valuable means to this end was the estab. of experimental gardens in 1817, which were removed to their present site in Chiswick in 1822. From these gardens plants and seeds were distributed to all parts of the world. At the meetings of the society, members and others exhibited plants, fruits, and flowers, and in time prizes came to be offered for competition. This led to the formal institution of shows in which although called F. S., fruits and vegetables are also exhibited. Fortnightly shows are held throughout the year at the society's hall, Vincent Square, Westminster. The Alpine Garden Society holds three shows in London with special classes for amateurs and novices, and shows at Birmingham and Southport. The National Auricula and Primula Society (S. section) holds an ann. exhibition during April in London; the Cactus and Succulent Society of Great Britain has an ann. two-day summer exhibition in London. The National Chrysanthemum Society, founded in 1846, holds an exhibition in Nov. in London, and the National Dahlia Society one annually in Sept. The Brit. Gladiolus Society promotes an ann. international exhibition, and the National Rose Society has spring, summer, and autumn shows in London, and a prov. show. Other associations which hold ann. shows are the National Carnation and Picotee Society, the Brit. Carnation Society, the Brit. Delphinium Society, the Iris Society, the Rhododendron Association, the National Sweet Pea Society, and the London and S. of England

Viola and Pansy Society. F. S. are also promoted by a number of newspapers. These shows help to make known plants newly introduced into England and those which are the result of cross-fertilisation, hybridisation, etc. Following the foundation of the London Horticultural Society, many other societies came into being, including many local ones in towns and villages. The most important national society of this description is the Royal Caledonian Horticultural Society founded in 1809. Its F. S., which are its chief feature, are held in Edinburgh in April and Sept., and are open to the whole of the United Kingdom and Ireland. See also HORTICULTURAL SOCIETIES. See *Royal Horticultural Society's Gardener's Pocket Diary and Note Book* (ann.).

Flowers, Language of. A special significance is attached to flowers, in that they are used to represent various ideas and sentiments. A consistent and well-understood symbolism has gathered around them, which the orientals especially have developed into a perfect vehicle for communicating expressions of all degrees of warmth. The use of flowers was full of significance among the Greeks and Romans, and the study was revived during the Middle Ages in Europe, when it became especially appropriate in connection with the age of chivalry.

Our own floral symbolism is far more simple and truly poetical than that of the orientals, and we can call to mind what the simplest of our flowers revealed to the eye of Wordsworth.

Certain flowers have a common significance among European nations. Thus the rose is the emblem of beauty; the lily of purity; the violet of modesty; the daisy of innocence; the pansy of thought, and so on; whilst the laurel has long been accepted everywhere as the symbol of glory and the oak of patriotism. Consult John Ingram's *Flora Symbolica*, 1868 (a work which contains also floral poetry, original and selected).

Flowery, see FLEURY.

Fludd (Flud, or Floid), Robert (1574-1637), Eng. physician, Rosicrucian and mystic philosopher, of Kent. He entered St. John's College, Oxford, 1591, then spent five years studying on the Continent, taking his medical degree at Oxford, 1605. He was a follower of Paracelsus, and tried to form a philosophic system based on his teachings. F. was author of many obscure Lat. works, theosophical, philosophical, and mathematical. His works include *Apologia Compendiaria Fraternalitatem de Rosea Cruce Affuens* (1616); *Veritatis Proscenium* (a reply to Kepler) (1621); *Philosophia Sacra et Vere Christiana* (1629), *Summum Bonorum* (reply to Mersenne) (1629); *Dr. Fludd's Answer unto M. Foster* . . . (1631); *Integrum Morborum Mysterium* (1631); *Clariss Philosophiæ et Alchymie Fluddianæ* (1633); and *Philosophia Mosaicæ* (1638) (Eng. ed. 1659). See J. Webster, *Displaying of Supposed Witchcraft*, 1677; A. Walte, *The Real History of the Rosicrucians*, 1887; and J. B. Craven, *Doctor Robert Fludd, the English Rosicrucian*, 1902.

Flügel, Otto (1842-1914), Ger. philosopher; b. at Lützen; son of the burgomaster. Pastor, 1871. Co-editor, *Zeitschrift für exakte Philosophie im Sinne des neueren philosophischen Realismus Philosophie*, from 1873; of *Zeitschrift für Philosophie und Pädagogik*, from 1894. After Kehrbach's death continued issue of Herbart's works. Wrote *Der Materialismus* (1865); *Die Probleme der Philosophie und ihre Lösungen* (1876, 1906); *Die Seelenfrage* (1878, 1902); *Das Ich und die sittlichen Ideen im Leben der Völker* (1885); *Die Bedeutung der Metaphysik Herbaris für die Gegenwart* (1902); and *Herbaris Leben und Lehre* (1907).

Fluid, name given generally to substances devoid of rigidity. Gases and liquids are included in the term, since these bodies offer no sensible resistance to change of form, though they resist compression. Thus when a F. is acted upon by any distorting combination of forces it *flows*. Hydrodynamics is the name of the branch of applied mathematics which deals with the motion and equilibrium of Fs. The word fluid is figuratively applied to things which are not in reality such. For example, we speak of electric F. in the sense of electricity, whose general properties and motions are known to conform to certain differential equations which the motions and properties of true Fs. strongly suggest. The best writers, however, avoid this figurative use of the word as far as possible nowadays, for it dates from the time when electricity, magnetism, etc., were actually believed to be due to Fs., which were supposed to have a real objective existence. All Fs. are elastic, but liquids are highly incompressible, whereas gases can easily be compressed. There is more or less frictional resistance to the molecular motions in every F. It is somewhat difficult to draw a sharp distinction between the solid and the liquid state. A great deal depends upon external circumstances, such as the intensity of gravity and temp. Some substances, when exposed to long continued gentle stress, flow like visco-liquids, whereas they would splinter if subjected to sudden intense stress.

Fluke, see LIVER-FLUKE; TREMATODES. **Fluoboric Acid Gas**, pungent, soluble gas obtained by heating a mixture of boron trioxide and fluorspar with concentrated sulphuric acid. It does not attack glass, but has a great affinity for water and rapidly chars many organic substances. It combines readily with ammonia gas, forming various compounds according to the relative proportions of the two gases.

Fluorescein ($C_{20}H_{12}O_{11}$), i.e.

a chemical product or dye obtained by heating phthalic anhydride with resorcin at 200° till the mass becomes viscid. It is a reddish or yellow-brown powder, dissolving in water or an alkali to form a solution with a beautiful green fluorescence. It is little used itself for dyeing

purposes, as the colours are not fast, but eosins are derived from it, and rival safflower and saffronin for rose-red dyes. See PHTHALIC ACID.

Fluorescence, optical property possessed by certain substances whereby light of one colour is absorbed and light of another colour is emitted. When light falls on sulphate of quinine, for example, the liquid exhibits a bluish colour, which is continued some distance below the surface. The light which passes through the liquid is incapable of producing the same effect on another quantity of the substance, so that it appears that light of certain qualities has been absorbed to produce the F. The phenomenon was first described by Sir D. Brewster in 1833, was investigated by Sir John Herschel, and later by Sir G. G. Stokes. If a beam of sunlight is focused on a solution of quinine sulphate by means of a lens of long focus, a blue cone of light is formed and can be plainly followed by the eye through the liquid, though the intensity of the light rapidly diminishes as it recedes from the surface. In order to discover what rays are responsible for the blue light, a test-tube containing quinine sulphate may be passed through the different parts of the spectrum. No change is observed when the tube is held in the red, orange, and yellow, that is, in the less refrangible rays, but as it approaches the violet, rays of a blue colour proceed, and this continues beyond the visible spectrum into the ultra-violet rays. The general effect then is that light waves of short-wave length are absorbed and waves of longer wave length are emitted. Among fluorescent substances may be mentioned fluorspar, chlorophyll, aesculin, uranium glass, tincture of turmeric, paraffin oil, barium platino-cyanide, magnesium platino-cyanide, fluorescein, and various sulphides. The phenomenon of 'F.' is now put to use in electric discharge lamps. The electric current in the discharge tube produces ultra-violet radiation and when this falls on a coating of a fluorescent material deposited on the wall of the tube light of the visible spectrum is emitted. See Sir G. G. Stokes, *Mathematical and Physical Papers* (vols. iii. and iv.), 1880-1905; R. W. Wood, *Physical Optics*, 1914; and J. A. Radley and J. Grant, *Fluorescent Analysis in Ultra-Violet Light*, 1933.

Fluoric Acid, see HYDROFLUORIC ACID.

Fluorine, chemical element of the halogen group, atomic weight 19, atomic number 9. It is an extremely active gas, combining readily with most chemical elements. It was isolated in 1886 by Moissan, who obtained it by electrolysis of liquid hydrofluoric acid free from water. As hydrofluoric acid is itself a non-conductor of electricity, the addition of a quantity of potassium hydrogen fluoride was necessary to convey the current. The electrolysis was carried out in a U-tube made of an alloy of iridium and platinum, this substance being less readily acted upon than other metals. The electrodes were made of the same material, and the products of electrolysis

were carried off by lateral tubes, the entrances to the U-tube being stoppered with fluorspar. As an additional precaution a temp. of -23°C . was maintained during the operation, this being done by surrounding the tubes by the vapour from boiling methyl chloride. The object of this cooling is to condense any hydrofluoric acid gas present. F. is now prepared on a large scale by the electrolysis of fused potassium hydrogen fluoride in an electrically heated copper V-tube with graphite electrodes. F. is a pale yellow gas with an irritating smell. It condenses at -187°C . to a yellow liquid, and forms a light yellow solid at -233°C ., whilst at -252°C . it becomes white. It is the most active element known, decomposing water readily, and liberating appreciable quantities of ozone. It combines violently with non-metals such as bromine, iodine, carbon, sulphur, silicon, phosphorus, arsenic, etc., frequently causing them to burn with incandescence; it readily attacks mercury, sodium, potassium, magnesium, and other metals, and is only unaffected by oxygen, nitrogen, and chlorine. Curiously enough the gas can be kept over mercury if it is not shaken, but this is due to the formation of a layer of fluoride which protects the metal from further attack. The only compound of F. with hydrogen is *hydrofluoric acid*, prepared commercially by heating fluorspar with sulphuric acid in leaden vessels. It is a colourless liquid boiling at 19°C .; its vapour is extremely poisonous, and it combines readily with many metals, forming fluorides. Its most useful property is that demonstrated by its action on glass; it attacks the silica, and may thus be used for etching glass. When the materials are dry, no action takes place. F. is found in nature in fluorspar (CaF_2), cryolite and other minerals, and traces are found in sea-water and in the enamel of teeth. Various compounds of F. have recently become of considerable industrial importance, and many of them are of high significance in atomic energy operations.

Fluorspar, or **Fluorite**, mineral mainly consisting of calcium fluoride (CaF_2). It occurs crystallised in the cubic system and in the massive form. The crystals have a perfect cleavage, a hardness of 4, sp. gr. 3.2, and occur in a wide range of colours from transparent to almost black. It often contains calcium chloride and traces of organic matter. Many crystals contain an internal cavity, which is found to contain liquid or gas. The colour, too, is attributed to organic matter, as when the mineral is heated the colour tends to disappear and small quantities of carbon monoxide, hydrogen, etc., are evolved. Some varieties exhibit the phenomenon of fluorescence (q.v.), and phosphorescence is observed when the mineral is submitted to Röntgen rays. F. occurs in association with ores of tin, lead, copper, and silver, and also in cavities in volcanic rocks. It is of wide distribution, and is common in England, particularly in Cornwall, Devon, Derbyshire, and Cumberland. In mining dists. F. is used as a flux for copper, lead,

and gold ores. The violet variety, known as 'Blue John' in Derbyshire, is made into ornaments. The mineral was highly prized by the ancients for this purpose, but the spar is too soft for personal ornaments. F. is the chief source in the manuf. of commercial hydrofluoric acid, used for etching glass. The transparent variety is used in the construction of optical instruments.

Flushing (Dutch, *Vlissingen*), fortress and seaport in the prov. of Zeeland, Netherlands, on the S. coast of the is. of Walcheren, at the mouth of the W. Scheldt. It was once an important naval station, but is now a leading port of commerce, carrying on, in normal times, an extensive trade with England, Java, and S. America. The tn. has grown in favour as a summer resort. It has a royal dockyard, and since 1875 a large floating dock. The chief industries are shipbuilding, brewing, and the manuf. of oil and soap. Exports agric. produce and shrimps. In the Second World War the greater part of F. was captured on Nov. 1, 1944, by a strong force of Brit. commandos who were landed on Walcheren. Canadians stormed the causeway from the mainland. On Nov. 3 F. was entirely in Brit. hands. Pop. 23,000. See also WESTLAN FRONT IN SECOND WORLD WAR.

Flushing and Flushing Bay, once a vil. of Queens co., New York, U.S.A., but since 1897 has been part of the bor. of Queens, New York city. It is situated on Long Is., at the head of F. B., and is named after early nonconformist settlers from F. in Holland.

Flute, musical wind instrument consisting of a long tube of wood or sometimes metal, in sev. detachable joints and open at the lower end. The vibration of the air in the tube is caused by blowing into the upper end through an oval-shaped hole in the side. The different intervals in the pitch are obtained by closing or opening the different finger-holes in the lower part of the tube, by which the vibrating column of air is lengthened or shortened as desired. The F. in general use possesses a workable compass of about three octaves from the low C in the treble clef with all the chromatic intervals. There are six finger-holes in the lower part of the tube arranged at fixed intervals from each other in order to produce all the notes which form a major scale; the second octave is obtained by blowing with increased force which raises each note to an octave higher, and the third octave can be added by a system of cross-fingering. When chromatic intervals are desired the instrument must have additional finger-holes which are manipulated by means of keys. *Oculus-wood* is the material from which the majority of Fs. are constructed; but gold, silver, and other metals are sometimes used. Ebonite also is used. The F. has been in use from the earliest times. Olympus the Phrygian has been credited with the introduction of F.-playing into Greece, where it was largely used in religious ceremonies and encouraged by means of competitive trials

of skill. The old Eng. F., called the *flûte à bec*, from its supposed resemblance to the beak of a bird, was played from the upper end of the tube, had seven finger-holes and was made in various sizes, called treble, tenor, alto, and bass Fs. respectively. The 'German' F. (*flauto traverso*) gradually superseded the *flûte à bec* from its invention about 1720. Handel was one of the earliest composers to introduce the 'German' F. into the orchestra, employing it for some of the solos in *The Ode on St. Cecilia's Day* (1739). The F. of Handel's day, however, owing to the arrangement of the finger-holes and the difficulty of manipulating the fingering, could only be played in tune in certain keys; this difficulty was abolished by Boehm about 1834, when he introduced the cylindrical bore and a new system of fingering in place of the old conical bore. Boehm's instrument is in tune in practically all keys and is now the one generally used. F. solos are less common than they were formerly, but the instrument still plays an important part in orchestras, where the F. part is generally placed at the top and is written in the violin or G clef. Other varieties of the F. are the flûte, simply an octave F. in B₃, much used in military bands; the *flageolet*, a smaller variety of the old *flûte à bec*; the piccolo, an octave F.; and the 'flûte d'amour', a minor third below the ordinary F. The old varieties of the cornet (usually classed in a family of its own, with the serpent and key bugle and the pilgrim's staff are now obsolete. The old recorder is now in use again (see RECORDER). Among the foundation stops of most organs there are generally one or more 'F.' stops. See also FIFE, FLAGEOLET, PICCOLO. See R. S. Rockstro, *Construction, History, and Practice of the Flute*, 1890; and P. Wetzzer, *Die Flöte*, 1906.

Flute-stop, organ stop of the diapason species and so called because its tone resembles closely that of a flute. The bell diapason, as it is often called in Britain, is the *flûte à pavillon*, a stop of Fr. invention, and is characterised by its peculiarly powerful tone.

Fluting, in architecture, the channel mouldings cut vertically on the surface of the shaft of a column. In Doric columns the flutes round the shaft are twenty in number and meet with a sharp edge. They are carried up above the necking and end abruptly at the base of the cap. In the other orders the flutes are twenty-four in number, and are

MODERN
CONCERT
FLUTE

separated one from the other by small fillets. The flutes each terminate in a semicircle at top and bottom. Sometimes, in order to strengthen the columns, the flutes are cabled, that is to say, they are filled in with a bead for about a third of the length of the shaft from the base. In Romanesque architecture many decorated Fs. appear, in which the flutes are curved, zigzag, or wreathed.

Flux (from Lat. *fluere*, to flow), substance used to aid in separating metals from the other constituents of their ores. The action may be either the removal of silica or other earthy matter by promoting fusion, or actual combination with the oxygen, sulphur, etc., in the compound from which the pure metal is to be extracted. Black F. is a reducing F., that is, it extracts oxygen from the ore. It consists of a mixture of finely divided carbon and potassium carbonate, and is made by heating crude cream of tartar with about half its weight of nitre. White F. is a mixture of carbonates of soda and potash. Other fluxes are lime, borax, silica, calcium sulphate, fluorspar, and red lead.

Fluxions, method of mathematical computation devised by Sir Isaac Newton. The method was used by Newton for some time before he disclosed its principles to the world in 1693. For some years the system was used by Eng. mathematicians, but was gradually abandoned in favour of Leibnitz's notation. Leibnitz looked upon quantities as made up of very small parts, as the circumference of a circle may be represented as a polygon of an infinite number of sides. Newton, on the other hand, represented such a line as the effect of the continuous motion of a point the velocity of which in equal intervals of time measures the magnitude of the quantity. The method of F. was fully treated in the *Treatise on Fluxions* of Colin Maclaurin, pub. in 1742.

Fly, see DIPTERA; HOUSE FLY.

Fly, Artificial, see ANGLING.

Fly-blister, see CANTHARIDÆ.

Fly-catcher, name of a Passerine family of Muscipidæ, but it is used in a wider sense generally to describe all birds who catch flies on the wing. There are over 40 genera and 280 species. The Fs. are small-sized, bright-plumaged birds, and abound in warmer parts of the old world and in Australia. They are not found at all in N. and S. America. The bill is a distinctive feature; it is strong and short, and has bristles on the broad, flat base. The common Brit. F., *Muscicapa grisola*, is a tiny brownish-grey bird. The pied F. (*Muscicapilla atricapilla*) is a native of Great Britain, rare in the S., not uncommon in the N. The beautiful paradise F. of the E. Indies and the 'grinder' F. of Australia do not belong to the family Muscipidæ.

Fly-fishing is the sport of catching fish by use of an artificial fly as bait. It is rightly considered to be the most fascinating branch of angling, and great ingenuity has been bestowed upon the manu. of the various flies used for the purpose. Not only has the angler to

choose a fly closely resembling in colour and shape the flies dancing over the stream at the time, but he must also cast the bait in such a way as to preserve the appearance of life. F. is principally used for the salmon, trout, and grayling. Sometimes three or four flies are cast together upon the water and drawn below the surface somewhat at random, while another method is to select a particular fish and cast a fly a short distance up-stream, allowing it to float down over the fish's head. The sport requires considerable dexterity and has innumerable devotees. See bibliography for ANGLING.

Flying, or **Flight**, the act of moving through the air by propulsion given by wings. In the strict sense of the term the power of flight is only possessed by certain insects, birds, and bats, the latter including the so-called F.-fox. There are other animals which modify their progression through the air by various means which give their actions a certain similarity to actual flight, and they are therefore loosely termed F. animals. It is uncertain to what extent the extinct reptiles (pterodactyls, pterosaurs, rhamphorhynchus) were actually capable of F., but they certainly possessed wings very similar to those of the bat. The so-called F.-fish (q.v.) give themselves an initial impulse by means of a powerful spring effected by their muscular tails; and use their pectoral fins after the manner of a parachute, being thereby able to sustain themselves for some hundreds of feet in the air. The action of the fin, however, can hardly be said to be analogous to that of the wing in birds. Certain species of lizards, as, for example, the *Draco volans*, have a skin formation attached to their ribs, which are peculiarly elongated. In such a way as to form a kind of kite, and this enables them to make short darts through the air. The F.-opossums or F.-phalangiers, a genus of small arboreal marsupials found in Australia, have a fold of skin along the flanks which, serving as a parachute, allows them to make prolonged leaps with considerable agility and grace. A smaller member of the same species is known as the F.-mouse. There are also two genera of squirrels (*Pteromys* and *Sciuropterus*) which have a development of the skin between the fore and hind legs and possess the power of making leaps for great distances through the air. In doing so they also make use of their tail, the hairs of which stand out on either side and serve to some extent as feathers for supporting them, while the tail also aids to direct their flight. The parachute action exhibited by the animals mentioned above is developed to a greater extent in the F.-lemur (*Galeopithecus*), an insectivorous animal in whom the hairy fold of the skin reaches from the throat to the end of the tail and includes the whole length of both fore and hind legs up to the claws. These animals can leap a distance of over 200 ft., and are found in the Indian archipelago. Zoologically it is difficult to say whether the F.-lemurs should be classed with lemurs, bats, or insectivores, but the latter is the usual method of

classification adopted. There is also a kind of squid or cuttlefish known as the F.-squid, having broad lateral fins, which enable it to spring high out of the water. See also BAT; BIRD; DRAGON; FLYING-FISH; INSECT; OPOSSUM; PTERODACTYL; SQUIRREL. For F. machines see articles on AERONAUTICS; AEROPLANE. See J. B. Pettigrew, *Animal Locomotion*, 1882; Strasser, *Über den Flug der Vögel*, 1885; Maybridge, *Animal Locomotion*, 1887; and for the flight of birds F. W. Headley, *Structure and Life of Birds*, 1895.

Flying Boat, type of aircraft designed for landing on water, in which the body itself serves as a boat, and is not supported by floats, as in the case of a *seaplane*. Used in the empire air-mail services.

Flying Bomb, pilotless jet-propelled aircraft used by the Gers. as a long-range bombardment weapon against London and other targets, both in England and on the Continent, in 1944. Its speed was between 350 and 400 m.p.h., the weight of explosives about one ton, and the range approximately 150 m. During the eighty days of the most intense bombardment of London between June and Aug. 1944 some 2300 of 8000 F. Bs. launched reached the London area. Of the bombs launched some 25 per cent were erratic, many diving into the sea. A few strayed as far as Norfolk and Northampton. The remainder were brought down by the combined efforts of anti-aircraft guns, fighter pilots, and barrage balloons. In the first week of the bombardment 33 per cent were brought down, while rather more than that reached London. By the end of the eighty days 70 per cent were being brought down by the defences, and only 9 per cent reached London. In the ensuing months F. Bs. were launched pickaback from Heinkel planes over the North Sea, but the number that reached England was negligible. In the intense period the record destruction of F. Bs. was on Aug. 28, when out of 101 which approached the Eng. coast ninety-seven were brought down by the defences. But for the timely discovery of the Ger. intention to use the weapon as a means of cowing the people of London much greater damage would have been wrought. In April 1943, however, reports from secret agents suggested that the Gers. were developing a long-range bombardment weapon of a novel type. Reconnaissance aircraft obtained photographs in May showing that at Peenemünde on the Baltic coast there was a large experimental station where jet-propelled F. Bs. for launching from inclined ramps fitted with rails were being tried out. Later it was seen that the Gers. were building all along the Fr. coast, from Cherbourg to Calais, a series of concrete structures similar to those seen on the Baltic coast and all the Fr. sites were seen to be oriented in the direction of London. These ramps or sites were repeatedly and successfully bombed, and then in March 1944 the Gers. began constructing an entirely new series of firing points, much more speedily constructed, and so camouflaged as to make detection almost impossible until they had actually

fired. By this time, however, the detailed arrangements for defence were being rapidly completed. The Ger. attack started a few days after the allied landings in Normandy (June). An awkward problem was that of seeing the F. B. at all. Pilots on patrol had the greatest difficulty in spotting so small and fast-moving an object sev. thousand feet below, though over land help was rendered by radio telephone. In darkness, however, it was easy to spot the flaming tail of the F. B. many miles away, but in order to bring down the bomb the pilot had to fire his guns at a range of 300 yds. If he fired when too far away he would probably miss the bomb; if he fired when he was too near the bomb might blow up and destroy the pilot. Meanwhile Prof. Sir Thomas Merton produced a simple and ingenious range-finder, which proved to be the complete solution for this difficulty. In July 1944 a light-scale attack was made on Portsmouth and Southampton, but most of the F. Bs. fell in the sea or in open country, showing that the weapon was not accurate enough against targets of that size, and during the rest of the summer the attack was directed indiscriminately at the unique target of London, and about 92 per cent of all the fatal casualties occurred in the London region. In the summer Brit. and Amer. Air Forces dropped over 100,000 tons of bombs on the F. B. sites. In these operations these forces lost nearly 450 aircraft, involving a loss of 2900 pilots and aircrew—figures which afford an indication of the seriousness of the threat. Large stores of F. Bs. were located in tunnels and caves near Paris, and many of these were discovered and destroyed. A train loaded with 200 F. Bs. was detected about this time, and information was passed back to England in time for Brit. bombers to fly out and blow up the train before it could move on. There is no doubt that but for timely interference the bombardment would have started early in 1944 at a time which would have seriously affected the efficiency of the defences. The only completely effective answer was to capture the sites, especially those in the Pas de Calais. The successful allied invasion achieved that purpose though the previous destruction of the first 100 launching sites not only delayed the bombardment, but also forced the Gers. for the sake of concealment to construct their second series of sites on simpler and less efficient lines. It may be added that during 1944 some 24,000 houses in London were destroyed and 800,000 more or less badly damaged. F. Bs. and rockets were also fired by the Gers. at Antwerp and Liège in Belgium between Oct. 13, 1944, and the end of March 1945. Antwerp in particular was subjected to incessant attacks, which caused much loss of life and damage, but this did not interfere with the working of the port and the moving of military supplies, an essential prelude to the supplying of the allied armies during the winter, and their spring campaign, which finally resulted in victory in May 1945.

Flying Bridge, see FERRY.

Flying Dragon, or Draco, genus of lizards, belonging to the family Agamidae. The species are brilliantly coloured and are unable to change their hues; in habit they are entirely terrestrial, and in diet insectivorous; their harmlessness makes

FLYING DRAGON

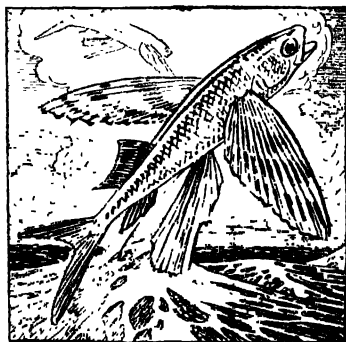

them suitable for pets. Their great peculiarity lies in the wing-like membranes, which extend from their sides, can be opened and shut at their owners' will, and serve as a parachute when they leap from one branch to another. *D. volans*, a Malayan lizard, is the best-known species; in length it is about 5 in., with another 5 in. for the long, thin tail.

'Flying Dutchman,' name given to a spectre ship, supposed by popular belief to haunt the waters round the Cape of Good Hope. According to the legend, the captain of the vessel, Vanderdecken, was condemned for his blasphemy to sail for ever round the cape in a special ship, always unable to 'make' a port. Sailors consider the appearance of the *Flying Dutchman* a bad omen and quickly change their course to avoid it. The legend has sev. variants in many tales of Ger. mythology, and its prototype is likewise current in other countries. According to Sir Walter Scott, the vessel was originally laden with bullion, a murder was committed on board, and plague broke out. Wagner's opera, *Der fliegende Holländer*, is based on this legend.

Flying-fish are of two species, the *Ereocetus* and the *Dactylopterus*. They are bony, and can travel some distance in the air above the water. Of the *Ereocetus*, or flying herring, there are forty known species, mostly in warmer seas. A few are seen in Brit. waters and in the Mediterranean. The long pectoral fins are the distinguishing feature. The length of the body is about 1 ft.

Flying Fortress, four-engined heavy Amer. Boeing B17 bomber used with considerable effect in daylight raids on Germany in the Second World War. These machines fought their way to

targets far inside Germany, with or without fighter escort, in the face of the most intensive fighter opposition. Their success was due to the type of guns carried and their location on the machine, and to the type of formation assumed and maintained throughout a raid. The weapon employed was the .50 machine gun firing 54-in.-long bullets at muzzle velocity of 2800 ft. per sec. The ammunition was usually loaded in sequence of five rounds, one tracer, two incendiary, and two armour-piercing. The gun's rate of fire averaged about 650 rounds a min. A force of 250 B17s carried over 3000 machine guns—a most formidable array. This heavy armament would have been less effective in combat had the Amers. not developed and adapted a formation pattern that ensured a complete screen of fire for each aircraft. Any blind spot of one F. F. was checked and covered by the gunners of one or more accompanying F. Fs. The aircraft were stacked up in tiers, and flew in close formation so that the guns in the nose and tail, the ball turret, the waist guns, and those in the other positions had full play. The skill required from the pilots and crews of the F. F. was of the highest degree, retention of individual positions over a period of sev. hours being essential. The total crew of a F. F. was ten. Often the losses on a raid were remarkably small. Thus only five were lost on a 1000-bomber and fighter raid on Wilhelmshaven, but sixty were lost in a raid on Schweinfurt (Oct. 14, 1943), there being no fighter escort. Subsequently the U.S. Army Air Force sent long-range Thunderbolts in large numbers to escort the forts all the way to their objective, and in a raid in Nov. 1943 on Düren, near Cologne, not a single F. F.

FLYING-FISH (*Ereocetus Volitans*)

was lost. Again, on July 24, 1943, in an attack on the Ger.-controlled magnesium and aluminium plant in Heroya, in Norway, only one B17 was lost—forced down over Sweden without loss of the crew. At Stuttgart (Sept. 6, 1943) forty-five were lost out of 338 B17s, but eighty-four enemy aircraft were destroyed. If

the losses over Schweinfurt were heavy, all five of the works at that place were almost completely wiped out.

An improved model, the B50, is known as the superfortress. It is made by the Boeing Airplane Company at Seattle, is powered with four Pratt & Whitney 3500-h.p. engines, and can climb to 40,000 ft. Its bomb capacity is stated to be 10 tons, and its maximum range without refuelling 6000 m. However, in 1940 one of these aircraft flew non-stop round the world, 23,000 m., in 94 hrs. 1 min., at an average speed of 239 m.p.h. It refuelled four times from tanker aircraft whilst in flight.

Flying-fox, see FRUIT-BAT.

Flying-lemur, insectivorous mammal with a parachute provided with special muscles, very efficient for flying. It can sweep for a distance of 70 yds. The claws are for climbing, and the colour is that of mottled bark. It is about 20 in. long, and inhabits the Indian archipelago.

Flying Machines, see AERODYNAMICS; AERONAUTICS; AEROPLANE.

Flying-squirrel, member of the squirrel group of rodent animals, having a parachute-like expansion of the skin of the flanks, partly supported by bony processes of the feet, which enable it to take extraordinary leaps, gliding for a great distance through the air. There are two widely distributed genera, the *Pteromys*, including the larger, and the *Sauromys*, the smaller species. The former are characteristic of the Indian and E. Indian region, the latter of N. America, Asia, and Europe. The European species is about the size of a rat, of a greyish-ash colour, with a short tail, and it lives in the forests. Its fur is of little value. The N. Amer. species, on the contrary, is a good deal larger, and its tail is as long as its whole body. In general appearance F. Ss. resemble ordinary ones, and their habits, food, etc., are much the same. They are rarely seen except at night.

Fly River, New Guinea, rising in the N.W. corner of the Brit. part of the is., and flowing into the gulf of Papua by a wide delta. MacFarlane and D'Albertis ascended it 90 m. in 1875, and in 1885 Capt. Everill explored it for 200 m. Its banks are densely wooded.

Flysch, remarkably thick mass of sandstones and shales extending very continuously from the S. Alps to the Vienna basin, and then round the Carpathians into the Balkan peninsula. Although uniform in character, it is not of the same age in every place, and probably extends from the Lower Cretaceous period to the Tertiary. It consists in all probability of debris washed down the sides of the hills over a long period. Nowhere are fossils abundant except in the Oligocene bed of Glarus. Similar formations to the F. are found in the Pyrenees, the Apennines, the Caucasus, and in the Siwalik beds of the Himalayas. According to locality the F. is variously known as Vienna sandstone, Carpathian sandstone, Macigno, Red F., Wild F., etc.

Fly-trap, see *DIONÆA MUSCIPULA*.

Fly-wheel, wheel of large diameter and heavy rim connected with the driving-

shaft of an engine in order to equalise the motion. Where the motion of an engine proceeds from the to and fro movement of a piston-rod impelled by the expansive power of steam, it is evident that the velocity decreases towards the end of the stroke when the piston and crank are approaching the same straight line. The moving parts of the engine thus tend to proceed in jerks. The function of a F. is to receive the excess of energy when the impulse is great, thus retarding the motion of the engine, and to aid the engine when the impulse is less than the mean. In other words, by virtue of its turning-power when in motion, it acts as a reservoir of energy by which intermittent impulses are made uniform, or by which intermittent demands on the energy may be spread over a longer period. It is thus used in two sets of circumstances: (1) When the engine is moved by force applied in successive strokes, as in a single acting steam engine, a gas engine, a treadle lathe, etc.; (2) when the work which the engine is called upon to perform consists of intermittent strokes, as in punching machines, etc. For effective working the F. should be placed near the seat of intermittent motion; thus, a punching machine driven by gas should have a F. on the crank-shaft to regularise the motion of the gas engine, and another on the punching mechanism to store the energy to be given out in successive punches.

F.O.B., abbreviation for 'free on board,' used in contracts for the sale of goods to denote that costs of carriage and delivery of the goods on board ship must be paid by the seller.

Foch, **Ferdinand** (1851-1929). Fr. general, b. at Tarbes and of old Pyrenean descent. Educated at Metz, and was here when the Franco-Prussian war broke out, and during that war was posted to an infantry regiment. Entered the artillery school, and passed out with distinction as a gunner officer. He was a lieutenant in 1875, and captain in 1878, after a course at the École Polytechnique, Paris. In 1885 he entered the staff college, and in 1895 became instructor in military history, strategy, and applied tactics at the college. His lectures, which are republished in his *Principles of War* (1903, 1918), were at once recognised as being of sterling merit in their earnest and profound analysis of the elements and conditions that had brought success to the Ger. arms in 1870-1871, and success to Fr. arms in the forty years prior to the battle of Waterloo. He was known before the First World War as author of a number of standard books on tactics and strategy. He was promoted lieutenant-colonel in 1898, colonel in 1903, and general commanding 13th Infantry Div. in 1907. In the First World War he served on the W. front, becoming a marshal of France in 1918, and generalissimo of the whole of the Brit., Fr., and Amer. forces in France and Flanders. From the very first days of the campaign F., who in 1914 was a corps commander, established his reputation as one of the most brilliant of the allied leaders, and it is perhaps not a little surprising that his wonderful

achievement at the head of the Ninth Army in the fighting in the St. Gond Marshes in the 1914 battle of the Marne was not at once productive of a more dramatic promotion. At the Marne battle he played a most prominent part in arresting the onward rush of the Ger. armies and saving the cap. from the invader. He was in command of the Fr. centre between Sézanne and Mailly, and for three days he was compelled, against the repeated efforts of the Gers. to pierce his line, to retire. Yet promptly in the succeeding days he renewed the offensive with a stubbornness which was characteristic of his whole nature, and at last, having drawn the enemy ever further into the marshes, he took him in flank and

Lupical Press

MARSHAL FOCH

buried him back over the riv. He again signally distinguished himself in 1915 during the first battle of Ypres, his aid being invoked by F.-M. Sir John French (later Earl Ypres) when the Gers. launched their first gas attack. In the great Somme offensive begun by the Brit. in the middle of 1916 the co-operation of the Fr. armies was under the direction of Gen. Foch. Finally in the darkest days of 1918, when it became apparent to every one that the success of the enemy armies in Europe generally was largely due to unity of command among Ger. headquarters, it was agreed by the Allies to co-ordinate the action of the allied armies on the W. front under Gen. F. The decision was taken in April 1918, and from the turning point of the last Ger. rush, namely in the middle of July at the second battle of the Marne, the Fr. marshal, by a series of remarkable actions along the entire front, gradually 'rolled up' the Ger. armies, and forced them to sue for an armistice.

As a mark of appreciation Marshal F. was made a field marshal of Great Britain and awarded the Order of Merit. His chief publs. are *The Principles of War* and *The Conduct of War* (1904). In these it is clear that his model is Napoleon, and that

after earnest and searching examination he rejected the Ger., and particularly von Moltke's, system in principle and endeavoured to restore principles which were more in keeping with the genius and traditions not only of the Fr. Army, but of the Fr. nation as a whole. The strategy of F. inspires confidence from the fact that his own guiding maxim is that 'to hold positions is to prepare implicitly for defeat, if nothing further is attempted, if the offensive is not immediately assumed,' a lesson which his fellow countrymen completely ignored later when they reposed entire confidence in the Maginot line. In his professional capacity at the Ecole Supérieure de la Guerre F. was before 1914 a master of the science of war. His success was therefore the practical application of sound principles of strategy combined with an absolute mastery of technique. After the Armistice F. engaged in a strenuous but fruitless struggle for a military frontier on the Rhine, though he never advocated a political annexation of the Rhineland and the Palatinate. He took his case to all the authorities—the president (Clemenceau), who favoured it, but thought the constitution was against it; the Council of Four, the Fr. Cabinet, and the plenary conference of the Allies. He was defeated all along the line in this political campaign, which opened a breach between himself and his old friend and ally, Clemenceau, which was never to be closed. Physically Marshal F. was a man of middle height, with deep bass voice, grey-blue eyes, and typical Fr. military moustache. He was a man of few words, and when speaking in public was precise and logical, staccato in utterance, and essentially mathematical in expression and point of view. See *The Memoirs of Marshal Foch*, trans. by T. B. Mott, 1931, and M. Weygand, *Foch*, 1947.

Fochabers, vil. of Morayshire, Scotland, situated on a height overlooking the R. Spey, 8 m. S.E. of Elgin. Gordon Castle is near by, and in the vil. is a handsome public educational building which was erected by Alexander Mylne, who was a native of the par. Pop. 1000.

Focsani, or Fokshani, tn. of Rumania and cap. of the dist. of Putna. It is situated on the Milcov, 125 m. N.E. of Bucharest, and it is an important commercial centre, having a riv. trade with Galatz. Before the Second World War there were soap and oil factories, tanning works, and a trade in wine and grain. The Turks were defeated here in 1789 by the Austrian and Russian allies. Pop. 32,000.

Focus (from Lat. *focus*, a hearth), point to which converging rays are directed or from which rays diverge. When rays of sunlight, which may be taken as parallel, are received upon a concave mirror, they are all reflected to a certain small area in which any object will appear to be intensely illuminated; the geometrical point corresponding to that area is called the F. of the mirror. If light is received upon a convex mirror the reflected rays are scattered, but their direction may be followed backwards to a point behind the

mirror, which is therefore called the "virtual" F. When parallel rays are made to converge by means of a lens, the point where they meet is called the F. of the lens, and it is at this point, or near it, that sun's rays may be made to ignite paper, wood, etc. In geometry a F. is a point which has some definite relationship to the points on a continuous curve. Thus the F. of a parabola is a point the same distance from a point on the curve as the latter is from a fixed straight line. An ellipse is a curve whose distance from a fixed point called the F. bears a constant ratio, less than unity, to its distance from a fixed straight line. There are two such foci, except in the case of a circle, where the centre is the F. In estimating the propagation of earthquake shocks, the F. is that point from which the earth-waves diverge in all directions; frequently there are two such foci.

Fodder, see FATTENING FOODS.

Foerster, Wilhelm (b. 1869), Ger. philosopher and educationist. Prof. of pedagogy, Munich Univ., 1914-20. Resigned on account of his pacifist opinions. Went to Zürich, and after the Bavarian revolution became Bavarian minister in Switzerland. Notable as an advocate of education based on the spirit of positive Catholic Christianity, and as an opponent of Ger. militarism. Owing to his opposition to Ger. official policy he was exiled (1933), and now lives in America.

Fœtus, embryo in its later stages of development, when it is recognisable as belonging to the species of its parents. In the first week of fertilisation the human ovum passes into the cavity of the uterus, in two weeks it is about $\frac{1}{4}$ in. long and $\frac{1}{4}$ in. broad, and the folds which ultimately determine the head and the caudal region are developed. By the fourth week the embryo is curved upon itself, the rudiments of the ear appear as small nodules, and oval buds indicate the coming of limbs. The eye is recognisable in the fifth week, and the main segments of the limbs are defined. At eight weeks the F. has a distinctly human appearance, the nose is prominent, the fingers are separate, and the tail becomes reduced to a rudiment; the length of the F., excluding the legs, which are small and curved inwards, is about $\frac{1}{4}$ in. In the third month the limbs assume more definite proportions, nails appear on the fingers and toes, and sex can be distinguished. In the fourth month hairs are developed, and the hind limbs gain in proportion to the fore limbs; the F. is from 6 to 8 in. long, and may live for a few hours if b. at this time. In the sixth month the length has increased to about 12 in.; eyelashes and eyebrows appear. In the seventh month the body is plumper, the eyelids open, and the F. is capable of living if b. In the eighth and ninth months the body increases in size and plumpness, the colour takes on a rosy flesh tint. At the end of the ninth month, when the F. is b., it should measure about 20 in. in length, and should weigh from 6 $\frac{1}{2}$ to 7 $\frac{1}{2}$ lb. In its fetal stage the embryo is of course dependent upon the maternal blood supply for nutriment. The organ

of nutrition is the placenta, in which an interchange of products of the maternal and fetal circulation takes place. The connection between the F. and the placenta is the umbilical cord, which after birth becomes atrophied. *See also* EMBRYOLOGY.

Fog, or **Mist**, condition of the atmosphere produced in sev. different ways. It is due to the condensation of aqueous vapour which is always present in the air and begins to condense when the point of saturation is arrived at. Such a point is reached sooner in air at a low than at a high temp., hence Fs. are often produced by the sudden cooling of air, owing to its meeting another current at a lower temp. For the same reason morning mists disappear as the sun's heat increases. Vapour is more readily condensed if there be something which affords a nucleus for such condensation, so that the presence of dust particles is sufficient to produce F., even in non-saturated atmospheres. The density of the F. or mist produced depends upon the amount of aqueous vapour in the atmosphere, the temp. and pressure, and the number and size of dust particles. A cloud is simply a mist formed high up above the earth's surface. If the drops of condensed vapour are sufficiently large they fall as rain.

The drops of water in a F. are extremely small, one thousandth ($\cdot 001$) of an inch or less in diameter. A drop of $\cdot 001$ of an inch in diameter falls through the air at about 200 ft. per hour. A F. of drops of this size would soon clear, if it were not renewed, as the height of Fs. is generally less than 1000 ft. But Fs. are renewed by cooling at their upper surface and by evaporation from the ground; frequently, too, there are many smaller drops which fall more slowly; a drop half the size (diameter) falls at one quarter of the speed. The thick, opaque Fs. prevalent in large cities, and especially in London, are due to the large number of carbon particles floating in the air. A F. will arise where a warm, damp current of air passes over a cold surface. This phenomenon is particularly to be noticed in the region of ice floes. The Fs. on the coasts of Nova Scotia and Newfoundland are due to the warm air from the Gulf Stream passing over the colder water from the Arctic Ocean. On the other hand, mists frequently arise from the contrary cause of cold air passing over warm water. Thus at eventide, or when a sudden fall of temp. sets in, the air cools more quickly than the water, and cannot absorb the vapour given off by the latter, leading to the production of mists so often seen over sheets of water or marshy ground. In London Fs. frequently occur during the winter months, beginning usually in Sept. and reaching their greatest frequency in Nov., whence they gradually decline until the middle of Feb., after which a greater falling off takes place, the least foggy month being July. Fs. usually occur on a calm day or when there is a light E. wind blowing. The record of London Fs. kept since 1863 shows that the worst F. was that of 1879, which lasted practically

from the beginning of Nov. to the following Feb., Dec. having no fewer than seventeen foggy days. In the year 1873 no fewer than seventy-four Fs. were recorded. The presence or absence of F. has a great effect upon the death-rate, sufferers from asthma, bronchitis, pneumonia, pleurisy, and other diseases of the lungs, as well as whooping cough, being especially affected thereby. Dense Fs. in great cities are of considerable inconvenience owing to the general or partial suspension of traffic caused, and they are the chief obstacle to safe air travel. Fs. are classified by the meteorological authorities, with the concurrence of the aviation and shipping authorities, according to the distance at which objects can be seen in daylight—a distance called the visibility. In a dense F. visibility is less than 55 yds.; this may seem too great an allowance, but the classification is based primarily on the needs of planes and ships, and for these a F. is prohibitively dense if the visibility is less than 55 yds. A thick F. is one with a visibility between 55 and 220 yds, while a moderate F. is one with a visibility between 550 and 1100 yds. The distances of visibility of lights at night are adjusted to ensure uniformity of classification; an ordinary street lamp would be visible at 100 yds. in a F. in which the daylight visibility was only 50 yds. See also FOG SIGNALS. See C. J. Cave, *Clouds and Weather Phenomena*, 1926; D. Brunt, *Meteorology*, 1928; and H. H. Clayton, *Atmosphere and the Sun*, 1930.

Fogazzaro, Antonio (1842-1911), poet, novelist, and distinguished Liberal Catholic, b. at Vicenza; studied literature and divinity under the Abate Zanella, and law and music at Padua and Turin. With his Wordsworthian simplicity and pathos he was the purest modern It. writer. He first pub. a poetic romance, *Miranda* (1874), followed by *Falsolda* (1876), which brought him a modest recognition as a poet. Turning to fiction he produced *Malombra* (1881) and *Cortis* (1887), both unworthy of his genius. His next novel, *Misterio del Poeta* (1888), a unique and beautiful idyl, was his first great success; and this was succeeded by the trilogy *Piccolo Mondo Antico* (1896); *Piccolo Mondo Moderno* (1901); and *Il Santo* (1905), to which was ultimately added *Lella* (1910). F.'s fame rests chiefly on *Il Santo*, wherein is expressed the culmination of his theological sympathies with the young Christian democrats and the broad principles of modernism. This work, trans. into sev. languages as soon as it appeared, and placed on the index, caused a greater stir than any other modern European novel save, perhaps, L. N. Tolstoy's *War and Peace*. See lives by E. Donadoni, 1913, 1939; G. Vitelli, 1934; and L. Portier, 1938.

Fogelberg, Benedict Erland (1786-1854), Swedish sculptor, b. at Gothenburg. His father was a copper-founder. Studied under Pierre Guerin, the sculptor, and Bosio. In 1820 he fulfilled the dream of his life, and went to live and work in Rome. He was recalled to his native country by royal command in 1854, but

returned to Trieste in the same year, and d. there suddenly. His works display independence of thought and wonderful imagination influenced by anc. Gk. art. His statues of Odin, Thor, and Balder at the National Museum at Stockholm, completed in 1845, are strong and beautiful expressions of his art. His portraits of Gustavus Adolphus, 1840, Charles XII., 1851; and of Bjarne Jarl, the founder of Stockholm, 1855, are full of life and vigour. See life by J. Böttiger, 1880.

Foggia, tn. of Apulia, Italy, and the cap. of the prov. of F. It is situated in a fertile dist., 76 m. N.W. of Bari. The cathedral, dating from 1172, was partially destroyed by an earthquake in 1731 and rebuilt in a different style, though some Norman work still remains. It is on the main line from Bologna and Brindisi, and is an important centre for the market produce of the surrounding dist. The prov. has an area of 2688 sq. m. The tn. was badly damaged in the Second World War in 1943. The modern part of the cathedral roof was damaged and the arch of Frederick II was demolished. The tn. fell to the Allies on Feb. 27, 1943. Pop. (tn.) 57,200, (prov.) 62,300.

Foghorn, see FOG SIGNALS.

Fogo, one of the Cape Verde Is. It is the highest in the group and has an active volcano, reaching 8800 ft. above the sea. The climate is good, though tornadoes sometimes sweep across its borders. The area is 170 sq. m. São Filipe is the chief tn. Total pop. 20,900.

Fog Signals are audible signals used on board ship, on railways, or elsewhere, at times when lights or ordinary signals would be of no avail. The maritime code, first made in 1861, and revised in 1897, is now universal. According to this code steam vessels under way are to sound a prolonged blast every 2 min. upon a steam whistle or siren; if under way, but stationary, two prolonged blasts at the same interval. A sailing vessel under way must sound a foghorn, giving one blast every 2 min. if on starboard tack, two blasts if on port tack, and three blasts when sailing before the wind. When at anchor each vessel is required to ring a bell at intervals of not more than 2 min. F. S. are given on railways by laying small detonating caps upon the lines, which explode as the front wheels of the engine pass over them.

Föhn (Lat. *favonius*), warm, dry wind blowing down the valleys of the Alps from high central regions, generally in the winter months. It is caused by the expansion of air in the mts., cooling and thus condensing the vapour, which as it descends to lower levels is dynamically heated, causing warmth and dryness. The F. wind often blows with great violence, and causes much discomfort and strain on the nervous system. Similar local winds occur in many parts of the world, on the W. coast of Greenland, in the Rocky Mts., Colorado, and New Zealand. This wind is often known as the sirocco in the S. Alps, though its nature and cause are not the same as the true sirocco wind. See Buchanan, *Atmosphere*

Temperature during Föhn, and E. Walter, *Der Schweizerföhn*.

Föhr, one of the N. Frisian is. in the North Sea, off the W. coast of Schleswig-Holstein. Wild fowl abound in the autumn, oysters are exported to Hamburg, and fishing is largely carried on. Wyk is the chief tn. Area 30 sq. m. Pop. 7000.

Foil, general name for thin plates or sheets of metal, resembling a leaf in thinness. It is used in chem. for electrical apparatus, and by jewellers for backing gems of the less precious kind. The latter is sometimes known as Dutch F., consisting of small sheets of silvered copper, rolled very thin. It is coated with a mixture of isinglass and translucent colour, highly polished. Tinfoil is the commonest kind, formerly used for wrapping chocolate, tobacco, etc. Gold-F. is chiefly used by dentists for filling teeth, and is thicker in substance than gold-leaf, which is employed principally for gilding purposes. Gold-leaf is prepared by a prolonged beating-out of the metal between sheets of vellum and thick skin. The leaves can be produced in ten different shades of colour, according to the amount of silver or copper alloy used, and are about 3½ in. square.

Foil, see under FENCING.

Foix, title of a distinguished old Fr. family, which was famous from the eleventh to the sixteenth centuries, resident in the tn. of F. Count Roger, grandson of the count of Carcassonne (d. 1012), was the first to assume the title of count of F. He d. about 1064. His brother Peter succeeded him, followed by his son Roger II., who distinguished himself in the crusade of 1095; this count was excommunicated by the pope for seizing Church property. In 1190 Count Raymond Roger fought in Palestine, and assisted in the capture of Acre; afterwards he fought in the wars of the Albigenses. His estates were seized by the Church on the excuse of heresy and given to Simon de Montfort. He regained them before he d. by large bribes to the Church. His grandson, Roger Bernard III., was a better poet than a warrior; he was first made a prisoner by Philip III. of France and then by Peter III. of Aragon; he married the daughter of the vicomte de Béarn. His great-grandson, Gaston III., was the most famous member of the family (see below). Gaston IV. (d. 1479) married Leonora, daughter of King John of Aragon and Navarre. His grandson, Francis Phoebus (d. 1483), became king of Navarre. His sister Catherine succeeded him (d. 1517), having married Jean d'Albret (d. 1516). When Henry of Navarre became king (1589), the estates of F. became part of the royal domain of France. Another grandson of Gaston IV. was Gaston de F. (d. 1512), a distinguished soldier; his sister Germaine became the second wife of Ferdinand I., king of Spain. Gaston took the command of the Fr. troops in Italy, and d. at Ravenna.

Foix, Gaston (Phoebus) III. de, Comte de, and Vicomte de Béarn (1331-91), son of Gaston II. He was surnamed Phoebus,

because of his great personal beauty; he also bore a golden sun in his escutcheon on account of this name. He fought for France against England and defended the frontiers of Gascony, but being displeased at King John II.'s preference for the count of Armagnac he left the Fr. Army and went to fight in Prussia. Returning to France in 1358 he rescued the royal princesses from the Jacquerie at Meaux, and at once began war against the count of Armagnac, whom he defeated and compelled to pay a large ransom. He was appointed governor of Languedoc, and when Charles VI. became king he was recalled, the duke of Berry being chosen as governor. Gaston, however, refused to give up Languedoc, and fought for two years, retiring defeated to his own estates. He married Agnes, daughter of Philip, count of Evreux, and Queen Jeanne II. of Navarre; he divorced her in 1373. Their only child, Gaston, tried to poison his father, and it is probable that his father killed him in 1381. Gaston on his death left his estates to Charles VI. Froissart writes a vivid description of the splendour of Gaston's court, of his delight in beauty, and his love of hunting, and asserts 'that there was none like him, of so fair a form or so well made.'

Foix, cap. of Ariège dept., France, on R. Ariège, at the foot of the Pyrenees, 44 m. S. of Toulouse. It is faced on the W. by a cavernous rock, with three Gothic towers and the ruins of an old castle. Gaston de Foix was b. here (1489). There are iron and steel works, bauxite mines, and flour mills. Pop. 6000; arron. 46,800.

Fokien, see FUKKIN.

Fokine, Michel (1880-1942), Russian dancer and choreographer, b. in St. Petersburg. Began his training under Mme Kursavina's father at the old Imperial School of Ballet. His versatility soon marked him out as an altogether exceptional dancer, and thus early he suggested reforms of the conventional ballet which has now become familiar. F. was responsible for the choreography of *Les Sylphides*, *Le Pavillon d'Armide*, and of the *Prince Igor* dances. Other triumphs of his art were *L'Oiseau de feu* and *Schéherazade*, but perhaps his supreme masterpiece was *Petrouchka*. F.'s choreography showed a keen sensibility to musical style, besides a mastery of romance and the dramatic motif through expressive action, mime, and gesture. As a reformer of the dance he ranks with Noverre and, in co-operation with Diaghilev, he raised the status of the ballet among the arts. See C. W. Beaumont, *M. Fokine and his Ballets*, 1935.

Fokker, Anton Hermann Gerard (1890-1940), Dutch aeroplane builder, b. at Kediri, Java. Educated at Haarlem. Became an aviator at the age of twenty. International pilot in 1911; in 1912 competed successfully in Russia—also erected a factory at Johannesthal, Berlin; in 1913 opened another at Schwerin. During the First World War he kept the Gers. supplied with fighting aircraft—his biplanes and triplanes being named after him.

The Ger. general staff valued his services so highly that he was naturalised by military decree, but in 1919 he liquidated his Ger. affairs and opened business in Holland. In 1924 he became a director of an Amer. aeroplane company. Inventor of the means of shooting through the field of a tractor-propeller. This invention, however, was really only a development of a Fr. idea—that of the great Fr. pilot, Garros. The machine with perhaps the greatest flying record was the Fokker F-7, used by Kingsford-Smith among others; it was a three-engined monoplane, and in 1928 was flown over all the great oceans and across the Amer. continent.

Fokshani, see FOCSANI.

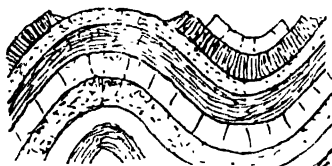

Folard, Jean Charles, Chevalier de (1669-1752), Fr. officer and tactician, served at the battles of Cassano (1705) and Malplaquet (1709). His writings include *Nouvelles Découvertes sur la guerre* (1724); *Commentaires sur Polybe*, 1727-30 (1753); *Traité des colonnes et de l'ordre profond* (1727-30). Napoleon later adopted this column formation recommended by F. See *Mémoires pour servir à l'histoire de la vie de Folard*, 1753, and *Esprit du Chevalier de Folard*, 1761, pub. by Frederick II.

Foleland, see BOC-LAND.

Folemate, see FOLKMOOT.

Fole-right, or Folkright, body of customs recognised as law in early Eng. hist. before the Norman Conquest. The term later became synonymous with common law. See F. W. Maitland, *History of English Law*, 1899, and H. M. Chadwick, *Studies in Anglo-Saxon Institutions*, 1905.

Fold, in geology, a bending or curve in stratified rocks. Curvature of some degree occurs in most strata, but the term is particularly applied to a somewhat sudden inclination to the general direction.

OPEN SYMMETRICAL FOLD

An anticline or upward bend and a syncline or downward bend

Where the strata continue their original direction on a higher level after a single bend, the F. is termed monoclinic; if more often occurs that the strata are doubly bent upwards or downwards, when the Fs. are called anticlinal or synclinal.

Folengo, Teofilo (1491-1544), It. Macaronic poet, b. at Cipada near Mantua. He is also known as Merlino Cocciajo, a name under which he wrote. He became a Benedictine monk, but in 1516 he seems to have grown tired of the monastery, and we find him wandering about the country in company with a lady named Girolama Deda. His first pub. was a romance in

verse entitled *Merlino Cocciajo macaronicon*; this proved a success and was followed by *Orlandino*, which he pub. under the name of Limerio Pitocco (Merlin the Beggar) da Mantova. This was in 1526, and he seems then to have tired of his wandering and returned to his monastery, where he wrote an account of his roamings entitled *Chaos del tri per uno*, part prose, part verse, and in a mixture of Lat. and It. He wrote a life of Christ, *L'Umanità del Figliuolo di Dio*, and many other poems that were not pub. Rabelais quotes and even copies him; the early eds. of his *Opus macaronicum* are very rare.

Foley, John Henry (1818-74), Irish sculptor, was b. in Dublin. His first exhibits were his models of 'The Death of Abel' and 'Innocence' in 1839; both these were well received, but his 'Ino and Bacchus' (1840) created even a greater stir. It was executed in marble for the earl of Ellesmere. Some more of his works are 'The Death of Lear' (1841); 'Prospero and Miranda' (1843); 'Contemplation' (1845); 'The Mourner' (1849); and 'Caractacus' (1867). All his works were of a very high order, but his statues and busts were especially noted. His bronze equestrian statue of Lord Hardinge, now in front of the gov. house, Calcutta, is one of the finest works produced in this country. He also executed the statues of Goldsmith and Burke in Trinity College, Dublin, and a symbolical group, 'Asia,' and a statue of the Prince Consort for the Albert Memorial in Hyde Park. His portrait busts are noted for their excellent likenesses.

Folgoré, Giuseppe, It. poet, one of numerous writers of sonnets in the thirteenth century. His poems vary very much in their degrees of excellence, but are all more or less humorous and satirical, and typical of the time at which they were written. Rossetti trans. them into Eng., and there are also trans. by J. A. Symonds. See D. G. Rossetti, *Dante and his Circle*, 1874; and J. A. Symonds, *Italian Literature*, 1881.

Foliation, in geology, a structure characteristic of the gneisses. The different minerals appear in the rock in layers, not continuous, but usually lenticular in form, that is, the bands of quartz or felspar increase in thickness to a maximum and then taper out, while other layers widen out. These bands are very often curved and tortuous; if the lenticular structure is visible to the naked eye, the rock is called a gneiss, if much finer grained it is usually termed a schist. When a gneiss has large elliptical folia of felspar, it is said to be an Augen gneiss, from the Ger. *Augen*, eyes. F. must be distinguished from the lamination of sedimentary or metamorphosed rocks, which may either be due to the fact of their having been deposited in layers, or, as in slate, to great pressure exerted through the folding of strata.

Foligno, or Fuligno (anc. Fulgintia), tn. of Perugia prov., Umbria, central Italy, 20 m. from Perugia, is situated on the Topino. It is noted for parchment, silks, leather, soap, woollens, and machinery. The earthquakes of 1831-32 did much damage. The cathedral of San Feliciano

is the chief public building. F. was once head of a confederacy of Umbrian cities. It is now a bishop's see. F. was one of the most damaged tns. in Umbria in the Second World War, scattered bombs falling over all the centre of the tn. The Gers. made elaborate plans to blow up the cathedral and the municipal offices, but did not have time to accomplish their purpose. The cathedral sustained damage though the fine façade of the N. transept was unharmed. The church of St. Augustine was destroyed,*except for the façade. The oratory of the Annunziata was ruined and with it Perugino's 'Baptism of Christ.' Pop. 13,000.

Folio (ablative of *folium*, leaf, or often an adaptation of it. *foglio*), with reference to pagination, a leaf of paper or parchment of a MS. or book, numbered only on the front, measuring about 17 by 22 in. In bibliography and printing the phrase 'in folio' is used of a sheet folded once to make two leaves, and hence of a book formed of such sheets, a book of the largest size. In book-keeping a F. is the page or two pages (numbered aliko) in a ledger on which the creditor and debtor account is entered.

Folk Dancing. The simple, spontaneous and uninstructed dances of people in small tns. and country places. The word folk means the common people, and such phrases as folk-lands, folk-lore and F. D. are related to the rights, the customs, the habits and life of the ordinary pop. In every country of the world dancing has played its part, and practically everywhere is susceptible of a rough div. into two main parts: formal and spontaneous. In its more stately and intentional manner dancing has been surrounded with rigid rules, precise etiquette or social custom, from auct. times when it was part of religious ritual, to the later day of pomp in court balls. In its simpler aspect it has been part of the play of the children in the street and a natural outlet of the spirits of adult merry-makers on the vil. green. Dancing is now influenced by professionalism and the habit of the professional mind is to adopt the convenient plan of limiting its definition to a specific style. In the strict language of the dancing instructor, F. D. is not quite the same as country dancing, but in a looser and more general use of words the two phrases are interchangeable. In England the Eng. Folk Dance and Song Society leads a vigorous movement to keep alive and revive popular interest in F. D., which except in the N. had virtually died out late in the nineteenth century. Cecil Sharp, a devoted pioneer, worked hard to preserve folk music and F. D. before it became extinct. The Brit. Gov. gives a grant to assist the organisation of the pastime on the ground that F. D. is a traditional and inexpensive means of keeping the people cheerful and healthy. See J. Black, *Folk Dances of Europe*, 1910, and D. Kennedy, *England's Dances: Folk Dancing To-day and Yesterday*, 1948.

Folk High Schools. Dan. organisation for adult education, particularly intended

to provide a general humanistic education. Inaugurated in 1944, they number fifty-seven, with an attendance of over 6800 pupils, aged eighteen, residing for periods of from three to five months, at a monthly cost of from £4 to £5. Though subsidised by the State, a great freedom is allowed to the teaching staff, and the students, who attend voluntarily, are not faced with examinations, marks are not given, and everything is done to encourage the free pursuit of general culture, in subjects such as hist., civics, art, philosophy, religion, and politics. Independent work is an important part of the system, and centres on well-stocked libraries. The school at Askov (where the library numbers 50,000 vols.) is the largest, and is an 'extended' school in that opportunity is given for students to continue their education through two or three winter terms. The Home Mission and other religious sects have their special high schools. The work of the whole organisation is of the highest value in preventing young adults becoming absorbed in one profession or business to the exclusion of all other forms of cultural experience.

Folklore, science of the elucidation of the peasant and local elements in modern culture. In the customs and traditions of the peasant class in all countries are embedded the knowledge of past events which hist. ignores, and religious and legal observances, the significance of which has long been forgotten. Those fragmentary survivals of a savage past are to be found in such apparently meaningless quantities as game rhymes, nursery rhymes and tales, ballads and marches, vil. ann. observances, and old saws. These survivals of an older culture remain among the non-progressive portion of the pop., and their analysis and elucidation constitute the science of F.

The logical and inductive treatment of traditions respecting persons and places often results in the elucidation of scientifically proved facts which throw considerable light upon the dark places of hist. Thus the children's rhyme 'London Bridge is broken down,' when taken into conjunction with sundry Eng., Breton, and Norse folk-tales, reveals first the intense interest and wonder of the Britons of the Rom. period in the architectural work of an alien and superior culture, and secondly illustrates the fact that London Bridge was captured by King Olaf the Dane in the tenth century. Thus we discover the true attitude of the auct. Britons to their Rom. conquerors, and can gauge the importance of a strife that was sufficiently stubborn to merit chronicling not only in the pages of the *Heimskringla*, but in the more lasting song-treasury of youth.

The little that can be gleaned concerning some characters known to be historical may be supplemented by F., as in the case of Hereward the Wake, Rob Roy, and Wm. Tell, tales regarding whom are prevalent in the dists. where they dwelt. But in such cases the wonder element is mingled with fact, and discrimination is necessary to arrive at sound conclusions.

The testimony of F. as regards anct. religious practice is chiefly afforded by old vil. or civic observances, customs in connection with calendric or seasonal changes or 'sacred' wells. For example, the tn. of Hawick, in the Scottish border country, possesses an anct. civic rhyme sung annually at the riding of the tn. marches, which commences 'Teribus and Teri Odin.' This in A.-S. is 'Tyr habbe us, ye Tyr, ye Odin,' or 'Uphold us, Tyr; uphold us, Odin,' so that the lay, sung with such fervour by the loyal lieges on all high occasions, civic and political, is undoubtedly a fragment of an invocation to the N. war-god Tyr and the All-Father Odin. Such an example shows not only what the anct. religion of the townsfolk of this border burgh was, but also proves them to have sprung from a race of Teutonic origin, so that such a fragment of song is as full of proof as any historical document.

Again in many parts of Great Britain and Ireland 'sacred' wells are found, the bushes surrounding which are covered with rags. In pagan times these springs were regarded as the haunt of some minor deity or spirit to whom sacrifice of some description was periodically rendered. The rags surrounding these shrines are still offered up by the country folk, and the practice is strikingly illustrative of the substitution of the part for the whole, which follows the breakdown of the practice of human sacrifice, the rag representing a part of the person who makes the sacrifice. Fragments of worship of the rain-god are often retained in connection with well worship, as in the isle of Gigha, off the coast of Scotland, when the water of a sacred well is blown to the four quarters of the heavens when rain is desired.

The legal aspect of F. is important. Starting from the premises that most of the anct. legal codes of people in a barbarian condition are in verse of an alliterative form, we can see how many rhymes employed by the peasant class are fragments of anct. law. Thus the Scottish children's rhyme, 'Tappie, tappie touseie, will ye be my man?' probably typifies the surrender of a freeman to an overlord. The rhyme gathers greater significance when we learn that the speaker seizes by the forehead the child to whom he addresses the words. Countless gifts of land are still commemorated in doggerel, and it is significant that until a late date in Eng. law it was admitted as a principle that if oral declarations conflicted with written instruments the former had the more binding authority. The marriage service of the Church of England exhibits marked signs of having been originally composed in verse.

Many folk-tales describe a constitution of society which is plainly barbarous. Implicit in them are vestiges of marriage by capture, the law of mother-right or descent from the female side, totemism, fetishism, and witchcraft or shamanism. In elucidating these—as indeed all F. problems—the anthropological method, or argument by analogy from the habits and

customs of existing savage races, is insisted upon by folklorists in contradistinction to the mythological method, or elucidation by reference to natural phenomena. Where the folklorist sees only the record of some prehistoric custom or event, and the mythologist espies the hist. of a sun-god, the impartial observer may discover traces of both, or neither. But there are many cases in which both methods may be singly employed. Thus by the anthropological we find in old tales the savage elements which prove their vast antiquity, to which has been superadded during the centuries a certain amount of the matter of modern culture. We find, for example, queens who wear their crowns, yet open the door to callers, talking animals, a childlike belief in magic—all the simplicity and credulity of the barbarian condition.

Turning from folk-tale to folk custom pure and simple, the exact description of which is dubious, and which may or may not refer to religion, law, or hist., we have such phenomena as 'sin-eating,' in which a paid person undertakes to devour the sins of the dead before burial through the medium of bread and salt, 'in order that the deceased may not walk.' This practice, accompanied in some dists. by incantations, appears a relic of ceremonial cannibalism, by which the relatives of the deceased secured themselves from being haunted by the dead man by devouring him. Such too are the Irish customs of placing a dead person's hand in the milk-pail in order that the milk may increase in richness, the taking of mould from graveyards for medicinal purposes, and so forth. Lastly differences in race may be traced to many folk customs; thus the daubing of the bridegroom's feet with soot in N.E. Scotland, the painting of the Southam 'Godiva,' the slaughter of the ram lamb at Holme, are all probably remnants of non-Aryan culture. The race has become absorbed, but its customs remain in a more or less fragmentary condition.

See W. Henderson, *Notes on Folklore of the Northern Counties of England and the Border*, 1879; Sir G. L. Gomme, *Folklore Relics of Early Village Life*, 1883, *Ethnology in Folklore*, 1892, and *Folklore as an Historical Science*, 1908; Sir J. Rhys, *Celtic Folklore*, 1901; J. A. MacCulloch, *Childhood of Fiction*, 1905; E. Hall, *Folk Lore of the British Isles*, 1928; F. van der Leyen, *Volkstum und Dichtung*, 1933; Christina Hole, *Wonder Tales of the British Empire*, 1934, *Folk Tales of Many Nations*, 1936, and *English Folk Heroes*, 1948; and Sir G. W. Cox, *Tales of Gods and Heroes*, 1940.

Folkmoor, Folkmote, or Folcmote (folk-meeting; A.-S. *gemot*, mot assembly), name for the popular national assembly which met for political and judicial purposes or for deliberation in A.-S. times. The Gers. and Scandinavians had similar assemblies in olden times. At first the meetings were held in the open air on the moot-hill, and all the freemen in the shire attended, but later only the head of each family was admitted, and the meeting was held in the moot-hall. The people were summoned

by means of 'The Axe and the Arrow,' 'The Flery Cross' (described in Scott's *Lady of the Lake*), 'The Wardstaff of the Ongar Hundred,' 'The Dumb Borsholder,' etc.; and the officers of the court were the *burlieman*, who acted in the capacity of judge; the *raatmen*, or councillors; and the *stallere*, who was the superintendent of the court.

Folk-music, traditional melodies, the spontaneous expression of national temperament in popular times, and essentially an art of the peasantry. Nearly every race has its own folk-songs and dances; in primitive races they are almost invariably associated with religious rites. European F. is, of course, the finest, and the nationality of the chief types can be readily identified. Celtic, Ger., and Slavonic races have the strongest predilection for self-expression in folk-songs, and many of their examples are of rare beauty. F. is very strongly rhythmic, and of the most simple and regular construction. Sev. of the great composers have collected and transcribed folk-tunes, e.g. Brahms's *Hungarian Dances*, Liszt's *Hungarian Rhapsodies*, Dvořák's *Slavonic Dances*, etc.; whilst nearly all composers have used them, more or less, in their works, notably Haydn (Hungarian), Mendelssohn (Ger. and Scottish), Grieg (Scandinavian), Tchaikovsky, Glinka, and Borodin (Russian), etc. Even Negro tunes have been used, chiefly by Coleridge-Taylor, who embodied both Amer. plantation songs and African Negro chants in sev. of his compositions; and Dvořák, who used plantation songs in his New World symphony and the Op. 96 String Quartet (known as the 'Nigger' quartet). Much attention has recently been devoted to the collection and study of Brit. F., notably by Cecil Sharp (*Folk-Songs of England*), Mrs. Kennedy-Fraser (*Songs of the Hebrides*), and Rutland Boughton (in various writings on musical æsthetics); and the settings of Irish folk-tunes by Percy Grainger, the celebrated pianist, are well known. See MUSIC, SONG, etc.

Folkright, see FOLK-RIGHT.

Folkstone, municipal bor., seaport, and mkt. tn. in Kent, about 6 m. N.W. of Dover and 72 m. from London. It has a deep-sea harbour, which was begun in 1881. The shipping entering and leaving was over 800,000 tons before the Second World War. The tn. lies in a hollow between two high cliffs on the Eng. Channel, and is a fashionable resort. It is opposite Boulogne, and is a gateway to the Continent. Its harbour admits vessels of from 10 to 12 ft. draught at high water. The old pier was widened and lengthened in 1901. The Leas, on the top of cliffs 100 ft. high, form a tableland of lawns, in all 2 m. in length. The Leas Cliff Hall is a prominent feature of the Leas; it is built into the face of the cliff with a roof promenade on a level with the Leas, and is largely used for concerts and for conferences. At the foot of the cliffs is a pastoral walk known as the Under-cliff. On the E. side of the tn. lies the B. Cliff, an area which in recent years has been much developed. Beyond this lies

the Warren, an area of undisturbed natural beauty. Among other parks, grounds, and open spaces are Radnor Park; the sports ground on the Cheriton Road, with a co. cricket ground; and the Westenhanger race course (about 5 m. from the tn.), at which six meetings are held each year. Other places of entertainment are the Pleasure Gardens Theatre and the Marine Gardens Pavilion, a large building near the harbour and owned and controlled by the corporation. F.'s anct. par. church, dedicated to Sts. Mary and Eanswythe, stands on a site that in the early days of Christianity in these lands was occupied by a priory. It has long since disappeared, as also has the first nunnery in England which stood close to it, founded by St. Eanswythe, daughter of the king of Northumbria, to whom sev. miracles are ascribed. The church dates back to the twelfth century, and is a building of much historical and archaeological interest, not the least important feature of it being a very fine stained-glass window, the cost of which was met by the medical men of Great Britain in commemoration of F.'s distinguished son, Wm. Harvey, discoverer of the circulation of the blood. The free grammar school was founded in 1674. There is a fine central library on Grace Hill, and a new branch library was opened at Cheriton in 1938. The art gallery and museum occupy the upper floors at the central library. The tn. was frequently raided by enemy aircraft in the Second World War, but a progressive policy of rehabilitation has largely restored the tn.'s many amenities. Pop. (1931) 37,571; (1945) 27,000.

Follette, Robert Marion La, see LA FOLLETTE.

Follicle, in anatomy, a small tubular gland. A dental F. is a sac enveloping the developing tooth; a Graafian F., one of the small vesicles in the ovary, each containing an ovum; sebaceous Fs., the glands of the skin which secrete sebum; hair Fs., the sacs enclosing the roots of the hair.

Folquet de Marseille (1150-1231), troubadour of It. race. In 1198, being weary of love and having taken holy orders, he became abbot of Le Toronet in Provence. Here he joined Simon de Montfort and disgraced himself by his fanatical rage against the Albigenses, persecuting and slaying, until his victims, according to the story, numbered 500,000 persons. For this extraordinary zeal he was canonised by the church. He d. in the abbey of Grandseigne, and was given a place in paradise by Dante. His many poems have not yet been trans. into Eng.

Folticeni, see FALTICENI.

Fomentation (from Lat. *foreo*, I warm), method of applying warmth to some part of the body, but very often the term is used to signify the substances used. Fs. are used to remove pain, and a simple one is made by dipping flannel into very hot water, boiling if possible, and wringing it out in a towel. This should be applied immediately and covered with wool and waterproof sheeting to prevent the escape

of the heat. As soon as this becomes cool it should be replaced by another flannel. Very often boracic powder is dissolved in the hot water, and turpentine, camomile, opium, or belladonna is sprinkled on the flannel, especially when the pain is very great. *Fs.* are very efficacious in cases of pleurisy and colic, or for any pains in the chest or stomach, and very often a serious illness is ward off by prompt application of them.

Fomorians, anct. race of gods in Irish Gaelic tradition, related to the pre-Celtic race known in Irish story as Fírbalgs. But, whereas the Celts regarded them as baneful, they were generally regarded as peaceful agric. deities. The most prominent was Balor of the Evil Eye.

Fonblanque, Albany William (1793-1872), Eng. journalist, descended from an old Huguenot family of Languedoc. In 1828 he became editor of the *Examiner*, which he controlled for seventeen years (1830-47) with the utmost success. The paper, under the management of Leigh Hunt, had already a high reputation, but under the direction of *F.* it reached its zenith. He pub. a collection of his articles under the title of *England under Seven Administrations* (1837). See E. B. Fonblanque, *Life and Labours of Albany Fonblanque*, 1874.

Fond du Lac, city of Wisconsin, U.S.A., situated at the head of Lake Winnebago, 60 m. N.W. of Milwaukee. It lies among the hills, and is the cap. of Fond du Lac co. The first settlers arrived on the site about 1834, and it was chartered as a city in 1852. It possesses artesian wells and has a considerable lumber trade. Pop. 27,200.

Fondi (anct. Fundi), tn. of Caserta prov., Campania, Italy, 13 m. from Gaeta, on the Applan Way. Close by is a salt lagoon (*L. Fundanus*). There are remains of a Gothic cathedral (with eleventh-century mosaics), a Dominican convent where Thomas Aquinas taught, and the castle of the Colonnas. The anct. Cæcubus Ager near by was very fertile and noted for wines. The whole of the tn. was severely damaged by bombing in 1943. The monumental churches damaged were San Pietro, largely destroyed, San Francesco, half the cloister gone, Santa Maria Assunta, and San Domenico; also the castle was half destroyed. Pop. about 12,000.

Fonsagrada (Holy Well), com. and tn. of Lugo prov., Galicia, Spain, 76 m. E.N.E. of Santiago, with flour mills. Pop. about 17,000.

Fonseca, Manoel Deodoro da (1827-92), first president of the United States of Brazil, b. at Alagoas. He entered the army, and took part in the wars against Montevideo (1864) and Paraguay. On May 14, 1887, he issued a manifesto defending the political rights of military officers, and won over the entire army. When Correa d'Oliveira became Conservative Prime Minister he gave *F.* a command; six months later the ministry was overthrown, and soon after *F.* returned and was persuaded to head an insurrection; the result was a bloodless victory

and the proclaiming of a republic, of which he became president (Feb. 1891). In the following Nov. he retired from public life.

Fonseca, Marchessa de (*née* Eleonora Timentel) (c. 1768-99), gifted It. lady, studied under Spallanzani, married (1784) to the marquis of *F.* Introduced to the court of Ferdinand IV., she became for a short time maid of honour to his queen, Marie Carolina. In 1789 she espoused the cause of the Fr. Revolution. Her salon at Naples was the headquarters of opposition to the court, and she founded and ed. the *Monitore Napoletano* during the ascendancy of the popular party in Naples (1798-99). On the restoration of Ferdinand she was executed.

Fonseca, Gulf of (Amapala Gulf or Bay of Conchagua), large gulf of the Pacific, bordered by Salvador, Honduras, and Nicaragua, in W. Central America, discovered 1522-23, and named after the bishop of Burgos. The volcanoes Conchagua and Coseguina are on either side of the entrance (about 21 m. apart).

Fons Sanus, see FOSSANO.

Font, vessel or basin in which the water used for the rite of baptism is placed. In the earliest period the baptistery contained a basin in the floor sufficiently large to allow the immersion of adult converts. When infant baptism became the general rule this was much diminished in size, and was placed higher. When baptism came to be by affusion the size decreased still more, until we arrive at the *F.* as we know it, with a basin usually about 2½ ft. in diameter. The basin is supported on a pedestal which rests on one or more broad steps. The material is generally stone and in the Rom. Church, where the chrism, required to be preserved for future use, is mingled with the water, the *F.* is often lined with lead. In the Middle Ages examples of *Fs.* composed entirely of lead also occur. The exterior is generally octagonal, sometimes circular, square, or hexagonal, and is frequently decorated in a rich manner. The *F.* almost always stands at the W. end of the church.

Fontaine, Jean de la, see LAFONTAINE.

Fontaine-l'Évêque, city of Hainaut, Belgium, 6 m. W. of Charleroi. It has coal-mines and freestone quarries, and manufs. of iron, nails, knives, bolts, chains, boilers, etc. Pop. 8,100.

Fontainebleau (Fontaine Belle Eau, Lat. Fons Bellaqueus or Bleaudi), tn. of Seine-et-Marne dept., N. France, near the Seine, 37 m. S.S.E. of Paris. It is situated in a magnificent forest of 42,500 ac., one of the loveliest wooded tracts in France, and the haunt of landscape painters, notably of the Barbizon school (Rousseau, Corot, Diaz, Millet). There are quarries of sandstone and paving-stones, manufs. of porcelain, glass, and gloves. Grapes are freely cultivated, and there are also breweries. The school of practical artillery and engineering was moved here from Metz in 1871. The anct. royal palace (begun in the thirteenth century) has fine gardens and parks surrounding it. It was formerly one of the favourite royal residences of France. Pop. 15,000. *Consult* R. Pinor and C. Figeac, *Mon-*

graphie de Fontainebleau, 1866; E. Bourges, *Recherches sur Fontainebleau*, 1896; L. Tarso and M. Charlot, *Palace of Fontainebleau*, 1902; Marie Louise Gothein, *A History of Garden Art* (trans. by Laura Archer-Hind), 1923; and E. Pilon, *Fontainebleau* (trans. 1933).

(1895), shows the full influence of the Fr. school of realists. Toured England, and interested himself in O.E. ballads. His *Gedichte* and ballads (*Männer und Helden*) tell of the glories of old-time England. Other novels include *Vor dem Sturm*, a historical romance, and *Der Stechlin*

THE PALACE, FONTAINEBLEAU

D. McLesh

Fontana, Domenico (1543-1607), It. architect, b. at Mellae on Lake Lugano. In 1563 he went to Rome and Cardinal Montalto became his patron; under his auspices he built a chapel in the church of Santa Maria Maggiore and the Villa Negroni. When his patron became Pope Sixtus V. he was appointed chief architect, and built the Lateran Palace, the Quirinal, and the Vatican library. His most remarkable achievement, however, was the removal of the Egyptian obelisk (brought to Rome in the time of Calligula) from the circus of the Vatican to the front of St. Peter's (1586), of which he leaves a written account. When Clement VIII. became pope F. was dismissed and went to Naples, where he became architect to the viceroy, the count of Miranda, and did some good work. His son, Giulio Cesare, succeeded to his post and built the Naples Univ.

Fontana, Prospero (1512-97), It. painter, b. in Bologna. He belongs to that period of the Bolognese school that was influenced chiefly by imitators of Raphael. He executed an enormous amount of work, his subjects being chiefly sacred and profane hist. At Bologna he started a school of art, and among his pupils were Lodovico and Agostino. His masterpiece is the 'Adoration of the Magi,' in the church of Santa Maria delle Grazie at Bologna.

Fontane, Theodor (1810-98), Ger. poet and novelist, b. at Neuruppin, Brandenburg. F. is the novelist of Berlin life, the pioneer of the modern (pre-Nazi) Ger. novel, a typical late nineteenth-century Berlin man of letters. His literary method changed with the years, and gradually moved from historical romance to realism. His masterpiece, the novel *Elli Briest*

(1898). See F. Servaes, *Theodor Fontane*, 1900, and J. Furstenauf, *Fontane und die märkische Heimat*, 1941.

Fontanes, Louis, Marquis de (1737-1821), Fr. poet and politician. In 1783 he pub. a trans. from Pope, *L'Essai sur l'homme*, *La Chartreuse*, and *Le Jour de mort*, and in 1788 *La Verger* and *Épître sur l'édit en faveur des non-calholique*. Under Napoleon he became president of the legislative chamber from 1804 to 1810. His *éloge* on Washington was written at Napoleon's request. His works were collected in 1839 and ed. by Sainte-Beuve with a life of the author.

Fontarabia (Spain), see FUENTERRABIA. Fontenay-le-Comte, or Fontenay-Vendée, tn. 19 m. N.W. by W. of Niort, on the R. Vendée, just where it begins to be navigable, in the dept. of Vendée, France. Hats, woollen goods, and coarse linen are manufactured, but the possession of the beautiful Romanesque church of Notre Dame (fifteenth century and onward) is the city's chief distinction. Pop. 9000; arron. 118,000.

Fontenay-sous-Bois, tn. 6 m. E. of Paris, in the dept. of Seine, France. Commerce is chiefly in charcoal, wood, and the produce of market gardeners. Pop. 30,000.

Fontenelle, Bernard le Bovier de (1657-1757), Fr. advocate, philosopher, and poet, nephew of Cornelle, contributing to the *Mercurie galant* by 1677 (ed. by T. Cornelle). He has been called 'one of the last of the Précieux, or inventor of a new combination of literature and gallantry,' and was in Voltaire's eyes the most universal genius of his age. He wrote tragedies (*Aspar*, 1681), operas (*Psyché*, 1678; *Bellerophon*, 1679), pastorals like Segrais (1624-1701), *Lettres*

galantes du chevalier d'Her (1685) in the style of Voiture (1598-1648). In 1688 he sided with the moderns in the 'Quarrel of Ancients and Moderns.' In La Bruyère's *Caractères* he is satirised as Cydrias. He had a brilliant reputation in the salons of the time, and was at the height of his fame under Fleury's ministry (1726-43). His works include *Poésies pastorales* (1688); *Dialogue des morts* (1683); *Entretiens sur la pluralité des mondes* (1686), maintaining the fascinating paradox that planets and fixed stars are populous worlds; *Histoire des oracles* (suggested by van Dale's work) (1700); *Éloges des Académiciens* (1699-1740). Admitted to the Fr. Academy, 1691, in spite of Racine's and Boileau's opposition, he was also admitted to the Academy of Sciences, 1697, and secretary from 1699 to 1741. His *Éléments de la géométrie de l'infini* appeared 1727; *Théorie des Tourbillons cartésiens* in 1752. See collected works, 1790 and 1825; Charnay, *Biographie de Fontenelle*, 1846; Flourens, *Fontenelle, ou de la philosophie moderne*, 1847; E. Faguet, *Études littéraires sur le XVIII^e siècle*, 1890; and A. Laborde-Milab, *Fontenelle*, 1905.

Fontenoy, vil. 5 m. S.E. of Tournai, in the prov. of Hainaut, Belgium. Here in 1745, during the War of the Austrian Succession, the Fr. under Marshal Saxe defeated the duke of Cumberland and his allies, the onslaught of the Irish Brigade, which was fighting for the Fr., being irresistible. Pop. about 900.

Fontevrault (Fons Ebraldi or the Well of St. Evrault), tn. 9 m. S.E. of Saumur, in the dept. of Maine-et-Loire, France. Here in 1099 Robert d'Arbrissel founded a great abbey where a community of nuns and monks followed the order of F., which received papal sanction in 1106. Pop. 1600.

Fonthill Abbey, see under BECKFORD, WILLIAM.

Foochow, Fuchow, or Fuchau, cap. of the prov. of Fukien, China. It is on the R. Min, 34 m. from its mouth, and has been open to foreign merchants since the first Chinese war in 1842. Suburbs sprawl in every direction, but the city itself is girded by upwards of 5 m. of wall, 30 ft. high, topped at intervals by curious watch towers and pierced by seven gates. The riv. is spanned by the 'Bridge of Ten Thousand Ages,' which is supported by forty granite piers, and which was probably built in the eleventh century. The chief export is tea. After opium the staple imports are woven and metal goods. The prov. of Fukien is its outlet for tinned food, bamboo-pulp paper, and soap. The great arsenal on Pagoda Is. was instituted by Fr. engineers in 1867. Has one of the few dockyards in China. Since 1921 it has been the seat of the Christian Univ. The Jap. occupied F. for some years following their invasion of China, but in May 1945 Chinese troops retook the port. Pop. 314,900 (1926 census of Chinese maritime customs); other estimates give 400,000. For F. in Kiangsi and Liaoning (Manchuria), see FUCHOW.

Food, Adulteration of, see ADULTERATION.

Food and Agriculture Organisation (F.A.O.) was first proposed by the United Nations conference on food and agriculture held at Hot Springs, Virginia, May 1943. An interim commission formulated a constitution for the organisation, which was adopted by a later conference held at Quebec, Nov. 1945. This latter conference estab. the F.A.O., the constitutional purposes of which are to raise the levels of nutrition and standards of living of the peoples under the respective jurisdictions of the United Nations; secure improvements in the efficiency of the production and distribution of all food and agric. products; better the condition of rural pops.; and thus contribute towards an expanding world economy. The functions of the F.A.O. are to collect, interpret, and disseminate information on nutrition, food, and agriculture, and to promote national and international action with respect to scientific and economic research relative to these topics; the conservation of natural resources; the improvement of processing and marketing; the adoption of policies for the provision of adequate agric. credit; and other matters. Provision is made for an annual conference of F.A.O. to determine the policy and approve the budget of the organisation and make recommendations for submission to member nations with a view to national action. The conference may delegate powers to an executive committee, whose members act on behalf of the conference and not as representatives of their respective govts. An F.A.O. conference, which met at Copenhagen in the autumn of 1946, set up a commission with wide powers of reference covering the provision of sufficient food at fair prices for all peoples. The main proposal submitted to the commission was a plan by Sir John Boyd Orr for a World Food Board which would itself enter the market, buying food stocks when production was in excess and releasing them when it was deficient, thus at once ensuring supplies and stabilising prices; but the commission rejected this proposal as impracticable, though it retained some of the essential features of the plan. By means of its surveys F.A.O. will prepare the programmes which would be required to make nutritional standards adequate throughout the world and offer the advice and services, outlined in detail in the commission's report, to make these programmes effective. Policies and measures are discussed at the organisation's ann. conferences, when decisions may be taken by voluntary agreement, and, to strengthen the organisation in handling its volume of work, the commission's report proposes to establish a World Food Council, representing eighteen nations, which will meet if required in the intervals between the conferences. Prices are dealt with in the report on similar lines; there is to be no international purchasing authority, but the producing nations are simply invited to co-operate in pursuing policies of orderly marketing. The report accepts the Brit. proposal that each nation

should build up buffer stocks to be acquired or released by way of smoothing out seasonal fluctuations. At present the report awaits the consideration of the national govts. It is already evident that a mandatory scheme of international regulation is unacceptable by the large exporters, especially Amer. Regret has been expressed that the teeth were taken out of the Orr plan; but at least, if the great exporters of food are willing to see that their interest also lies in co-operation, the commission has offered a means of realising the aims of the Hot Springs conference which originated the F.A.O.

Food and Feeding (like the verb 'to feed', food comes from a Teutonic root, whence O.E. *foda*—cf. 'fodder'). Food is anything taken into the body which is capable of supplying physical energy, promoting growth, repairing tissue, furnishing energy for bodily heat and work, and aid in protection from disease. Man is the only animal who does not know instinctively how to select his food, and so the science of dietetics has evolved. He is also the only animal who cooks his food, which may render it more appetising to some people, but certain foods become less digestible and not so nutritious as in their natural raw state. On the other hand, heat destroys harmful bacteria, particularly in meat and milk (see C. E. Dukes, *Bacteria in relation to Domestic Science*, 1947).

The solid or 'nutritious' components of food fall into the following classifications:

NITROGENOUS

Proteins:

Casein: precipitated from milk, especially by rennet; important in cheese.

Myosin: present in the muscle or fibres of meat.

Gluten: present in the viscid matter (dough) of wheat.

Legumen: found in pulses, i.e. peas, beans, lentils, etc.

Albumen, gelatine: found in egg white, milk, muscle, vegetables, etc.

NON-NITROGENOUS

Carbohydrates: Starches and sugars.

Fats: olive oil, butter, etc.

These two groups, organic in origin, are derived from living organisms. The first, or nitrogenous, group, is essentially composed of nitrogen, carbon, hydrogen, and oxygen; is mainly flesh forming, building up and repairing nitrogenous tissues of the body; and, in the process, supplying a limited amount of heat. The second, non-nitrogenous, group (sometimes called carbonaceous compounds) is composed of carbon, hydrogen, and oxygen, and is the main source of energy and heat. The *inorganic* or *mineral matters* in food include sodium, potassium, iron, sulphur, calcium, phosphorus, iodine, etc. They are necessary for the normal building and functioning of the body, the greatest proportion being found

in the bones. Most of these inorganic matters are contained in organic foods, e.g. iron in meat and egg yolk; calcium and phosphorus in milk; iodine in fish, etc. Vegetables, grown in fertile soil, are also an important source of mineral salts, some of which salts can only be absorbed by the body in their natural combinations in food. Certain mineral matters cannot be utilised by the body unless particular *vitamins* are present. Vitamins are minute substances in natural food, and are essential to health (see DIET). There are also certain complex organic substances which by their presence alone set up catalytic action (enzymes) in the digestive organs; and it is probable that these substances are present in natural foods but, by refinement or concentration such foods become relatively 'indigestible.' *Roughage* in food, i.e. the unabsorbed cellulose from vegetables, fruit, whole wheat, flour, bran, etc., is necessary to supply bulk for the elimination of waste matters; and, in the refinement of foods, valuable material which aids digestion and nutrition is discarded.

The amount of food required in health is determined generally by the size and muscular output of the individual; but the growing child needs relatively more than his parents; and the adult muscular worker requires more energy-producing food than the sedentary worker. The energy value of food is measured in 'calories,' i.e. the amount of heat (great calories) required to raise a kilogram of water 1° C. The calorie value of food varies, e.g. carbohydrate giving only half as many calories as its equivalent weight of fat.

The following table (pub. in 1933, and printed by permission of the Brit. Medical Association) shows the approximate number of calories required for the average child and adult:

MAN-VALUES AT AGES (CATHCART AND MURRAY)

Ages	Calories
Adult male	1·00 3400
„ female	0·83 2840
Child 1 and under 2 years	0·30 1020
„ 2 „	0·40 1360
„ 3 „	0·50 1700
„ 6 „	0·60 2040
„ 8 „	0·70 2380
„ 10 „	0·80 2720
„ 12 „	0·90 3060
Old person (65+)	0·75 2550

A definite proportion of calories should be derived from first-class protein, second-class protein, fat, and carbohydrate, in order to fully supply the needs of the body. The recommended proportion is 6 per cent first-class protein and 6 per cent second-class protein; 27 per cent fat, and 61 per cent carbohydrate. The following table shows the total calorific value of certain foods, together with their protein, fat, and carbohydrate content.

TABLE OF FOOD VALUES. ANALYSIS AND ENERGY VALUE OF EDIBLE PORTION TAKEN FROM TABLES. (R. H. A. PLIMMER, D.S.O.)

Per lb. (or 453.5 (gm.))	Protein (gm.)	Fat (gm.)	Carbo- hydrate (gm.)	Cal- ories
Beef, fore- quarter .	85.3	83.5	—	1126

Most foods contain, in varying proportions, the essential elements to life, proteins, carbohydrates, fats, mineral salts, water, and vitamins. Certain foods have a much larger proportion of one constituent than another, e.g. meat supplying mostly protein and potato mostly starch. Milk, however, is a scientifically complete food, containing all the nutritive constituents to maintain life and promote growth, though the addition of some iron and vitamin C is recommended. Raw cow's milk is generally considered unsafe for human consumption owing to the possible presence of harmful bacteria. It should therefore be 'heat treated,' and this is usually done by pasteurisation. This destroys harmful organisms and some of the vitamin value. The latter may be supplemented by fresh orange juice, rose-hip syrup, etc. Milk is a food for children and invalids; but, to provide sufficient calories for his needs, the average man would need to take about eight pints a day and this would contain more protein and fat than is necessary, and insufficient bulk of unabsorbed matter to act as intestinal ballast.

Protein is the main constituent of protoplasm, and is essential to the body structure. It does, however, supply a limited amount of heat and so may take the place of carbohydrates; but starches, sugars, and fats can never take the place of nitrogenous foods in building and repairing the tissues of the body. Meat, fish, cheese, milk, and eggs provide good proteins. Lean meat and milk are readily assimilated, but cheese is difficult to digest owing to its insoluble fatty matters, but grating or thoroughly chewing renders it more easily digested. Eggs are an ideal food comparing favourably with meat and milk. They contain protein, fat, and mineral matters (particularly iron, phosphoric acid, calcium, etc.). The protein contained in egg white, however, is more easily digested when the myriad cells enclosing it are broken down by whisking or beating. Shell fish, particularly lobster and crab, are indigestible and sometimes contain certain irritant poisons. They should be eaten with caution. Oysters are easily digested but they are not very nutritious.

Carbohydrates (starches and sugars) are obtained mainly from vegetables.

the most important source coming from the cereals wheat, rye, oats, maize, and rice. Green vegetables, fruits, and nuts are also a source of starch and sugar. Wheat, rye, and maize are all used in bread-making, but wheat has the highest food value. Rice contains mostly starch, the whole grains being of better food value than the huskless polished grains. None of these cereals is a complete food as they are somewhat poor in fat and protein, hence the addition of milk, eggs, and butter. Sugar is of great importance as a food, and is derived from various sources, the chief being from the sugar-cane, sugar-beet, and sugar-maple; treacle, molasses, and syrup being by-products. Honey is an invert sugar (*see DIET*). Boiling for some time (as in home-made jam) converts white (refined) sugar into fruit sugar and renders it a more nutritious and desirable food.

Pulses (peas, beans, lentils, etc.) are a rich and economical source of protein, and are a fairly good source of carbohydrate. The soya-bean is rich in protein and fat, but contains little carbohydrate, and for this reason is used in the making of diabetic bread. It is also eaten with rice to supplement its protein deficiency; and a 'synthetic' milk can be made from the powdered bean, which is comparable to cow's milk.

Green vegetables, salads, and root vegetables are a valuable source of mineral salts and vitamins, and many (like the potato and carrot) are rich in carbohydrate. The soil in which vegetables are grown influences their nutritive value. It should be healthy and fertile, as inferior vegetables grown on poor soil are responsible for ill health. Green vegetables particularly should be eaten only when they are quite fresh. The potato is one of the most important root vegetables, and when properly cooked (*see DIET*) is a valuable source of food. Many vegetables may be grated and eaten raw with advantage, especially cabbage, sprouts, spinach, and also some root vegetables such as carrots, beetroot, etc. Young dandelion leaves are ten times as rich in iron as other vegetables. Tomatoes are a valuable source of vitamins. Edible fungi, such as mushrooms, are not very nutritious, and when cooked are indigestible. Vegetables as a source of protein must be considered bulky and indigestible. They contain much water and cellulose and the protein is not as easily assimilated as that from animal sources. Vegetarians supplement this protein deficiency by the addition of milk, cheese, eggs, and nuts.

Fats are an important food, especially to people living in cold climates. They include all the animal fats, vegetable fats, and fish fats (*see DIET*).

Fruit is principally of value on account of its refreshing qualities, sugar, vegetable acids, salts, and vitamins. Much of value lies in the skin of some fruits, but it should always be washed before being eaten. Bananas, figs, dates, and raisins are the fruits which contain a high caloric value, and therefore supply the most

energy. *Nuts* are rich in nitrogenous matter, but indigestible unless ground. They also contain more fat than any other vegetable.

The main constituent of every beverage is water. The chief restorative beverages are tea, coffee, and cocoa; they have a stimulative effect, but are of little nutritive value, except from any milk which is added. Alcohol if taken in moderation with food is a temporary stimulant, but may become a protoplasmic poison or anæsthetic. It stimulates the action of the heart and slightly raises the temp. of the body. There are many diet systems in vogue, both in health and in disease. The anti-uric acid regime known as *purin-free dietary* is the system based on the theory that in such disorders as gout, renal disease, neuralgia, etc., the body retains in its system a preponderance of uric acid and other purin bodies, which results in a poisoning of the tissues. Purins are substances constructed on the base $C_5H_4N_4$, and most appetising foods, such as sweetbread, meat, and meat extracts, oatmeal, lentils, tea, coffee, etc., are rich in them, and should therefore be avoided by those suffering from chronic diseases of all kinds. Foods such as milk, cream, butter, cheese, eggs, macaroni, and fruits of various kinds are, to some palates, less appetising, but are practically purin free. The adoption of this dietary greatly reduces the risks of overeating, and is easier to follow than other diets, restricted along more conventional lines. It should not, however, be followed indiscriminately, as if too little protein food is taken ill health results.

Another system, which has a certain number of adherents, is the practice of living upon foods obtained exclusively from the vegetable world, and abstaining entirely from flesh food and all food obtained by the killing of animals. Vegetarians are usually also total abstainers from all alcoholic liquors. The average vegetarian admits into his diet such articles of food as eggs, milk, butter, cheese, cereals, and some moderate vegetarians even eat fish. The movement took its rise about the middle of the nineteenth century, and the idea was best received in England, where there are numerous vegetarian societies, and restaurants. There are sev. varieties of vegetarian diet, but they all have one point in common, viz., abstention from flesh foods. In all ages there have been idealists who have advocated a vegetable diet, chiefly on ethical grounds, as exemplified by Plato, Plutarch, Shelley, Rousseau, etc., but they never had any very extensive following. The arguments for and against are many. Vegetarians maintain that flesh-eating is responsible for the propagation of some of the most serious diseases, especially cancer and tuberculosis. They also contend that nature provides the means of supporting life in the best and most nutritive form by such products as nuts, seeds, roots, eggs, etc., and not in the comparatively degenerate form of flesh. Anti-vegetarians object that with a purely

vegetable diet, in order to obtain sufficient nourishment, an enormous amount must be consumed and that the waste products are excessive in quantity. Scientific opinion too is unfavourable to vegetarianism, it being held that the structure of man's stomach and intestines proves that nature intended him for an omnivorous animal, his digestive organs being fitted to derive nourishment from every kind of food. The advances in the knowledge of the construction of vegetarian dietaries in recent years have been considerable, one of the greatest developments in extending the bill of fare being the manuf. of nut meats. There are also many vegetable extracts useful for making soups and gravies especially prepared from grains by malting processes. Various combinations of cooked grains exist, such as shredded wheat biscuits and others—all satisfactory foods. Generally speaking, however, vegetable foodstuffs are less appetising than others, and the vegetarian feeder, in consequence, is less likely to indulge in excess.

Diabetic diet, devised for patients suffering from diabetes, consists in removing from the food, as far as possible, everything which easily turns to the formation of sugar in the system, especially all excess of farinaceous food. Gluten bread, that is bread composed of wheat without starch, skim milk, cheese, eggs, meats, fresh fish, and green vegetables are prescribed, and sugars, starches, and all foods of an indigestible nature should be avoided. Saccharin is of great service in this diet, as it supplies the flavour of sugar without its objectionable properties. As regards beverages, sweet wines, liqueurs, ale, stout, cider, and cocoa should be avoided, but brandy, whisky, burgundy, claret, aerated waters, coffee, and tea may be taken with impunity. Milk too is as a rule allowable. Generally speaking a diabetic diet involves the use of foods rich in proteins and fat, and the abstention from those containing sugar and starch.

Banting system, for reducing obesity by means of a strict diet. The effect of this particular system of diet in his own case forms the subject of an interesting 'Letter on Corpulence,' pub. in 1863 by Wm. Banting. He was sixty-six years of age, 5 ft. 5 in. in stature, and weighed 202 lb., and by strict attention to diet managed to reduce the total amount of fat and in little more than a year lost 46 lb. of bodily weight. For breakfast he took from 4 to 5 oz. of any meat except pork; tea; and dry toast or biscuits. For dinner he took from 5 to 6 oz. of any fish except salmon; any meat except pork; any vegetable except potato; any kind of poultry or game; two or three glasses of unsweetened wine; and a small quantity of dry toast. His tea he always took without milk or sugar, and his supper was similar to dinner. He made his own case widely known by the circulation of his pamphlet, and his system was tried by numerous people and proved to be a great success. The large amount of meat, however, in this diet would be unsuitable in many cases, and

such a radical change should not be adopted without medical advice, as a prolonged course might have the effect of setting up dyspepsia. Weight can now be scientifically reduced by a definite diet which satisfies the requirements of the body but contains foods with a low caloric value.

Chloride-free Diet.—This is a recognised system in some of the leading hospitals of Paris, and consists of a diet prepared, cooked, and eaten without salt. Foods are selected containing the minimum of inorganic salts, and no salt is added either in the cooking or as a condiment. This diet is especially recommended in the treatment of chronic kidney disease, dropsy, heart diseases, persistent diarrhoea, etc. In many cases the beneficial results of the treatment are quite remarkable, and leave no doubt as to the therapeutic value of a salt-free regime. Milk, butter, fruits, jellies, tea and coffee, bread made without and cereals cooked without salt constitute a practically salt-free dietary.

Hay System (medical director Wm. Howard Hay, M.D.) had, and still has, a certain amount of popularity in America and elsewhere. It is based on the theory of the incompatibility of certain foods, and condemns the eating of carbohydrate foods with protein foods. Its aim is to maintain a high alkalinity of the body fluids by the eating of less meat, eggs, fish, and cheese, and these protein foods should only be taken with vegetables (but no starchy tubers) or salads, and followed by fresh acid fruits, omitting starchy sweet foods. Natural unrefined starches and sugars may be eaten with cooked or raw vegetables (including potato) and sweet fruits such as dates, figs, or raisins, with honey and cream.

Artificial feeding.—This occasionally has to be resorted to in the case of disease and grave illness, when food cannot be taken through the mouth, and when it is essential to try the artificial method, subcutaneous or intravenous.

Food-poisoning.—In times past this particular form of poisoning was thought to be extremely common, but at the present day it occurs only very rarely. Epidemics sometimes occur, but instances are not common. Food-poisoning may be classified under three main types: Metals, animal parasites, and plant parasites. Arsenic, lead, copper, antimony, tin, and zinc are the principal metals which have been known to cause poisoning in food. There was a widespread epidemic of poisoning by arsenic in Manchester and neighbouring cities of England from beer-drinking in 1900, which, on examination, was found to be due to the glucose used in the manuf. of beer. Lead-poisoning frequently follows the use of water which has been conveyed through new lead pipes, or it may result from the use of leaden colouring matters in biscuits, bread, and cakes. Zinc- and copper-poisoning may result from eating canned foods, but this is rare. The tins, however, should be wiped clean before inserting an opener, and the contents removed immediately into a clean

vessel. Dangerous and sometimes fatal cases of poisoning result from eating sausages, pork pie, game, shell-fish, etc. The symptoms are serious gastro-intestinal irritation, developing either immediately or four or five hours after food. The common occurrence of poisoning by eating canned lobster, crab, or other shell-fish is due chiefly to the rapidity with which they decompose after the can has been opened. A peculiar type of poisoning from milk, ice-cream, cheeses, etc., is also known, and seems to be due to the presence of a toxic substance. The most general poisons from vegetable foods are due to eating poisonous mushrooms, and the grains affected by ergot and allied species. Mineral oils, including medicinal paraffin, have harmful effects, and should not be used instead of edible oils in home cooking.

Preparation and cooking of Food.—This has much to do with its nutritive value, and many articles which, when raw, are unfit for nourishment, become nutritious when cooked. Well-cooked food is wholesome and appetising, while the same material badly cooked is unpalatable. Cooking serves three distinct purposes. It alters the physical condition and structure of the food, renders it appetising by improving the appearance and flavour, and kills by means of heat any disease germs, parasites, or such-like organisms the food may contain. This last is a very important matter and applies to both animal and vegetable foods. Scrupulous cleanliness should also always be observed in serving and keeping food. Every care should be taken to ensure this for the sake of health. If kept or handled under unhealthy conditions, food, and drink too, become very dangerous purveyors of disease.

Food and National Health.—The continued austerity of the Brit. diet after the Second World War prompted sev. medical bodies, such as the Brit. Medical Association and the Central Council for Health Education, to review the prospects with some care. The maintenance of health since 1939, together with improvement in many mortality rates, and in height and weight records of children, suggests that the diet had been on the whole a well-balanced one. Medical opinion favours the retention of such features of the diet as have plainly helped to secure the health and stamina of the public. It seems agreed that sev. elements have acted in combination to produce the good effect. Among these are the provision of milk to special groups, the availability of fruit juices for these groups, the use of a lightly milled flour, the higher, but as yet by no means adequate, consumption of vegetables (including potatoes), and the lower consumption of sugar. It is considered further that the average diet would be improved by a somewhat higher consumption of cheese than was the pre-war habit, a higher consumption of fat fish, and a more general provision of milk and eggs. Implicit in the medical view is the realisation that a thorough educational campaign is needed to persuade the public to maintain the beneficial features of

the wartime dietary, especially in regard to the lightly milled flour and the moderate consumption of sugar and sweetened foods.

Food Control, British, in Wartime.—*The First World War* (1914-18).—During the first two years of the war gov. interest in food was concentrated on the rationing of troops rather than on the food supply of the nation. But matters became acute in Britain about the middle of 1916, and in Oct. of that year a royal commission on wheat was set up, which soon expanded into an organisation for controlling the wheat supply of Great Britain, France, and Italy. In the same year a food controller was appointed (Lord Devonport), and later a Ministry of Food was created. In the spring of 1917 the gov. took over the supervision of all flour mills, and the people were exhorted to ration themselves according to a certain scale. The Ger. submarine campaign was also making itself felt in connection with the supply of food, and there were signs of growing unrest among the people. At this time sugar was rationed, but the system was extended to other commodities, and brought into being numerous F. O. commissioners to administer the system. The following are some specimen rationed articles per head per week:

sugar 8 oz., butter and margarine 5 or 6 oz., lard 2 oz., meat 1s. worth, bacon and ham and other meats varied amounts, 'am 4 oz., cheese 2 oz., and tea 2 oz. This scheme of rationing ended the queues which had previously gathered at shops and solved the problem of food distribution in a manner that caused little hardship. Towards the middle of the year the submarine peril was practically overcome (*see* VINDICTIVE; ZEEBRUGGE).

The Second World War (1939-45).—As in the First World War the gov. had to regard national feeding as of overriding importance, and again the problem arose as to the means of operating national control of foods through a centralised organisation. The circumstances in Sept. 1939 were, however, very different from those in 1914; for the gov. now had the documented experience of 1914-18 and of the application of public rationing, besides the experience of various marketing schemes under which elaborate national organisations were formed. In anticipation of war a special food (defence plans) dept. had been set up in the Board of Trade in 1936. Towards the end of 1939 the real food problem became evident; it was not that of feeding the nation so much as that of fixing prices at levels to suit every one, including the consumer. Meanwhile the food (defence plans) dept. had prepared commodity plans and in a report of 1937 issued a statement of general policy, including the following principles: The experience of the war (*viz.* 1914-18), shows that if control is to be effective in maintaining supplies and holding prices, it must be introduced before a shortage has arisen and prices begun to get out of hand; all food should be controlled by a single authority; the food controller should ensure that every one would be able to obtain a fair share of the national food supply at a reasonable price; whenever control had to be imposed the transition from normal trading to wartime control should begin to take effect within a few hours; and experience showed that if prices were to be controlled demand as well as supply must be regulated.

The Essential Commodities (Reserves) Act of July 29, 1938, estab. a fund and empowered the Board of Trade to proceed with storage of essential food. Trading interests influenced the plans to the extent of centralising control in the first instance through the large importing and wholesale houses with subsequent application through retailers to the public. Nearly a score of food divs. for regional application of plans were set up in Britain. Food committees estab. under the local authorities were responsible for registration of retailers, ration control of the consumer, and licensing of local manufacturers. This was the first deviation from the principle of control through one central authority and in consequence there was some overlapping of functions. The gov. then provided for committees at all stages of handling food on the general foundation of an independent chairman, civil servants, and trading

interests. Ration books were printed to ensure the retail control of such commodities as sugar, meat, bacon and ham, butter, margarine, and cooking fats indicating that demand control in these specified foods was held to be essential. On Aug. 31, 1939, before the declaration of war, the gov. issued the Acquisition of Food (Excessive Quantities) Order, making it an offence for the public to buy more than one normal week's supply of food. F. G. committees appointed by local authorities were estab. under constitution orders. Requisition and control orders authorised the acquisition and control of stocks of imported foods and feeding stuffs and of home-produced foods in quantities exceeding stated amounts in any stores exceeding a given capacity. Thus the first application of control operated from the importing or large-scale wholesale end without effective check on consumer demand.

The next step was the fixing of maximum prices of most commodities under provisional orders limiting prices to the highest figures secured in ordinary market conditions before the war. A series of Maximum Prices Orders controlled all stages from production to consumer. These allowed increases to satisfy reasonable demands of home producers and the chief trading interests, covering higher costs due to war risk insurance, freight charges, etc. The gov. held imported stocks and *pro tanto* became an early war profiteer. But on the other hand the gov. subsidised producers on condition that retailed prices remained low to the consuming public.

It is 'fair to state that government food plans were originally intended to maintain low food prices to the public, to take powers to fix maximum prices at all stages, to rationalise transport and to pool supplies, and so were theoretically means towards complete nationalisation of food supplies. Price levels were to be advanced only in response to proved increases of cost.' In spite of all previous experience, however, the gov., generally too late to anticipate price advances, tried to legalise higher price levels, whilst warning interested parties of the dangers of exceeding maximum control prices. For a well-reasoned statement of the problems involved in feeding the nation in peacetime and wartime *see* G. Walworth, *Feeding the Nation in Peace and War*, 1940.

The war brought about a considerable tightening in the supply situation: in the case of the United Kingdom this was caused chiefly by the necessity of husbanding shipping space required for imports; while in the case of Sweden and Switzerland the continental blockade reduced imports to a fraction of peacetime requirements. Nevertheless in spite of these difficulties the overall situation was less strained than on the Ger.-dominated continent, and left room for more flexible systems of rationing than in Germany. The good supply of bread and potatoes meant that each individual had the opportunity—as distinct from the totally

rationed pops. on the Continent—to consume as many calories as his individual requirements indicated. While the purpose was to maintain a diet adequate in all essential nutritive elements, this end could only be achieved with the greatest economy of means, and foods requiring more shipping space, land, and labour were reduced in favour of those requiring less. Rationing was concerned mainly with protein foods, milk, and fats. The need for these foods varies less between different groups than does the need for other nutritive elements, and it was found possible to adopt a system of relatively undifferentiated individual rations. Nevertheless it was recognised that an overall *per capita* rationing was not capable of taking into account all special nutritional needs which were then met by various schemes superimposed, as it were, on the basic system. The most important of these schemes were communal feeding, and schemes for the distribution of protective foods, namely milk, eggs, and certain fruit and fruit juices for which special ration cards were given. The best known and most important of these schemes related to milk. In addition children received through welfare and maternity clinics quantities of fish liver oil and fruit juices. A third scheme was the use of 'points rationing.' Each consumer receives a card containing a certain number of points, and the commodities are 'priced' not only in ordinary currency but also in points. At present tinned meat, some fish, and beans for instance, are (1949) under point rationing. The system renders it possible to include or exclude foods as the situation demands, and through the double mechanism of price and point changes demand can be steered in the direction desired. At the same time the system leaves a considerable latitude of choice to the consumer (consult *Food Rationing and Supply*, 1943-44, issued by the Economic, Financial and Transit Dept. of the League of Nations (Geneva), 1944).

In contrast with the First World War, when profiteering in produce was found to be a constant evil, the Gov., by combining excess profits tax with price control prevented profit from war.

Food; Council. The prices of food remained at a high level for some years after the First World War had ended, and there were frequent complaints that traders were demanding unjust prices. Profiteering was a constant reproach levelled at middlemen and producers. The result was that a royal commission was appointed to investigate these complaints, and after its report in April 1925, a F. C. was set up in July of that year which consisted of twelve members, under the presidency of Lord Bradbury. Probably the remedy was belated, for about this time the ordinary laws of competition began to reassert themselves. The council from the first was a somewhat impotent body, for it had no power to compel witnesses to give evidence; nor indeed any power to enforce its recommendations. One useful piece of legis-

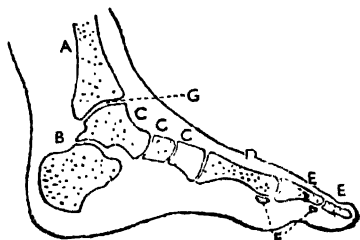

lation, however, the Weights and Measures Act, 1926, resulted from its activities.

Food Poisoning, see under FOOD and FEEDING.

Fool, see JESTER.

Fools, Feast of (Lat. *festum fatuorum stultorum*, or sometimes *asinorum*), grotesque masquerade or medieval Christian merrymaking, taking place more particularly on Holy Innocents' Day (Dec. 28), but extending more or less over the whole period between Christmas and Epiphany. Probably a survival of the old Rom. Saturnalia, it crept into the ceremonial of the Christian Church in spite of the fierce anathemas of fathers and councils, and even after the Protestant Reformation an observance of it was kept at Antibes (1644). The festival apparently originated in France, and was first mentioned by J. Belet (twelfth century). The aim professed was to interest people in the story of the Advent, but the boisterous drollery soon degenerated into profanity. Usually the donkey played a leading part in the pageant. Mock popes, cardinals, and bishops were elected with ridiculous titles, and the most sacred Christian rites were travestied. See Du Tillot, *Mémoires pour servir à l'histoire de la fête des Fous*, 1741; Schneegans in Müller's *Zeitschrift für deutsche Kulturgeschichte*, 1858.

Foolsap, long folio writing or printing paper, so called from the device of a fool's cap and bells originally used as a watermark. This mark became obsolete by 1795. It varies in size from 12 in. by 15 in. to 13 in. by 16 in. (for writing); double F. for writing and printing is 17 in. by 27 in.

LONGITUDINAL SECTION THROUGH THE FOOT IN THE LINE OF THE BIG TOE

A, tibia; B, bone of the heel; C, tarsal; D, metatarsal; E, phalanges; F, sesamoid bones; G, ankle joint.

Foot. In the human F. the bones are twenty-six in number, arranged in three groups, viz. the tarsal, or hindmost bones, the metatarsal, and the phalanges of the toes. A certain amount of elasticity is given to the F. by the cartilage with which the bones are covered and by the slight movements of which each bone is capable. The weight of the F. is borne on three distinct points; the heel, the point where the big toe joins the first metatarsal bone, and a similar point at the base of the little toe. The elasticity of the F. is greatest in the arch,

composed of five long bones, sloping gradually to the ground. The bones of the F. are all held together by short ligamentous bands of great strength.

Foot, unit of lineal measure used in Great Britain and U.S.A., estimated very roughly as the length of the human F. (traditionally the king's). The Brit. standard or statute F. is one-third of a yard, or 12 in. A square F. contains 144 sq. in., a cubic F. 1728 cub. in.

Foot-and-Mouth Disease, or **Murrain**, eruptive fever, caused by an undiscovered virus, beginning without warning, spreading with great rapidity. All animals, even human beings, are susceptible to attack. It is not necessarily fatal, but the vesicles or little tumours which appear in the mouth and between the toes cause affected animals to lose condition, the milk yield to deteriorate, and animals with young to abort. Lameness is often the first symptom noticed, the animal smacks its lips, and saliva drips from the mouth. In 1883 the disease caused much loss in Great Britain, but from then till 1910 the country was practically free. F.-and-M. D. is compulsorily notifiable. During recent years local outbreaks have been successfully met by rigid methods of isolation and the prevention of movements of cattle from the area affected.

Football, game in which two teams of players play with a ball. There are two main codes of F. in this country, Rugby and Association; the former allows the ball to be carried as well as kicked, whilst in the latter game handling is prohibited, except by the goalkeeper. The affairs of the Association game are in the hands of the F. Association, whilst the Rugby Union controls those of the handling code. Sev. public schools, such as Eton, Harrow, and Winchester, play varieties of F. peculiar to themselves. The game as played in the U.S.A. is now very different from the Rugby Union game on which it was modelled. From the earliest times games with a ball were probably in vogue, and we have record of some amongst both the Gks. and Roms. The Gks. had a game which consisted simply in throwing the ball from one person to another, another game (*ἀντροπας*) in which the ball was struck with the palm of the hand on to the ground as often as possible, and one called *βασιλευβα*, in which the players threw from one to another, with tricks and feints. None of these games had so much in common with F. proper as the Gk. *ἐπισκευπος* and the Lat. *harpastum*, the latter of which was in all probability the precursor of Eng. F. Pollux describes the latter as a game in which the players, divided into two bands, strove to carry the ball over two lines. There is no historical evidence to show that the Roms. actually introduced *harpastum* into Great Britain, but the probability is that they did so. There is no doubt, whatever the precise origin of the game, that it was known at a very early time in England. Its name occurs before that of any other athletic sport which is popular at the present day. W. Fitzstephen, in his *History of London* (c. 1175) speaks of the

young men of the city annually going into the fields after dinner to play at the well-known game of ball on the day *quoddiditurn Carnilevaria*, and as far as is known this is the earliest definite mention of F. in England. It is notable that Shrove Tuesday seems to have been the day on which more than all others F. was played, and the custom of a rough and tumble game on that day still survives in some parts of the country. At Derby, for instance, all the able-bodied men in the pars. of St. Peter's and All Saints took part in the contest. The game began in the market-place, a large ball being tossed up in the middle of the bands. The goals in such games were at opposite ends of the tn., and nothing stopped the players, who took the ball through water if necessary, and recked nothing of broken heads, torn clothing, and such details. This is also an ann. event at Athorstone (Warwickshire). Such ball-play was popular also among the anct. Scots, for we find the Shrovetide game at Scone, in the co. of Perth, described by Sir F. M. Eden, in his *Statistical Account of Scotland*. A feature of these games was their length, as they lasted in most cases for the major portion of a day. Fitzstephen, writing in the twelfth century, says that 'the boys annually on Shrove Tuesday play at the well-known game of ball.' Many further proofs of the popularity of F. among the anct. residents of the country are forthcoming. In many of the games every able-bodied man was compelled to take part in the contest: the day was made a general holiday, and any player who was fortunate enough to ground the ball in goal was a popular hero. In all these early contests the element of danger both to life, limb, and property was considerable, and sev. proclamations were issued at various times forbidding it. Edward II., as a result of a petition of the citizens of London, issued a proclamation on April 13, 1314, commanding and forbidding the game to be played in the city in future, 'as many evils may arise, which God forbid.' In 1349 Edward III. pub. a proclamation against F. and in favour of archery; similar writs to that then issued at London were sent to the sheriffs throughout England. In the time of Henry IV., A.D. 1410, we find F., prohibited in Normandy, described among the *jeux importunes*, and again in the statute 12 Richard II. c. 6. James III. of Scotland ordered in 1447 that 'football, and golfe, be utterly cryed down and not to be used,' and a royal proclamation was made in England in 1491 against the same two sports. F. was by no means stopped by these prohibitions, being played to a very great extent in the reign of Elizabeth. There were still no set rules for the conduct of the game, and no referees or umpires; consequently the number of accidents was large, and some of them were fatal. Proclamations continued to be issued against the sport, as in 1572 and 1581. In the seventeenth century various names appear to have been given to it; in Cornwall it was called hurling, and in the E. cos. camping or camp ball. An exception to the rule of

hostility to F. among kings was furnished by Charles II., who made a match at F. between his own servants and those of the duke of Albemarle in 1681. During these times there was practically no opportunity for the working classes to indulge their liking for F. save on Sundays, as there was no Saturday half-holiday then. This desecration of the sabbath naturally provoked the wrath of the religious people of the time, as is forcibly expressed by P. Stubbes in *The Anatomy of Abuses in*

has gradually assumed control of the Association game or 'soccer,' over which it is now the supreme authority in this country and the Brit. Commonwealth. The F. League, consisting of the eighty-eight clubs of the First, Second, and Third Divs., controls the prin. professional matches in this country. It sends six representatives to the F. Association Council, and it deals with all questions appertaining to the league management, promotion and relegation, fixtures, regis-

An incident in the England v. Scotland international match at Wembley, April 9, 1949.

the Realm of England (1583). Towards the end of the eighteenth century F. waned in popularity, and between 1820 and 1840 it was hardly ever played. But it survived. The reason for its survival must be looked for in the public schools, which each had a game peculiar to itself in many respects. The prin. features of these games will be dealt with later, but the natural wish of the old boys of public schools to continue playing was primarily responsible for the revival of the game and the development of Association F.

The first attempts to originate a code of rules to enable old boys to play together was made at Cambridge Univ. in 1846. Between that date and 1863, the date of the formation of the F. Association, sundry unsuccessful attempts were made to reduce the numerous school rules to one satisfactory code. In 1855 the Sheffield club was formed, in 1857 the Hallam club, and in 1859 the Forest F. club, afterwards the famous 'Wanderers.' In 1863 the F. Association was started, and

trations, and transfers of players, wages, talent money, benefits, protests by clubs and players, and similar affairs which are the direct domestic concern of the league. Similar associations govern the game in Scotland, Ireland, and Wales. There are two professional leagues in Scotland, Div. A and Div. B, promotion and relegation principles applying as in England.

Apart from these Scottish and Eng. leagues there exist throughout the country minor professional leagues. Perhaps the best known are the S. and Midland leagues. Others include the E. cos. and Cheshire co. leagues, and the Birmingham Combination. Many Eng. league clubs run reserve sides in these organisations. The F. Association also sponsors minor leagues, schools football, and National Youth championships.

Amateur F. flourishes more particularly in the S. The amateur leagues are controlled by the Amateur F. Association or, in some cases, the Amateur F. Alliance. Well-known amateur leagues include the

Isthmian, Athenian, Corinthian, and the Spartan Leagues. Possibly the best known of all amateur clubs in England is the Corinthians, who amalgamated with the Casuals in 1938. In 1895 the England team that met Wales was composed entirely of Corinthians. Their first tour was in S. Africa in 1897, and few clubs have done more to popularise the amateur game. Their name used to attract players from all over the country, although it has been said that the 1938 fusion was not a success. Another famous amateur club is Queen's Park, who compete in Div. B of the Scottish League.

In the early years of the game there were naturally many changes in the laws. Until 1869 handling the ball was permitted under certain conditions, but in that year the practice was abolished. The game is played with eleven men on each side, the formation being five forwards, three half-backs, two full-backs, and a goal-keeper. In 1911 a new off-side rule was made, which provided that a player could not be off-side in his own half of the field. When a player plays a ball any other player of the same side who at the moment of playing is nearer his opponents' goal-line is off-side unless three or more of his opponents are at such moment of playing nearer their own goal-line. The field of play is 120 yds. by 80 yds. (full-size). The goal posts are 8 yds. apart; the goal area is a space 20 yds. by 6 yds. in front of the goal, and the penalty area is a space 44 yds. by 18 yds. in front of the goal. When a player handles the ball or commits a foul inside the penalty area, the opposing team is awarded a penalty kick. The ball is placed on a spot 12 yds. from the goal, no player being allowed to stand between the ball and the goal-keeper. The penalty kicker endeavours to place the ball between the posts, only the goal-keeper being allowed to intercept the ball. The ball is kicked off at the beginning of each half period and after each goal, by the centre-forward in the centre of the field within the kick-off circle, 20 yds. in diameter. In 1936-37 a new rule came into force whereby a player is not allowed to try to kick the ball while it is in the goal-keeper's hands. It is also unlawful for the goal-keeper to punt the ball at the goal-kick; nor may he handle the ball outside his own penalty area and, in any event, may not carry it more than four steps without bouncing the ball on the ground. Providing he bounces it every four steps he can carry the ball anywhere within his penalty area. The ball is round, leather-covered, weighing 13-15 oz. and 27-28 in. in circumference. A goal is scored when the ball is kicked or headed between the goal-posts and under the horizontal bar. A goal may be scored from a free kick. The referee is assisted by two linesmen, who watch particularly when the ball goes into touch, and advise the referee when so asked. The referee has power to send off any player guilty of violent and ungentlemanly conduct, and his decision in all matters is final. During the 1948-49 season the F. Association rule 12 was rewritten to cover obstruction

of a player. If a player charges or obstructs a player who is not within playing distance of the ball, a foul is committed. The rule, however, does not define what the F. Association regards as 'within playing distance,' and leaves it to the judgment of referees, whose interpretations naturally often vary.

The most important competition of the year, because open to all clubs, is the Eng. Cup. This was instituted in 1871, and in the first years only very few teams competed for it, but their number has gradually grown, until now the first qualifying round for the trophy is played off in the first month of the season. The Scottish Cup was started two years later, and Ireland and Wales now have similar cups. Owing to the greater skill of professional footballers, the Eng. Cup is practically a competition for such teams, as no amateur club of recent years has survived longer than the first round of the competition proper. The present Eng. Cup is a modern vase; the original was stolen from a shop window in Birmingham in 1895 while Aston Villa were the holders.

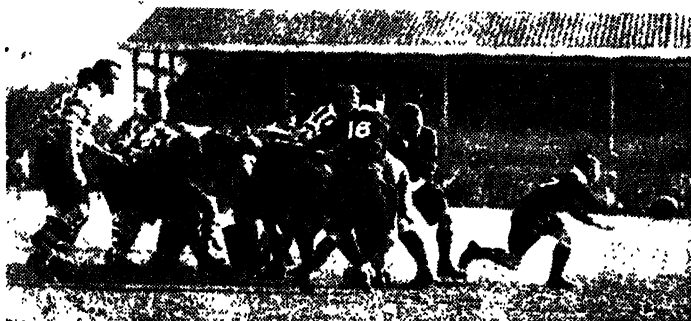

The cup is open to all clubs in the country. By a series of preliminary rounds, however, the vast number of entries are whittled down to the first round proper, when the Eng. League clubs join in. The same principle applies to the Scottish, Irish, and Welsh Cups, entries being confined to the applicable countries.

F. played on the Continent is on the same principle as that in England. Generally, though, a less severe interpretation is placed on their rules, particularly with regard to the obstruction rule. This is always brought to notice in matches between England and other countries. In recent years F. has become increasingly popular in other parts of the world, even finding a foothold in America, whose national game is baseball. Russia has taken it up in recent years, and their premier club, the Moscow *Dinamos*, played sev. leading Eng. clubs in 1946.

Rugby Union Football, or *Rugger* as it is generally termed, in contradistinction to soccer, is governed by the Rugby Union, which was founded in 1871 by the Blackheath and Richmond clubs principally. Many members of the Union are clubs associated with schools, univrs., and the armed services. The laws of Rugby F. were recodified and issued in their present form in 1926. The ball used is oval in shape and composed of the same materials as an Association ball; its length is from 11 to 11½ in.; its circumference, measured lengthwise, 30 to 31 in.; measured over the width, 25½ to 26 in.; and its weight at the beginning of a game is between 13 and 14½ oz. The score is made by means of tries and goals. A try is scored when the ball is touched down by one of the attacking side behind the opponents' goal line. A goal is scored when the ball is kicked over the crossbar and between the uprights of the opponents' goal. The width of the goal is 13 ft. 6 in., and the height of the crossbar is 10 ft.; the uprights extend for over a foot above the crossbar, and the ball may pass between them at any height. The

field of play is 75 yds. by 110 yds., lines are drawn parallel with the goal lines at a distance of 25 yds. out, these being known as the 'twenty-fives.' A goal may be scored in four different ways: (1) When a try is scored the ball is brought out any distance desired from the place where it was 'touched down,' at right angles to the goal line, and a place kick is taken. If this results in a goal, two points are added to the three already gained for a try. (2) A dropped goal is a goal from a drop-kick, which is a kick where the player drops the ball on the ground and kicks it immediately on the half volley. (3) A goal from a 'mark,' when a player catches the ball from a kick by the opposing side he may, instead of running with it, strike his heel into the ground and claim a mark.

once picked up) or a scrumage is formed. A 'scrum' consists of the opposing forwards packing in two bodies, generally three, in the first mark, then two, then three again, and shoving at each other. The ball is put into the scrum by the 'scrum half' of the side which did not commit the breach of the rules causing the scrum, and must be 'heeled out' as quickly as possible by the forwards to the rear, where the half is waiting for it. Offences which are punished by free kicks are handling the ball in the scrum, 'feet up' in the scrum; hacking, tripping, and impeding, and tackling an opponent who has not got the ball. The most common offences are passing forward, knocking on, and offside. If the ball is kicked into touch it belongs to the side which did not kick it in; if

RUGBY FOOTBALL: THE BALL COMING OUT OF THE SCRUM

A free kick may then be taken, and if a goal results it counts three points. (4) A penalty goal is a goal scored from a place kick which has been given as a penalty against the opposing team for some breach of the rules. A team consists of one full-back, four three-quarter backs, two half-backs, and eight forwards. The New Zealand team introduced an alternative formation, consisting of one full-back, three three-quarters, two five-eighths, two halves, and seven forwards. Seventy minutes, thirty-five in each half, is the usual time played. The choice of kick-off or goal is decided by tossing, and the kick-off is made from the centre of the half-way line. Any player who is onside may run or kick directly after the kick-off. A player is offside if he gets in front of the ball during a scrumage (this applies especially to the halves), or if the ball has been kicked or is being run with by one of his own side who is behind him; when an opponent has kicked or touched the ball, or when one of his own side, with the ball, or the kicker of the ball in any case, has run in front of him. The ball must not be passed forward, or 'knocked on.' When a player is fairly tackled by an opponent he must at once drop the ball, which is then kicked on (it must not be at

carried into touch, to the side carrying it. A 'line out' is formed when the ball has gone into touch; the half-back who throws the ball in must throw it at right angles to the touch line, or a scrum is held where it deviated from the straight line. When a player has crossed the touch in goal line, after a player has touched the ball down behind his own goal, and after an ineffectual attempt to place a goal from a try has been made, the ball is dead. If, however, a player carries the ball over his own goal line and then touches down, a scrum is held 5 yds. out from the goal line, opposite where he touched down. In the cases where the ball is dead a drop-kick or punt is taken by the defending side from their '25'; all the men of the side must be behind the man who takes the kick, or they are offside. A referee is in charge of the game, assisted by two touch judges with flags, which they hold up where the ball goes into touch; they also assist the referee in judging goals. No professionalism is allowed by the Rugby Union, a rule that led in 1893 to the formation of the N. Union, renamed the Rugby League in 1922.

Rugby League.—The professional game differs somewhat from the Rugby Union game. Only thirteen players form a team,

and the scoring is slightly different; the result of the alterations is a more spectacular type of F. Rugby League games are confined to the N. of England, particularly Lancashire and Yorkshire. Only one match throughout the season takes place in the S., this being the league cup final at Wembley, an innovation of recent years. The league is organised on the same basis as F. leagues, with various divs., relegation, and promotion principles.

The Eton games.—There are two separate varieties of F. played at Eton, the wall game and the field game. The former game is played by only a small proportion of the boys, but is interesting from its peculiarities. The ground is bounded on one side by a wall about 9 ft. high and 120 yds. long; on the other side by a line drawn parallel to the wall at a distance of 6 yds. from it. Another wall containing a door runs at right angles to the wall, and at the other end of the ground is a large elm; the door and a chalked space on the trunk of the tree form the two goals. Scoring is by shies and goals, one of which outweighs any number of shies.

The field game is more generally played at Eton. The ground is 150 yds. by 100 yds., and goals 12 ft. in width and 6 ft. high. Eleven players form a side, divided up into eight forwards and three behinds. The game is begun by a 'bully' in the centre of the field. Four players form the bully; just outside the bully on each side is a corner, and an 'extra corner' on one side, whilst just behind is the 'flying man'; then comes the 'short behind,' the 'long behind,' and the 'goals.'

The Harrow game is played with a ball which resembles a church hassock in shape, flattened at the sides and irregularly circular elsewhere. The ground is about 150 yds. by 100 yds. Two upright poles without any crossbar, 18 ft. apart, mark the goals. A goal is scored by kicking the ball between them at any height. Any number of players may form a team; in matches the number is eleven.

The Winchester game is played with a ball slightly smaller and lighter than an Association ball. The ground is 80 yds. by 25 yds. A net runs along each of the long sides to a height of 10 ft., and a line of stakes and ropes 1 yd. inside the net. This enclosed space is called under ropes. A furrow, called 'worms,' is marked on each short side. A goal is scored by kicking across worms, but the ball must not touch ropes, stakes, or nets, or an opponent.

American football.—From colonial times until 1871 a kind of Association F. was played by the colleges in the U.S.A. A 'soccer' championship has been in existence since 1913, and those clubs which have won on more than one occasion are the Bethlehem Steel Company F. club and the Fall River F. club. In 1871 a code of rules founded on Eng. Rugby was imported from Canada and played under, at first, by

Harvard Univ. The laws were not very satisfactory, however, and in 1876, after a match had been played with Yale under mixed rules, the Rugby Union laws were adopted generally. An ann. convention was appointed to modify the rules as required, but the roughness of the game reached such a pitch that at one time the authorities forbade the matches between Harvard and Yale. The Univ. Athletic Club of New York invited a rules committee to revise the laws of the game, which is now less rough and more scientific. Professionalism in F. has never prospered in the States. The teams are composed of eleven men. The ground is 330 ft. long by 160 ft. wide, and is divided by chalk lines into squares of 15 ft. side, leaving a 5-ft. strip clear on each side, parallel with the touch line. The middle line and two lines, 25 yds. from each goal line, are made wider than the others. The goal is composed of two uprights more than 20 ft. high, 18 ft. 6 in. apart, and joined by a crossbar at a height of 10 ft. The ball is the same as an Eng. Rugby ball. There are seven forwards (two guards, two tacklers, two ends, and a 'centre-rush' or 'snapper back'), a quarter-back, two half-backs, and a full-back. A touchdown (a Rugby try) is 5 points, a goal 6 points (1 point more for conversion of a touchdown), a goal from the field 4 points, and a 'safely' (an Eng. Rugby touchdown) 2 points. A man is offside as in Eng. Rugby, but is put outside when the ball strikes the ground. The quarter-back is the general of the side; it is he who shouts the code words and commands which inspire the 'tricky plays,' such as the 'fake-kick,' the 'wing-shift,' 'double passes,' 'false passes,' 'delayed runs,' etc. In order to prevent blocks it was enacted that 10 yds. must be made by one side in three successive attempts. The great feature of Amer. F. is the 'interference' which is allowed; the game resolves itself into a series of scrums interspersed with runs and kicks. Each man faces his opponent in the scrum, and thus a species of man to man contests is continually going on. Another feature of Amer. F. is the 'shift,' a tactical manoeuvre entailing a sudden change of formation; various shifts have been developed but were regulated by rules after 1922. The principle of substitution of one player for another in the course of the game is admitted. Development has been towards transforming the Eng. Rugby code into an intricate and partly standardised system of tactical play. See M. Shearman and J. E. Vincent, *Football, its History for Five Centuries*, 1885; A. M. Weyand, *American Football*, 1926; W. W. Wakefield and H. P. Marshall, *Rugger*, 1927; W. J. A. Davies, *Rugby Football*, 1928; C. M. Buchan, *Association Football*, 1928; H. B. T. Wakelam, *Rugby Football*, 1935; F. N. S. Creek, *Association Football*, 1937; E. H. Sewell, *Rugger, the Man's Game*, 1947.
